siderable. The climate is very healthy and the present time is the best season. One leaves the hot, low country by rail in the morning, and arrives by night in the most pleasant, cool atmosphere of an average of 58°.

Hakgala Gardens are some miles distant from the park, and, being more sheltered, are never visited by frost. Tree Ferns abound on the slopes of the hills, near the water, and on the roadsides. The hills are mostly covered with virgin evergreen forest, and, in order to retain the natural forests, the Government does not sell ground for cultural purposes above 5,000 feet.

The forest is largely surrounded by grassland, called "patanas," and the line where grass and trees meet is so very sharp as to have the appearance of being artificially made. The patanas are burned by the natives, as the burning is followed by young grass, which is grazed by cattle. *Lobelia nicotianifolia* is the most conspicuous plant near Nuwara Eliya. In the patanas, where wild Manna grass prevails, the only shrub or tree to be found is *Rhododendron arboreum*, from 9 feet to 15 feet high, and many hundreds of years old, having withstood numerous fires. They are covered in March and April with masses of scarlet flowers.

The hills and slopes, with grassland and *Rhododendron*, alight with far-spread patana fires, afford a sight never to be forgotten. The sunrise, too, is most beautiful. Monkeys and elephants are found in the neighbourhood, but the forests are free from dangerous animals. The climate, which is very healthy, reminds one of Northern Italy. It is fortunate that, in this tropical island, there is such a cool health resort, where at times one can get out of the powerful heat of the low country.

Hakgala Garden is laid out in a still more natural style than Peradeniya gardens, the situation on the slope of a mountain affording greater possibilities. Nurseries and flower-gardens are interspersed as positions allow, and large drives, connected by natural paths and steps, which lead to lovely groves of Tree Ferns and climbers, run through the whole park. The Tree Ferns do exceedingly well, not only the native species, but also those which have been introduced, and the whole garden has a very natural appearance, for the fine, old trees of the virgin forest have been well cared for.

At Heneratgoda, near Colombo, and only about 30 yards above sea-level, is another botanical garden. This garden contains the oldest Para Rubber

trees, brought to Ceylon in 1876, from their seeds the whole of the great Rubber industry of Ceylon has sprung. Tapping for Rubber may be seen in progress. The garden is rich in useful and interesting trees, creepers, and Palms.

The land about Colombo is largely under cultivation and produces fine fruits and vegetables for the Colombo market. Coconut Palms are seen in every garden, although these are harmful to the other plants, owing to the roots intruding on every flower-bed.

Caladiums of every shade are grown in the gardens. Roses, although they do not flower much, are also there, and in large pots along the paths and around the houses are to be found Ferns, Palms, Begonias, and Marantas. Native Orchids grow on the trees; some gardens contain either a collection or a mass of one species. The Lettuce Tree (*Phormium tenax*), the leaves of which are cooked as a vegetable, forms quite a feature amongst old and new houses.

The Government School Garden, near Colombo, is also worthy of a visit. The Ceylon School Gardens are under the supervision of Mr. C. Drieherg. Europeans have greatly assisted in the development of this wonderful country, but the standard

work, needlework, fibres, mats, and tuggery of Palm leaves, including the strips known as "olas," on which the old native scriptures and other books are written.

For the benefit of those visiting Ceylon, I may say that travelling accommodation is satisfactory, and, in some places, even more than this. Although good cooking can be had, this is not the case where, as in some instances, it is left to the coolie and Ceylon natives.

Minerals do not abound in Ceylon, but its precious stones and pearls are famous, and, although at first an exorbitant price is asked for them, they can be purchased reasonably by bargaining. *Fr. Henkel.*

(To be continued.)

NEW CHINESE TREES AND SHRUBS AT ALDENHAM HOUSE GARDENS.

MR. E. H. WILSON'S third expedition to China in search of new species of plants for introduction to gardens was organised by Professor Sargent, of the Arnold Arboretum, Boston.

the collection shown at the Royal Horticultural Society's meeting, on Tuesday, August 30 (see fig. 72), and for which the Society's Gold Medal was awarded, formed a part of these plants that were potted. As the plants became established, they were transplanted in larger pots, those from the boxes being transferred to the open ground. The majority of the subjects grew with wonderful freedom, and, with the exception of a few, which Mr. Wilson queried as being tender, they survived the cold of winter well. This, I believe, was due to the collector selecting seeds from plants growing at the highest altitudes. Altogether, I believe, Mr. Wilson secured seeds of about 1,500 different kinds plants, and although many of these are of a herbaceous nature, we have now some 570 different shrubs represented in the collection. A few of these we have exchanged with other collections from the same source. To name, or to attempt to describe the greater part of the collection would require too much time and space; in the majority of cases we have only the genus and the collector's number to refer to. Especially numerous were the following:—*Berberis*, represented by some 20 numbers, *Cotoneaster*, *Evodia*, *Lonicera*, *Prunus*, *Pyrus*, *Clematis*, *Rubus*, *Rosa*, and *Spirea*. The *Berberis* particularly promise to prove valuable additions to our garden shrubs; the plants are small, as most of them were raised from seeds received from late consignments, but the following are making fine specimens:—Nos. 1073, 1356, 1137, 1344, 1038, 1267 (which Wilson describes as a new species), 1261, 930, 1177, 105aa, and *B. polyantha*. Amongst the *Buddleias* are many fine forms of *B. variabilis*, and one of these, which has been named *B. v. gigantea*, received an Award of Merit at the last R.H.S. meeting (see p. 188). *B. nivea* is a free grower, and the foliage is covered with a dense, white tomentum. Others include *Callicarpa* in variety, *Catalpas Fargesii* and *vestita*, *Cedrelas*, which form handsome, small trees; *Celastrus*, *Celtis*, which form small trees, several having handsome fruits; *Cercis*, including *C. racemosa*, which is both hardier and a better garden plant generally than *C. chinensis*; *Clematis* in great variety, amongst which *C. Soulieana* is now flowering, the pale yellow tubular blooms being deliciously scented; and various *Cocculus*, which form handsome foliage climbers. Of *Cotoneasters* we have a great variety, including *C. humifusa*, which is quite distinct from any other species, forming a useful trailing plant. *Cyananthum* is a distinct climber, with pink flowers much resembling *Hoya carnosa*. There are also species of *Fleagmus*, *Dentidia*, *Diervilla*, *Diospyros*, *Ehretia*, *Eleutherococcus*, *Eucommia ulmoides*, *Eupteleas* (forming fine foliage plants), and *Evodias*, forming small trees of graceful habit; a new *Forsythia*, *Fraxinus chinensis*, *Hydrangea* (in numerous variety), *Idesia polycarpa pubescens*, *Hex Peryi*, *Lespedezas*, beautiful late flowering shrubs; *Liquidambar formosana*, the Chinese Tulip tree *Liriodendron chinensis*, *Loniceras* in bush and climbing form, *Mulberries*, *Neillias*, *Paderia*, a free-growing climber with peculiar flowers; *Paulownia* 769, a plant with massive foliage, and one that Wilson says should move absolutely hardy, with beautiful dark purple-violet coloured flowers; *Philadelphus*, *Piptanthus* 885, to which the collector specially refers; *Potentilla*, *Pterocaryas*, *Pteroceltis*, and *Pyrus* in great variety, of which those bearing the following numbers appear to possess large, elegant foliage, 956, 997, 1255. Of *Prunus* we have great variety; also *Rhamnus*, *Rhus*, the leaves of which assume intense autumnal colouring; *Ribes* and *Roses* of the *moschata* and *Banksia* types, but as yet these have not flowered. *Rubus* is seen in endless variety, many of the plants in pots being 3 feet high. 188, *R. lasiostylus*, has curious white fruits. Others of

FIG. 77.—ZEPHYRANTHES FLOWERING NEAR THE DIRECTOR'S OFFICE IN THE ROYAL BOTANIC GARDEN, PERADENIYA, CEYLON.

of education and wealth of the natives does not appear to have risen much for many years.

Although Ceylon has been under the influence of the East and West for centuries, it still retains its own customs, languages, and religions.

Agricultural and horticultural shows are sometimes held in the different towns of Ceylon, and I had the opportunity of visiting one at Nuwara Eliya on March 28. A large variety of fruits and vegetables was shown (see fig. 79). Flowering and foliage plants were also displayed, and one tent contained a collection of cut flowers (see fig. 78), the Roses being very pretty.

Apples, as well as Pears and Peaches, are grown at this high elevation (about 6,000 feet), and the show being open to the whole country, fruits, flowers, plants, and vegetables from the tropics were exhibited. These included Coconuts, Plantains (Bananas), Pineapples, Limes, Lemons, Mangos, and Papaws. Very interesting was the display of native agricultural and horticultural products, both wild and cultivated varieties being shown. There was also an exhibit of metal

U.S.A. The Hon. Vicary Gibbs and a few other persons interested in the expedition each received a portion of the first consignment of seeds in the early part of 1908. Those which were sent to Aldenham were immediately sown in small boxes, and labelled, each according to the number specified on the seed-packet.

The first batch, which was a somewhat large one, was sown, and the seed-pans placed in a gentle heat for a time, where many of the seeds germinated rapidly. This first batch of seedlings was at once removed to cooler and drier quarters. All the later sowings were placed out-of-doors in cold frames, where protection could be afforded from heavy rains. When the seedlings were large enough, they were pricked out into boxes, and, to induce them to grow freely, they were kept under rather close conditions in cold frames, and damped frequently. At the time of transplanting, two or three of each number were also potted into 60-sized pots, for the purpose of forming a representative collection. These have since afforded much interest, and

large stature are *R. nivicus*, *R. inominatus*, *R. coreanus*, *R. fuscus*, *R. Lambertianus*, *R. ichangensis*, *R. Parkerii*, and *R. bambusaarum*, all of which possess striking foliage. Others of lesser growth, but worth special mention, are *R. polytrichus*, *R. Playfairii*, *R. omiense*, *R. roseifolius*, and several others under number only. *Schizandras* form good climbers.

To the list must be added *Schizophragma*, *Spiræas* in considerable variety, and including the new *S. Veitchii*, *S. Henryi*, *S. dasyantha*, and others of the *sorbifolia* type; *Stachyurus*, *Staphylea*, such as *S. holocarpa*, *S. h. alba*, and *S. Bumalda*; *Strax* 884, which Wilson specially refers to; *Strausvasia undulata* and *S. 1064*; *Symplocos*; *Syringa*, including No. 1273, a new species; *Viburnums* in great variety. The seeds of these last-named were slow in germinating, and did so in the autumn. *Viburnum 1288* is a conspicuous plant of good growth. *V. rhytidophyllum*, now fairly well known, is also included. *V. coriaceum* is a handsome evergreen species, with large dark green leaves. *Vitis* are also very varied, and several of them assume good autumn colouring in the leafage. *V. armata*, *V. sinensis*, *V. Delavayi*, *V. flexuosa*, and *V. 235*. This last

so perpetual and consistent a bloomer under glass as *Richmond* or *Liberty*, yet it is quite as good form, is much deeper in colour, is a very reliable former for an early winter crop, and, in addition, has excellent fragrance. The *Tea Ros*s and their many beautiful hybrids are double's more generally forced, not only because of their beauty, but also for the greater succession of flowers they give in comparison with the *Hybrid Perpetuals*. Beside a selection of *Hybrid Perpetuals* for a supply of dark blooms to contrast with the lighter shades of the *Hybrid Teas*, the perfect white of *Fran Karl Druschki* and the clear pinks of *Mme. Gabriel Luizet*, *Mrs. R. G. Sharmou Crawford*, and *Mrs. John Laing* must be included, as well as the varying and intense shades of crimson and maroon found in *Victor Hugo*, *Captain Hayward*, *Fisher Holmes*, and *Prince Camille de Rohan*. But it was not so much the varieties I wished to note as the fact that operations for early forcing must be taken in hand very shortly. My own experience goes to show that this section or class require much steadier treatment at the first than is the case with others, and I advise a beginning soon. In the case of established plants that have

hole of the flower pot stands, are best. Should disturbing the roots cause the wood to shrivel, syringe the plants freely, but avoid too much root moisture while the plants are in the open. Plants may be lifted from the nursery beds as soon as the shoots are fairly ripe.

As the nights get colder, remove the plants to some cool structure such as a late vinery or a pit; if they have been treated correctly, they will be carrying new growths an inch or two in length, and these must not receive a check. If they are kept growing steadily from the early part of December, they will soon respond to sun heat in the early part of the year. This steady treatment avoids the "blind" or flowerless growths so frequently found upon *Hybrid Perpetual Roses* that have been unduly forced or allowed to experience a check of any kind. A. P.

CULTURAL MEMORANDA.

BLACK STRIPE IN TOMATOS.

This disease usually makes its appearance when the plants are 2 feet to 3 feet in height. A black streak appears in the stems here and there, and, if not immediately checked, the disease spreads through an entire house with great rapidity, completely spoiling the plants, if not killing them outright.

Black stripe enters deeply into the tissues, as will be seen on cutting a section of the stem; growth appears to cease, and the cells shrivel in the affected parts. The disease quickly spreads to the fruit and leaves, which become deformed and covered with a network of black lines, growth becomes weak, and flowers, which are not already set, fall off.

It is most prevalent in houses in which Tomatos have been cultivated year after year, especially if the plants are grossly fed and inclined to grow rank.

I have tried several good fungicides, also dusting, and vaporising with flowers of sulphur (the latter, by the way, is excellent for mildew), but all these remedies had little or no effect on black stripe. Excessive sun-heat is the only remedy I have found effectual in checking it. We close the house about noon on a bright day, allowing the temperature to rise to 115° or 120° Fahr., and I have never known this remedy to fail.

On one occasion last season, the disease made its appearance during a spell of dull weather, and several days elapsed before a bright day appeared, and then only a temperature of 105° Fahr. was obtained, which had practically no effect. Several days later, a temperature of 120° Fahr. was reached, and the result could be seen almost immediately. The disease was cured, and all the affected plants commenced to grow again, although the old scars remained; but these soon became healed, like wounds on the trunk of an actively-growing tree.

The temperature necessary to eradicate the disease appears to be about 115° Fahr. Care should be taken that the roots are sufficiently moist, as such high temperatures cause excessive transpiration, and, if the roots are at all dry, burning results. The foliage should not be thinned excessively before shutting up the house, and if some of the more exposed fruits are slightly shaded from the direct rays of the sun, it is an advantage, as I have occasionally had a fruit, here and there, scalded.

Our Tomato houses are not shaded in any way, and the thermometers from which the above temperatures were taken were more or less in the direct rays of the sun. The houses are not opened until the following morning, to allow the temperature to fall gradually, as a sudden change to colder conditions might have serious effects. W. J. J.

FIG. 78.—FLOWER SHOW AT NUWARA ELIYA, CEYLON.

is a promising plant. The foregoing forms but a random list in alphabetical order, but it will, perhaps, serve to convey some knowledge of the numerous genera that are included in this interesting collection of new trees and shrubs. *E. Beckett, Aldenham House Gardens, Elstree.*

THE ROSARY.

HYBRID PERPETUALS FOR FORCING.

With the advent of *Richmond*, *Liberty*, *General MacArthur*, *Chateau de Clos Vougeot* and a few more of the best dark-coloured *Hybrid Teas*, the older class of *Hybrid Perpetuals* have been somewhat neglected for pot culture. But we should still keep to the latter for their perfumes, some of which are totally distinct, and among the sweetest of all. The old favourite, *General Jacqueminot*, has been forced for close on 60 years, and probably it is the variety most generally grown by amateurs. Granted that it is not

been stood in the open, the wood should be fairly well ripened by now. Examine the pots, and see that the drainage is perfect. I usually turn most of the plants out of their pots for this purpose. By this means, one can also decide better if a shift into a larger pot is desirable, besides being able to remove some considerable portion of the top compost; there is also considerable benefit in adding only a little fresh compost. I think sufficient use is not made of ½-inch bones for drainage, as these are a great help in feeding the lower roots, whereas broken pieces of pots are quite useless in that connection. We prune our *Hybrid Perpetuals* rather harder than the *Teas*, especially when thinning the centres. After the plants have been examined they should still remain in the open for a time, but care must be taken to see that worms do not enter the pots through the drainage hole. If pieces of slate are used to prevent this, see that they do not adhere so closely to the pot as to cause the soil to become water-logged. For this reason beach stones, with a spoonful of soot just where the drainage

The Week's Work.

THE FLOWER GARDEN.

By E. BIRKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Heaths.—Many of the Heaths are now making a fine display in the flower garden with their profusion of showy flowers. Few plants are more adapted for grouping in masses to create an effect than the hardy *Ericas*, for, although isolated specimens are very beautiful objects, large, irregular masses are even more so, especially on open, undulating land. With a good selection of species and varieties, it is possible to have Heaths in flower out-of-doors almost the whole year round. They do extremely well in wind-swept positions, where most other subjects fail, and they have another advantage in requiring little attention, an occasional weeding being all that is necessary. They may be planted during the autumn and winter months, whenever the ground is in a suitable condition. The plants are not so

vide showy fruits, but are pleasing also when in flower, and are of an attractive nature generally: Cotoneaster, Rhamnus, Euonymus (the Spindle Tree is especially beautiful when grown as a standard), Viburnum, Lonicera, Berberis (in great variety), Crataegus, Hypericum, Hippophaë, Rosa rugosa, Pyrus, *Rhodotypos kerrioides*, Rubus, *Cobutea arborescens*, and *Coriaria terminalis*.

General work.—At this season of the year, cuttings of many varieties of Roses will root in the open ground. Select well-ripened shoots and plant them in soil containing plenty of road-grit, labelling each variety carefully. The season for Sweet Peas is almost finished, and those of the earliest sowing should be discarded altogether. If seed is required, gather the pods at intervals when the weather is favourable, and place them in an open, dry position to ripen. Some bulbs, including Narcissi, and English and Spanish Irises, may now be planted with advantage. Keep the hoe constantly at work amongst the beds and borders, and see to the tying of the shoots

and everything else in readiness before disturbing the border. The bulk of the new soil should consist of sound fibrous loam, chopped roughly. To this may be added a fair proportion of old mortar rubble, crushed bones, wood ashes and a sprinkling of any of the artificial manures specially recommended for the purpose. A good heap of broken bricks should be ready to hand, also a stack of freshly-cut turves to place over the drainage. Start at the outside of the border, that is, at the point furthest from the vines, taking out a trench down to the drainage. Work the soil away from the roots, using a fork for the purpose, being careful not to injure them. As the work proceeds, the roots should be tied in bundles as far as possible and covered with a damp mat. This lifting is the most critical part of the operation, and should never be entrusted to a novice or a careless person. Let the old soil be cleared away as the work proceeds. If sufficient new loam cannot be obtained to entirely renew the border, part of the old compost may be utilised, but not if the latter is in a sour

FIG. 79.—EXHIBITION OF FRUITS AND VEGETABLES AT A CEYLON FLOWER SHOW.

fastidious in their soil requirements as many people imagine, and peat is not absolutely necessary, although it proves a valuable addition to the natural staple if it is deficient in humus. The soil should be well dug, and have plenty of decayed vegetable matter and leaf-mould incorporated with it, as well as a quantity of sand. Allow the soil to settle before planting, which should be done firmly, and a good mulch of decayed farmyard manure should be placed about the roots when the planting is finished. The various forms of *Calluna vulgaris*, the common "Ling," are especially useful at this season. Besides being beautiful in bloom, some of the varieties have striking, variegated foliage.

Shrubs with ornamental fruits.—At the present time many shrubs are attractive in their showy fruits, which provide a touch of colour in the shrubbery just in advance of the autumn leaf-falling, making them of great value, either for the mixed shrubbery or as isolated specimens. The following subjects not only pro-

vide in the case of plants requiring attention in this matter. The Dahlia season has been largely spoiled by the wet weather. The Facony and Cactus-flowered varieties are the most valuable for supplying cut blooms. We cultivate a variety of the Pom-pom section named White Aster; this is a good variety generally, being free in flowering, and the blooms are very useful for many purposes.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSELL, G.C.B., Moulton Paddocks, Newmarket.

Renovating of vine borders.—The vines in the earliest houses having now ripened their growths, any intended alterations to the border or overhauling of the roots may be proceeded with. If the drainage is faulty it will be advisable to lift the vines entirely and replant them afresh. The work should be done quickly, as the vines will suffer if the roots are out of the ground for any great length of time. Have the fresh soil prepared

inert condition, in which case it will be better to employ a quantity of good soil from the kitchen garden. Having put the drainage in a satisfactory state and covered the drainage materials with the fresh turves, placed grass-side downwards, replanting may be done. Spread the roots straight out at different depths in the border, but always well towards the surface. Any bruised or broken roots should be cut back to sound tissue, making a clean cut. Long, bare roots, devoid of fibre, may be notched at intervals along their upper sides. Fill in the soil as the work proceeds, treading and beating it firmly. When finished, the border should be a few inches above the original level to allow for the soil settling.

Top-dressing.—When it is not considered necessary to renew the border, as advised, old vines and those in an unsatisfactory condition may be greatly assisted by top-dressings. Remove as much as possible of the inert soil from the surface until the roots are exposed, and

replace it with fresh compost, in which a good proportion of mortar rubble and artificial manure has been added. Such treatment will encourage the development of surface roots and assist in other ways in restoring the vines to health and vigour. When examined 12 months hence, this fresh loam should be full of fibrous roots. Liquid manure may also be given with advantage to vines which require assistance. When the Grapes are cut, a thorough soaking of the diluted drainings from stables and cowsheds will help to recuperate vines which have carried heavy crops, or a thick mulch of fresh cow manure placed on the border and well watered by means of either can or hose-pipe will produce results equally satisfactory.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PILKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Salvia grandiflora splendens.—The intense scarlet colour of the flowers of this beautiful autumn and winter-blooming plant is always appreciated. Salvias are comparatively easy of cultivation, and are most useful for conservatory or home decoration, besides supplying flowers that are valuable for dinner table and other decorations. Stock plants intended for autumn-flowering may be given top-dressings of some artificial fertiliser, and, alternately with the ordinary water, weak liquid manure from the farmyard. Salvias are gross feeders, and must be regularly supplied with water, for if the roots are allowed to become dry, the bottom leaves will drop, and the bare stems detract very much from the decorative value of the plants. Previous to housing them, which should be done about the end of September, the foliage should receive a thorough cleansing.

Solanum Capsicastrum and *S. Pseudocapsicum*.—Where these plants have been cultivated in pots, red spider and aphid will be found most troublesome pests. The leaves should therefore be syringed thoroughly with an insecticide. A cool greenhouse from which the frost can be excluded will furnish suitable winter quarters for both species. As soon as the berries are of a bright colour, stimulants should be withheld, and the surroundings kept as dry as circumstances permit.

Pot Roses.—Plants intended for early forcing should have their shoots well ripened previous to pruning. They should be stood well apart on a good layer of ashes throughout the summer and autumn in full exposure to sunshine. Extreme care must be exercised in affording water, and mildew eradicated at once by frequent syringings with sulphur water; aphides and red spider must also be combatted.

Cuttings of Marquarite and Fuchsia should now be inserted. Select the healthiest shoots and place them firmly, about an inch apart, around the edges of "60" pots filled with a sandy compost.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Pruning the Morello Cherry.—The Morello requires to be pruned quite differently from the Sweet Cherry, the method being similar to that used with Peaches and Nectarines. All useless and old fruiting wood that can be spared should be cut out so as to allow room for training some of the young shoots, as these will produce the best fruits next season. It is wiser to prune the trees now, or immediately after the crop has been gathered than to wait until the leaves have fallen, as the operator will be better able to decide, while the foliage is still on the trees, which wood can best be spared. Another advantage is that the young shoots are most likely to be allowed a proper distance apart, and the danger of overcrowding avoided. In taking out the useless wood before the leaves fall, more light and air reach the remaining wood, thus enabling it to mature more thoroughly. After the necessary pruning has been completed, the trees should be given a good syringing with a suitable insecticide to cleanse them of any insect pests that may be present on the foliage. Make sure that sufficient moisture has reached the roots; this is best ascertained by using a border tester.

Packing of Figs and Peaches.—Where these

fruits have to be sent a considerable distance by rail, great care must be exercised both in gathering and packing them. Figs should be packed in a single layer in a box 3½ inches deep, which will allow of a few soft vine leaves being used. Place the fruits close together in rows with a pad of cottonwool between each row; the remaining space should be filled with some soft packing material before placing on the lid. Peaches will need boxes an inch or more deeper than Figs, according to the size of the fruits. They should be wrapped in tissue paper, placing a small pad of wood-wool around each fruit. Pack them closely together, as in the case of Figs, and fill any space remaining with soft material, so that they cannot shift in transit.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Burford, Surrey.

Masdevallia.—The Masdevallias are not grown so extensively as they deserve to be; the principal reason is probably their small pecuniary value. Yet they include many beautiful, curious, and interesting species and hybrids. Few plants produce such showy and brilliantly-coloured flowers as *Masdevallia ignea*, *M. Veitchiana*, *M. amabilis*, *M. coccinea*, and its many distinct varieties of the *Haryana* type. All of them produce a splendid effect when in bloom, and they are charming when arranged with the white flowers of *Odontoglossum crispum*. Other distinct species well deserving of cultivation are the pure white *M. tovarensis*, the yellow-flowered *M. Davisii*, *M. rosea*, and the orange-red *M. racemosa*, to which may be added several attractive and interesting hybrids, such as *M. Chamberlainiana*, *M. Gairiana*, *M. Courtauldiana*, *M. Rush-tonii*, *M. splendida*, *M. Cheloni*, *M. Henrietta*, *M. Rebecca*, *M. Stella*, *M. Curlei*, *M. Fraseri*, *M. Pourbaixii*, *M. Acis*, *M. Ajax*, *M. Geleniuma*, and *M. glaphyrantha*. Those species that are characterised by the singularity and quaintness of their flowers include *M. Gargantua*, *M. elephanteiceps*, *M. ephippium*, *M. torta*, *M. Peristeria*, *M. macrura*, *M. coriacea*, *M. corniculata*, *M. leontoglossa*, *M. melanoxantha*, *M. Mooreana*, *M. Burfordiense*, *M. Schlimii*, and *M. velifera*. Among the dwarf-growing kinds is the extraordinary *M. muscosa*, with an extremely sensitive lip, a suitable companion being the still rare *M. xiphères*. Others that may be instanced are *M. polysticta*, with its spider-like flowers, *M. deorsa*, with distinct, drooping, metallic-like foliage, the pretty *M. Arminii*, *M. Wageneriana*, *M. Estradae*, *M. caudata*, *Shuttleworthii*, *M. Schroderiana*, *M. rrorata*, *M. caloptera*, *M. xanthina*, *M. macroblepharis*, the Gnat Orchid, *M. nidifica*, *M. Nilsonii*, *M. anchorifera*, *M. Indibunda*, *M. platyglossa*, and *M. hieroglyphica*. Well-grown plants of any of these, when in full bloom, form pretty little objects, and are appreciated generally. These dwarf-growing plants should be grown on a damp, elevated stage, with their leaves well up to the roof-glass. They should never be allowed to become dry at the roots, neither should they be kept in a saturated condition, or the leaves of many of them will damp off. The present is a good time to overhaul these Masdevallias, and where a house is devoted to their culture it should be thoroughly cleaned both inside and outside. The walls should be well scrubbed and white-washed, and, if the house has a north or north-east aspect, the stippling should be removed from the roof-glass. If any of the plants need repotting, or old, overgrown masses require to be divided, the work should be attended to at once. The winter-flowering *M. tovarensis*, *M. ignea*, and *M. Davisii* should not be disturbed now, unless they are in a very bad condition at the roots. February is the best time to repot them. Masdevallias form many roots, therefore they should be afforded a good root-run. The pots should be two-thirds filled with drainage, and for the rooting medium use *Osmunda* fibre, *Polypodium* fibre, and *Sphagnum*-moss in equal proportions, cut moderately finely, intermixing plenty of small, broken crocks. When repotting, keep the base of the plant on a level with the rim of the pot, and carefully work the compost between the roots. Pot with moderate firmness, so that when water is applied it will percolate freely through it. In dealing with large, worn-out plants, that have but few roots, divide them and pot the pieces up separately into small pots; when these are thoroughly re-established, bring them together again in one receptacle. As with

many other Orchids, the critical time with Masdevallias is during the first three or four months after root disturbance, it being an easy matter to over-water them, causing many old roots and leaves to die. Keep the surface of the compost just moist, and, preferably, towards the edge of the pot, rather than in the centre. With the exception of *M. tovarensis*, all these plants succeed in a comparatively low temperature, doing very well with *Odontoglossum* of the *O. crispum* type. During winter, it will be better to place them in the warmer and drier part of the house. Keep the repotted plants well shaded from all sunshine, but do not allow the shadings to remain over them longer than is really necessary. At this season a good damping between the pots twice a day will be sufficient, unless the house is very exposed to sun-heat, when an extra damping may be necessary. The black spots so frequently seen on the foliage of these plants are often caused by affording too much water at the root, also by maintaining too moist an atmosphere, especially during cold, dull weather in the autumn and winter months.

THE KITCHEN GARDEN.

By JOHN DENN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Hoeing.—Take advantage of the fine weather to stir the soil among the growing crops. It will assist the plants in their growth and destroy countless small weeds which make their appearance now, and which are difficult to kill after September has passed. The neatness of the kitchen garden in winter will depend greatly on the attention it receives now, and no effort should be spared to rid the ground of weeds before the season is too far advanced.

Mushroom.—Beds that were spawned a month ago should be examined and, if the soil on the surface is dry, a gentle watering should be given through a fine rose. Rain-water should be used, and it should be warmed to about the temperature of the atmosphere in the house. Beyond syringing the walls and floor of the house when the atmosphere becomes dry, further moisture will not be necessary except in extreme cases. Collect material for successional beds; a steady, lasting heat is necessary, and the manure should be turned every second day to sweeten it. Beds that are freely mixed with soil continue to crop much longer than those composed of horse-droppings entirely, provided they are of sufficient depth to maintain the necessary heat and moisture.

Cucumbers.—Plants raised from seeds sown a month ago should now be ready for planting on small mounds of soil over a gentle hot-bed. The plants should reach the top of the trellis by the end of October, and for the present no fruits should be allowed to develop if this can be avoided. Cucumbers planted a month ago for cropping in early winter should have the shoots trained to the trellis 9 inches apart. The branches must be frequently pinched to promote sturdy, short-jointed growths. Top-dress the plants as often as roots appear above the soil, using light, turfy loam and leaf-soil in equal proportions. Plants in full-bearing should be thinned freely, and old, rough leaves removed to make room for the laterals, which should be pinched at the second joint beyond the fruit. Give liberal supplies of liquid manure and encourage these old plants to produce Cucumbers as late in the season as possible. A humid atmosphere, with a night temperature of 70° to 75°, should be maintained.

Tomatos.—Reduce the foliage on Tomato plants in the open air, and give a dressing of artificial manure to hasten the development of the fruits before cold nights set in. These plants are easily injured by cold, wet weather, and protection should then be given if possible. Tomatos in pots intended for furnishing fruits in early winter will have set several bunches of fruit, and should receive liberal feeding either as liquid manure or as a top-dressing of artificial manure mixed with loam. Keep the plants under cool conditions as long as possible, in order to prolong the supply of fruits well into the winter. Plants intended for successional fruiting will require full exposure to light and air, so that the berries may be set before dull weather arrives. Pinch out all side growths and reduce the foliage to allow light and air to freely enter amongst the plants.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or reject them, unless by special arrangement. The Editors will hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. It is, of course, a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, SEPTEMBER 12—United Hort. Ben. & Prov. Soc. Coms. meet.

TUESDAY, SEPTEMBER 13—Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. C. Herman Senn, on "The Cooking of Vegetables.") British Gard. Assoc. Ex. Council meet.

THURSDAY, SEPTEMBER 15—Nat. Rose Soc. Autumn Sh. in R.H.S. Hall, Westminster.

FRIDAY, SEPTEMBER 16—Shelfield Chrys. Soc. Early Show (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich—57.7°.

ACTUAL TEMPERATURES:—LONDON.—Wednesday, September 7 (6 P.M.): Max. 60°; Min. 50°. *Gardeners' Chronicle* Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 8 (10 A.M.): Bar. 30.3; Temp. 63; Weather—Sunshine.

PROVINCES.—Ireland: September 7: Max. 58°; Min. 53°. Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY—Twenty-fifth Annual Unreserved Sale of Pot Plants at The Nurseries, Chingford, Essex, by order of Messrs. H. B. May & Sons, by Protheroe & Morris, at 11.

TUESDAY—Great Annual Trade Sale of Winter-blooming Heaths, &c., at Burnt Ash Road Nurseries, Lee, S.E., by order of Messrs. B. Maller & Sons, by Protheroe & Morris, at 11.

WEDNESDAY—Great Annual Sale of Winter-flowering and other Plants at The Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11.

THURSDAY—Twenty-ninth Great Annual Trade Sale of Winter-blooming Heaths at Longlands Nursery, Sidcup, S.E., by order of Messrs. H. Evans & Sons, by Protheroe & Morris, at 11.

FRIDAY—Imported and Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

The Fertility of the Soil.

No horticultural problem has given rise to more discussion than that of the causes of the fertility of soils; and the varying pronouncements of science find an echo in the varied practice of cultivators. At one phase of the investigation, scientific men have proclaimed that, since plants absorb mineral salts of potassium, phosphorus, nitrogen, &c., from the soil, fertility depends on the quantities of these several plant-foods contained in the earth. At another phase, after the chemist had demonstrated that ordinary soil contains from 50 to 100 times more of these substances than a field crop extracts from it, the scientific agriculturist declares that the amount of mineral constituents is of less importance to soil-fertility than is the relation between the soil and the water it contains. In support of this view, he invokes not

only chemical analyses of soils, but also the facts that, in practice, the cultivator devotes a large proportion of his energies to increasing, or modifying in a manner favourable to plant-growth, the amount of water in the soil. As knowledge of the physiology of plants increased, it became clear that, though the soil is a great storehouse of plant-food, and contains almost unlimited reserves of the mineral substances essential to plants, yet, unless the mineral substances are present in an available form, that is, in a form in which they may be dissolved readily, the soil is infertile.

During the dispute between the upholders of the chemical and the advocates of the physical theories of soil-fertility, a third party intervenes. Waving aside the disputants, he proclaims that the secret of fertility is to be found neither in the physical nor in the chemical condition of the soil, but in its biological state. He points out that the earth is a living earth; that it teems with bacteria—a clod of soil containing many millions of these living and very active organisms. For a time, the astonishing discoveries of the bacteriologist hold the attention of the audience interested in the physico-chemical discussion. In quick succession, he announces the discovery of nitrogen-fixing soil bacteria, supplying the proof that the earth renews its stores of combined nitrogen through the activity of certain of its bacteria, which take the free nitrogen gas of the air, combine it with other elements, and so render it available to the roots of plants. Next he shows that other races of bacteria change the ammonia, formed during the decay of plant- and animal-remains, into nitrates, and thus serve also the requirements of plants. Further, he reveals the presence of yet other soil bacteria, which work in a spirit of flat contradiction to that of the nitrifying organisms, and, by decomposing nitrates, give rise to ammonia, which, unless combined with mineral bases, escapes into the air, and so is lost to the soil. In the gigantic stride which he has made during the last 50 years, the bacteriologist solved the old riddle of the fertilising effect of leguminous crops. But in science the last word is never said, and now the zoologist takes a turn in bringing his science to bear on the problem of soil-fertility. As Mr. Hall has pointed out in these pages, and as he indicated in his admirable address before the agricultural sub-section of the British Association at Sheffield, bacteria are not the only micro-organisms which play an important part in determining soil-fertility. In that underworld of life—the foot or so of surface soil—exist large numbers of protozoa,—amoeba-like, unicellular animals. They feed upon the bacteria, and therefore count in determining the composition of the microflora of the soil. To the voracity of the protozoa is due the limitation in numbers of the soil bacteria, and it is by reference to them that the remarkable effects of sterilisation on soil fertility are to be explained. As our readers know, soil heated to the temperature of boiling water yields larger crops than ordinary soil. The explanation of this enhanced fertility, which we owe to Drs. Russell and Hutchinson, of Rothamstead, is strikingly simple. The heat to which the soil is exposed suffices to kill the protozoa and some bacteria. The bacteria which are left are largely of the ammonia-producing type. Freed from rivals

and secure against devouring protozoa, they increase with enormous rapidity, till, within a few days, every grain of soil contains about half a million of these organisms. As a consequence of the exuberant activity of the ammonia-producing bacteria, large quantities of ammonia accumulate in the soil, and the plant, obtaining plentiful supplies of nitrogen, grows apace. Thus, stage by stage, the problem of soil-fertility is being solved, though not yet may the complete solution be held to have been obtained. As the soil is a complex physico-chemical-biological structure, so is its fertility the result of complex and interacting conditions. Nevertheless, horticulturists have reason to be grateful to scientific men for their labours, though, with the wide experience which comes of constant work on the soil, they may not be ready always to hail each new discovery as a solution of all their difficulties.

OUR SUPPLEMENTARY ILLUSTRATION shows a rustic arch covered with the beautiful Rose Leuchstern in full bloom. This is one of the most useful varieties of the climbing Polyantha Roses, being absolutely hardy and flowering early. Although the flowers are single, they last fresh for a long time, being the best single Rose in that respect. The Supplementary Illustration shows its extreme freedom in flowering. It was introduced to gardens by J. C. SCHMIDT in 1899, and at once became popular. It is more hardy even than Crimson Rambler, which it resembles very much in habit and growth, but is not so susceptible to attacks of mildew or red rust disease. It is equally suitable for training on pillars as on archways.

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held in the Society's Hall, Vincent Square, Westminster, on Tuesday, September 13. A lecture on Roses, by Mr. GEO. PAUL, Jun., will be delivered at 3 o'clock.

—The president and council have accepted the offer of the following prizes from Mr. ROBERT SYDENHAM, for award by them at the Exhibition of Springs Bulbs on March 14 and 15, 1911. Bulbs grown in moss-fibre or similar material (amateurs): Six single Hyacinths in separate vases, not exceeding 6 inches in diameter, to be selected from any one of the following varieties:—Enchantress, Innocence, Isabella, Jacques, Johan, King of the Blues, Koh-i-noor, Ornament Rose, Princess May, Queen of the Blues, Roi des Belges, Rose a Merveille, and Schotel. Prizes 21s., 17s. 6d., 15s., 10s. 6d., 7s. 6d. Six vases of Tulips (vases not exceeding 7 inches in diameter) no restriction as to the number of bulbs in a vase, to be selected from the following:—Duchesse de Parma, Fabiola, Joost van Vondel, Keizerskroon, La Reve, Mon. Tresor, Prince of Austria, Queen of the Netherlands, Rose Gris de Lin, Van der Neer, Vermilion Brilliant, and White Joost Van Vondel. Prizes, 21s., 17s. 6d., 15s., 10s. 6d., 7s. 6d. Six vases of Narcissi (vases not exceeding 7 inches in diameter) no restriction as to the number of bulbs in a vase, to be selected from the following:—Blood Orange, Bullfinch, C. J. Backhouse, Dairymaid, Emperor, Glitter, Horace, Leonie, Lilian, Lulworth, Madame de Graaf, Red Flag, Victoria, and White Lady. Prizes, 21s., 17s. 6d., 15s., 10s. 6d., 7s. 6d.

POETRY OF GARDENS.—MESSRS. TRUSLOVE & HANSON will shortly add to their well-known series of anthologies a volume entitled *In Praise of Gardens*, compiled by S. J. SHAYLOR. The volume will include most of the notable poetry upon gardens in the English language, and also prose-selections. It will be illustrated with views from famous gardens.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—The KING has been graciously pleased to become patron of the Gardeners' Royal Benevolent Institution, of which his MAJESTY, as Prince of WALES, was formerly president. QUEEN MARY has also been graciously pleased to continue the patronage her MAJESTY accorded to the Institution as Duchess of YORK and Princess of WALES.

"THE BOTANICAL MAGAZINE."—The issue for September, which constitutes Number 69 of the 4th series, gives illustrations and descriptions of the following species:—

RHODODENDRON UNGERNII, tab. 8332.—The district in the Caucasus wherein this plant is found wild is also the home of *R. ponticum* and *R. caucasicum*, the plants being found at different elevations, *R. Ungernii* occupying the middle zone. The plant, from which the illustration was prepared, was raised from seeds received at Kew in 1866, and although it is now a bush about 6 feet high, it has flowered very rarely. Because of this, it is not likely to prove such a good garden plant as its congeners mentioned above. The flowers are very faintly suffused with rose, the individual blooms being about 2 inches across. The plant would probably prove hardy in favoured parts of this country.

CHIRITA RUPESTRIS, tab. 8333.—This beautiful Gesnerad was discovered by Mr. C. CURTIS on the limestone rocks of Lankawi, which lies off the coast of Kedah in the Malay Peninsula. The plant is cultivated at Kew in a moist tropical house, and forms a bushy, compact annual about 2 feet in height, flowering freely during the autumn. It requires a similar treatment to the *Gloxinia*. The flowers are bright blue with a blotch of bright yellow in the throat, and they are $\frac{3}{8}$ inch across.

TRISTELLATEIA AUSTRALIS, tab. 8334.—This is a climbing plant of the Malpighiaceae, a native of East tropical Africa. It produces pendant shoots, terminated with graceful racemes of yellow flowers, set off with red anthers. The plant grows well in the Palm house at Kew, where it flowers in summer time.

MICROELES CALONEURA, tab. 8335.—This plant has the appearance, both in fruit and flower, of a *Pyrus*, the small clusters of brown fruit being pear shaped. The species was originally discovered by Dr. HENRY in North Wushan, China, and seeds were sent home by Mr. E. H. WILSON when plant-collecting for Messrs. JAS. VEITCH & SONS. The plants raised at the Coombe Wood Nursery of this firm flowered for the first time in 1909, and furnished the material for the plate in the *Botanical Magazine*. The inflorescences are many-flowered corymbs with white blossoms.

ALECTORURUS YEDENSIS, tab. 8336.—This is the plant sometimes met with in gardens under the name of *Anthericum yedense*, but after being placed in more than one other genus it has been finally referred to *Alectorurus*. Plants received at Kew from Mr. A. K. BULLY, Neston, Cheshire, prove quite hardy and flowered in July, although not freely. The plume-like inflorescences are a pale rose colour.

PRESENTATION TO A HORTICULTURAL SOCIETY'S SECRETARY.—MR. QUINTIN AIRD, headmaster of Hardgate School, Dalbeattie, and Secretary of the local Horticultural Society, was presented with a gold watch on the occasion of his removal to Howwood, near Paisley; a gold and opal ring being given to Mrs. AIRD. In handing over the gifts, Dr. FREW specially referred to Mr. AIRD's services to the Horticultural Society, of which body he has acted as secretary for eight years. Mr. AIRD has been one of the most successful amateur gardeners of the locality, his exhibits having gained many prizes at the local shows.

APPOINTMENTS FROM KEW.—According to the *Kew Bulletin* Mr. C. K. BANCROFT, B.A., formerly Major Scholar of Trinity College, Cambridge, has been appointed by the Secretary of State for the Colonies, on the recommendation of Kew, Assistant Mycologist in the Federated Malay States. Mr. ALBERT RICHARD GOULD, a member of the gardening staff of the Royal Botanical Gardens, has been appointed by the Secretary of State for the Colonies, on the recommendation of Kew, a Curator in the Agricultural Department of the Gold Coast in succession to Mr. J. ANDERSON, resigned. Mr. WILLIAM LESLIE WOOD, lately a member of the gardening staff of the Royal Botanic Gardens, has been appointed by the Secretary of State for the Colonies, on the recommendation of Kew, Superintendent of Government Plantations in the Federated Malay States in succession to Mr. F. R. LONG, resigned. The *Bulletin* also states that Mr. LEWTON-BRAX, formerly Mycologist and Lecturer on Agriculture to the Imperial Department of Agriculture for the West Indies, and afterwards Assistant Director in the Division of Physiology and Pathology in the experiment station of the Hawaiian Sugar Planters' Association, has been appointed Director of Agriculture in the Federated Malay States in succession to Mr. W. J. GALLAGHER, resigned.

THE FLORENCE INTERNATIONAL HORTICULTURAL EXHIBITION.—An international horticultural exhibition will be held in Florence during the first fortnight of May, 1911, in celebration of the fiftieth anniversary of the proclamation of the kingdom of Italy. The exhibition, which is to be held under the patronage of the town of Florence and of the Horticultural Society of Tuscany, will receive the financial support of the Italian Government. It will comprise upwards of 450 competitions for ornamental trees, fruit trees, vegetables, forced and preserved fruits, collections of seeds, bulbs and tubers, Colonial plants and their produce, floral art and horticultural industries. Prominence is to be given also to the literature and history of horticulture and to horticultural instruction. Among the prizes offered are valuable "prizes of honour," given by their Majesties the KING and QUEEN of ITALY. All enquiries should be addressed to the Comité Exécutif de l'Exposition Internationale d'Horticulture de Florence.

INTERNATIONAL BRUSSELS EXHIBITION.—The next horticultural show will take place in the Horticultural Hall, from September 24 to 27. To the programme already published has been added classes for Orchids, Dahlias, Roses, Gladioli, and other seasonable flowering plants.

PARIS AUTUMN SHOW.—The International Exhibition of Chrysanthemums, fruit, and vegetables, to be held in the Cours la-Reine, Paris, will open on November 4 next, and close on the 15th of the same month. The schedule of prizes, containing full particulars, has just been issued, the classes number 165. There are also details relating to the International Chrysanthemum Conference, organised by the National Horticultural Society of France and the French National Chrysanthemum Society. This gathering will take place in the hall of the former society, at 84, Rue de Grenelle. Seven questions are on the agenda for discussion, viz.: suggestion for a pocket edition of the colour chart; the effect of the time of taking cuttings and stopping on bud selection; insects and diseases; damping of the blooms; manuring for outdoor culture; history of the Chrysanthemum; and practical packing of blooms. The time table for members of the Conference is, briefly, as follows:—November 3: 1.30 p.m., Floral Committee Meeting for judging novelties. November 4: 8 a.m., meeting of the

International Jury: 10.30 a.m., opening of the show by the PRESIDENT of the FRENCH REPUBLIC; and day, lunch to the jury; in the afternoon, visit to the show. November 5: 9 a.m., first sitting of the Congress; 2 p.m., second sitting; 9 p.m., reception of the members of the Conference. November 6: 8.30 a.m., the members will visit the Luxembourg greenhouses and gardens and the natural history museum, and at mid-day lunch at the Palais d'Orsay, later driving to the Bois de Boulogne and visiting the Paris City nurseries. Applications for tickets for the excursions, accompanied by the sum of 10 francs, should be made to M. G. CLEMENT, 117, Rue de Paris, Vanves (Seine). The Secretary's address is 324 Rue de Grenelle, Paris.

ANGER FROM PLANTS ON WINDOW SILLS.—A defendant at Clydebank Police Court was recently charged with having placed a flower-pot on the sill of his window without sufficiently protecting it and preventing it from falling. He pleaded guilty. The flower-pot fell from the window and almost struck a woman as she was passing. This was the second case within a short period of flower-pots or boxes outside windows in this town falling. The magistrate imposed a modified penalty of 5s., or three days' imprisonment.

"ENCYCLOPÆDIA BRITANNICA." The University of Cambridge has taken over the control and copyright of the *Encyclopædia Britannica*, and will publish a new and complete edition about the end of the present year. This 11th Edition, which has been eight years in preparation, entirely supersedes preceding editions. It will be comprised in 28 quarto volumes, of which the last will be devoted to a full and comprehensive index. It is more than 140 years since the *Encyclopædia Britannica* was first planned by "a Society of Gentlemen in Scotland." The 1st Edition began to appear in 1768, and was completed, in three volumes, in 1771.

"HORTICULTURAL DIRECTORY."—We are asked to state that the editor of the *Horticultural Directory*, 12, Mitre Court Chambers, Fleet Street, London, will be obliged if head gardeners will notify him of any changes of title or address that have occurred since October, 1909.

PITS FOR SOIL-STERILISATION.—In connection with the enhancement of fertility produced by sterilisation of soil referred to in our leading article, it may be mentioned that, according to the *Journal of the Agricultural Department of Victoria* (vol. viii., p. 366), a simple pit for the sterilisation of soil may be constructed as follows:—A shallow pit, 18 inches in depth, is lined with brick—the walls being made of 9-inch brickwork—and divided into two by a single-brick partition. The compartments, which are used consecutively, each hold about two tons of soil. Steam is generated by a small portable boiler, worked at a pressure of 25-30 lbs., and $\frac{3}{4}$ inch piping leads from the boiler to the pit floor, where it joins with a T-piece in each compartment. From the T-piece, six pipes are let into spaces in the brickwork floor. The pipes are 3 inches apart, plugged at their free ends, and perforated along their upper sides with 3/16th inch holes 3 inches apart. A tile-drum, covered with cinders an inch below the surface, carries off the water from the condensed steam. Before use, the pipes are covered lightly with sand, the pits are filled with soil, the latter covered loosely with old sacking. Steam is turned on and allowed to pass for 30 minutes after the surface layers of the soil have reached a temperature of 212° F. The steam is then turned on to the second compartment, which in the meantime has been filled with soil.

THE BRITISH FLORA.—The President of the Botanical Section of the British Association, Professor J. W. H. TRAIL, chose for the subject of his address the need for the publication of a comprehensive national flora of the British Isles. He pointed out that, though a great deal of systematic investigation has been done of recent years, there is no one work in which the chief results of this research are collected, and that, as a consequence, the student has to consult large numbers of scattered memoirs before he can obtain the information which he seeks. On these grounds, as well as on the ground that it would lead to further discoveries, Professor TRAIL urges that a well-organized botanical survey of the British Isles should be undertaken, and he gives practical effect to his suggestion by proposing that a committee of the British Association should be appointed to report on the steps necessary for the organisation of such a survey, and preparing materials for a national flora of the British Isles.

PUBLICATIONS RECEIVED.—*The Upper Garden*, by Robert de la Condamine. (London: Methuen & Co.) Price 5s.—*The Gardeners' and Poultry Keepers' Guide and Illustrated Catalogue*. (London: W. Cooper, Ltd.) Price 2s. 6d.—*Appar's Ornamental Shrubs of the United States*, by A. C. Appgar. (New York: American Book Company.)—*The Estate Magazine*. (London: Spottiswoode & Co., Ltd.) Price 6d.—*Board of Agriculture and Fisheries*. Leaflet No. 230, Pear Leaf Blister Mite; Leaflet No. 231, Cheese-Making for Small Holders. (London: 4, Whitehall Place, S.W.)

THE "RUINED" ARCH AT KEW.

This antique-looking structure (see fig. 80), suggestive of the Roman period, is situated not far from the "North" Gallery of paintings. It spans the path leading from the Cumberland Gate to the Lion Gate, the walk being almost parallel with the wall bounding the gardens next to the Kew Road. The arch was designed by Sir William Chambers, and built in 1759-1760, a year previous to the erection of the Pagoda, which is also the work of the same architect. In addition to its ornamental character, the structure was formerly used as a bridge by carriages entering the gardens from the Kew Road. It consists of three arches, a large central one and two smaller ones situated one on either side. The last-named were originally closed, forming cells, which were entered by doors in the sides of the central arch. The whole is built of brick faced with stone, and time has given to the structure the air of antiquity sought by the designer. As can be seen in the illustration, a considerable portion is clothed with Ivy, while evergreen shrubs, notably Box, and several stately Elm trees, which tower above it, add to the dignity of Chambers's Ruined Arch.

NOTES FROM A "FRENCH" GARDEN.

We are now commencing the year's work afresh. The seeds sown at this time will furnish the main crops for the spring operations. The sowing of the seeds and the handling of the young plants require great care, as disease is often prevalent at this time of the year. The young Cabbages are ready to be transplanted in frames set in a well-drained part of the garden. They are covered with the lights in wet weather. A batch of Cauliflowers is sown in frames set on pots or bricks and covered with lights. When a great number of plants is required in the spring, another sowing is inserted a fortnight later. The variety Early London is a suitable one for forcing on hot beds where Cauliflowers

are required early in May. For market purpose, I prefer the "Driancourt" and "Lenoir," as these varieties form large curds, which keep firm for a few days before bursting. They are generally ready for cutting late in May or early in June.

The Lettuces sown in August are now being pricked out 30 per cloche. A little ventilation may be afforded when the plants are well established. The ground is being prepared now for their final planting. In heavy soils, the bed should be formed with a good slope to the south to throw off the excessive moisture in October and November. Advantage should be taken of

Those who intend to make cold work a feature of the spring cropping should choose for the purpose the white-seeded variety of Lettuce "Little Gott," which bears the sun better than the "Little Gott" (black seed).

The experience of this year's cold work has demonstrated that the Lettuce "Little Gott" is more remunerative than the variety "White Passion," as this latter sort requires heating in the open, and the removal of the glass early in April greatly impedes the growth for two or three weeks—a great loss at that time of the year.

The ground intended for the transplanting of

FIG. 80.—THE "RUINED" ARCH IN KEW GARDENS.

the fine days in this month to prepare the ground for the growing of Lettuces during the winter. The beds are made 4 feet 6 inches wide, and accommodate three rows of cloches. Paths 12 to 18 inches in width are allowed at this time of the year between each bed. The decayed manure from the old hot-beds is well broken up and passed through a screen with a half inch mesh; it will be used as a top dressing when transplanting the seedling Lettuces. If it is intended to form hot-beds early, a few seeds of Lettuce "Little Gott" may be inserted within a week; the seedlings should be pricked out before the end of September.

the Onions must be prepared at an early date, so that the transplanting may be finished before October 6 or 8, when the planting of the Lettuce seedlings commences.

The main batch of Celery Chemin is now blanched by spreading mats on the beds. When the plants are touching one another, it is advisable to only cover the outsides of the beds to prevent decay. In wet weather, Celery must be frequently examined, and the heads sent to market as soon as they are ready.

The autumn sown batch of Carrots will soon be ready for pulling, and must be thinned again if necessary. P. Aquinas.

TREES AND SHRUBS.

MORTALITY OF TRANSPLANTED CONIFERÆ.

MR. PERCY GROOM on p. 115 writes:—"It would be interesting to have the experience of gardeners as to the relative mortality in the transplanted evergreen, hardy species belonging to the two classes," i.e., Coniferae and broad-leaved dicotylous trees. In confining the comparison to evergreen trees of each class, one is confronted by the difficulty that beyond Coniferae we have no hardy evergreen trees in this country except the evergreen Oaks, of which *Quercus Ilex* is the only truly hardy species, and such small trees as the Holly, Yew, and perhaps Box. There is no need, however, to confine the comparison with respect to mortality after transplantation to evergreen trees, and a comparison can as accurately be instituted between Coniferae and evergreen shrubs. It will be necessary, however,

One year.—*Cedrus atlantica* var. *glauca*, *Cupressus* of the true Cypress section, such as *C. sempervirens*, *C. macrocarpa*, &c., *Cryptomeria*, *Libocedrus*, *Pinus Laricio*, *Sequoia*, *Tsuga Mertensiana*.

Two years.—*Abies*, *Cedrus*, *Cunninghamia*, *Cupressus* of the *Chamaecyparis* section, *Juniperus*, *Pinus*, *Pseudolarix*, *Pseudotsuga*, *Scadopietyis*, *Taxodium*, *Thuja*, *Tsuga*.

Three years.—*Araucaria*, *Larix*, *Picea*, *Pinus* (the *Strobus* section).

It will be noticed that certain plants are mentioned under two or three headings, but, as I have stated above, there is a difference in the species or varieties of a genus as well as between the various genera. For example, *Cedrus atlantica* var. *glauca* will not stand more than one year without being transplanted, while the other members of the genus can be left for two years. When Conifers have attained a height of 6 feet or more, and have been regularly transplanted, they

The same size (2 feet to 6 feet) may be used, but where the plant does not reach the latter height, the comparison will still hold good in point of age according to its size.

One year.—*Arbutus*, *Azara*, *Berberis Darwinii*, *Cotoneaster microphylla*, *Photinia*, *Quercus* (evergreen), *Ulex*.

Two years.—*Berberis* (evergreen), *Camellia*, *Cistus*, *Escallonia*, *Ilex*, *Laurus nobilis*, *Laurel* (common), *Laurel* (Portugal), *Olearia*, *Phillyrea*, *Veronica*.

Three years.—*Aucuba*, *Buxus*, *Ligustrum*, *Osmanthus*, *Skitamia*, *Taxacæa*.

It will be noticed that *Rhododendron*, *Kalmia*, and other Ericaceous subjects are not given in the above list, but these all transplant so readily at any size that they can hardly be included. If we compare the two lists given above we find that there is practically little difference between Coniferae and other hardy trees and shrubs so far as regards the rate of mortality after transplanting. There is the same impatience of removal with many plants in either series, and also the same readiness to recover after transplanting with other subjects. Again, in both lists those plants that will not stand more than two years are in the majority, so that, on the whole, the two series may be said to be practically alike for the purpose of comparison with regard to mortality after transplantation.

The whole subject of transplanting, however, is a very complicated one, and there is always something new to learn about it. It may be said to consist of a few general rules to which one is always finding exceptions. *J. Clark, Bagshot, Surrey.*

ERIGERON MUCRONATUS.

THIS pretty but unassuming little plant was formerly known by the name of *Vittadema triloba*, but the above is now held to be its correct title. It is a small, modest plant, but is unsurpassed in the open garden for the length of its blooming period. In the south-west, its first flowers expand in March. It continues to bloom all through the summer months, may often be seen in full flower in November and, if no hard frosts occur, it sometimes carries blossoms until the New Year. It is a native of Mexico, but the horticultural dictionaries are silent as to the date of its introduction into this country. It is popularly termed the Mexican Daisy, and appears perfectly hardy as far north as Worcestershire. It increases itself very rapidly from self-sown seedlings, and the places where these appear are often remarkable. An old brick wall in a neighbouring garden has its coping and face almost entirely covered with tiny plants of this *Erigeron*, the produce of self-sown seed, and in the mortar between the bricks they remain in perfect health. Though they are very small and make but little growth, yet they bear minute flowers in profusion. Seedlings may also be found in the mortar of walls not more than seven years old. The wall-tops in many gardens are covered with this little plant, and in my garden, where I had but one plant, the top of a wall, 12 feet in height, is lined with strong plants for a length of many feet, these forming a flowering fringe all along the summit of the wall, and having a very pretty effect for many months in the year. Where it thus reproduces itself so freely, it is scarcely worthy of a place in the border, though, as may be seen from the accompanying illustration (fig. 81), it is decidedly decorative when planted in a rough stone edging, which it will smother with flower in April, May, and June, and well into the autumn. The Daisy-like flowers are each about three-quarters of an inch in diameter, and are pink when they first expand, gradually becoming white as they age. *Wyndham Fitzherbert.*

[Photograph by Wyndham Fitzherbert.]

FIG. 81.—ERIGERON MUCRONATUS AS AN EDGING PLANT: COLOUR OF FLOWERS, PINK.

before comparing Coniferae with other subjects to note the behaviour of various Conifers in this respect, as there are great differences between the genera, and sometimes between the species of a genus, as regards their death rate after being transplanted. In the following list, account is taken of Conifers from 2 feet to 6 feet in height, as from the seedling, grafted, or cutting stage up to about 2 feet practically all Coniferae are best transplanted annually, and we make it a rule to do so. The only exceptions are *Picea pungens* and its var. *glauca*, *Pinus austriaca*, *P. Cembra*, and *P. sylvestris*. These can be left for two years, and be moved without any fear of the loss being, even in exceptional cases, more than five per cent. The heading one year, &c., means that, to have a fair chance of living after being transplanted, the plants mentioned below should not remain longer than that time without being moved.

will stand for another year or even two years longer than the time given above, and still have a fair chance of living, as they then hold a good ball of soil, and the roots are not checked so much by the move as when all the soil falls away from them as soon as the plant is lifted. To show how the behaviour of transplanted Conifers varies, we may note the genus *Pinus*. *P. Laricio* (the Corsican Pine) is a bad subject to move at almost any age and size, and requires catching at just the right time to ensure even moderate success; *P. austriaca* (the Austrian Pine), a variety of *P. Laricio*, can be transplanted with safety at almost any time, provided that it has not been standing more than three years; while *P. Cembra* and practically all the five-leaved Pines will move with perfect safety at any size, even if they have not been transplanted for four or five years.

Turning to hardy evergreen trees and shrubs other than Coniferae, we get the following list.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

GRAPES AT SHREWSBURY (see p. 185).—May I be allowed to correct a slight error in the notes by *Vitis* on "Grapes at the Recent Shrewsbury Show" in the last issue? The variety Buckland Sweetwater was awarded the 1st prize in the "any other white Grape" class, and not Chas-clas Napoleon. *Alfred Child, Catesby House Gardens, near Parenty.*

YUCCA FILIFERA.—A specially fine plant of this *Yucca* is illustrated on p. 401 of the *Revue Horticole*. The plant is a splendid and probably unique specimen (at all events in Europe) of this interesting member of the Liliaceae, showing the fine dimensions to which this plant can grow under favourable circumstances. The tree was planted in 1869 at Saint Amié in Herault, France, and is now more than 21 feet in height, or 6 metres 70 centimetres according to French measurement. It is a splendid four-branched tree with handsome pendulous racemes of pure-white flowers hanging from the end of each branch. The plate is accompanied by a long and detailed description of the plant by M. Charles Cochet. *W. E. Gumbleton, Belgrove.*

MANETTI STOCK FOR ROSES.—There has been much said against the Manetti stock, but Hybrid Perpetual Roses do grandly upon it, and not so very long since it was largely employed for grafting pot Roses of the Tea Scented section. The Manetti makes a better stock for pot Roses than for plants growing in the open, and should not be ignored. It is not so coarse rooted in pots, and, being earlier and quicker in its root action, I prefer it for grafting the Hybrid Perpetuals. Plants growing upon this stock very quickly form new roots, and when they are lifted early, potted at once, and started into growth steadily, it gives satisfactory results. The point is to keep the wood plump by syringing if rains and night dews are not sufficient. Roses upon the Manetti stock also ripen sooner in the open, and are considerably cheaper to purchase, although they are not quite so long-lived as those upon the Briar. *Rose Grower.*

POLLINATION OF MELONS (see p. 140).—The artificial pollination of Melons is not a necessity for the fruits to set, especially when the plants are grown under proper conditions. The humidity of a Melon house, although admirably suited to the growing of the bine, is not favourable to pollination, for two reasons, (1) the pollen grains are not sufficiently dry to be readily disseminated, (2) the plant has not that firm, hard constitution which one grown in a frame possesses. I have proved that plants grown on the extension system do not (specially some varieties) set their fruits so readily as plants that are stopped early, and continued up the trellis with three or more growths. Insects have easier access to the flowers in frames, therefore pollination is more certain, hence the simple matter it is to produce crops under this method of culture. It is also more natural, the bine trailing on the ground, from which it derives a considerable amount of nutrition. But some varieties, under either condition of culture, do not set their fruits freely, and this is attributable to the formation of the flower. Most gardeners believe that the age of the seed influences the period of fruiting, plants grown from two and three-year-old seed being more precocious. There is one point I take exception to in Mr. Foster's remarks on p. 140. He states: "Those fruits which are left to swell after their own natural manner produce only seeds that the grower would term flats." Then he goes on to say: "Fertilisation does not affect the weight of the fruits grown." This is conclusive in saying that fertilisation decreases the weight of the flesh, and non-fertilisation increases it, because, in the former case, the seeds certainly weigh something; whereas, in the latter case, they can be blown away, and must weigh insignificantly. But this raises the point, Can a Melon fruit swell without being fertilised? What difference is created, and how is it created if pollinated by hand, insect agency, or not at all?

My experience of Melon-growing, and I have produced 500 fruits in one season, is that the fruits do contain seeds that will reproduce themselves, but in what ratio to an artificially-fertilised fruit I have not interested myself to prove. Mr. Foster states further: "To demonstrate to the Editors the freedom with which Melons will grow unaided, I enclose a branch of a second crop of fruits that have set and grown away while two later fruits of the first crop were maturing." This is a very ordinary occurrence, and why and how is it? It proves the prolific variety, and also the surroundings are made natural for self-fertilisation by the admission of more air, hardening the growth, and favouring pollination by insect agency. One famous Melon grower whom I served under ripened two and three crops of Melons from the same plants. This system I was not so fortunate with, but my usual practice was to cut perfectly ripe fruits in 12 weeks from sowing the seed. *W. H. Clarke.*

WHERE ARE THE WASPS?—Doubtless some of your readers could give good reasons why there is such a scarcity of wasps this season. I have never seen so few. For the last 20 summers wasps have been the plague of my life. Each season they have destroyed half the fruit in the garden, and have made it impossible for us to eat our meals in comfort. Scarcely a season has passed without my destroying 50 to 60 nests with cyanide of potassium in the garden and farms here. In the spring we killed a large number of queen wasps. I have also seen very few bees this season. Is that the reason why our flowers of Scarlet Runners have failed to set? *Thos. Oldham, Sloughon Grange Gardens, Leicester.*

ARGEMONE GRANDIFLORA (see pp. 136, 138).—I am forwarding two specimens of Argemone. The seeds, sown about the beginning of April in the open ground in rows, about 12 inches apart, germinated very slowly, the seedlings not appearing before the middle of May. They grew slowly, and were thinned out to 12 inches apart. About the middle of July, the first flowers open'd, and from that time the growth of the plants was more rapid. At present, the plants have attained a height of 5 feet, and the beds are covered with the clear, white blooms, which will continue until the plants are killed by frost. Argemone grandiflora would be cultivated more extensively if its beauty were better known. *Fredrick Roemer, Quedlinburg, Germany.*

EARTHWORMS AND SLUGS.—The notes on earthworms in the *Gardeners' Chronicle* for September 3 and August 27 are very interesting. Can any reader tell me of what use or value the slug (*Limacidae*) is? Whilst trenching in these gardens during the past spring, I came across several slugs recovering from their winter rest each with the end of an earthworm in its mouth, which I noticed they swallowed or sucked down whole, lengthways into their stomachs. After watching a slug swallow an earthworm, I caught the slug, killed it, and opened its body, when the earthworm was found whole inside the slug. This proves that the slug is an additional hindrance to plant life, as the earthworms help to fertilise the soil. *Wm. Perry.*

WHAT THE EARTHWORM DOES (see pp. 157, 186).—From a series of experiments conducted in Russia, it has been proved that the earthworm plays an important part in keeping up the supply of available phosphorus in the soil. In one set of tests, alternate layers of different kinds of soil were placed in boxes having glass on one side for purposes of observation. In these layers earthworms were placed, the soil being kept in a suitable condition of moisture, so that the worms worked as naturally as they would in the open ground. The experiments lasted a year, at the beginning and end of which time analyses were made to determine the results. A check test was made by providing other boxes of soil identical in every respect, except that no earthworms were placed in these. In the soils worked over by the worms the soluble phosphoric acid was found in all cases to be greater than in those not worked by the worms. Here we have a discovery which appears to be of no small importance, and perhaps Mr. Willis may be inclined to experiment on the lines indicated, for in his able article, which appeared in the *Gardeners' Chronicle* for August 27, p. 157, it was stated

that the humus formed under the influence of earthworms "is always of a neutral character and never acid." The experiments referred to seem to show that the earthworm in passing the earth through its body uses some kind of an acid which renders the phosphorus of the soil soluble. It was also discovered that the nitrogen content of the soil was more evenly distributed through the soil at the end of the experiment than at the beginning, and that the humus of the upper soil is carried downward by the earthworm. Thus, without the work of the earthworm, all the humus that has accumulated through centuries by the decay of plant and animal life on the surface of the ground would never have been so well mixed with the soil. When one takes into account the long ages in which the earthworms have been at work, an idea is obtained of the great part they have had in the preparation of the earth for the use of man. The earthworm may be classed as an apparently insignificant agent which has had much to do in making the soil more productive. *F. J.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

AUGUST 30.—*Present:* Mr. E. A. Bowles (in the Chair), with Messrs. A. W. Hill, J. Fraser, J. W. Odell, Wm. Hales, G. Gordon, W. Fawcett, A. Worsley, and A. W. Sutton.

Garden warblers attacking Plums.—Mr. WORSLEY said that garden warblers were this year attacking the ripening Plums on the trees, contrary to their usual habit. Mr. GORDON suggested that this may be due to lack of insects—their usual food—this season, and instanced an experiment with hawks whose tastes he had trained till they preferred fruit as a food.

Aberrant branching in Mentha.—Mr. FRASER showed a plant of *Mentha gentilis variegata* bearing one pair of leaves united by their petioles and half the edges of the lamina. The axillary branches were also lateral, following the leaves. The main axis was at right angle to its base, flattened above and convex beneath like a petiole. Then it bore one leaf with an axillary shoot, and then the axis resumed its upright position with opposite, decussate leaves. Three nodes below also had a single or twin-leaf on one side, and one lateral branch behaved in the same way.

Petaloid calyx in Rose.—A specimen of Rose *Eugenie Lamesch* was also submitted by Mr. FRASER, to show phylloid sepals and median proliferation of the flower. The axis in the centre of the flower was prolonged, bearing another flower-bud.

Oncidioida × Charlesworthii.—The first cross of an *Oncidium* with *Coelioda* (*O. incurvum* × *C. Noezliana*) was shown by Messrs. CHARLESWORTH, of Haywards Heath. The specimen submitted was one of several of the same raising, all of which showed the same characteristics and colouring. A Certificate of Appreciation to Messrs. CHARLESWORTH was recommended.

Rhododendron ponticum.—Mr. BOWLES showed a terminal bud of *Rhododendron ponticum*, the leaves having petaloid colouration.

Adventitious root of Plane tree.—Mr. WILKS sent an adventitious root of a Plane tree which he had found penetrating a straw stake-band 6 feet from the ground. It was thought that the moisture which had been held by the band had induced the formation of the root.

Grapes.—A sample of Muscat Grapes was submitted from Colonel TURNER, of Pinkney Park, which showed cracking and decay at the point of union of berry and stalk, and the leaves were badly spotted. It was agreed that the defects were due to too low a temperature in the house, with insufficient ventilation.

Decayed Montbretia foliage.—Some *Montbretias*, *Irises* and *Gladioli* having decaying foliage were sent by Mr. EDWARD HALL, of Leamington Spa. The bulbs and corms were apparently in good health, without traces of disease. Many similar specimens had been lately received, but up to the present no explanation of the trouble was forthcoming.

DUMFRIES AND GALLOWAY HORTICULTURAL.

AUGUST 31.—The annual summer show of the Dumfriesshire and Galloway Horticultural Society was held in the Drill Hall, Dumfries, on this date, the opening ceremony being performed by Major-General Sir Geoffrey Barton, K.C.V.O., C.B., of Craigs. Despite the unfavourable weather, the hall was well filled with a good display of excellent horticultural produce, the pot plants being the most deficient in point of numbers, although the quality was high in the majority of cases. Cut flowers were inferior in quality to those of last year, with the exception of the hardy herbaceous plants, which were very fine, but this was evidently due to the weather, traces of this being apparent in many of the classes. Vegetables were excellent, and fruit was very good, several noted growers competing.

In the open classes, which were not numerous, J. WYLLIE, Esq., Elmbank, Dumfries (gr. Mr. Jas. Henderson); Messrs. J. & W. TWEEDIE, Mouswald, Dumfries; and Mr. D. J. MAXWELL, Newtownards, won the leading prizes.

T. RANKIN, Esq., Dalswinton (gr. Mr. R. A. Grigor), was awarded the Dumfries Corporation Challenge Cup for a table of plants; the trophy now, we are informed, becoming the absolute property of the exhibitor.

The competition for plants in pots was limited, but there were few poor plants shown, and some very good stove or greenhouse Ferns and early Chrysanthemums were noteworthy. Mr. RANKIN led for stove or greenhouse plants; 2nd, J. DAVIDSON, Esq., Summerville, Dumfries (gr. Mr. J. Wilson). Mr. RANKIN also excelled with Petunias, Tuberosus Begonias, stove or greenhouse Ferns (a very fine plant of *Adiantum farleyense* being among the lot), table plants, Zonal Pelargoniums, and greenhouse plants in flower. Mr. DAVIDSON, Mr. WYLLIE, and two amateurs, Mr. J. L. ARMSTRONG, Dumfries, and Mr. D. J. MAXWELL, Newtownards, were also successful in these classes.

In the cut flower classes, the leading features were hardy herbaceous flowers and Sweet Peas. Of the former the chief class was for a collection of 20 sorts, the prizes being offered by Messrs. T. Kennedy & Co. There were five exhibits, and Mr. J. DAVIDSON won the 1st prize with a good collection; 2nd Colonel MAXWELL WITHAM, C.B., Kirkconnell, Newabbey (gr. Mr. Jas. McGill). In the other leading class for these flowers, Colonel GORDON, Threave, Castle Douglas (gr. Mr. Jas. Duff), was placed 1st; Colonel MAXWELL WITHAM being 2nd. The Sweet Peas showed the effects of the season, but the 1st-prize display in the class for Messrs. Service's Silver Cup, exhibited by J. RANKIN, Esq., Dalswinton, were excellent; 2nd, Mr. J. J. TWEEDIE, Broombush, Lockerbie. The other leading winners in the cut flower section were Colonel GORDON (gr. Mr. J. Duff); J. WYLLIE, Esq. (gr. Mr. Jas. Henderson); T. RANKIN, Esq. (gr. Mr. R. A. Grigor); J. H. M'GOWAN, Esq., Ellangowan, Dumfries (gr. Mr. E. W. Pritchard); H. KESWICK, Esq., Cowhill Tower (gr. Mr. C. Murray); Mr. D. WHITELAW, Lochbarbriggs; Mr. W. ANDERSON, Collin; Mr. D. J. MAXWELL, and Messrs. J. & W. TWEEDIE.

In the fruit classes, Grapes were of outstanding quality. For a collection of fruits, Major W. MAXWELL, Glenlair (gr. Mr. B. Rutherford) was 1st, Colonel GORDON being 2nd; both having very creditable exhibits. Major MAXWELL was also placed 1st for Black Hamburg Grapes and Melons. Colonel GORDON was 1st for black Grapes, white Grapes, Peaches, Plums, dessert Apples, baking Pears, and Cherries. Mr. RANKIN was 1st for Muscat Grapes with best bloom and dessert Apples, and Mrs. KAY, Drumpark (gr. Mr. W. Scott), was 1st for Nectarines and dessert Pears.

Vegetables were among the finest produce of the show. For the collection, four very good exhibits were staged, and the 1st prize, after prolonged consideration, was given to Colonel GORDON, although some of his vegetables were larger than some would choose for the table. Mr. RANKIN was placed 2nd and Mr. KESWICK 3rd. In the other vegetable classes the leading prize-winners were Colonel GORDON, Mr. RANKIN, Mr. WYLLIE, Mrs. KAY, Mr. J. H. M'GOWAN, Mrs. CARRUTHERS, Portrack (gr. Mr. W. Brown), and Colonel MAXWELL WITHAM.

Amateurs showed well, as a whole, and the competition in these classes was better than usual.

Non-competitive exhibits were displayed by Messrs. T. KENNEDY & Co., Dumfries, who exhibited a large table of flowering and foliage plants in front of the platform, together with an effective design on the floor of the hall, also cut flowers of many kinds and fruits. Messrs. JAS. SERVICE & SONS, Dumfries, arranged a good group of flowering and foliage plants on the floor; and Messrs. T. SMITH & SONS, Rose Growers, Stranraer, sent cut blooms of new and old varieties of Roses.

CHESTER FLOWER SHOW.

AUGUST 31.—This exhibition was held on the Reader, under the auspices of the Cheshire Agricultural Society. The exhibits were fully up to the average in number, and the attendance was satisfactory, the marquees being crowded during the afternoon.

Groups of plants are generally of fine quality at this show; this year brought four competitors who staged in good form throughout. A. ASH WORTH, Esq., Grosford (gr. Mr. W. H. Shaw), was awarded the 1st prize, showing well-coloured Codiaums (Crotons) and Caladiums, well-grown Palms and well-flowered Ixoras, all suitably arranged; 2nd, Major MACGILVERDY, Bache Hall (gr. Mr. E. Stubbs); and 3rd, JOHN R. SAMUEL, Esq., Shotwick.

In the class for six stove or greenhouse plants, not fewer than three in flower, AYBOLD TYRRE, Esq., Plas Newton (gr. Mr. A. Ellams), led with medium sized plants; J. R. SAMUEL, Esq., and E. P. JONES, Esq., Chester (gr. Mr. W. Reeves), were placed 2nd and 3rd respectively.

For four Ferns, the prize-winners were:—1st, J. R. SAMUEL, Esq.; 2nd, Mrs. BUTT, Chester (gr. Mr. E. Palin); and 3rd, A. E. HALL, Esq., Chester (gr. Mr. J. Williams).

Mr. A. ELLAMS won in the class for four Pelargoniums, having well-flowered plants.

The best single specimen plant, a small *Dipladenia*, was shown by C. H. CRASEY, Esq., Birkenhead; 2nd, Mr. J. A. SAMUEL.

Mr. H. COVERTS won the 1st prize for 12 *Cactus Dahlias* with charming flowers of William Marshall, Killarney, Caradoc and others. For six blooms of these flowers, G. F. H. ROBERTSON (gr. Mr. E. Jones) was the winner of the 1st prize.

Mr. J. BREEN won the 1st prize in the class for 12 Asters; and for six varieties of annuals, P. L. YORKE, Esq., Erddig Park (gr. Mr. G. Aitkens), led with good bunches. The best 12 bunches of hardy herbaceous flowers were shown by Countess GROSVENOR (gr. Mr. F. England), and the best six bunches by Mr. E. STEERS.

For 12 distinct varieties of Sweet Peas, Mr. E. JONES won the 1st prize with good flowers, none of them being named; for six varieties, Mr. G. FAULNER, Rowton, led, having Sunproof Crimson, St. George, Asta Ohn, Evelyn Hemus and other popular kinds. This exhibitor also won the 1st prize in the class for six varieties.

Mr. G. ROLT, Christleton, led in the class for 12 Roses with bright blooms, the best being Frau Karl Druschki, Hugh Dickson, and Killarney. For 12 Gladioli Mr. E. JONES led.

Fruit as usual was good; the 1st prize for nine dishes was won by EGERTON LEIGH, Esq., Holmes Chapel (gr. Mr. H. Bateman); he had good Black Hamburg and Muscat of Alexandria Grapes, Peaches Sea Eagle and Bellegarde, Nectarines Pineapple, Melon Royal Sovereign, and other kinds.

The best two bunches of black Grapes were shown by Sir GEORGE MEYRICK, Bart., Bodagan (gr. Mr. W. Pilgrim), in well-coloured bunches of Madresfield Court; for two bunches of white Grapes J. G. FROST, Esq., Chester (gr. Mr. J. Clack), excelled, having Muscat of Alexandria.

Peaches were best shown by Mrs. M. CLOVER, Willaston (gr. Mr. A. Crisp), and Nectarines by Mr. E. JONES with highly-coloured fruits of Pineapple.

G. R. DARSIE, Esq., Newton House (gr. Mr. J. Dean), staged the best Melon.

Mr. G. AITKENS led for a collection of hardy fruits.

Mr. A. J. BLAIR, Basford, won in the open class for table decorations, and Mr. E. JONES in the class restricted to exhibitors living within a 10-mile radius of the exhibition.

VEGETABLES.—Messrs. Sutton & Sons offered prizes for a collection of six kinds. Mr. F. STEERS won the 1st prize. For Messrs. Clibrans' prizes, offered for a collection, Mr. J. EDWARDS-WINSTAY, was the 1st prize-winner; for Messrs. Webb's prizes, Mr. J. TOMLINSON, Whitegate, showed best; and for Messrs. Dickson & Robinson's, Mr. R. WALKER, Ringway, was the 1st prize-winner.

In the single dishes the 1st prize-winners were: Mrs. WALKER and Messrs. J. WESTON (four), C. PARKER (two), J. TOMLINSON, W. REEVES, J. EDWARDS, J. TAYLOR, A. WATKINS, E. P. SMITH, W. CARTER, F. SNEEL, and J. DEAN.

The following firms staged exhibits not for competition: Messrs. DICKSONS, Chester, Lilies, Phloxes, Roses and other flowers; Messrs. CALDWELL & SONS, Roses, Dahlias and herbaceous flowers; Messrs. DICKSON & ROBINSON, herbaceous flowers; Messrs. CLIBRANS, fruits and vegetables.

SANDY FLOWER SHOW.

AUGUST 25.—The 42nd annual show of this society was held under fine conditions in the beautiful park of Sandy Place. Sandy is situated where the G.N. and L. & N.W. Railways cross, this offering good facilities for visitors, the show attracting more than 11,000. There were many fine groups of plants shown, especially in the class for a group of plants to cover 150 square feet. The competitors in the largest class were Sir G. H. KENRICK (gr. Mr. J. V. Macdonald), Messrs. J. CYPHER & SONS, Cheltenham, and Mr. W. VAUSE, Leamington, the prizes being awarded in this order. Mr. Macdonald is to be congratulated on his achievement, as it was his first attempt at this show. His scheme included an artificial bridge, covered with virgin cork, in the centre of the group, and this was draped with *Lycopodium caesium*. The background was made up with tall Bamboos, well-coloured, single-stemmed *Codiaum Warburgii*, and crowned with a large *Kentia Palm*, which was rather yellow for so prominent a position, but this defect was obliterated a little by a mass of *Lilium speciosum* at the base. Other notable plants in this group were *Ocimum* and *Fuchsia triphylla*, which was effectively used under the bridge. The 2nd prize group, shown by Messrs. J. CYPHER & SONS, left little to be desired, and highly maintained the reputation of the firm; every individual plant in this group was in splendid condition, and was placed to advantage. The chief features in this group were the numerous varieties of Orchids in the foreground. The 3rd prize group was also meritorious.

In the class for 10 stove and greenhouse plants, Messrs. JAS. CYPHER & SONS were awarded the 1st prize, and Mr. W. VAUSE the 2nd; but the positions were reversed in the class for six foliage plants. The class for a group of plants occupying an area of 75 superficial feet was contested by Miss FITZPATRICK (gr. Mr. H. Tyson) and Sir CHARLES HAMILTON, Bart. (gr. Mr. T. W. Burkinshaw). The former exhibitor's group was exceptionally well arranged; *Amaryllis* were well shown, also *Acalypha hispida* in the background, and *Caladiums* in the foreground. The group was awarded 1st prize. Miss FITZPATRICK won the 1st prizes in the other classes for specimen plants.

Fruit and vegetables were staged in a separate tent. The 1st prize for six dishes of fruit was won by Sir C. HAMILTON (gr. Mr. T. W. Burkinshaw). This exhibit was very meritorious, black and white Grapes being very fine. The same gentleman won in the class for Black Hamburg; 2nd, Marquis of NORTHAMPTON (gr. Mr. A. R. Searle); 3rd, G. D. NEWTON, Esq. (gr. Mr. C. Cousins). For black Grapes, not Hamburgs, Sir C. HAMILTON was again placed 1st, with Alwick Seedling; Mr. J. W. WRIGHT 2nd; and the Marquis of NORTHAMPTON 3rd. Sir C. HAMILTON was awarded 1st prize for Muscat of Alexandria; 2nd, A. J. THORNHILL, Esq. (gr. Mr. T. Lockie). For any other white Grapes, the 1st prize was won by the Marquis of NORTHAMPTON, with Bowood Muscat; 2nd, J. BRISCOE, Esq. (gr. T. Todd). The best Peaches and Nectarines were shown by Mr. THORNHILL; the best scarlet-fleshed Melon by the Marquis of NORTHAMPTON; and the best green-fleshed Melon by Sir C. HAMILTON.

ROYAL CALEDONIAN HORTICULTURAL.

SEPTEMBER 7, 8.—The autumn show of this Society was held in the Waverley Market on these dates. Compared with the Centenary Show of the previous year, held in the same month, there was a considerable falling off in the number of entries for fruit and a slight decrease in those for plants, but there were more competitors in the vegetable and cut-flower classes. The total entries showed a decrease of over 160 as compared with 1909. The quality of the exhibits, however, was of the high standard usually seen at these shows, and in some of the fruit classes, notwithstanding the bad season in most parts of the country, it was very high. The Grapes shown in the Challenge Trophy class were probably as fine as any seen at these shows. On this occasion, too, the traders made a splendid display, so that the large Market House, which covers about an acre and a quarter, was very fully occupied.

FRUIT CLASSES.

(Open to Gardeners and Amateurs.)

There were four entries in the class for a table of dessert fruit, as compared with two in 1909. The tables were, as usual, 10 feet by 4½ feet, and decorated with plants or cut flowers, or both. Not more than 16 dishes of fruit could be shown, and these had to be selected from a list published in the schedule. Separate prizes were awarded for fruit and for decoration. The 1st prize of £5 for fruit was awarded to the Duke of PORTLAND, K.T., Welbeck, Notts. (gr. Mr. J. Gibson); the 2nd of £3 10s. to the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre); and the 3rd of £2 to WHITELAW REID, Esq., Wrest Park (gr. Mr. Geo. McKinley); while for decoration the positions of the 1st and 2nd prize winners for fruit was reversed. The pointing in the 1st prize exhibit was as follows:—

	Maximum Points.	Points Awarded.
Apples (1)	7	5½
Apples (2)	7	5
Figs (1)	7	6
Figs (2)	7	5½
Grapes, Black (1) ...	9	7½
Grapes, Black (2) ...	9	7
Grapes, Black (3) ...	9	6½
Grapes, White (1) ...	10	7
Melon (1)	8	7
Melon (2)	8	6½
Nectarines (1)	8	6
Nectarines (2)	8	6
Peaches (1)	8	6½
Peaches (2)	8	6
Pears (1)	8	7
Pears (2)	8	6
	129	101

The points awarded for decoration were 21½ out of a possible of 23. The Grapes shown were (white) Muscat of Alexandria, (black) Madresfield Court, Muscat Hamburg and Prince of Wales (one bunch of each); Peaches Dymond and Royal George; Nectarines Humboldt and Pineapple; Melons Green Gem and Universal; Figs Negro Largo and Brown Turkey; Pears Souvenir du Congrès and Marguerite Marillat; Apples Cox's Orange Pippin and Ribston Pippin.

The points awarded to the Earl of HARRINGTON were for fruit, 97½, and for decoration, 23; and to WHITELAW REID, Esq., for fruit, 80½, and for decoration, 17. In the decoration of the 1st prize exhibit, Montbretias were the leading feature, while *Lilium lancifolium* was the chief flower used in the 2nd prize group, and Carnations in the 3rd.

For the collection of 12 dishes of fruit, the Duke of PORTLAND was placed 1st, the Earl of HARRINGTON 2nd, and the Earl of WEMYSS, Gosford (gr. Mr. Wm. Galloway) 3rd. The 1st prize lot consisted of Grapes Muscat of Alexandria (three bunches) and Madresfield Court (three bunches), Peaches Princess of Wales and Barrington, Nectarines Pineapple and another, Melon Countess, Apples Peasgood's Nonesuch and Emperor Alexander, Fig Negro Largo, and Plum Kirke's.

For the collection of 12 dishes of fruit grown in an orchard house (Grapes excluded), the Duke of PORTLAND was again awarded the 1st prize, the Earl of HARRINGTON the 2nd, and WHITELAW REID, Esq., 3rd. The Duke of

PORTLAND's collection consisted of Nectarines Pineapple and Spencer, Peaches Royal George and Barrington, Apples Gascoigne's Seedling and Peasgood's Nonesuch, Pears Doyenné du Comice and Marguerite Marillat, Plums Kirke's and Jefferson, Figs Negro Largo and Brown Turkey.

On this occasion there were only three entries for the Scottish Challenge Trophy for eight bunches of Grapes, not more than two of any variety, and only one of the previous holders of the Cup exhibited. The Cup has to be won three times before it becomes the property of one of the competitors, and already it has been won twice by two of them. Fresh interest was lent to the competition this year by the appearance of a new competitor, who succeeded in carrying off the trophy with a magnificent exhibit. This was Mr. CAMERON CORBETT, M.P., Kilmaurs, Ayrshire (gr. Mr. J. Dixon). The trophy was presented by Mr. W. H. Massie, and, with the 1st prize of £6, the winner also secures a gold badge. The 1st prize exhibit was awarded 54½ points out of a possible 74. The 2nd prize was secured by the Earl of HARRINGTON, with 52 points out of 73, and the 3rd by Miss WELSH, Newstead Abbey, Notts. (gr. Mr. T. Ireland), with 44½ points out of 72. The varieties, with the points awarded to each bunch, shown by Mr. CORBETT were as follow:—

	Maximum Points.	Points Awarded.
Muscat of Alexandria (1) ...	10	8½
Muscat of Alexandria (2) ...	10	8½
Black Hamburg (1)	9	8
Black Hamburg (2)	9	7½
Madresfield Court (1)	9	8½
Madresfield Court (2)	9	8½
Muscat Hamburg (1)	9	7½
Muscat Hamburg (2)	9	7½
	74	64½

In the class for two bunches of Grapes, distinct varieties, there were two entries, and the 1st prize fell to Lord ELPHINSTONE, Carberry Tower, Musselburgh (gr. Mr. D. Kidd), while the 2nd was awarded to the Marquis of TWEEDALE, Yester, Haddington (gr. Mr. John Highgate). Lord ELPHINSTONE's bunches were Canon Hall Muscat, Alicante, Gros Maroc, and Muscat of Alexandria, and the Marquis of TWEEDALE's, Madresfield Court, Black Hamburg, Alicante, and Muscat of Alexandria. For 12 bunches of Muscat of Alexandria, for which there were six entries, the Earl of MAR & KELLIE, Alloa Park, Alloa (gr. Mr. W. J. Buchanan), won the 1st prize, Capt. A. STIRLING, of Keir, Dunblane (gr. Mr. T. Lunt), the 2nd, and Col. J. STEWART MACKENZIE, of Scotforth, Brahan Castle (gr. Mr. W. Campbell), the 3rd. There were eight entries for two bunches of Black Hamburg, and the 1st prize was awarded to the Earl of MAR & KELLIE, the 2nd to Mrs. MONTGOMERY, Kelvinside House, Glasgow (gr. Mr. D. G. McKerracher), and the 3rd to J. A. HARVIE-BROWN, Esq., of Dumipace, Stirling (gr. Mr. Jas. Menzies).

In the single-bunch classes, the best Muscat of Alexandria Grapes was shown by Capt. STIRLING, of Keir; the best Black Hamburg by Mr. CAMERON CORBETT; the best Black Alicante by N. E. D. MENZIES, Esq., Dumfries (gr. Mr. W. Smith); the best bunch of Lady Downe's by Mrs. HAMILTON ORGLVIE, Archerfield, East Lothian (gr. Mr. Thos. MacPhail); the best Madresfield Court by Mr. CAMERON CORBETT; the best black variety, not included above (Cooper's Black), by Capt. STIRLING; and the best white not included above (Buckland Sweet-water), by the Duke of PORTLAND. For the black variety with finest bloom, Col. E. R. STEWART-RICHARDSON (gr. Mr. J. E. Davis) was placed 1st with Appley Towers.

The best green or white-fleshed Melon was shown by Mrs. KAY, Drumpark (gr. Mr. W. Scott), with Sutton's Best of All, and the best scarlet-fleshed by the Earl of HARRINGTON. The Earl of DEVON, Powderham Castle, Exeter (gr. Mr. T. H. Bolton), had the best 12 Figs; the Earl of STAIR (gr. Mr. B. Ness) had the best six Peaches (Barrington); Captain STIRLING the best six Nectarines (Pineapple); Sir GEO. BULLOUGH, Kinloch Castle, Rhum (gr. Mr. P. K. Hills), the best 12 Gage Plums (Reine Claude de Bayay); the Duke of PORTLAND the best 12 Yellow Plums (Jefferson); Col. GORDON, Threave House, Castle Douglas (gr. Mr. J. Duff), the best 12 Red Plums (Pond's Seedling); and WHITELAW

REID, Esq., the best 12 Purple Plums (Monarch). Sir GEO. BULLOUGH won the 1st prize for a collection of four varieties of dessert Plums, nine of each, and WHITELAW REID, Esq., was 1st for the collection of culinary Plums, four varieties, nine of each.

Sir GEO. BULLOUGH was the 1st for four dishes of Pears, five of each, grown in an orchard house.

HARDY FRUIT.

There were three entries in the class for 12 varieties of Apples, five of each sort; the 1st prize was won by Mr. E. F. CADDICK, Caradoc, Ross; while for a similar collection, grown in Scotland, for which there were four entries, Col. GORDON carried off 1st honours. Mr. J. LEE, Kingscroft, Chester, was placed 1st for a collection of six varieties, whilst for four dishes of pot-grown or orchard-house Apples, Mr. D. NIBOLL, Rossie, Fingandemy, won the 1st prize with superb fruit. The Duke of PORTLAND led for six dessert Apples, three of each, and in the single dish classes, six fruits of each. Mr. E. F. CADDICK had the best Charles Ross, Potts's Seedling, Stirling Castle, Warner's King, Gascoigne's Scarlet Seedling, Bismarck, Ecklinville Seedling, Emperor Alexander, Golden Spire, Lane's Prince Albert, Lord Derby, Lord Grosvenor, and Peasgood's Nonesuch. Mr. J. LEE had the best fruits of Wellington, Irish Peach, Lady Sudeley, Beauty of Kent, Cellini, and Grenadier. Col. GORDON had the best James Grieve, Worcester Pearmain, Duchess of Oldenburg, and Lord Suffield.

The Duke of PORTLAND excelled in the class for a collection of Pears, 12 varieties, 4 of each, and Sir GEO. BULLOUGH won the 1st prize for a collection of six varieties, four of each, grown in Scotland. The Earl of WEMYSS, Gosford (gr. Mr. Wm. Galloway), had the best examples of Beurré d'Amanlis, Doyenné du Comice, and Louise Bonne of Jersey; Sir GEO. BULLOUGH the best Conference; the Duke of PORTLAND the best Durondeau, and Souvenir du Congrès; WHITELAW REID, Esq., the best Jargonelle, H. J. YOUNGER, Esq., of Benmore (gr. Mr. R. Greenlaw), the best Pitmaston Duchess, and the Earl of DEVON the best Williams' Bon Chrétien.

PLANT CLASSES.

The best collection of four stove or greenhouse plants, distinct, in flower, was shown by C. DICKSON, Esq., Lasswade (gr. Mr. Duncan Mackay), the varieties being *Acalypha hispida*, *Statice profusa*, *Oncidium incurvum*, and *Bougainvillea Sanderiana*; 2nd, Sir R. USHER, Bart., Rotho (gr. Mr. Geo. McKinnia).

For six foliage plants, distinct, exclusive of Palms, the 1st prize was secured by the Earl of HOME (gr. Mr. Alex. McMillan), with fine examples of *Anthurium crystallinum*, *Alocasia metallica*, and *Dieffenbachia magnifica*. There were only two exhibits, but the other, shown by Sir WILFRID LAWSON, Bart., was disqualified for non-compliance with regulation 10 of the show rules.

For six foliage plants, in pots, not to exceed 9 inches in diameter, the 1st prize was secured by Mrs. HUTCHISON, Carlwrie (gr. Mr. John Thom). This exhibitor staged splendid examples of *Dracæna Van der Grooten* and *Dracæna Victoria*. 2nd, the Earl of HOME.

For an exhibit of six table foliage plants, distinct, in pots not exceeding 6 inches in diameter, the plants to be not less than 15 inches above the pots, the Earl of HOME again led, showing good examples of *Cocos Weddelliana*, *Pandanus Veitchii*, *Dracæna Princess May*, and *Codiaeum superba*, *interruptum*, and *Achievement*; 2nd, Mrs. YOUNGER, Alloa (gr. Mr. Jas. Fairholm).

BEGONIAS.

Tuberous-rooted Begonias were a fine feature. The 1st prize for six varieties was secured by Mr. ROBERT BROWN, Dalkeith; 2nd, Mrs. LEWIS, Edinburgh (gr. Mr. W. F. Galloway), for three specimens, Mrs. BAILLIE HAMILTON, Duns, was placed 1st; and Mr. R. BROWN again led for three double varieties. Mr. BROWN also secured the 1st prize for one plant of a double Begonia, all his specimens being remarkably fine.

The Chrysanthemum classes were poorly filled. The 1st prize for six pots was won by Mrs. SIMSON, Colinton (gr. Mr. Fraser), for a very indifferent lot. Fuchsias were also poorly shown. For two plants, distinct, the 1st prize was awarded to C. DICKSON, Esq. In the Pelargonium classes, one collection was evidently not

considered; the judges must have overlooked them. For three plants, Sir R. USHER, Bart., was placed 1st, there being four exhibits.

CUT FLOWERS.

In the section for cut flowers, one of the most important classes was that in which a Silver Cup is offered for the best display of hardy perennials on a circular table, 5 feet in diameter. Mr. ADAM BRYDON, Innerleithen, gained the premier place. The exhibit was crowned with pretty spikes of *Lobelia cardinalis*, and flanked with such subjects as *Gladioli*, *Montbretias*, *Tritomas*, *Erigerons*, and *Lilium speciosum*. The display was easily worthy of the premier place. 2nd, M. G. THORBURN, Esq. (gr. Mr. A. Dickson); 3rd, Mrs. FLEMING HAMILTON (gr. Mr. Wm. Young). More of these groups are desirable at this Edinburgh show; only three exhibits were seen on this occasion. In the class for 24 spikes of *Gladioli*, Messrs. GEORGE MAIN & SONS, Prestwick, easily secured the 1st prize, putting up some magnificent spikes, *Mars*, *Turome*, *Triomphe de Caen*, and *Bouquet de Feu* being exceptionally good. The 2nd prize was won by Mr. JOSEPH C. FORDY, Warkworth, Northumberland, for a very even lot, but the blooms lacked the freshness and brilliance of those in the 1st prize group. Only two exhibits were staged but there were also classes for six and three spikes, in which competition was good. Mention must be made of the exhibit which gained the 1st prize in the class for 12 spikes. The exhibitor was Mr. A. BRYDON, Innerleithen, and he had a keen competition.

SWEET PEAS AND ROSES.

In the Sweet Pea classes the flowers were somewhat small, but the brilliance of the colours at this season was very noticeable. For 12 bunches, 1st place was secured by the Hon. Mrs. BAILLIE HAMILTON: the variety Earl Spencer was noticeable. 2nd, Mr. JOHN FLETCHER, Lanark; this exhibitor showed the variety Mrs. Hugh Dickson in capital condition. Mrs. BAILLIE HAMILTON again led in the class for six bunches, Mr. FLETCHER being 2nd. There was a class for a vase to contain not fewer than 18 spikes of any new variety of Sweet Pea not yet in commerce; three exhibitors staged. The 1st prize was given to an intense-coloured seedling somewhat resembling George Stark, but much deeper in colour. It was shown by Mrs. DUNBAR-DUNBAR, Forres (gr. Mr. John Grigor).

In the classes for Roses, the premier prize was a silver challenge cup presented by Messrs. Alexander & Hugh Dickson, Belfast, for a collection of 24 Roses in not fewer than 12 varieties. Six exhibits were staged, the finest by Mrs. DENNISTOWN, Row (gr. Mr. Wm. Parlange); 2nd, Mr. J. RUSSELL, Newton Mearns; 3rd, Earl of DALROUSIE, Carnoustie (gr. Mr. John Simpson).

For 36 ROSES, distinct varieties, Messrs. JAMES COCKER & SONS, Aberdeen, easily led, with a brilliant lot of blooms, their rich colour being remarkable. 2nd, Mr. HUGH DICKSON, Belfast; 3rd, Messrs. D. & W. CROALL, Dundee.

In the class for a collection of Roses, arranged in a space 15 feet by 5 feet, and shown with Rose huds and foliage, Messrs. COCKER, Aberdeen, were awarded the 1st prize for a superb collection; 2nd, Mr. Wm. FERGUSON, Dunfermline. Both exhibits were conspicuous for the fine quality of the flowers. There were numerous classes of Dahlias, Roses, Carnations, Pansies, Violas, &c., and good examples were staged in nearly every section. Mention must be made of the splendid exhibit of early-flowering Chrysanthemums, shown by Mr. JOHN SMELLIE, which secured the 1st prize in the class for 18 bunches.

VEGETABLE CLASSES.

(Open to All.)

For a display of vegetables, 18 dishes, not fewer than 12 kinds, and not more than two dishes of any kind, the 1st prize was awarded to the Duke of PORTLAND, Welbeck Abbey (gr. Mr. Gibson), for a superbly-finished collection, which comprised Sutton's White Celery, Prizetaker Leeks, Superb Pink Celery, Early Giant and Autumn Mammoth Cauliflowers, Epicure Cucumber, Gladstone and Centenary Peas, extra fine Eclipse and White City Potatoes, Ailsa Craig Onions, Parsnips and Carrots. 2nd, Col. E. STUART RICHARDSON (gr. Mr. J. E. Davis).

For a display of vegetables grown in Scotland, 12 dishes in 12 kinds, Mr. GATLOWAY, Gosford,

secured the 1st prize with meritorious dishes, including Favourite Pink Celery, Duke of York Tomato, Ailsa Craig Onion, and Alderman Pea; 2nd, Mr. URQUHART, Melrose.

The FLORAL COMMITTEE awarded First-class Certificates to the following plants:—*Montbretia Comet*, a seedling from and darker than *Prometheus*, and *Lathyrus latifolius magnifica*, both from Mr. G. DAVIDSON, Westwick. Also to Hybrid Tea Roses Mrs. Charles E. Allen and Mrs. Frank Watman, from Mr. HUGH DICKSON, Belfast; and to James Ferguson, a sport from *Caroline Testout*, from Mr. W. FERGUSON, Dunfermline.

NON-COMPETITIVE EXHIBITS

Mr. J. PROCTOR, Portobello, staged a large collection of early Chrysanthemums in small pots, also a variety of Ferns. (Bronze Medal.)

Mr. L. R. RUSSELL, Richmond, had a large group of Ivies arranged on the floor. Interspersed among these were Clematis in small pots. He had also specimens of a good strain of *Celosias*. (Gold Medal.)

Messrs. GEO. FAIRBURN & SONS, Carlisle, set up a large table of Cactus and Pompon Dahlias. (Silver-gilt Medal.)

Messrs. STORRIE & STORRIE, Glencarse, near Perth, staged fruit in pots, Gooseberries, Apples, Currants, &c., and examples of their strains of *Celosia*, *Streptocarpus* and *Gloxinia*. (Silver-gilt Medal.)

Messrs. W. THOMSON & SONS, Clovenfords, showed baskets of Duke of Buccleuch and Gros Colman Grapes in fine condition.

Messrs. TILLIE, WHITE & Co., Edinburgh, contributed a splendid display of vegetables, Tomatoes, Celery and Leeks being very fine. (Silver Medal.)

Mr. A. THOMSON, Dean, Edinburgh, showed early Chrysanthemums. (Bronze Medal.)

Messrs. R. B. LAIRD & SONS, LTD., Pinkhill, Edinburgh, arranged on the floor of the Market a large and artistic group of decorative plants, including *Hydrangeas* and *Liliums*.

Mr. D. McONISH, Crieff, staged Pentstemons, Phloxes, and herbaceous flowers. (Silver-gilt Medal.)

Mr. A. L. Gwillim, New Eltham, Kent, provided a large display of Begonia blooms. (Silver Medal.)

Messrs. GUNN & SONS, Olton, Birmingham, staged bunches of Phloxes in great variety. (Silver Medal.)

THE KING'S ACRE NURSERY Co., Hereford, staged a large collection of hardy fruit, comprising Apples, Plums, Peaches, &c., in pots, and dishes of Pears and Apples. (Gold Medal.)

Mr. R. BOLTON, Warton, Carnforth, staged Sweet Peas in splendid condition, and in the more popular varieties, Mrs. Townsend, Clara Curtis, and Earl Spencer being extra fine. (Gold Medal.)

Messrs. DOBBIE & Co., Edinburgh, had a brilliant display of cut flowers, artistically arranged in large masses of one kind. Specially fine were the Sweet Peas Earl Spencer, Masterpiece, Edrom Beauty, and Mrs. Townsend. Some choice African Marigolds were noticed. There were also enormous quantities of cut Dahlias in all the sections, and a variety of other flowers in season, besides a charming display of cut Roses on another table. Messrs. DOBBIE also staged early Chrysanthemums and Dahlias in pots. (Gold Medal.)

Dr. McWATT, Duns, furnished a table with hardy plants such as Violas, Primulas, *Gladioli*, and Delphiniums. (Bronze Medal.)

Messrs. J. METHVEN & SONS had groups of plants freely arranged on the floor of the Market. (Silver Medal.)

Messrs. MASON & Co., Jameston, Dumbarton, set up a small collection of cut flowers. (Bronze Medal.)

Messrs. SUTTON & SONS, Reading, showed a circular arrangement, which was marked by a series of pillars worked out in Asters and joined together with arches of the same flowers, many of their specialities, particularly Melons, Tomatoes, Potatoes, Asters, Beets, Carrots, and Marrows. (Silver-gilt Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, provided some charming Orchids, both hybrid and species; also cut Carnations. (Silver-gilt Medal.)

Mr. JOHN DOWNIE, Murrayfield, Edinburgh, had a group of stove and greenhouse plants tastefully grouped on the floor. (Silver Medal.)

Messrs. M. CAMPBELL & SONS, High Blantyre,

had Carnations in variety, also very fine Cactus and Show Dahlias. (Bronze Medal.)

Messrs. R. WALLACE & Co., Colchester, staged an extensive collection of *Montbretias*, arranged in groups of one variety; also blue *Gladioli*, *G. primulinus* hybrids and others, as well as a few hardy flowers. (Silver-gilt Medal.)

Messrs. THOS. S. WANE, LTD., Feltham, had a boldly-arranged bank of Double Begonias, the finest they have ever brought North; the lovely pink Lady Cromer, the frilled Mrs. J. Brinsmead, and Lady Clifford being among the more prominent. (Gold Medal.)

Messrs. W. CURRISH & SON, Highgate, had a group of various flowers on the floor which was one of the most attractive features of the show. A Lily pond with a vast array of hardy flowers grouped around and broken up with tall vases of *Gladioli*, *Tritomas*, *Pentstemons*, and a collection of Perpetual Carnations. (Gold Medal.)

Mr. MATTHEW CUTHBERTSON, Rothesay, exhibited a large collection of *Montbretias*, for which he was awarded a Bronze Medal.

The ROYAL HORTICULTURAL SOCIETY sent a collection of Grapes from Wisley which were the cause of much discussion among growers, some of the varieties being not very well known. They were well cultivated, Alhwick Seedling, Diamond Jubilee, Mrs. Pearson, Appley Towers, Muscat Hamburg, Madresfield Court, Black Hamburg, Duke of Buccleuch and Canon Hall Muscat were represented by excellent clusters. To this a special award was made.

Messrs. J. FAIRLEY & Co., Cairney Hill, Fife, staged a nice collection of Roses and Carnations, which was prettily arranged. (Silver Medal.)

Mr. R. FERGUSON, Dunfermline, exhibited Roses in large masses. (Bronze Medal.)

Messrs. JOHN FORBES, LTD., Hawick, arranged a large collection of cut flowers in their usual tasteful manner: Phloxes, Pentstemons, Carnations, and Violas being perhaps the most noticeable. (Silver-gilt Medal.)

Messrs. J. COCKER & SONS, Aberdeen, staged a selection of hardy flowers. (Silver Medal.)

Messrs. CUNNINGHAM, FRASER & Co., Conely Bank, Edinburgh, had a large bank of hardy flowers intermixed with Phloxes and Pentstemons, with excellent Roses. (Silver-gilt Medal.)

Messrs. BUNYARD & Co., Maidstone, provided a collection of hardy fruits, including a few trees in pots. (Silver-gilt Medal.)

Mr. H. N. ELLISON, West Bromwich, had Ferns in favourite sorts. (Silver Medal.)

Mr. C. ENGELMANN, Saffron Walden, contributed Perpetual Carnations in fine varieties, showing high cultivation. (Silver Medal.)

Messrs. ED. WEBB & SONS, Wordsley, Stourbridge, exhibited a mixed collection of flowers, fruits and vegetables; Sweet Peas, *Liliums* and Carnations were choice. (Gold Medal.)

Messrs. WEBB & BRAND, Saffron Walden, had a very attractive exhibit of Hollyhocks in a great variety of colours. (Silver Medal.)

Messrs. WELLS & Co., Merstham, exhibited a large collection of cut flowers, which included fine Pentstemons, Phloxes, and a great variety of Chrysanthemums, the singles of these being very pretty.

Messrs. YOUNG & Co., Cheltenham, staged a nice lot of Perpetual Carnations. (Silver Medal.)

Messrs. A. YOUNG & Co., Elgin, showed Sweet Peas. (Silver Medal.)

Obituary.

WILLIAM LEIGHTON.—The death of this well-known Glasgow seedsmen, of 36, Renfield Street, and Ardul, Maxwell Drive, Glasgow, occurred on August 27. The deceased gentleman was on his way to Switzerland, but, on being seized with illness in Paris, returned to this country and went to Eastbourne, where he died. The funeral took place in Edinburgh, of which city he was a native, in the Grange Cemetery, on September 1, and was largely attended. Mr. Leighton entered the seed trade as an apprentice with the then well-known firm of Messrs. Peter Lawson & Sons, Edinburgh, and, being a hard worker and a man of ability, he soon reached a foremost position in the seed trade.

MAX LEICHTLIN.—The well-known German Botanist, Herr Max Leichtlin, died on September 3, in the 79th year of his age. The funeral took place at Baden Baden on the 5th inst.

APPLE LEAVES: *Talbot*. The "greenish mould" on the Apple leaves is a fungus, *Cladosporium*. The fungus is not the cause of the death of the leaf, and is probably only saprophytic. This dying or "scorching" of Apple leaves takes place in the case of certain varieties, in years like the present and last, when cold, wet nights and generally unfavourable weather conditions prevail. It is often most pronounced in cases where the trees lack potash. In some cases it is considered that *Cladosporium* develops a parasitic habit, and causes a "leaf-spot" disease. (See *Journal*, Royal Horticultural Society, vol. xxxiii., p. 507.)

APPLE SHOOTS: *H. G. C.* The white, flocculent substances on the branches of your Apple trees are colonies of woolly aphis, or American blight. This pest may be eradicated by scrubbing the affected parts with some insecticide, such as caustic soda or Calvert's carbolic soap. In the winter the trees should be well sprayed with the following specific:—1 lb. caustic soda, $\frac{3}{4}$ lb. carbonate of potash, 10 ounces of soft soap, and 10 gallons of water, adding the soft soap last. The nursery firm from whom you obtained the trees may not be responsible, as the pest is common in neglected gardens, and may have spread from a neighbour's trees.

APPLE SOPS IN WINE: *J. Columbus*. One fruit was wine colour right through to the core, the other quite white with no trace of red.

BEGONIA LEAVES: *Wm. Yandell*. Microscopic examination showed no trace of any fungus disease in the Begonia leaves. The trouble may be due to mites: dip the plants in Tobacco water.

CATERPILLARS ATTACKING BEECH TREES: *J. F. C.* The caterpillars are those of the Buff-tip moth (*Pygaera bucephala*). It is not uncommon for them to attack Copper Beeches.

CELERY DISEASED: *E. O. J.* The plants are affected with *Septoria petroselinii* var. *April*. See reply to *J. S.*, p. 152, August 29. Do not plant Celery on the same land next year.

COLOR VARIATION IN ROSE SOUVENIR D'UN ANNI: *C. P., Nagpur*. Almost all Rose sports have a tendency to revert. *S. veur de S. A. Prince* sported from *Souvenir d'un Anni* simultaneously in more than one place, and it is not infrequent to find various shades of pink upon this sport. Countess of Oxford and Heinrich Schultheis both produced two distinct sports, and these have reverted upon more than one occasion. Sometimes these are striped similar to *Pride of Reigate* and *Mme. England*, and occasionally one portion of the flower is quite distinct from the others, and not even striped or splashed.

FIG LEAVES UNSATISFACTORY: *E. M. M.* The Fig leaves sent are quite free from disease.

FRUITS CRACKING: *R. T. Galtaher*. The fruit sent was, on its arrival, covered with several kinds of fungi, some of which were converting the flesh into pulp. It is impossible to say what was the original cause of the trouble without seeing a fruit in the first stages of disease.

GRAPES: *J. G. Walker*. There is no fungus disease attacking the Grapes sent. The cracking, &c., must be due to some error of cultivation.

GRAPES DISFIGURED: *J. G. W. and Muscat*. There is no trace of disease on the Grapes. Their disfigurement has been caused by rubbing, probably during the process of thinning.

GRAPES FAILING TO COLOR: *S. G. Rogers*. The cause is due to some cultural defect: there is no fungus in the tissue at the hard places; the blue-green "mould" is a fungus that comes afterwards, when the skin cracks.

GRAPES MUSCAT OF ALEXANDRIA AND BLACK HAMBURGH: *Muscat*. These two varieties cannot be grown satisfactorily in the same house as they require different treatment. Muscat Grapes require considerably more heat than Black Hamburgs; the varieties also flower at different times. An abundance of light and sun is necessary to "finish" the berries of

Muscat varieties, whereas Black Hamburgs prefer shade, and although a very fair crop of both varieties may be ripened in the same house, really good results can never be attained. Should it be decided to devote the house to Muscats, time may be saved by planting Muscat of Alexandria on to the Black Hamburg, the latter making an excellent stock. This would prevent any disturbance of the border. To prevent the roots getting through the wall, take out a narrow trench and concrete the face of the wall on the inside.

GLOXINIAS AND BROCCOLI: *J. T., Letchmere*. The Broccoli plants are badly affected with "Club-root" (*Plasmiodiophora brassicae*). (See *Gardener's Chronicle*, August 27, p. 171.) With the aid of a microscope, you could see the cells of the roots filled with the plasmodium and spores of this destructive parasite. Vaporite is not of the slightest use to check the disease; you must use lime. If you will forward specimens of the Gloxinias, we will submit them to an examination in order to determine the nature of the "rust."

GOOSEBERRY DISEASE: *J. G. P. Cooks*. The plants are affected with the American Gooseberry-mildew. This disease is now notifiable, and you should at once report this outbreak to the Secretary, Board of Agriculture, 4, Whitehall Place, London, at the same time asking for the Board's illustrated leaflet on the disease. Spraying against this disease is quite useless at this time of year; the tip of every shoot on every bush should be removed for 6 inches and burnt, and all the suckers removed. The brown scurfy "scurf" present on the surface of the shoots sent contains the winter spores, and these will drop out and infect the soil unless the affected parts are removed.

HORTICULTURAL INSTRUCTOR: *Instructor*. Your first qualification should be a sound, practical knowledge of all the branches connected with horticulture; if, in addition to this, you can express yourself clearly before an audience, little further is needed. A knowledge of the sciences connected with gardening, such as botany, chemistry, physics, and economic entomology, will prove useful. The possession of the first-class certificate in the examination held by the Royal Horticultural Society, or the advanced course of the Science and Art examination in domestic economy and rural hygiene, would be of value.

INSECT EATING ELM LEAVES: *J. C.* Unless you send us specimens of the insects, we cannot advise you in the matter. Spraying with some arsenical or other strong poisonous insecticide, if practicable, is to be recommended.

MAGNOLIA LEAVES: *T. A. Hyde*. There is no disease present on the Magnolia leaf sent; the trouble must be looked for in some other direction. Probably the adverse weather conditions or some cultural defect is responsible.

MONBRETIA FOLIAGE TURNING BROWN: *W. H. C.* There appears to be no trace of any fungus or insect disease in the Monbretia sent, and we can offer no explanation of the leaves going brown as they have done.

NAMES OF FRUITS: *Hallow*. Thanks for sending such excellent specimens. We consider it is *Kirke's*.—*B. H., Cork*. The history of the seedling Apple you send is very interesting. The variety has several merits, the flesh being firm and of agreeable flavour, but the fruit lacks size and colour, and we are afraid that because of these defects it will never become a popular sort. It might prove a useful variety in some localities.—*Rides*, Apple Scarlet Pearmain.

NAMES OF PLANTS: *G. W.* 1. *Helianthus multiflorus maximus*; 2. *Achillea*, *Platensis*, the Pearl; 3. *Helianthus rigidus*; 4. *Fuchsia Arabella*; 5. *F. Scarcity*; 6. *F. Sir Colin Campbell*; 7. *F. Aurora superba*; 8. *F. Charming*; 9. *F. Mrs. C. Turner*; 10. Not recognised.—*H. S.* 1. *Fuchsia gracilis*; 2. *F. Riccartonii*; 3. *Pelargonium ardens*; 4. *P. quercifolium* var. *Douglas*; 5. *P. fragrans*; 6. *P. capitatum*.—*D. Barr*, *Pseudotsuga* (*Abies*) *Douglasii*.—*J. D. PEACH FOR EXAMINATION: *W. L.* The Peach arrived a mass of pulp; send examples of the disease in its early stage.

PEAR CRACKING AND LEAVES DISEASED: *T. G. G., York*. The fruits and leaves are affected with "scab," caused by *Fusicladium pirinum*. At this stage you can do nothing beyond burning the affected fruits and leaves, being careful to gather and burn all the latter when they fall. Next spring spray the trees with dilute Bordeaux mixture (not more than half strength). The first application should be made when the buds are opening, repeating the operation at the time of blooming and again when the fruits have formed.

PEAR LEAVES DISEASED: *G. S. B.* The disease of the Pear leaves has been caused by the caterpillars of the Pear-leaf blister-moth (*Cemastoma scitella*). The best remedy is to give one or two early sprayings with arsenate of lead, when the leaves are appearing, and before the caterpillars have burrowed into them.

PELARGONIUM SEEDLING: *G. T.* The flowers are pleasing, but the variety shows no advance on others already in cultivation.

ROYAL ARBORICULTURAL SOCIETY: *A. T.* The Secretary is Mr. John Davidson, Estate Office, Hayden Bridge, Northumberland.

STOCKS FOR FRUIT TREES: *Fruit Trees*. Scan our advertising columns, or insert a small advertisement in some gardening paper.

TAR ON FRUIT TREES: *F. J. K.* We are afraid you can do little now, as the damage is already done, and the use of paraffin oil, as you propose, would only accentuate the trouble. Try the effect of cut grease, rubbed on with a piece of coarse sacking.

VINE ROOTS: *A. Morton*. There is no fungus present on the roots and leaves of the vine sent. The "spotting" of the leaves must be due to some wrong cultural treatment.

THE PROFFITABLE ARTE OF GARDENING.

THE above is the title of what is probably the earliest book on horticulture published in England. It seems to be an enlarged edition of "A most briefe and pleasant Treatise teachyng how to dress sowe and set a garden" (1563). Other editions exist dated 1568, 1574, 1579, 1586, 1593, 1594, and 1608. My copy is the 1574 edition, and as an enlargement to the title it reads: "To which is added much Necessarie Matter and a Number of Secretes, with the Physicke Helpes belonging to each Herbe, and that easily prepared, gathered by Thomas Hill, Citizen of London, now for the third time set forth." The publisher was H. Bynemman. Little is known of the author except that he translated and compiled books on other subjects as well as gardening. He was born in or about the year 1543, and died in or about the year 1594.

Were we to depend upon the text of the volume we could not but conclude that Hill was learned and well read in Latin and Greek, while some parts of it are derived from French authors of the period. He himself declined to be placed among the learned of his day, for, in an address "To the Reader," which is composed of apt and musical English, he remarks: "What fault is there so small, which *Momus* will not finde. If the learned sort, brought up alwayes under *Micrua* are sometime touched of him; much more I who never tasted of the learned laake, but rather alwayes rudely taught among the Smythes of

Vulcanus Forge, but needes be stung of him."

The volume is divided into two books, the first of which contains 14 chapters and the second 64. The former gives general details; the latter treats of the various vegetables and flowers, with their "physical helpes." The first part contains, one would faine believe, everything that the superstitious and credulous ever thought of in connection with the workings of vegetable Nature. It lessens our anxiety regarding what we might suppose to be the training necessary to an ordinary gardener in these times, to be informed that everybody was not expected to be thoroughly grounded in these subtle distinctions, but the author's "conscience bound (him) somewhat to put such matter into their heads (the common sort of people's), occasioning them thereby to use the counsaile." The plants described and treated in the second book are Lettuce, Endive, Succorie, Blete—two kinds, Spinage, Orache, Beetes, Coleworts, Land Cresses, Parceley, Sperage, Sauerie, running Time, Louage, Garden Mallows, Fennel, Annis, Cummine, Coliander, Mustard, Chervill, Capers, Dill, Rue, Isope, Mintes, Garden Time, Organic, Violettes, Roses, Basil, Maiorame, Marigolde, Lavender, Spicknarde, White Lillie, Wood Lillie, Floure Deluce, Pionie, White Poppie, Floure Petilius, Velvet Floure, Gilfilloure and Carnation, Strawberries, Borage, Buglos, Rosemarie, Germanander, Blessed Thistell, Wormwood, Sothernwood, Sauge, Purslane, Peneroyall, Artichocke, Leekes, Onion, Garlike, Radish, Navew, Parsnep, Yealow Carot, Melons, Pompons, Gourds, Beame of Egypt. This is a by no means exhaustive list if it is compared with that of *Husses*, of which it falls very far short alike in Vegetables and Flowers. The latter include garden Mallows (Hollyhocks), which it is remarked "the women in our time use to decke their houses and windowes with"; Violets and Roses, which are given a lengthy chapter, in which methods of "forcing," retarding, and preserving blooms for winter are discussed. In this chapter he mentions another of his books, "intituled *Naturall and Artificiall Conclusions*, where I write largely of these and many other right pleasant conclusions, to be read and understood of the common sort." Of the Marigold we are informed it was named "the husbandman's Dyal, for the same so aptly declareth the houres of the morning and evening." Here is a "secret" which holds good to the present: "To haue them grow bigge, and to beare thicke and brode floures, you ought then to remoue and set the yong plantes often." The White Lily was preserved in the bud like Roses for winter, and the credulous were assured that Lilies of red, green or blue could be had by following the directions he gave. Lily of the Valley "growing properly in Woods and Chieflly in Valleys" had been "of late yeres brought and planted in the gardens." The Floure Deluce was *Iris florentina*, and like most of the flowers already mentioned, it was cultivated for its "Physicke Helpes," as was also the Peony. A concoction of the root of Peony "received unto the nose doth put away the King's euill—and the roote hanged about the necke dothe put away the falling sicknesse, as by a late practise was tryed,

that whyles a child had this roote hanging about the necke, the chyld so long was not greued with the disease, but when the same was taken from his necke, then was he vexed in lyke sorte as before." Floure Petilius is the French Marigold, which the author remarks was like the "Sweet Bryertree." But he has got confused with some remarks of Pliny's. The last flower is the Carnation.

Of the vegetables the greatest space is given to Leeks, Artichokes, Lettuces, Rue, Onions, Garlick, Radishes, and a very lengthy chapter on Gourds. Rue in those days possessed quite wonderful properties. Beds edged with it were for ever free from vermin of all kinds, and a green shoot hung in a room dispersed flies. It was one of the greatest specifics against the Plague, and for the eyesight it was very beneficial, as Milton afterwards declared it to be, for "both curious painters and fine gravers doe often eate of this herbe, with their meate, for the clearing and amending of their sight." And these are only a few of its marvellous properties. The tangled roots of "Sperage," or Asparagus, were called "a sponge," a term which Milton uses several times, and he makes it clear that Sperage was the name given to the shoots, and sponge to the roots from which the shoots sprang. Some years ago I made a glossary of the quaint words to be found in the pages of this volume, a few of which are:—Backes for bat; blades, lanceolate leaves; cod, a pod; forked dibble, a garden fork; Mulse, honey and water; sneze, snuff; Rosen, resin; battle, ground well-cultivated; batten, to feed, e.g., "batten them with dung"; clag, sticky, applied to clay soil; ouerticke, clayey; shift, a layer; timely, early; trimmed, cultivated; lapping, covering; and Nosewort, *Veratrum album*. Raisins are spelled "reasins," which recalls Shakespear's "reasons as plenty as blackberries," just as "battell" reminds one of Douglas' "In battell gers burgeons." The volume is illustrated with "A Proper Knot for a Garden," Two Mazes, and a bird's-eye view of a Flower garden, the central portion of which is enclosed by an ornamental paling with many crowned pillars. The beds are oblong and oval, and surround a knot laid out in the middle of the space. Between this and the outer fence of the pales are more oblong beds or borders, and there is also an ornamental gateway: a draw-well on one side, and the termination of a covered walk on the other. The later editions include a treatise on Bees, and another on Grafcng, or, let us say, on fruit culture. R. P. Brotherhood.

NOTES ON IRISES.

CERTAIN WHITE-FLOWERED SPECIES.

Of the various white-flowered species of bearded Irises in cultivation, the two most common are *I. florentina* and *I. albicans*, but considerable confusion appears to exist both in gardens and in herbaria as to the identity of the two. This confusion dates back to the time of Linnaeus, who defines *florentina* as a bearded Iris and then bewilders the reader by referring him for illustration to plate 154 in Miller's *Leaves*, which clearly represents some member of the spuria group. Thunberg's description in his *Dissertation* (1782), "scapus simplex, subtriflorus, pedalis et ultra," is too vague to allow of identification, and it is not until the plate appeared in the *Botanical Magazine*, tab. 671,

that a plant is figured under the name of *I. florentina* that is identical either with *florentina* or *albicans* as they are generally known. The two names should, however, be attached to two quite distinct plants. The former, as represented in the *Botanical Magazine*, flowers early with the common form of *I. germanica*, has a distinctly blue-grey tinge in the falls, scarious spathes, and a certain number of straggling, whitish hairs on the inner side of the haft of the standards. The foliage is relatively narrow for the size of the plants, and the pedicel or branch that supports the lowest of the four flowers, that the inflorescence contains, is at least 3 inches or 4 inches in length. Attempts have been made to show that this *Iris* is a seedling form of *I. pallida*, and the scarious spathes, together with the presence of hairs at the base of the standards, lend support to this view, but with me, at any rate, all attempts to self-fertilise the plant have been fruitless, and the only way to settle the question would be to raise and flower plants from self-fertilised seed. The origin of the plant is shrouded in mystery, and, after searching through many herbaria, I have never yet succeeded in finding any authentic wild specimen of

hairs at the base of the standards. For some reason or other it is a difficult plant to manage here. Rhizomes sent direct to me from Kashmir flowered well in their first season, but since then they have dwindled and disappeared, although a purple-flowered form of *I. germanica*, which was sent with them, flowers well and increases rapidly. Fortunately, there is now obtainable a hybrid of this species, raised by Sir Michael Foster, and lately distributed under the name of the Shelford variety of *I. kashmiriana*. Its flowers are of great substance, slightly tinged with blue, and it would scarcely be surprising to find that it is a cross with *I. pallida dalmatica*, for the shape of the flowers and the inflorescence are very similar. So far, however, the hybrid has proved infertile, and the problem of its parentage remains unsolved.

Another plant—from Beluchistan—which flowered with me for the first time this year, proved to have beautiful, large, white flowers, delicately tinged with blue. The long, pointed, green spathes separate it at once from the above-mentioned species, and it is possible that it is only a form of *Iris Bartonii*, which came from Kandahar. The fact that white *Iris*es are very

THE ALPINE GARDEN.

RARE CORSICAN PLANTS.

CORSICA is the home of many rare and interesting plants, several of which are well worthy of a place in the smallest and most select rock garden. Among the better known plants native of this island is the charming Crucifer *Morisia hypogæa*, which produces its pretty flowers early in spring. Being neat in habit and free in flowering, it forms one of the gems of the rockery. Another dwarf plant of low stature is *Erodium chamædryoides*, which, with the little *Arenaria balearica*, is also found in the Balearic Isles. The yellow-flowered *Draba Loiseleurii* also comes from Corsica, while among bulbous plants from the same place may be mentioned the pretty *Crocus corsicus* and the tiny *C. minimus*, with the rich purple-flowered *Romulea Requiinii*. Among the larger growing plants *Helleborus corsicus* is very distinct with handsome foliage and numerous, greenish-white flowers produced in winter and spring. Of more recent introduction are the following three scarce and charming plants.

CHRYSANTHEMUM TOMENTOSUM.—The members of this genus are usually associated in one's mind with the popular greenhouse *Chrysanthemum*, but this little species is totally unlike *Chrysanthemum sinense*, being only 2 inches in height when in flower. It is closely allied to *C. alpinum*, which is found at high elevations on the European Alps. *C. tomentosum* is dwarf and tufted in habit, with densely tomentose pinnatifid leaves, giving the plant a hoary appearance like *Achillea umbellata*. The white flowers are $\frac{3}{4}$ inch in diameter, and are borne on stems about 1 inch in length. They are produced freely; the plant commences to flower in May, and keeps up a succession till September. *Chrysanthemum tomentosum* grows freely in a well-drained, gritty soil in a pan in a cold frame. It has not yet been determined if it will withstand the winter out of doors, but a dry, somewhat sunny and sheltered ledge should suit it. The species is endemic to Corsica, being found in pastures on the summits of Mount Renoso and Mount D'Oro.

ERODIUM CORSICUM (See fig. 82).—The genus *Erodium* contains many choice and useful plants for the rock garden, some of the less rampant growers being *E. chrysanthum*, with its yellow flowers and silvery foliage; *E. supracanum*, of neat habit and with pink flowers; *E. amanum* from Syria, with finely-cut silvery foliage and white flowers produced during the whole summer; and *E. Sibthorpiatum*. One of the smallest is *E. corsicum*, which grows from 1 inch to 4 inches high, and produces small orbicular ovate leaves, that are softly hairy and deeply crenated. The flowers are $\frac{3}{4}$ inch in diameter, and vary in their shades of rosy-pink, whilst the veins are of deeper colour. They are produced from May to September. The plant illustrated in fig. 82 was still in flower in the latter month. It is a free-growing, hardy subject, and soon makes a good tuft. Propagation is effected by means of cuttings inserted in summer or by seeds. *E. corsicum* is found growing on granite rocks by the sea, and makes a very solid rootstock like many of the other species.

STACHYS CORSICA.—Unlike many of the better-known members of this genus *S. corsica* is a compact, low growing plant, 1 inch to 2 inches high, with small leaves and pretty, straw-coloured flowers with a purple lip. It is a choice little plant, found on the stony mountains of Corsica and Sardinia, and it is propagated easily by cuttings. It forms an ideal plant for growing in pans, flowering early and keeping up a long succession of bloom. W. J.

Photograph by W. J. 1910.

FIG. 82.—*ERODIUM CORSICUM*: FLOWERS ROSE-PINK WITH DEEPER-COLOURED VEINING.

this plant. Another error connected with this *Iris* is that it is exclusively the plant whose dried rhizomes form *Orris* root, but among several importations of rhizomes from the neighbourhood of Florence, cultivated by the late Sir Michael Foster, Messrs. Barr & Sons, and here in my garden, not *I. florentina* but *I. pallida* in various forms has invariably made its appearance.

From this *Iris florentina* another species, which is found in Spain, in the neighbourhood of Cadiz and Almeria, was first separated by Lange in 1860, under the name of *I. albicans*. It is clearly distinguished by the fact that the flowers are nearly sessile on the stem, by the snow-white colour of the flowers, by the entire absence of hairs at the base of the standards, and by its spathes, which are more or less scarious only in their upper halves, when the flowers open. It flowers, too, considerably later than *I. florentina*, and the broader leaves, with their curious tendency to twist, give the plant quite a different appearance. This *Iris albicans* is doubtless the plant illustrated in Redouté's *Liliacæ*, t. 25, under the name of *I. florentina*.

A third white-flowered *Iris*, which, unfortunately, is not common in cultivation, is *I. kashmiriana*, a species with milk-white flowers and

commonly used in the East as decoration in graveyards makes it difficult to obtain really wild specimens, and increases the difficulty of determining their original habitat and distribution.

Besides these plants, there is another that it would be extremely interesting to obtain, and which may very likely exist in Egyptian gardens, namely, the white form of *Iris Madonna*, specimens of which, together with others of the blue form, which has been in cultivation for some years, were obtained on Mount Saber in the Yemen district of Arabia by Botta in 1837. A few white-flowered plants were, I believe, obtained by Messrs. Dammann, who introduced *Iris madonna* to cultivation, but I have been unable to obtain specimens or to trace them. I should be grateful if any one possessing such an *Iris* would communicate with me. The typical blue form of *I. Madonna* is undoubtedly a true *germanica*, and a handsome garden plant.

There is also said to exist a white form of *I. germanica*, but so far I have never seen under this name any plant that was not either *I. florentina* or *I. albicans*, both of which differ from *I. germanica* in other respects than that of colour. W. R. Dykes, *Charterhouse, Godalming*

THE ROSARY.

AUTUMNAL ROSES.

THERE can be no question that the Roses which flower most freely in autumn are by far the most valuable for garden cultivation. Some of the loveliest of the Hybrid Perpetuals, such, for example, as Duke of Edinburgh, Duke of Teck, Horace Vernet, and Charles Lefebvre, have their first blooms too late to achieve much subsequently in this special direction, but there are exceptions to every rule, and A. K. Williams, for example, which too often comes somewhat early in summer with hardened, abortive buds, as if it had come before its proper season, is usually at its best during the autumn months. Perhaps, so far as regards southern Scotland at least, the reason may be that in September it experiences much more favourable atmospheric conditions than it does in July.

By far the most valuable Roses for autumn effect are the Hybrid Teas. At the present date (September 10), the variety which outshines all others in my garden for size and charm of form and complexion is Phariser, which I saw for the first time, and admired greatly, in Corsewall Gardens in this county about this time of last year. I acquired some strong plants of it immediately after seeing it there, and the variety has proved a great acquisition. So, also, has the famous Lyon-Rose, by reason of its unique beauty during the early summer months, and it promises to flower moderately well during the autumn, though its growth is not so vigorous (being somewhat lacking at present in foliage) as could be desired. A very fine autumn flowering Rose is Margaret, raised recently by Messrs. Wm. Paul & Sons at Waltham Cross. Mary, Countess of Ilchester, is a graceful Rose, with many of the attributes of a Hybrid Perpetual, but it is described by the raisers as a Hybrid Tea, although it grows with considerable vigour during June and July, it did not produce a single flower till the end of August, and even then it was exceedingly sparing of its blooms. Mrs. David Jardine is a very beautiful Rose, with similar limitations. There never was a period, in my estimation, when vigorous-growing, floriferous Roses were more greatly required. If we had a few more varieties with the glorious characteristics of La France, Viscountess Folkestone, Caroline Testout, Clio, Margaret Dickson, Prince de Bulgarie, Madame Pernet-Ducher, Corallina, Enchantress, and Phariser they would be prized immensely. But so long as we have such varieties as I have indicated, we need not complain. *David R. Williamson.*

MARKET GARDENING.

LATE TOMATO CULTURE UNDER GLASS.

In market gardens Tomato plants raised from seed at about the third week in May, are planted in transverse rows, 2 feet apart, and at 1 foot in the rows in span roofed houses, in which Cucumbers have been grown up to the end of the third week in July. The plants are supported individually by a soft kind of string (specially manufactured for the purpose), looped round the stems of the plants about 6 inches from the ground, and then secured to the wires fixed under the roof glass. The plants grow well in the rich soil used previously for Cucumbers, and with a free circulation of fresh air amongst them both day and night, make strong and sturdy growth, being furnished with large, strong trusses of flowers from within 6 inches or 9 inches of the ground upward. The lateral growths are kept persistently pinched out, in

order to concentrate all the energies of the plants into the production of large trusses of flowers and the development of heavy crops of well-shaped fruits. The soil in which the plants are growing should be kept uniformly moist by affording them clear water at the roots about three times in the week during favourable weather conditions. Some market growers twine the plants carefully round the individual string supports as they grow. But, in my opinion, the better way is to keep the plants in position by ties made of raffia coiled once round each string before making the several ties. The raffia should be placed immediately below each truss, in order to support the increasing weight of the developing fruit. As soon as the plants have set a couple of trusses of fruit each, a surface dressing of shore manure should be applied between the rows to the thickness of

A JOURNEY TO JAPAN.

SINGAPORE, THE QUEEN OF THE MALACCA STRAITS.

(Continued from page 196.)

I LEFT Ceylon, the island of many beauties, after about four weeks stay. The groups of Coconut Palms (*Cocos nucifera*) about the harbour furnished us with a last glimpse of the vegetation, and once more we saw the lofty mountains against the horizon, Adam's Peak, where Buddah is said to have first set foot on earth, dominating all. Three days later we passed the golden mountain of Sumatra, and on April 13 arrived at the picturesque island of Singapore, the cynosure of the Cambodian Peninsula. Owing to the reflection of the sun in the sea, the far-off islands seem to rise above the water, and, on the near

FIG. 83.—HOSEA LOBBIANA, AS PHOTOGRAPHED IN THE SINGAPORE BOTANIC GARDENS: THE FLOWER-RACEMES HAVE SALMON-ORANGE COLOURED BRACTS.

2 inches, after two or three of the bottom leaves have been removed from each plant to admit of a current of fresh air. It is well to allow a free extension of leaf growth until the time has arrived for letting in extra light and air in order to assist the fruits to ripen. Each time the plants are watered, after the top dressing of manure has been applied, food will be washed down to the roots, and thereby add considerably to the ultimate weight of the crop. As the season advances, with a corresponding fall in the temperature, less fresh air should be admitted. After the Tomato plants are set out in the border, the soil between the rows and the plants should be trodden well, as this will induce a firm growth, and the flower clusters will form quite close to the ground. *H. W. Ward.*

islands, the Mangrove trees are seen singly and in groups. The entrance to the harbour of Singapore is like a garden scene; the Malay fishermen come in their small canoes and dibo for halfpennies, whilst others bring large boats full of coral and fine shells gathered on the near island of Pulo Brani or Pulo Benggit. Singapore is the great centre for eastern trade and commerce, the harbour being of sufficient size to accommodate the largest fleet of ships. At few places in the world can one see persons of so many different nationalities. The town has the appearance of a thriving place, and the European dwellings, which extend for several miles to the north, are situated as in a large park. The air is fresh and cool, and the clouds absorb much of the sun's heat; only near the

shore is it uncomfortably hot in the sunshine. Trees and flowers embellish the gardens, the roads are maintained perfectly, and they are shaded by fine trees covered with Epiphytes, especially *Drymoglossum Ferns* and Pigeon Orchids (*Dendrobium crumenatum*), which are said to flower here every nine weeks. The Bird's Nest Fern (*Asplenium Nidus*) forms large masses on lofty branches, the nest-like repositories containing soil and debris which supply the plant with food.

THE BOTANIC GARDEN.

A road bordered by orchard trees leads to the botanic garden (Kebun bunga), "the garden of flowers," as the Malaysians term it. The gardens are partially laid out after the style of a European landscape, embellished with a wealth of tropical subjects. There is a rare collection of Palms. Dr. Ridley, the Director, is a great botanist and collector, and Singapore forms a fine centre for exploring the whole Malayan peninsula and the Malayan Islands, which stretch to Borneo, and north to Siam, and westward to Sumatra. He has discovered many fine novelties, including *Schizostachyum brachycladum*, the finest of the yellow-stemmed Bam-

tion, planted with useful plants, including numbers of Para Rubber trees. The surroundings of the town are interesting. Mangroves grow near the coast, but inland there is still virgin forest. The illustration at fig. 85 shows a giant tree of *Hopea Mengarawan*, and at its foot the native plant collector of the botanical garden. *Campnosperma auriculata*, with its giant leaves, is conspicuous, and *Gutta-percha* trees (*Ficus elastica*) were once common, but many have been destroyed. *Alsephila Scottiana*, *Nenga Wendlandiana*, *Zalacca edulis*, and *Mapania humilis*, a small *Pandanus*-like *Cyperus*, grow underneath the trees. In places where the water flows slowly over gravel and between fallen leaves and dead wood, grows, in deepest shade, *Cryptocoryne Griffithii*, with its yellowish-brown flowers just above the water. When the water rises suddenly, a bubble of air covers the entrance of the flower to protect it until fertilisation has been accomplished. *Barclaya Mottleyi* grows here also, and the rosy fruits rise above the shallow water at places where there is a little more sunlight. The flowers are very magnificent for a Nymphaeacean plant, and the petals are deep purple. The fruit is divided into a number of

the town of Singapore, is interesting. A high wall confines the water in a lake, surrounded by most delightful scenery, including dense jungle. Rare *Utricularias* grow by the side or in the shallow water, raising their tiny, brown flowers above the surface. Nymphaeas do not grow in the island, as every pool of water is soon covered with dense grass. *Gleichenia linearis*, which, much in general appearance, is like *Pteris aquilina*, is very conspicuous, growing many yards high. *Monochoria vaginalis* grows in every ditch associated with *Brexia malaccensis*, species of *Eleocharis* and *Microcarpaea muscosa*. F. Henkel.
(To be continued.)

FORESTRY.

SEASONABLE WORK.

THE time is approaching when foresters should arrange their winter's work. No time should be lost in completing such operations as the trimming of hedges and rides of the coverts, as, when these are accomplished, the season for planting and the marking of timber and underwood commences. In the planting of forest trees, care should be taken to select such varieties of Conifers and any other trees that thrive in the particular district: some trees are suited only to clayey and others to dry soils. When unsuitable trees are employed, their failure is often attributed to lack of skill on the forester's part; whereas, probably, the employer has selected the kind of tree that may not be suited to the soil.

Great care should be exercised in the marking of saplings (or tillers) that are standing in the underwood, intended to be cut in the coming season. Choose straight-stemmed, healthy plants, and not offshoots from a stem. How often one sees coverts that have been ruined through leaving too many saplings. In this district, some of the trees stand only 4 feet apart. Good timber cannot be expected from trees left in this manner, and what is to become of the underwood? Many will say, "Underwood does not pay." This is very true; but underwood is necessary where hunting or shooting is practised. It is a very good practice to examine the saplings again after the underwood has been cut, and thin them out a little more if necessary. Twelve to fifteen yards is quite close enough for trees in a covert, if a good underwood is desired. This distance does not apply to new plantations of Conifers or other forest trees where no underwood exists. A. Gooding, *Eartham House, Chichester*.

FORESTRY IN SCOTLAND.

IN the course of his presidential address delivered before the Royal Scottish Arboricultural Society in February last, Sir John Stirling-Maxwell drew attention to the immediate needs of forestry in Scotland. After pointing out that the present is a favourable moment for initiating a forward policy, Sir John Stirling-Maxwell urged the necessity—as a first step in developing Scottish forests—of a survey of the ground adapted for tree-planting in Scotland. The popular idea that any waste ground at any elevation, may be utilised forthwith for tree-planting is not only erroneous, but mischievous. If silviculture in these Islands is to be restored to its proper position, it can only be done by the selection of suitable ground for planting, by the adoption of a proper rotation, and by the division of the land set aside for silviculture into areas which are to be planted annually.

After the survey Sir John Stirling-Maxwell considers that a demonstration forest is the most pressing need. Nor can it be doubted that this opinion is correct. Lectures and scientific instruction in the subject will not make trained foresters, and without foresters experienced in the practical management of trees any national scheme of silviculture is foredoomed.

FIG. 84.—PLANT SHELTERS IN THE BOTANIC GARDEN, SINGAPORE.

boos, from Sarawak; *Hosea Lobbiania*, from the same district, with most beautiful salmon-orange coloured bracts all along the racemes of flowers (see fig. 83); a new tree-like *Impatiens*; and several other species.

Large, shady, and lofty conservatories, mostly without glass, provide shelter to many new plants (see fig. 84), besides fine collections of the better-known kinds. Some of these latter in flower included *Conga tomentosa*, a fine mauve-coloured creeper; *Holmskioldia sanguinea*, from India, with orange red flowers; *Roupellia grata*, from Sierra Leone, with dark, glossy leaves and pale, mauve-purple, bell-shaped, flowers; *Cassia multijuga*, yellow; *Kopsia albiflora*, a well-known shrub, with flowers like those of *Bouvardia*; *Xora macrothyrsa*, from the South Sea Islands, one of the most striking shrubs of the tropics, with orange scarlet flowers; *Dipladenia Harrisoni*; *Allamanda nerifolia*; and *Mussaenda*, especially *M. cyathophylla*, with deep, velvety-red bracts. Portions of the gardens consist of virgin forest, with a few paths leading through it. Tigers formerly existed in the island, and even now they swim over the Labore Straits occasionally and frighten the inhabitants.

Adjoining the garden is an experimental sta-

well-marked carpels, which separate easily. It is rose coloured, and rises to the surface when ripening. The seeds are of the size of medium Nymphaea seeds, and are covered thickly with large and slender soft hairs and a sticky, white mass, which swells in water and keeps the seed floating for a long time, like the arillus does in Nymphaeas. The leaves are all under water, but, the water being very shallow, they are near the surface, and the direct rays of the sun reach them. *Cryptocoryne Griffithii* forms runners, and is of sturdy habit. The plant is covered all over with short hairs, and is quite different to a Nymphaea in general appearance. I have sent seeds to Kew and other places. In the tropics, most plants are exposed to more sun and light than they require, therefore, many of them do not expose the whole surface of their leaves to the sun. It is quite different in northern countries, and, to cultivate these water plants successfully, they need the most sunny situations.

Selaginella Willdenovii, the blue "Climbing Fern," is also seen growing, and *Nepenthes ampullaria* is quite common. *Pleurothallis foetida*, an interesting terrestrial Orchid, may be seen, but Orchids in general are rare.

The reservoir, containing the water supply for

SEED EXPERIMENTS WITH PINUS SYLVESTRIS.

An interesting experiment, as yet in its initial stages, is being conducted at Bangor in Wales and in various Continental investigation stations. The experiment in question is designed to test the truth of the common opinion that seed of the Scots Pine obtained from trees grown in Scotland yields the best plants. An account of the results obtained up to the present time is given by Mr. Fraser Story in the *Transactions of the Royal Scottish Arboricultural Society* (xxiii., Part ii., July, 1910).

For the purposes of the investigation seed was obtained from the following countries:—Scotland, France, Prussia (2), Belgium, Bavaria, Russia (2); the Scotch seed being supplied by Mr. J. Grant-Thomson, Granton-on-Spey. Mr. Story finds that of the plants raised from seeds from the above-mentioned sources, those from Scotch seed were at the end of two years smaller than any of the others; thus, at Bangor the average height of 2,445 seedlings from Scotch seed was 3 inches, whereas that of 2,520 seedlings raised from Belgian seed was 5½ inches, and the average height of the seedlings produced by seed derived from the other countries was intermediate between the Scotch and the Belgian seedlings.

At the end of the third year (first year after transplanting) the following averages were observed:—Belgian seed 10½ inches and Scotland 7 inches, and the estimate of the plants was that the Belgians were "much the best," Bavarian "second," and Scotch "small but good."

Similar, and in some respects more striking, results with respect to rate of growth were obtained in a series of experiments at Chozin (Prussia) whereas seedlings from Scotch seeds showed a growth of little over 2 inches, the Belgian plants grew to 7 inches.

It remains to be seen, of course, whether the Scotch seedlings will remain inferior in rate of growth to those derived from Belgian seed, or whether it is merely a case of making haste slowly.

TREES AND SHRUBS.

SPIRÆA AITCHINSONII.

This is one of the finest of the summer-flowering Spiræas, being at its best during July and August, when it forms a striking feature in the garden. It is a vigorous, tall-growing species, native of the Himalayan regions, and was introduced to this country at the time of the Chitral Relief Expedition. The plant attains a height of 10 feet or more, and has stout, glabrous stems furnished with pinnate leaves. Each leaf is composed of 15 to 19 linear-ovate leaflets, which are hairy beneath, glabrous and shining above, and toothed on the margins. The flowers are borne in terminal panicles from 9 inches to 18 inches in length, and are pure white. The wood is red and shining; the colour shows up well after the fall of the leaf. The plant does best in open situations, as it requires plenty of room to develop, being quick-growing. A stock is easily raised from seeds, which ripen in most seasons, but the plant can also be propagated by means of cuttings.

SPIRÆA DISCOLOR.

This plant, which is often known as *Spiræa arifolia*, is a native of North-western America. It is one of the tall-growing members of the genus, reaching a height of 12 feet and sometimes more. The stout stems are clothed with rugose leaves 2 inches to 3 inches long, according to the age of the branch, being largest on the young, strong growths. The foliage is woolly beneath, sparsely hairy above, and deeply-toothed or sometimes lobed on the margins. The flowering season is July, the inflorescences being feathery, terminal panicles 6 inches to 1 foot in length. The flowers are white on opening, but change to cream. The wood is dark-brown, ribbed, and more or less woolly. Propagation is effected by cuttings, which root readily at almost any time of the year. *J. Clark, Bagshot, Surrey.*

IN THE MARITIME ALPS.

FROM THE GESSO VALLEY TO THE UPPER BOREON.

In the neighbourhood of the Baths of Valdieri are chronicled so many interesting species that I thought I might as well make it the beginning of my researches into the wealth of the Maritime Alps, that earthly paradise of precious plants. But the Baths, and the granitic glens that radiate thence, only succeeded in showing me how "blasé" I had grown. For I found there, in rich luxuriance, only common plants, such as *Asphodel*, *Anthericum liliago*, *A. liliastrum*, *Lilium bulbiferum*, *Labrum album*, *Rosa fragaria*, *Sap. naria ocymoides*, *Lychnis flos-*

ever, I vainly toiled and toiled up stony gorges to the Lac de Portette without getting any better reward than a sight of *Anemone sulphurea* growing poor and plain in crevices of the granite cliffs.

From the lake I saw, far away, the Ciriegia Pass, by which I was to cross into the Upper Boreon Valley, and I trembled, for all the pass was snow, making an unbroken coverlet of white for *Viola nummulariaefolia*. However, in a day or two I took my companion firmly by the hand and proceeded with him over the Ciriegia. Up the Val Valletta the way is dull and flat, then suddenly it mounts over some three hours of snow-walking (July 15) to the summit of the

FIG. 85.—SCENE IN A SINGAPORE FOREST: THE LARGE TREE IS HOPIA MENGARAWAN.

(See p. 212.)

Jovis, and *Tulipa celsiana*. In rubble beds and slopes *Viola Valderia* grows, and in the Valasco valley, across the stream, a fine abundance at one point of *Saxifraga pedemontana*. This same valley gives, of course, the *Primulas* that I had grown to regard as ordinary (*P. graveolens* and *P. marginata*) and is given as a station for *Saxifraga florulenta*, though I, not yet knowing this plant's chosen home, never climbed the shady gullies high enough to see. No doubt it occurs there, for the Baths lie under the very shadow of the Argentera, the highest point of the range, and the centre of *florulenta*'s distribution. How-

pass (3,370 feet). Near the Col, however, some stone slopes were open, and we diverged to ransack them. *Saxifraga rotunda* was there in flower, and we had our first real sight of the lovely little *Thlaspi limsellifolium*, the Maritime Alp version of my cherished *Thlaspi Iberidellae rotundifolium*. *T. limsellifolium* really deserves a special note; it is an exquisite plant, narrow-leaved and green, instead of livid, fat-leaved, and succulent like the other; its flowers also tend to be of a lighter pink than *rotundifolium*, but have the same intense and delicious fragrance. It also differs in that it is sometimes found in

crevices, for *T. rotundifolium* never, I fancy, deserts the stone slopes, but, on the south side of the Ciriegia, *T. limosellofolium* may be seen making sheets of colour in the crannies of the granite cliffs.

Meanwhile we were feverishly prying for the *Viola* among the tiny leaves that peeped here and there among the newly-uncovered stones. *Campanula strobilifera* was soon identified, but a little round-leaved plant, which ought to have been *Viola nummulariaefolia*, for a long time baffled us, for my companion had collected it bearing, apparently, a Crucifer's seed. However, my doubt about this remained deep. "Look again," I cried at last, "there is no Crucifer it could possibly be." We looked again; lo! the Crucifer pod belonged to a stray piece of *Hutchinsia*. Not only that, but the real plant carried the undoubted capsule of a *Violet*. *Viola nummulariaefolia* was discovered. However, I may leave this most indescribable and exquisite of *Violets* for a later account, when I shall have collected it in flower. It is a high Alpine among high Alpines, never descending from these exalted stone slopes, where it has good company. For, just to the left of the pass, rises the Mercantour, where *Eritrichium nanum luxurians*, and not a hundred miles farther on the greatest of great *Saxifragas* makes its august appearance in a crevice of the cliff. On the French side, the Ciriegia falls away in a slope of what looks like appalling abruptness; a snow-precipice it seemed as we began to descend delicately like *Agag*, and it was at that moment that I saw my first plant of *Saxifraga florulenta*, hailed it with a loud cry, and nearly caused my companion and myself to descend the Ciriegia with far more speed, and even less comfort, than we had climbed it. After this, time ceased. *Florulenta*, in its crannies, cries aloud for a hammer and chisel—one of the most ineradicable of plants, if one did not know *Phytoloma comosum*, *Daphne rupesstris*, and *Androsace imbricata*.

The *Androsace* was there, too, by the way, curiously yellow in its bloom, but now no more regarded than silver in the days of King Solomon. Also the *Thlaspi*, in great beauty, and the *Viola*, here opening its first flowers.

At last, we descended again towards lower levels over a great snow-field, littered with black dead plants of flowered or barren *Saxifraga florulenta* washed down by the winter rains from their ledges. Where vegetation began again, we came on a very brilliant yellow *Senecio Doronicum*, wholly green of leaf, and on many good forms of *Gentiana acaulis*, which increased in abundance as the path rapidly descends, through *Viola Valderia* to *Viola calcareata* at the Pine-tree level. Far below, now, was seen the little Hotel Boncon-Cascade, and we dropped down towards it rapidly by many short cuts through a forest of Scots Fir, with rare undergrowth (among the Larches, higher up, for the most part) of *Pinus uncinata*. At last, the woods were done with, and through rich meadows of *Anthericum* and *Campanula* the path led placidly to the hotel. *Reginald Farrer*.

HARDY FLOWER BORDER.

RAISING SEEDLINGS OF PRIMULA JAPONICA.

THIS is one of the best times to sow seeds of this lovely hardy *Primula*, which is well worthy a place in any garden. The seed is most uncertain in germinating. In the autumn of 1907 I sowed a bed with seeds, and a fine batch of seedlings came up in the spring of 1908, and others in the two following springs, though the seed had lain two and three years respectively in the ground. I find, from long experience, the seed is much better sown in a shady place in the open than indoors, and if the soil is a little damp, so much the better. A very good plan is to enclose the seed-bed with four sides of wood, like

the sides of a box, about 3 inches deep, and cover the frame with fine wire netting. Prepare some good soil mixed with leaf-mould for the seed-bed, flatten it firmly, and moisten it with water. Cover the seeds thinly with fine soil, and put on the wire cover to keep off the birds, with a layer of soot or lime around the outsides to prevent slugs. This plan saves a great deal of trouble, and involves little care; whilst if pots or pans are used, the soil is apt to get too dry, and the seeds, not germinating at once, are thrown away as useless. When the seedlings are large enough to handle, they should be transplanted in a bed of well-prepared soil, and given water in dry weather. About the month of August they will be large enough for planting in their permanent quarters, and on the treatment they receive at that stage depends much of the future success. The bed must be deeply trenched, and, if fresh manure from a byre can be obtained, a liberal supply of it dug in, but not too deeply. This will keep the roots moist in summer, and afford food, as the plants are gross feeders. The little seedlings should be lifted with good balls of soil attached to the roots, and afforded a good watering after planting. The stems and leaves die down in winter. There are some fine new strains of *P. japonica* and hybrids from this species. The flowers range in colour from deep crimson through shades of pink to pure white, the blooms being of a large size, and many of the flower-stems over 3 feet in height. The foliage is very handsome. It is a pity they are so rarely grown, and I believe the uncertainty in the seed germinating tells greatly against their popularity; but if the above directions are followed, this difficulty will be overcome. Like all other *Primulas*, seedlings give the best results, and it is advisable to sow seeds yearly. *J. Scott Eliot, Teviot Lodge, Hawick, N.B.*

The Week's Work.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

The shrubby Hibiscus.—The several varieties of *Hibiscus syriacus* or *Althæa frutex* are now making a fine display. The large, delicately-coloured flowers always evoke admiration, and the lateness of their flowering is an additional advantage. These shrubs require but little attention, and will succeed admirably in almost any position in the shrubbery, but they need plenty of room. Disturbance at the root should be avoided, and in dry weather they should be supplied with water, as they are easily injured by drought; a good mulch will assist in keeping the roots moist. Little pruning is required, as growth is somewhat slow. The varieties have single and semi-double flowers, ranging in colour from pure white to deep purple. Plants may be obtained in both standard and bush forms.

Violets.—Those plants which have been grown on in the open ground, as advised in a previous Calendar, to furnish a supply of flowers in winter, may now be transferred to the frames in which they are to flower. Shallow frames, containing a flow and return hot-water pipe, are the best suited for the purpose. The soil should consist principally of loam, with a liberal addition of mortar rubble and leaf-mould, and the nearer the plants are to the glass the better. Be careful not to crowd them, and, in transplanting, avoid damaging the roots, endeavouring to preserve a good ball of soil about them. Plant firmly and then give a copious watering. For a few days the lights may be kept on the frames, but directly the plants have recovered from their disturbance, an abundance of fresh air must be admitted whenever the outside conditions are favourable. When water is necessary it should be applied in the forenoon when the weather is most favourable. Keep the glass clean, so that when the lights are placed in position the maximum amount of light may reach the foliage.

The water garden.—The *Nymphaeas* are passing out of flower, and the most attractive subjects are those with handsome foliage. Especially pleasing now is *Phragmites communis*, with its waving plumes, also the Giant Reedmace, *Typha latifolia* and the narrow-leaved *T. angustifolia*, *Miscanthus*, *Cyperus*, *Acorus*, *Scirpus*, and *Poly-*

gonum. *Rumex Hydroclapathum*, the Giant Water Dock, has exquisitely-coloured foliage, and the leaves of *Saxifraga peltata*. *Rheum*, *Gunnera*, and *Petasites gigantea* are also effective. Many hardy border perennials make fine subjects for the water's edge. *Senecio clivorum*, *S. Ledebouri* and *S. tanguticus* are each fine in their season, whilst clumps of *Lythrum salicaria rosea*, *Helianthus orgyalis*, and *Chrysanthemum maximum* produce a fine effect. *Pontederia cordata* is a good late-flowering aquatic plant.

Seasonable work.—The herbaceous borders will need a thorough overhauling, as a great many of the subjects have finished flowering, and all untidy flower growths, wherever possible, must be removed. I do not advocate the too-early removal of all the old inflorescences, preferring to allow them to wither naturally, as this benefits the plants. At this season we frequently experience slight frosts, but if a light covering is placed at night time over tender-flowering bedding plants such as *Heliotropes* and tuberous-rooted *Begonias*, it is possible to prolong their season of flowering for a time. Let there be no delay in taking any more cuttings that are required from the plants in the beds.

FRUITS UNDER GLASS.

By E. GOODACRE, Gardener to Sir ERNEST CASSEL, G.C.B., Moulton Paddocks, Newmarket.

Pineapples.—Plants that are swelling their fruits must be allowed plenty of heat and moisture. A bottom heat of 80° to 85° should be maintained with an atmospheric temperature of 70° at night-time, and a proportionate rise during the day. A few of the decayed leaves should be removed from the collar of the plants and any inert or sour soil replacing the latter with well-decayed leaf-droppings mixed with rich, fibrous loam, pressing the new soil firmly about the base of the plants.

Successional plants.—Those that are making a vigorous growth should be given a little manure water at the roots, but care must be taken not to give too much, especially during a period of cold weather, or the soil will become sour, causing the young rootlets to suffer a check. Syringing overhead should be discontinued, and the night temperature gradually decreased. Any plants which have filled their pots with roots may be repotted into slightly larger receptacles. Suckers should be potted immediately the sap at the end is dried up, into 6-inch pots, these being of ample size at this time of the year. Pot firmly, employing a rather light, fibrous loam to which has been added a little bonemeal. Stand the plants quite close to the glass, and be specially careful to avoid overcrowding. Give a light spraying overhead twice daily, but little or no water will be required at the roots until the latter are growing freely. A light shading will be necessary during bright days until the young plants are fairly established.

Melons.—Plants of the late batch of Melons, which were planted about the end of August, are now showing the female flowers. No time should be lost in getting the flowers "set." During sunny weather, take advantage of the sun's heat to hasten the growth as much as possible, closing the house early in the afternoon, with plenty of atmospheric moisture. Care must be exercised in the use of the syringe now that the days are shortening, and, whilst having plenty of moisture in the house to counteract the effect of fire-heat, the foliage should be allowed to become dry before night; the roots should be kept in a moist but not sodden condition. Late batches of Melons are always an uncertain crop, for, although the fruits may swell to a fair size, unless sunny weather prevails they are flavourless and insipid.

Perpetual fruiting Strawberries.—If the fruits have set well and are swelling freely, they may now be thinned, allowing not more than four or five on each plant. Support the truss with a forked twig. A sprinkling of some good artificial manure may be placed on the surface of the soil, and lightly forked in. Occasional waterings with liquid manure and soot water will also prove beneficial. When the fruits commence to colour use clean water only, and apply this with care, giving just sufficient to prevent the foliage flagging, and on fine days only. A free circulation of rather warm, dry air is necessary to obtain good flavour in the berries.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Perpetual-fruiting Strawberries.—These will soon be ripening some of their berries, and will need constant attention, as the weather may be damp and cold, causing the fruits to rot. If necessary, the plants should be given a copious watering. When this has been done, the ground about the plants should be sprinkled with a mixture of soot and fine soil (the soil being used to prevent the soot from being blown on to the fruits) to guard the fruits from the attacks of slugs. After the soot is applied, place some clean and moderately-short straw carefully around the plants to keep the fruits off the ground and to prevent them being splashed with soil by the rains. The trusses of berries may be raised by wire supports made for the purpose, and obtainable from the sundriesmen, or by small forked sticks. Small or deformed fruits should be removed. Should bad weather set in the plants may be protected by lights, which may be lodged on a few pieces of scantling fixed to supports 2½ feet in height at the back and 2 feet at the front. This method will be found better than placing frames or handlights over the plants, as it allows a free circulation of air about the plants at all times. A piece of netting should be placed at the sides and ends to protect the fruits from birds. Three good varieties are Laxton's Perpetual, St. Joseph, and St. Antoine de Padoue.

Desert Pears.—These are now swelling freely, and the larger fruits will need to be supported. This is best done by tying a piece of matting around the stalk and fastening it to some part of the branch immediately above the fruit, or small pieces of fish netting may be placed under them, as in the case of Melons. The fruits should be exposed to the sun and air as much as possible, in order to obtain good colour and flavour. Trees that are ripening their fruits should be examined frequently and the ripe Pears gathered. It is easily determined when they are ready by gently lifting the fruit on one side, and if it is ripe the stalk will part readily from the wood. The borders in which late-fruiting varieties of Pears are growing should be examined, and, if found to be dry, they should be afforded water or manure-water. Where birds are troublesome, it will be necessary to net the trees, using a mesh small enough to keep out tits, for these most troublesome birds have already commenced to peck Pears in these gardens.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Banford, Surrey.

Odontoglossum.—Where *Odontoglossums* are cultivated largely, and especially where many species and hybrids are included, one or another will need some attention at the roots at all seasons of the year. Some of the plants that bloomed during last winter and early spring required that attention soon after they had recovered from the effects of flowering. Plants that are healthy and well established experience comparatively no ill effects by merely knocking them out of small pots and putting them directly into larger ones without any removal of the soil, but others that are shrivelled through overflowing or loss of roots, if repotted in hot, summer weather, with all the old soil shaken away from them, often take years to recover, and, in many cases, gradually dwindle away and die. It is advisable to overhaul such weakly plants during the month of September, as the weather is then generally more favourable to their recovery. At the present time there are large numbers of *Odontoglossums* that have started well into growth, among which, as a guide to beginners, some of the more common and well-known species may be mentioned:—*O. triumphans*, *O. Pescatorei*, *O. Hallii*, *O. tripudians*, *O. gloriosum*, *O. odoratum*, *O. ramosissimum*, *O. Edwardii*, *O. luteo-purpureum*, *O. hystrix*, *O. sepectrum*, *O. Harryanum*, the numerous forms of *O. crispum*, and the natural hybrids *O. Andersonianum*, *O. Ruckerianum*, *O. Wilckeanum*, *O. excellens*, *O. Adriane* and *O. elegans*. Old and well-established plants that have their new growths too near the edge of the pot should be carefully turned out, and, if the soil is in good condition, the back portion only should be removed, leaving the front part practically undisturbed. Cut away the old back pseudo-bulbs,

leaving only two or three to support each leading growth. By this means the plant may be placed into the same sized pot again, but if the new growths promise to be exceptionally strong, the plant may be transferred to a trifle larger receptacle, avoiding over-potting at all times. The pots should be quite clean and dry, and, in the case of well-rooted plants, about half-filled with broken crocks, covered by a thin layer of Sphagnum-moss. A suitable compost consists of *Osmunda* fibre, *Polypodium* fibre, and Sphagnum-moss in equal proportions, and a moderate amount of small crocks to assist the drainage. Cut these materials up moderately finely and mix them well together. Previous to using the moss, let it be well cleared of leaves, rubbish, slugs, and small snails. For several weeks after the plants have been repotted, our practice is to examine them every night for the first appearance of slugs, for if these are caught early their increase is checked. During the autumn, as the nights become colder, it is advisable to look under the stages and on the walls, and floors, as slugs are apt to find their way into the house through the ventilators. Plants that have deteriorated should have all the decayed compost removed, dead roots cut off, and the entire plant thoroughly cleansed in water. Afford such plants additional drainage material, filling the pots to quite three-parts of their depth with clean crocks, using pots of as small a size as possible. When potting *Odontoglossums*, keep the base of the pseudo-bulbs on a level with the rim of the pot and press the compost down among the roots moderately firmly, but not so tight that water cannot pass freely through it. Afford the plants a good watering, and for several weeks afterwards apply enough water to encourage the Sphagnum-moss to grow on the surface. Syringe between the pots every morning when the weather is favourable, and again just before sunset; this last damping will cause the roof glass to be covered with condensed moisture, which is in every way favourable to the growth of the plants. Admit as much fresh air to the plants as possible through the lower ventilators, especially when the outside temperature is about 50°. When the temperature is higher than this, the air being calm and rain or heavy dew falling, the top ventilators may also be opened. The plants should be protected from strong light and sunshine until they have become well established in the new compost. The pseudo-bulbs that are cut off may be used for propagating purposes, fixing them firmly in pots filled with small crocks and keeping them always moist, or they may be placed on a bed of Sphagnum-moss or damp coconut fibre.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKETTS GILLIE, Esq., Barton Hill, Westwood, Yorkshire.

Richardia africana.—If these plants have been grown in beds out-of-doors during the summer months, the first opportunity should be taken for repotting them. This operation needs to be carried out a few weeks before the plants are to be removed indoors and they should be placed for that time under a north wall. Plenty of moisture must be afforded the roots. If early blooms are desired, these are more easily obtained from plants that have been repotted earlier in the season, as directed in a previous Calendar. The earlier plants are now filling the pots with roots, and may be afforded a liberal feeding with liquid manure from the farmyard. If blooms are wanted at Christmas time, the plants should be staged in a position as near to the glass as possible.

Cineraria.—These plants require a long season of growth, and a suitable position for them is on a layer of ashes in a cold frame. Regular attention must be paid to repotting the plants until the flowering stage is reached. Great care must also be exercised in affording water; the plants should be examined daily, and a good soaking given to those needing moisture. Aphid is often troublesome during the autumn and winter months, but this pest may be kept in check by frequent fumigations with a nicotine compound. The plants should be re-arranged frequently, as the foliage of healthy plants develops quickly. Ventilation must be afforded with care, in order to prevent cold draughts. If the plants are top-heavy, it is advisable to support them in the centre to a stout stake.

Codiaeum (Croton) and Cordyline (Dracena).—Cuttings of *Codiaeums* may be inserted in

60-sized pots, and rooted in a propagating case with a brisk bottom heat. The specimen plants should be allowed full exposure to the sunshine, in order that the leaves may develop a good colour. *Dracena* cuttings may be rooted in the same manner as *Codiaeums*, or old stems may be used for propagating purposes. These latter should be cut into pieces, each having one or two buds, placed into shallow pans or boxes filled with a sandy compost, and plunged in a brisk bottom heat. Ringing may be practised with unsightly plants of either *Codiaeums* or *Dracenas*.

Retarded plants.—Where cut flowers are required for autumn, successional batches of retarded crowns of *Lily-of-the-Valley* should be potted. The crowns should be unpacked immediately they are received from the nursery and placed into a water tank, for if the roots suffer from dryness, it will have an adverse effect upon the quality of the blooms. *Spiraeas* respond readily to gentle forcing, and are of great value for furnishing a supply of cut blooms. The pink-flowered varieties, such as *Peach Blossom* and *Queen Alexandra*, should be grown in a cool atmosphere, as excessive heat causes the colour to become pale. Keep the foliage of these *Spiraeas* as dry as possible, but supply the roots with as much water as they require, although it is not advisable to stand the pots in saucers, as is sometimes done. *Azalea mollis* may also be obtained in bloom during the autumn months. The variety of colour in the flowers is charming for winter decoration, but the blooms do not last long. *Lily-of-the-Valley* crowns may be forced into bloom in 21 days; *Spiraeas* require from seven to nine weeks, and *Lilium Harrisii* from 12 to 15 weeks.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Spinach.—Spinach sown a month ago will now be ready for thinning. Allow distances of 4 inches between the plants, and give light dressings of soot at intervals, also, hoe the ground frequently between the rows.

Winter salad.—Provision should be made now for the supply of salad through the winter months. If Lettuce were sown in August, the plants should now be ready for transplanting into cold pits. The soil in these pits should be raised to within 15 inches of the glass and made moderately firm before the plants are inserted. If cold frames are available, there need be little difficulty in maintaining a supply of salads throughout the greater part of the winter. Of Lettuces, the Cabbage type is the best; All the Year Round, Stunstead Park and Hardy Hammersmith are good varieties for the purpose. Damping is to be most feared in Lettuces in pits during the winter, therefore, sufficient space must be allowed between the plants for the air to pass freely amongst them. The lights should be left off the frames as long as the weather is favourable, but if wet weather occurs, they should be replaced, allowing ventilation both at the top and bottom of the pit. A sowing of Stunstead Park, Maximum and Brown Cos may be made now on a west border to provide plants for planting out early in the spring. Endive should be planted in cold pits and treated in the same manner as recommended for Lettuce. The Batavian variety is best for winter use, as it is not so readily affected by damp as the more tender sorts.

Spring Cabbage.—The principal plantation of Cabbage may be made now on ground which has been manured for a previous crop. Ground recently occupied by Onions will be suitable and will require little preparation beyond breaking up the surface with a fork. Plants stand the winter better on such ground than on that which has been trenched and manured for them. *Ellam's Early*, *Flower of Spring* and *Early Offenham* are reliable sorts. Allow a space of 15 inches between the plants, and let the rows be made 18 inches apart. The ground about Cabbage plants put out a month ago should be hoed frequently, and the plants sprinkled with soot. The soot will cause the foliage to assume a dark-green colour, and it will keep slugs and other pests in check.

Leeks.—Late plantations of Leeks must be supplied with sufficient manure water to keep them growing freely, and the soil between the plants should be stirred with the Dutch hoe.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations. The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPTEMBER 20—
Nat. Dalmia Soc. Exh. at Royal Bot. Gardens, Regent's Park (2 days.)

SATURDAY, SEPTEMBER 24—
Brussels International Show (Ex. of Fruit and Market Garden Produce) (4 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—55.9°.

ACTUAL TEMPERATURES.—
LONDON.—Wednesday, September 14 (6 P.M.): Max. 60°; Min. 51°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, September 15 (10 A.M.): Bar. 30.2; Temp. 61°. Weather—Dull.

PROVINCES.—Wednesday, September 14: Max. 58° England E.; Min. 52° Elgin.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Dutch Palms at 67 & 68, Cheapside, E.C., by Frotheroe & Morris, at 10.30.

TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
Unreserved Sale of the Whole of the Plants in Pots at St. John's Nurseries, Worcester, by order of the Receiver *re* R. Smith & Co., Ltd., by Frotheroe & Morris, at 11.30.

THURSDAY AND FRIDAY—
First Portion of the "Lytham Hall" Collection of Orchids, at 67 & 68, Cheapside, E.C., by Frotheroe & Morris, at 1.

Forestry Experiments in Britain.

In the course of a valuable paper published in the *Journal** of the Board of Agriculture, Messrs. Robinson and Lindsay Watt draw attention to the present lack of data with respect to forestry results in Great Britain, and point out how important it is that all available information with respect to results actually obtained should be collected and published. The article by Messrs. Robinson and Lindsay Watt provides a contribution of this kind, and consists of an interesting account of a successful plantation of Larch and Spruce at a high altitude. The plantation in question, called the Coombe Plantation, was begun in 1848, and completed in two years. Mr. R. D. Marshall, of Castlezza Manor, Keswick, remembers seeing the planting upwards of 60 years ago, and is now witnessing the clear cutting of the wood. The interest attaching to the plantation is two-fold. In the first place, the locality in which the plantation is situated is typical of thousands of acres of land in the Lake District, which is let at present at the rate of 2s. per acre. Hence, the complete records of the plantation should prove of service in case any large scheme of afforestation is contemplated for the district. In the second place,

Mr. Marshall has kept accounts of costs and returns, and has also, since 1875, picked out experimental groups of trees, of which he has measured the girth periodically. The area planted is 198 acres, and the altitude of the plantation ranges from some 900 feet to 1,500 feet above sea level. The illustrations accompanying the article give clear evidence of the need of providing Larch with wind-breaks, for, whereas, at elevations of 1,500 feet, the trees on the outside of the wood are streamer-like bushes of 5 feet to 8 feet in height, those growing at about the same altitude, but sheltered by Spruce on the windward side, are of normal development, and attain a height of from 50 feet to 35 feet. It is particularly interesting to find that, though Larch canker is present in the wood, the Larch that have been attacked by the parasite have, apparently, got the better of the disease, and that the trees have recovered from the damage inflicted on them by the large Larch sawfly (*Nematus Erichsonii*), which practically defoliated the trees in the autumns of 1907, 1908 and 1909. We have, in this latter fact, a striking example of the advantage which a Conifer derives from the adoption of a deciduous habit, for, as Professor Groen has pointed out in his recent articles on Conifers which appeared in these columns, defoliation of an evergreen Conifer is likely to be fatal, owing to the slow development of new leaves. The general conclusion reached by Messrs. Robinson and Watt is that the locality in which the plantation is situated is well suited to the growth of Larch, and that this is demonstrated by the general absence of disease, and by the dimensions reached by the trees. Under the most favourable conditions, they attain a height of 78 feet, and a girth (4 feet from the ground) of 54 inches—this in the course of 62 years. Whereas the Larch thrives best in somewhat sheltered hollows, doing well in breezy, but not in windy situations, the Spruce grows well at all elevations, and attains a greater volume than the Larch. We cannot attempt to summarise here the results indicated by the measurements of the trees on the experimental plots, but recommend those interested in the subject to consult the original paper. The financial account of the plantation, which will appear in the forthcoming issue of the *Journal*, should prove of no less interest and value than the present general account on which these notes are based.

OUR SUPPLEMENTARY ILLUSTRATION represents two fine varieties of *Mittonia vexillaria*, for which Mr. H. G. ALEXANDER, Orchid grower to Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., was awarded a Cultural Commendation at the Royal Horticultural Society's meeting on June 7 last, the variety Snowflake securing an Award of Merit on the same occasion. Similar specimens of *Mittonia vexillaria* were staged by Mr. ALEXANDER at the Temple Show, May 28, 1907, in the group to which the Veitchian Cup was awarded, the plants collectively having about 150 flower-spikes, the largest specimen bearing 18 spikes, with an aggregate of about 100 flowers. The finest varieties were the deep magenta rose *M. vexillaria* Empress Augusta Victoria, the large white-lipped *M. v. Cobliana*, the white *M. v. virginale*, and the superb *M. v. Westobirt* variety, which secured a First-class Certificate at the same show. *M. vexillaria* gives a severe test to cultural skill, and no higher testimonial in that direction could be given to Mr. ALEXANDER than the evidence of these plants, which flower so abundantly year after year and yet continue to grow with increased vigour.

OLD KEWITE AS MAYOR.—Mr. JAMES LEIGHTON, who left the Royal Botanic Gardens, Kew, in 1880, has just been elected Mayor of King William's Town, South Africa. Mr. LEIGHTON proceeded to Cape Colony after he had completed his period at Kew, and he has a nursery business in the town which has recently honoured him by electing him chief magistrate.

MONUMENT TO GEORGE DON.—On the 8th inst., at Forfar, a monument was unveiled to GEORGE DON, a Scottish botanist, who lived at the commencement of the last century. The following particulars are taken from the address read at the unveiling of the monument, being compiled by Mr. G. CLARIDGE DRUCE, M.A.:—"He is said to have been born in the parish of Mennair in this county (Forfarshire) in 1764, to have been educated in this ancient borough, then apprenticed to a clock-maker at Dunblane, where he made his first hortus siccus. As a journeyman he lived in Glasgow, and afterwards, as a gardener, he went to Dupplin Gardens, near Perth, using his scanty leisure to explore the Ochils, where he discovered *Myosotis repens*. He also discovered the minute moss now known as *Anodus Domianus*, which fruits in December; and the fact of finding it was so well remembered by him, that 25 years after he pointed out the rock on which it grew to his friends the MILLERS, and by their aid was thus able to secure specimens for his *Herbarium Britannicum*. Here, too, he met CAROLINE STEWART, who long afterwards, in 1792, became his wife. On leaving Dupplin, he went to the garden of Lord PLYMOUTH, at Hewell Grange, in Worcester-shire. He passed through Oxford, noticing the Oxford Ragwort on the walls of that classic city. He was six months at Broadworth, near Doncaster, and about 1786 must have been in London, for he records several species seen growing near the great Metropolis. He settled in Forfar, and in 1797, with a small sum of money he and his wife had saved, leased for a term of 99 years two acres of land, called the Doo Hillock, from Mr. GRAY, of Carse. This sloped westwards to what at that time was Forfar Loch. Here he lived in comparative penury, selling vegetable and plants. He made an artificial pond, in which he grew aquatics, while in his borders he planted his Alpines. He continually explored the Highlands of Clova, and, in fact, first made known the rich botany of his native county. He frequently absented himself for a week at a time, his plaid and a bag of oatmeal or bread and cheese affording him shelter and food; and so thoroughly did his hobby occupy his thoughts that he lost count of the days. In 1802 he removed to Edinburgh, having been appointed superintendent of the Royal Botanic Garden; and left his Forfar garden in the care of his father. In 1805 he was elected an Associate of the Linnean Society in recognition of his service to botany. In 1804 he began the publication of his *Herbarium Britannicum*, a Fasciculus of British Plants, dedicated by permission to Sir JOSEPH BANKS. Of this work he issued nine parts. DON did not long remain in Edinburgh; perhaps his independent spirit bore badly the restrictions which his position imposed, possibly his political principles were not popular, but more probably the small stipend of £40 a year was found to be insufficient to keep his wife and family in the city; at any rate, about the end of 1806 he again returned to this town, continuing his occupation as a florist, and sending out plants and specimens to many correspondents, in particular to the Countess of AYLESFORD, who was making water-colour drawings of British plants, which are still in the possession of her descendant, the Earl of DARTMOUTH. The plants, 120 in number, instead of being thrown away were dried and preserved in her herbarium, which subsequently belonged to her descendant, Miss C. E. PALMER, of Odiham, who recently

gave them to me. DON contributed an account of the *Native Plants in the County of Forfar, and the Animals to be Found There*, to *Headrick's General View of the County of Angus*, which appeared in 1812. He also, in 1811, wrote a paper *On the Varieties of the Pinus Sylvestris or Scotch Fir* to the *Memoirs of the Caledonian Horticultural Society*, published in 1814—a valuable and a suggestive contribution to botany, which hitherto has not received the attention it deserves. Despite his exertions, and the fact of his garden at Forfar being well stocked with a large variety of plants, DON made no headway in business, and eventually in 1812 he had to make some arrangement with his creditors, a blow from which his sturdy, independent and somewhat choleric temperament never recovered. In the autumn of 1813 he returned from one of his mountain expeditions with a severe chill; this being neglected grew worse, and, after six weeks, he died in abject poverty on January 15, 1814."

GOLD FISH.—Although gold fish were probably introduced into England from China so long ago as 1611, there was but little interest in them until about 50 years ago. The Japanese and Chinese, on the contrary, have indulged in the rearing and breeding of fish in confinement for many centuries, and as a result of careful selection have succeeded in evolving many extraordinary quaint and beautiful varieties, of which the specimens at the Japan-British Exhibition afford interesting examples. While the Chinese appear to devote their attention chiefly to the production of fish of abnormal hues, the Japanese have achieved success mainly in the rearing of specimens of curious shape and possessing abnormal fins. The Telescope Fish—a variety of gold fish with projecting eyes and extensive tail—being an extreme example. So extensive is this form of pisciculture in Japan that the fish described may well be included among the products of that enterprising country. Some difficulty was necessarily experienced in transporting these rare fish from the Far East to their home at the White City, but so successful was the experiment that fully 50 per cent. arrived in this country in perfect condition, and have now apparently become thoroughly acclimatised, and have multiplied to such an extent that shoals of tiny fry may be seen darting hither and thither in the miniature lakes at the exhibition.

HYBRID POTATOS.—The Rev. J. ACKMAN PATON gives in the current number of the *Journal* of the Royal Horticultural Society (xxxvi., i., p. 127) an account of his recent experiments in crossing species of *Solanum*. As the author points out, the ordinary commercial varieties of the Potato are by no means convenient subjects for the experimental investigation of unit, hereditary characters, for they themselves are hybrids and require to be self-fertilised, and their descendants classified before they could be made to serve this purpose. Of the species-crosses made by the Rev. J. PATON, that between the white-flowering *Solanum Commersonii* and *S. tuberosum* (wild Mexican form) yielded 12 berries, containing in all 33 seeds. From this seed, nine plants were raised. These F_1 plants have yielded numerous seed-berries, so that there should be a considerable number of F_2 plants on which the Rev. J. PATON will be able to pursue his interesting investigations. The most striking feature exhibited by the tubers produced by the hybrid (F_1) plants is their apparently complete immunity from late blight (*Phytophthora infestans*). Should they stand the test of further trials, with respect to immunity from this disease, the hybrids will undoubtedly prove of the highest commercial value, either for their own merits or for their use in crossing with cultivated varieties.

CHALK AS A DRESSING FOR LIGHT SOILS.—From experiments made by Mr. JOHN HUGHES, agricultural analyst for Herefordshire, it would appear that finely-ground chalk will prove of considerable value for dressing light soils. Though chalk is very insoluble in pure water—being 27 times less soluble than quicklime—it is, according to Mr. HUGHES, almost as soluble as the latter substance in a dilute solution of citric acid (.1 per cent.), which supplies a close approximation to the solvent powers of soil water. Instead of the usual dressing of 10 cwt. per acre of ground lime, an application of finely-ground chalk, at the rate of 1 ton per acre is recommended. The chalk dressing has the advantage of being easier of application and less costly than quicklime. Its action, however, in decomposing the humus of the soil would be slower than that of quicklime.

A PLANT CATALOGUE.—It is a pleasing indication of the public interest in plants that the authorities of many of the public parks find it necessary to publish catalogues of the plants growing in their grounds. There is much information which visitors are anxious to obtain that cannot be supplied by means of an ordinary label, and it is found that catalogues are the best means of affording it. Mr. D. BLISS, the superintendent of the Parks Department, Swansea, has just published a catalogue of the trees, shrubs, herbaceous and Alpine plants at present growing in the Cwmdonk Park, Swansea. The botanical name (and in many instances the Natural Order), together with the common name and country of origin, are given for each species. Nearly 2,000 species are enumerated, and the price of the catalogue is one penny. We feel sure it will prove of great value to interested visitors to Swansea's most beautiful park.

WART DISEASE OF POTATOS.—A pamphlet issued by the Harper-Adams Agricultural College, Newport, Salop, gives an account of experiments made with the object of testing the effect of fungicides on plants affected by wart disease (black scab), and of determining which varieties of the Potato are most resistant to the attack of the fungus (*Chytridium endobioticum*, Percival) responsible for wart disease. After describing the symptoms—now well known—of black scab, a brief account is given of the modes by which the fungus spreads from one place to another. The agents responsible for the distribution of the spores are animals, manure, and "seed." Thus it has been demonstrated that pigs and poultry straying from infected gardens may carry the spores and thus spread the disease. Again, manure from animals fed on diseased tubers contains the resting spores, and if used on fresh soil may give rise to infection. In particular, seed tubers from diseased Potato crops are responsible for the dissemination of the disease. In Shropshire, black scab is confined practically to gardens and allotments on light soils, and occurs mainly in the north and east of the county. No fungicide of the many tried in the course of the investigation has been found to have a decidedly beneficial effect in reducing the disease, though a summer dressing of copper sulphate destroys the motile spores liberated during that period. More definite results have been obtained from the testing of relatively immune varieties, and it is recommended, in consequence, to grow Southern Queen and Southern Star as earlies with Conquest for the main crop. Of late varieties, Abundance, Langworthy, and Peacemaker showed a superiority with respect to resistance over the other varieties which were tested. Those interested in the subject are recommended to apply to the college for a copy of the pamphlet, which, we understand, will be sent to applicants free of charge.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

SCARCITY OF WASPS.—Certainly wasps are scarcer than usual. I predicted a plague this year, seeing the number of queens in spring. We killed very many in the gardens. Last year, blue-bottle flies attacked the Grapes in three of our vinerys, and the damage they did in a short space of time was astounding. We trapped them in bottles of sweetened beer, but although we captured a great many flies, I am of the opinion (as in the case of wasps) that the traps also entice them to the fruit. In regard to Mr. Oldham's query (p. 204) as to the scarcity of bees being the cause of his Scarlet Runner Beans failing to set, I do not believe the honey bee visits the flowers of Scarlet Runners. I have eight hives in these gardens, and I have never seen any honey bees on my Runner Beans, but they are often visited by humble bees. This season our Runner Beans have yielded a remarkably heavy crop. *J. S. Higgins, Big Gardens, Concom.*

THE LATE THOMAS FRAZER OF WISLEY GARDENS.—The news of Mr. Frazer's death will be learned with great regret by all who have visited the Royal Horticultural Society's gardens at Wisley. Although he had been seriously ill for some time previously, Mr. Frazer returned recently to his labours in apparently greatly-improved health, but he died somewhat suddenly on the 7th inst., to the great grief of all his colleagues. Mr. Frazer was 51 years of age. He had been a member of the gardens staff almost from their first occupancy by the Society, and he possessed a wide knowledge of hardy plants. To the great number of Fellows visiting the gardens, he was a genial and a greatly-respected guide, and his loss will be widely felt. *A. D.*

POMPON DAHLIAS.—Whilst inspecting the trials of Single Dahlias (see p. 222) on Monday last at Messrs. J. CHEAL & SONS Nursery, I was impressed with the effectiveness of the Pompon varieties for garden purposes. This type has stiff, erect stems carrying the neat, round flowers, well above the foliage. Amongst the more notable varieties were Mars, Daisy, Elsa, Minnie, Nerissa, Virginia, Zerlina, Tommy Keith, Mizion, Emily Hopper, Crusoe and Adelaide. Of the Cactus-flowered varieties the following half dozen were carrying fine show-flowers on good stems well above the foliage:—Mrs. Paton (scarlet), Mrs. Landale (yellow, heavily flushed with pink), Snowdon (white), Mrs. J. H. Usmar (coppery-orange, suffused with coral pink), Hon. Mrs. Greville (orange-yellow, suffused with salmon), and Buttercup (rich yellow). *Visitor.*

ROCHEA FALCATA.—It has never been my good fortune to see finer examples of this pretty South African succulent than those exhibited by Messrs. STUART Low & Co., at the meeting of the Royal Horticultural Society on August 30. Bearing in mind the attractiveness of *Kalanchoe flammula* I was, from a distance, prepared to find another new species of *Kalanchoe*, but closer inspection revealed the fact that it was a very old friend, namely, *Rochea falcata*. The species is too well known to need any exhaustive description, therefore, it will suffice to say that it forms a stout, erect stem clothed with very succulent, curved leaves. The individual flowers are small, but they are packed closely together in a large, flattened head. They are of a brilliant red colour, with conspicuous bright yellow anthers. From one head of bloom a succession is kept up for some time. This *Rochea* is of easy propagation and culture, the essentials in order to ensure blossoms being plenty of air and sunshine. In some places it flowers well out-of-doors. The *Kew Hand-List* includes this species in the genus *Crassula*, while the well-known *Crassula* or *Kalanchoe coccinea* is referred to *Rochea*. *W.*

THE OLD SOLDIERS GARDENS AT CHELSEA HOSPITAL.—A considerable amount of interest is just now centred in the grounds attached to the Royal Hospital at Chelsea, as being the place selected for the holding of the International Horticultural Exhibition, 1912. Adjoining are the Ranelagh Gardens (which will also be used for the exhibition), at one time a place of popular

resort, but now open to the public, and a portion is set apart as gardens for the pensioners in Chelsea Hospital. There are about 150 plots, varying somewhat in size and occasionally in shape. Each one is regarded as the property of a soldier, to cultivate and treat as he thinks fit, that is, while he remains an inmate of the hospital and is physically capable of attending to his garden. The men are allowed to sell the produce, and thus obtain a little pocket money. The residents of the neighbourhood, as well as visitors, are good customers of the soldiers, and may be seen carrying away nosegays, a Lettuce, or a bunch of Radishes. At the present time the small gardens are gay with Dahlias, Perennial Sunflowers, Solidagos, and Michaelmas Daisies. Numerous annuals are grown, and showy heads of perennial Phlox assert themselves at a distance. Earlier in the season a brisk business is done in rooted plants of such things as Creeping Jenny (*Lysimachia nummulariaefolia*) and Musk (*Mimulus*), both of which admit of ready increase. Besides Lettuces and Radishes, Turnips, Onions, Kale, and in one instance, at least, Red Cabbage, were noted. There is, I believe, a series of prizes awarded during the summer to the holders of the best kept plots. *Correspondent.*

CIMICIFUGA RACEMOSA.

The Cimicifugas are hardy plants, and most of them are natives of North America. They closely resemble one another, differing mainly in height, season of flowering and in the purity of their colouring. With their long flower-leads composed of countless, small, white blossoms, they have a great likeness to Spiræas of the Aruncus type. They are near relatives of the Actæas. Considering their handsome appearance, it is strange that they are so seldom seen in gardens, but perhaps this may in some measure be due to their popular names of Snake-root and Bugbane. The most ornamental species is *C. racemosa*, a plant that was introduced into this country from North America in 1732. This, when it is thoroughly happy in its surroundings, will attain a height of 8 feet, and with its dozen or more tall flower-stems, terminated by slender bloom-racemes, some of which bend over gracefully, it presents a strikingly effective picture. Though the plants will grow in a border, they are much injured by drought, and in dry weather have a miserable appearance. They enjoy rich, damp soil and summer shade, such as would be thrown by a deciduous tree, and were they planted in the drier portions of the bog-garden or used for the ornamentation of the margins of lakes and streams in conjunction with Spiræas, Irises, Lilliums, Osmundas and such plants, they would soon become popular, as in such positions their grace and beauty are apparent. In an ordinary way there is no need to grow more than one or two species, as they are all much alike in general character, and flower much about the same time, which is from July till October. *C. racemosa* has a handsome mass of broad and much divided leaves, and produces stout, branching flower-stems feathered with white blossoms. The plant succeeds best in rich, moist woodland, where, in the more open spots, it becomes as wild as in its native woods. It is an admirable wild-garden plant. It is just the subject that should be selected for an open part of the wood, where it is not liable to be over-run by hungry roots. In such a site it will grow into a stately clump in a few seasons. *C. racemosa* is sometimes grown under the name of *C. Serpentaria*, a title which is said to be derived from the bending and twisted appearance of some of the bloom-racemes. Some are of opinion that *C. Serpentaria* is a finer plant than the typical *C. racemosa*. Other species are *C. americana*, *C. cordifolia*, *C. davyana*, *C. elata*, *C. fetida*, *C. japonica*, and *C. simplex*. *Wyndham Fitzherbert.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 13.—The fortnightly meeting took place on Tuesday last, the Hall being filled with a bright display of flowers and fruits. Dahlias and other out-door flowers predominated, and the principal novelties were also Dahlias, no fewer than 11 Awards of Merit being granted to new varieties by the FLORAL COMMITTEE out of a total of 14 made in this section. A Gold Medal was also granted for a display of these autumn flowers.

There were several important displays before the ORCHID COMMITTEE, and this body gave two First-class Certificates, three Awards of Merit, and one Botanical Certificate.

The FRUIT and VEGETABLE COMMITTEE had rather more than usual to inspect. The chief

sides these they had many very large clumps of *Nerine Fothergillii* major, each plant bearing a profusion of flower-spikes. (Silver Banksian Medal.)

Messrs. STUART LOW & Co., Enfield, had many varieties of perpetual-flowering Carnations attractively arranged in vases with greenery.

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, showed brilliantly-coloured Codiaëms (*Crotons*) in a bank of beautiful decorative Ferns. The Codiaëms were fine examples of good culture, and included such sorts as Resplendent, Thomsonii, Alexander III., Warrenii, chrysopetalum, B. Comte, Reidii, and Edmontoniense. (Silver Banksian Medal.)

Mr. A. LL. GWILLIM, Cambria Nursery, New Eitham, Kent, exhibited a large number of tuberous-rooted Begonia blooms on boards. They had double and single varieties in many pretty shades of colour. (Bronze Flora Medal.)

[Photograph by Wyndham Fitzherbert.]

FIG. 86.—CIMICIFUGA RACEMOSA; FLOWERS WHITE.

group was an exhibit of fruit trees in pots, for which a Gold Medal was awarded. Two First-class Certificates were given to varieties of Apples, and Awards of Merit to two Potatoes and a seedling culinary Pea.

At the 3 o'clock meeting a lecture on "Roses" was delivered by Mr. George Laing Paul.

Floral Committee.

Present: W. Marshall, Esq. (Chairman); and Messrs. H. B. May, J. Green, T. W. Turner, C. T. Druery, R. C. Reginald Neville, J. T. Bennett-Poë, W. Howe, J. Jennings, J. F. McLeod, W. T. Ware, C. R. Fielder, W. Bain, Charles Dixon, George Gordon, J. Hudson, A. Turner, H. J. Jones, H. J. Cutbush, W. J. James, Charles E. Pearson, E. H. Jenkins, and Charles Blick.

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, staged a bright group of Zonal Pelargoniums with banks of showy flowered Cannas interspersed, and a row of tall plants of *Plumbago capensis*. Be-

CLEMATIS.

Mr. L. R. RUSSELL, Richmond Nurseries, Richmond, Surrey, showed a capital floor group of Clematis plants. The following varieties were well flowered:—Lady Northcliffe (bright blue), Mme. Ed. André (purple-crimson), Jackmanii (snow-white), Jackmanii rubra, Jackmanii superba, Nellie Moser, Mme. Van Houtte (single white), Lady C. Neville (light blue with a darker stripe on the segments), Enchantress (a semi-double, white flower), and Beauty of Worcester (one of the brightest blue-coloured Clematises). (Silver Banksian Medal.)

ROSES.

Messrs. PAUL & SON, The Nurseries, Waltham Cross, made a very large and beautiful display of Roses. They were chiefly of the hybrid Tea and hybrid Perpetual sections. We noted the following varieties in extra fine specimen blooms:—H.T.s: Königin Carola (a lovely pink variety), Cynthia, Paul Lede (salmon-yellow), Marquise de Sinety (rich yellow), Mme. Leon Pain, Mme.

Edmee Metz (blush), Pharisæer, Lyon Rose yellow-salmon), Viscountess Folkestone, Dean Hole, Souvenir de President Carnot, Mme. Ravary, Mrs. David Jardine (a flat flower of a blush tint), Prince de Bulgarie, and Liberty. H.P.s of fine quality were: Suzanne M. Rodocanachi (a well-known, bright-crimson-flowered Rose), Hugh Dickson, and General McArthur. Messrs. Paul's new climbing variety, Florence Haswell Veitch, is a fairly double flower of a rich crimson colour, very pretty when half-expanded, and a welcome addition to its class, for it possesses fine fragrance. (Silver Flora Medal.)

DAHLIAS.

Messrs. BAKER, Wolverhampton, made a large display with Peony-flowered varieties. As regarded the colours, the flowers were striking. The following were the more effective:—Pink: Mrs. R. Copeland, Lady Norman, Mrs. W. E. Whineray, Baroness de Türkenheim, and Mrs. Mundy. Yellow: Ryton Roy, Hyde Park Gem, Codsall Gem, and Hon. Mrs. Walter Forbes. Purple: Mrs. Gilmour, Mrs. R. Heaton, and Queen Emma. Crimson: Germania, Mrs. R. Cooke, and Viscountess Wolverhampton. Orange red: Viscountess Newport, Sunset, and Romola Piazzini. White: Mrs. E. Cragg and Lady Muriel Paget. (Silver Banksian Medal.)

Messrs. J. CHEAL & SONS, Crawley, staged an enormous number of Cactus, flat and thread-petalled, single-flowered and pompon varieties. Of the thread-petalled, we observed the new variety Mrs. Landale. Others of this section are Saltan (deep crimson), Rev. T. W. Jamieson (rose-pink), Flag of Truce (white), and H. H. Thomas. Of single-flowered varieties, the more regular in form and distinct in colour were Tugi San, the florets of an orange colour, with crimson zone around the centre; Miss Morehead, a bright-crimson flower; Lady Bountiful, rosy purple, having a deep-crimson zone; Elaine, pure white; and Winona, very dark crimson. This firm likewise showed Peony-flowered Dahlias—about two dozen in all, rather bizarre in appearance when compared with the more symmetrical, refined Cactus, single flowered, and pompon varieties.

Messrs. CARTER, PAGE & Co., of London Wall, E.C., showed an immense bank of Dahlias against the wall at one end of the Hall. These consisted of nearly all types in every shade of colour. The flowers were inserted in earthenware vases of a green colour, and they had as foils small-leaved greenery of various kinds—Ampelopsis, Asparagus, Ivy, &c. (Gold Medal.)

Messrs. BURRELL & Co., Howe House Nursery, Cambridge, exhibited a few thread-petalled Dahlias, and two of the varieties are mentioned in our list of those granted awards.

Messrs. J. STREDWICK & SON, St. Leonards-on-Sea, showed 10 varieties of Cactus Dahlias, and among these were H. L. Brousson, a rosy-purple flower with white tips, and Sweet Briar, the colour of old rose.

Messrs. WHITELEGG & PAGE, nurserymen, Chislehurst, exhibited 18 Peony-flowered varieties. This firm also showed a number of blooms of the annual branching Aster M. Nicholls; the pink blooms are very double, and the plant grows to a height of 3 feet.

Mr. T. WEST, Brentwood, showed Dahlias in variety. (Silver Banksian Medal.)

SWEET PEAS.

About 40 vases of these flowers were shown by R. FELLOWES, Esq., Norwich, in great variety of colour. Good examples were observed of Earl Spencer, Zephyr, Rosie Adams, Constance Oliver, Geo. Herbert, Tom Bolton, a very dark crimson variety; St. George, Mrs. Andrew Ireland, Evelyn Hemus, Leslie Smith, a seedling, a choice light-pink flower; Chastity, a fine white, having a faint tint of pink, and Lady Beatrice, a seedling of promise. (Silver Flora Medal.)

Another display of these flowers was made by W. R. HAMMOND, Esq., Burgess Hill. (Silver Banksian Medal.)

HARDY PERENNIAL FLOWERS.

There were numerous exhibits of hardy flowers. Mr. FRANK BRAZIER, Caterham, who has previously shown rare skill in grouping hardy flowers, surpassed his former efforts. The chief subjects in his group were Phloxes, Pentstemons, early-flowering Chrysanthemums and Michaelmas Daisies arranged in bamboo stands and associated with such species of Vitis

as V. Henryana, sprays of the Spanish Broom and other appropriate foliage. (Silver-gilt Banksian Medal.)

Mr. JAMES BOX, Lindfield Sussex, also brought a very fine display, his exhibit occupying a full table length. He showed Phloxes in great variety, notably Lindfield Beauty, with flowers of a pretty pink shade; Aster Beauty of Colwall, Kniphofias of sorts; Gladiolus "America," of which there was a central group of 150 spikes; G. princeps; Liliums in variety, and many other seasonable flowers. (Silver Flora Medal.)

Messrs. R. H. BATH, LTD., Wisbech, had a large and representative display of early-flowering Chrysanthemums.

The GUILDFORD HARDY PLANT NURSERY staged a great variety of hardy flowers, including Clematis Davidiana, Kniphofia Macowanni, Senecio tangutica, Phloxes, and Michaelmas Daisies.

Messrs. WM. WELLS & Co., LTD., Meistham, had a capital group of early flowering Chrysanthemums, arranging the several varieties in bold masses. Polly (gold and bronze), Horace Martin (rich yellow), Roi des Blancs, and Mychett (scarlet), were among the best varieties in a most effective collection. (Bronze Flora Medal.)

Messrs. BACKHOUSE & SON, York, displayed a delightful lot of Colchicum speciosum album, some of the corns bearing as many as six of the handsome, pure-white flowers. This is one of the most notable of early autumn-flowering plants, and being now available at a cheap rate, should be grown by all. Other Colchicums in variety and a set of the autumn-flowering Crocus were likewise remarked. (Bronze Flora Medal.)

Mr. MAURICE PRICHARD, Christchurch, Hants., displayed a fine collection of hardy subjects, including Kniphofia Triumph, a late flower of golden bronze colour; K. Rufa, a beautiful variety of the miniature set; fine, well-flowered inflorescences of Crinum Powellii and C. P. album. Cyclamen hederifolium album, spreading out a couple of score of blossoms to a foot wide from a solitary corm; Scabiosa caucasica, exceptionally good in colour and in a fine mass, and, not least, the beautiful Hypericum agyptiacum, a miniature glaucous-leaved bush laden with golden buds and blossoms. (Silver Flora Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, arranged an excellent lot of flowers, such as Gladiolus in variety, Phloxes, Colchicums, autumn Crocuses, including C. zonatus, C. speciosus, and the rich, golden flowered C. Scharofjani. (Bronze Flora Medal.)

Mr. H. F. ROBSON, Ham, Surrey, displayed many seasonable hardy flowers in company with early Chrysanthemums.

Mr. AMOS PERRY, Enfield, exhibited Larkspurs, Artemesia lactiflora, a fine mass; Montbratias, Colchicums, Sarracenia purpurea, S. psittacina, Astroemeria psittacina, Sternbergias, and Aselepias tuberosa. (Bronze Flora Medal.)

Messrs. H. J. JONES, LTD., Lewisham, S.E., displayed a capital assortment of Michaelmas Daisies: S. T. Wright, Rycroft Pink, Beauty of Colwall, C. Anderson, extra good blue colour; Finchley White and Rycroft Purple being good and distinct varieties. (Silver Banksian Medal.)

Mr. G. RETRINE, Keston, Kent, included in an interesting group Tropaeolum tuberosum, with rich scarlet and gold flowers; Crinum, Stokesia cyanea, Phygellus capensis, Escallonia oregonensis (pink), Indigofera doussa (purplish), Eucryphia punctifida, with white flowers; Abelia floribunda, and species and varieties of Campanula. (Bronze Flora Medal.)

Messrs. JOHN FORBES, LTD., Hawick, brought large collections of Phloxes and hybrid Pentstemons, the latter including Crimson Gem, a splendid variety. (Silver Banksian Medal.)

Messrs. DOBBIE & Co., Edinburgh, had a superb exhibit of Marigolds, which embraced the bold and massive African sorts Prince of Orange and Lemon Queen, the pretty dwarf-growing, single-flowered Legion of Honour, and Dobbie's striped form of the tall French or exhibition variety. An excellent group of exhibition Quilled Asters, with several distinct varieties of Cosmos, were also noted in this group. (Silver Banksian Medal.)

Primula × Briscoei (P. Bulleyana × P. japonica), shown by Messrs. JAS. VEITCH & SONS, LTD., Chelsea, is interesting from the fact that it is the first hybrid resulting from P. Bulleyana. The flowers of the hybrid are not unlike those of P. × Unique. The habit is that of a pale-leaved P. japonica, with more crimsoned

mid-rib, the inflorescence inheriting, to some extent, the powdery character of the other parent.

AWARDS OF MERIT.

Gladiolus Rathline.—The flowers are of large size and of a deep cream tone, the lower central petal being yellow, and flushed with crimson at the base. The spike is handsome and well formed. From Mr. BULL, Ramsgate.

Cheysanthemum Hollicot White.—A handsome early-flowering variety of great purity, the flower-heads being borne on stiff, erect stems.

Cheysanthemum Hollicot Yellow.—The colour of this variety is a clear buttercup yellow, the slightly-drooping florets presenting a well-finished surface. Both Chrysanthemums were exhibited by Mr. W. ROOTS, Cranford, Middlesex.

Dahlia Cardinal (single).—A shapely flower of rich reddish-scarlet colour.

Dahlia Mrs. Joynton Hills (single).—The flower is orange coloured and buff, the base of the florets being of rich crimson.

Dahlia Mrs. Landale.—A garden Cactus variety with rosy-pink florets on a yellow ground.

Dahlia Hon. Mrs. Greville.—Also a garden Cactus variety, the colour being orange-yellow, suffused with salmon; a very handsome variety. These were exhibited by Messrs. J. CHEAL & SONS, Crawley.

Dahlia Princess Juliana (Peony flowered).—A pure white variety. From Messrs. WHITELEGG & PAGE, Chislehurst.

Dahlia Sweet Briar.—A garden Cactus variety of fine rose colour.

Dahlia H. L. Brousson (Cactus).—The colour of this variety is delicate salmon on a pale yellow ground. A fine variety of the best exhibition type. These two were shown by Messrs. STREDWICK & SON, St. Leonards.

Dahlia Ouida (single).—A shapely flower of salmon-rose shade and crimson centre.

Dahlia Loveliness (single).—This variety is rose-coloured, with crimson centre. These two were shown by Mr. M. V. SEALE, Sevenoaks.

Dahlias Minerva and Loveliness.—These belong to the Cactus-flowered section, and they were exhibited by Mr. CHARLES TURNER, Slough.

The National Dahlia Society made awards at the same meeting, granting First-class Certificates to Hon. Mrs. Greville, Ouida and Loveliness, described above; also to Bridal Crown, George Ireland, Clarissa, Mrs. Usmar, Rosette, Butterfly and The Earl.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, Gurney Wilson, J. Wilson Potter, H. Ballantine, W. H. White, H. G. Alexander, W. B. Hatcher, W. P. Bound, Walter Cobb, J. Cypher, Chas. H. Curtis, W. Thompson, F. J. Hanbury, Henry Little, Clive Cookson, R. G. Thwaites, W. Bolton, and de B. Crawshay.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver-gilt Flora Medal for a fine group, the principal feature in which was a batch of *Vanda coerulea*, all the plants being profusely-flowered. With these were the rare natural hybrid *V. amona*, and many choice and interesting species, one of the most extraordinary plants being the provisionally-named *Coryanthes Sauderi*, a very large flower allied to *C. macrantha*. The fleshy, lower part is yellow, spotted inside with purple, the neck-like middle showing several raised rings, and the apricot-coloured hood like upper part curved downward. There was also a pale yellow form of *C. punctata*; a singular little *Zygopetalum*; several plants of the new and pretty *Dendrobium Sauderae*, *Cattleya Adula* "Sunray" especially fine; *Laelio-Cattleya Walter Gott* (L.-C. *Blechneyensis* × *C. bicolor*), a very pretty bronze-orange flower with ruby-magenta lip; *Cyclopogon pandurata* and *Notylia sagittifera*.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver Flora Medal for an attractive group, the central plant in which was the noble *Cattleya Iris King Edward VII.*, which received a First-class Certificate. The group also included several fine varieties of *Laelio-Cattleya Blechneyensis*, L.-C. *eximia*, L.-C. *Pacavia*, fine varieties of *Cattleya Adula*, *Sophrro-Cattleya Chamberlainiana*, and other crosses of *Sphronitis grandiflora*; several

good specimens of *Cattleya Mrs. J. W. Whiteley*, *Miltonia Phalenopsis*, *Odontoglossum ardentissimum* and other *Odontoglossums*.

Messrs. CHARLESWORTH & Co., Haywards Heath, received a Silver Flora Medal for a group in which showy-flowered plants of varieties of *Cattleya Iris*, *C. Adula*, *C. Venus*, the noble *Lælio-Cattleya St. Gothard*, and *L. C. callistoglossa* were specially fine. *Brasso-Cattleya Moneta* (*C. Gaskelliana alba* × *B. C. Mrs. C. Maron*), by its fine shape and substance, well exemplified the advantages of secondary crossing. Among pretty species noted were *Ciribaea viridipurea*, *Notylia sagittifera*, the rose-tinted *Rodriguezia secunda*, *Acineta chrysantha*, the rare *Chondrorhyncha fimbriata*, and a grand variety of *Oncidium Kramerii*.

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, were awarded a Silver Flora Medal for a varied and interesting group of plants which included good forms of *Cattleya Iris*, *C. Adula*, and other showy hybrids, the long sprays of yellow *Oncidium Marshallianum* being also effectively displayed. With these were a good dark violet-flowered *Bollea Lalindei*, *Ionopsis paniculata*, *Coleogyne Micholitzii* and other

Warszewiczii respectively; the parentage could be distinctly traced in the beautiful flowers of the progeny. Some *Brasso-Cattleyas* and *Sophro-Cattleyas* were also shown.

Messrs. MANSSELL & HATCHER, Rawdon, Yorks., staged a group for which a Silver Flora Medal was awarded. It contained some fine specimens of *Lælio-Cattleyas* and hybrid *Cattleyas*, *Cattleya Iris* varieties, forms of *C. Adula*, and good *Lælio-Cattleyas* were, as in most of the other groups, the most prominent. Among *Odontoglossums*, *O. crispum-Harryanum*, *O. ardentissimum*, and others were remarked, such as *Cypripedium Rossetti*, the dark-coloured *C. St. Alban*, *C. Chas. Richman*, and others noted were *Brasso-Cattleya Digbyana Mendelin*, *B. C. Thorntonii*, the pretty *Dendrobium Sandera*, *D. bigibbum*, and *Odontoglossum grande*.

Mr. E. V. Low, Vale Bridge, Haywards Heath, was given a Silver Banksian Medal for a good group of fine varieties of *Cattleya Iris*, *C. Adula*, *C. Armstrongie*, *C. stalanta*, and others. In the centre of the exhibit was a fine specimen of *Epidendrum floribundum* and another of *Bulbophyllum Lobbi Colassus*, with four flowers, and besides these there were two finely-flowered plants

fig. 9 in *Gard. Chron.*, July 9, 1893, p. 31) with cream-coloured flowers spotted with purple and having a differently-shaped lip to the other species; a pretty little *Dendrobium* resembling *D. secundum*, the brightly-coloured *Sophro-Lælio-Cattleya pumeximia* (*L. pumila* × *S. L. eximia*), and others.

Messrs. STANLEY & Co., Southgate, staged a small group which included varieties of *Cattleya iridescens* (*Eldorado* × *bicolor*); these vary considerably, but the flowers are consistent in some shades having yellow on the isthmus of the lip. This firm also showed *Cypripedium A. de Lairese* with eight flowers, and a plant of *Cattleya Gaskelliana alba*.

Messrs. WILLIAM BULL & SONS, Chelsea, showed a fine specimen of *Odontoda Charlesworthii*, *Cattleya Iris* and *C. Maronii aurea*.

Mr. W. MILLER, Clarkson Nurseries, Wisbech, showed a selection of *Lælio-Cattleyas*, *Cattleyas*, *Cypripediums*, &c.

W. P. BURKINSHAW, Esq., Hessle, Hull (gr. Mr. Barker), exhibited *Lælio-Cattleya Ivernia* var. *Muriel Wilson*, a large and beautiful flower with broad, rosy-lilac sepals and petals, the lip being deep claret-crimson; *Cattleya Iris aurifera*, with golden sepals and petals; and a good *Brasso-Cattleya Plato* (*B. Digbyana* × *C. granulosa Schofieldiana*) were also noticed.

Mrs. NORMAN COOKSON, Oakwood, Wylam-on-Tyne (gr. Mr. H. J. Chapman), sent *Cypripedium Angela* (*niveum* × *Fairrianum*), a charming little flower; *C. Sybil superbum* (*Francisæ* × *Fairrianum*), an elegant flower with a rose-coloured dorsal sepal margined with white, and with dark lines, the petals also being tinged with rose and gracefully decurved; and *C. Chapmaniae* (*Calypto* × *Fairrianum*), with yellowish-green ground colour, the upper half of the dorsal sepal being white, and the base bearing purple-veined lines.

Messrs. JAS. VEITCH & SONS, Royal Exotic Nurseries, King's Road, Chelsea, showed *Neobenthamia gracilis* with many terminal heads of its pretty white flowers purple-spotted on the labellums and column.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cattleya Adula King Edward VII. (*Dowiana aurea* × *bicolor*), from H. S. GOODSON, Esq. (gr. Mr. G. E. Day).—This was pronounced to be the finest *C. Iris* yet shown, the flowers being among the largest and of perfect shape. The sepals and petals are yellowish-sap-green, with an obscure pale rose veining, the broad front of the lip glowing with amethyst-purple.

Lælio-Cattleya Berthe Fournier magnifica (*L. C. elegans* × *C. Dowiana aurea*) (see fig. 37), from Lieut.-Col. Sir GEORGE L. HOLFORD, Westonbirt (gr. Mr. H. G. Alexander).—The Westonbirt type of this handsome flower is well known, and many fine varieties of it have been shown, but in most of them the form of the lip has been nearest to *C. aurea*. This variety, *magnifica*, is quite different, the lip being displayed as in *C. Iris*, but much broader. The sepals and petals are reddish-rose, with a golden-yellow glow, and the lip bright amethyst-purple. The spike bore six fine flowers.

AWARDS OF MERIT.

Cypripedium Angela (*niveum* × *Fairrianum*), from Mrs. NORMAN COOKSON (gr. Mr. H. J. Chapman).—A charming white flower of good shape, the upper sepal, lip, and petals bearing dotted lines and markings of purple. The centre of the staminode is dark green.

Odontoda Cecilia (*C. Noctiana* × *O. Wiganianum*), from R. G. THWAITES, Esq. (gr. Mr. J. M. Black).—A new and, when perfected, a fine break, the flowers being of good size and shape. The ground is cream-white, densely spotted with Indian red, the lip bearing distinct blotches of the same colour each side of the crest.

Cattleya Adula Thwaites's variety, from R. G. THWAITES, Esq.—A grand flower, with rosy-lilac tinted flowers and a very broad crimson-purple lip, the centre being the darker, and the base having orange-coloured markings.

BOTANICAL CERTIFICATE.

Bulbophyllum polyblepharis, from Sir TREVOR LAWRENCE, Bart., K.C.V.O.—A remarkable little species, with leafy growth, as in some of the small *Pleurothallis*, the dark-purple flowers being borne singly on slender scapes, 2 inches high.

[Photograph by J. Gregory.]

FIG. 37.—LÆLIO-CATTELEYA BERTHE FOURNIER MAGNIFICA.

(Awarded a F.C.C. at the Royal Horticultural Society's meeting on the 13th inst.)

Cyclogynes: *Bulbophyllum Lobbi*, *B. Godseffianum* and *B. Dearei*; *Epidendrum Brasovale*, *Cirrhopetalum Mastersianum*, *C. pulchellum*, a fine plant of *Zygopetalum maxillare Goulieri*, and another of *Cyrtopodium punctatum*.

R. G. THWAITES, Esq., Chessington, Christ Church Road, Streatham (gr. Mr. J. M. Black), was awarded a Silver Flora Medal for an interesting group of hybrids raised at Chessington, the *Cochlidia* crosses being specially noteworthy. One of these, *Odontoda Cecilia*, a new break, secured an Award of Merit, as did the handsome *Cattleya Adula Thwaites's variety*, *Odontoda Wilsonii* (*C. vulcanica* × *O. Pescatorei*) is a neat flower with whitish ground colour, the inner parts of the segments being coloured a rosy-lilac and the lip showing *O. Pescatorei* markedly, as it invariably does where that species is used as a parent. *Cochlidia Thwaitesii* is a standard variety now that it is established, its varied tints of rose and purple being very attractive. There were three plants obtained from crosses with *Cattleya superba*, the other parents being *Cattleya Dowiana aurea*, *C. Harayana*, and *C.*

of *Cypripedium Jas. H. Veitch*, the one with four and the other with three flower-spikes.

Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander), sent the beautiful *Lælio-Cattleya Berthe Fournier magnifica* (see Awards), and *L. C. Golden Fleece*, the latter a charming yellow-flowered variety.

Sir JEREMIAH COLMAN, Bart., V.M.H., Gatton Park (gr. Mr. Collier), staged a group of much botanical interest. Prominent was a fine plant of the singular *Bulbophyllum lemniscoides*, with three drooping plume-like racemes; also *Eria stellata*, with a tall spike of white flowers; the fine white *Dendrobium Phalenopsis* "Gatton Park variety," which has violet marking on the lip. A curious hybrid *Spathoglottis*, between *S. kewensis* and *S. Colmanii*, with white flowers and a lilac tint on the column and lip; *Cattleya Gaskelliana corubescens*, and a hybrid between *Odontoglossum Edwardii* and *O. luteopurpureum* were also shown by this exhibitor.

Sir TREVOR LAWRENCE, Bart., K.C.V.O., Bnrford (gr. Mr. W. H. White), showed the very distinct and pretty *Stanhopea Rodigasiana* (see

The lanceolate sepals are extended perpendicularly, the projected lip is densely hairy, and the petals are small.

CULTURAL COMMENDATION

To Mr. W. H. White (Orchid grower to Sir Trevor Lawrence, K.C.V.O.) for a splendid plant of *Dendrobium Hockerianum* (chrysois) ; the long, slender stems bore a dozen sprays of large, yellow-fringed-lipped flowers, with dark centres

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair); and Messrs. J. Cheal, C. G. A. Nix, W. Jelferies, V. Bates, J. Davis, G. Reynolds, O. Thomas, J. Harrison, H. S. Rivers, W. Poupard, C. Foster, A. Dean, G. Hobday, J. Vert, J. Willard, G. Wythes, W. Pope, and J. Lyne.

Messrs. T. RIVERS & SONS, Sawbridgeworth, staged a singularly beautiful collection of Apples and Plums gathered from pot trees. Peasgood's Nonesuch Apples were coloured superbly, and hardly less so were those of Cox's Orange Pippin and Ribston Pippin. The coloured Plums were Reine Claude D'Altham, Late Prolific, Grand Duke, Emperor, Admiral, Kirke's, President, Late Transparent, and Monarch. White and yellow Plums included Early Transparent, Decaisne, Reine Claude, Transparent Gage, Golden Transparent, and Jefferson. (Silver-gilt Knightian Medal.)

C. J. CAYLEY, Esq., Tunbridge Wells (gr. Mr. Poulton), showed 15 bunches of excellent Grapes, including the varieties Madresfield Court, Black Hamburgh, Frankenthal, Gros Maroc, and Foster's Seedling. (Silver Knightian Medal.)

Messrs. W. PAUL & SON, Waltham Cross, staged a number of well-grown Pear trees in pots, all heavily fruited. Among them were Pitmaston Duchess, Beurré Diel, Beurré Clairgeau, Beurré d'Anjou, Marie Louise, Bergamotte Esperen, Beurré Alexander Lucas, Doyenné du Comice, and Margaret Marrillat. (Silver Knightian Medal.)

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, sent superb fruits of their new cooking Apple, the Rev. W. Wilks, and of the dessert variety, St. Everard.

A Cultural Commendation was made to a dish of Pear Doyenné Boussoch, from Mr. W. BANISTER, the fruits being very handsome, but the flesh rather dry.

Mr. G. W. MILLER, Wisbech, showed a large number of Apples, including Red Victoria. (Silver Banksian Medal.)

Messrs. G. BUNYARD & Co., Maidstone, had a collection of 75 fruit trees in pots, the display occupying 70 feet length of staging; also many dishes and baskets of gathered fruits. Of Peaches, as trees, were Sea Eagle, Duchess of York, Princess of Wales, Albatross, and Thomas Rivers. Grapes were represented by Muscat of Alexandria and Black Hamburgh. Plums included numerous trees of Golden Drop; Pears Emile d'Heyst, Princess, St. Luke, Marie Benoist, Fondante de Thirriott, and Beurré Diel. Of Apples, Pomona, Wealthy, Peasgood's Nonesuch, Gascoyne's Scarlet, Allington Pippin, Mother, Charles Ross, and Cox's Orange Pippin were splendidly shown. There were also numerous small fig trees and gathered fruits. (Gold Medal.)

Messrs. CLIBRAN & SON, Altrincham, set up a remarkable collection of Celery, comprising 24 named varieties. The samples were exceedingly clean, well blanched, and evidently of solid texture. A selection of the white sorts are Market White, Clibran's White, Empress, Jersey Lily, and Wright's Giant. Pink: Favourite, Clibran's Pink, Grove Pink, and Aldenham Pink. Reds: Standard Bearer, Williams' Matchless, and Leicester Red. (Silver Knightian Medal.) This firm also received a Cultural Commendation for six pot plants of their Exhibition Parsley.

AWARDS

FIRST-CLASS CERTIFICATES.

Apple Rev. W. Wilks.—Messrs. JAS. VEITCH & SONS were awarded a First-class Certificate for this yellow-skinned cooking Apple, which received an Award of Merit several years since. This beautiful Apple is the result of crossing Peasgood's Nonesuch with Ribston Pippin. It is singularly precocious as a bearer, fruiting on both maiden and on two-year-old trees.

Apple Red Victoria.—An Apple of wonderful colour, which penetrates into the flesh. It is a great cropper; and fruits have been shown on many occasions.

AWARDS OF MERIT.

The following two varieties of Potatoes were, after cooking and trial at Wisley, granted Awards of Merit:—Prima Donna, from Mr. A. CHAMBERS, Tunbridge Wells, and Palmeny Early, from Messrs. BARR & SONS. An Award of Merit was also given to a tall, late, long-podded Pea grown at Wisley, where it was received from Messrs. JAS. CARTER & Co., Holborn, described as seedling 223.

ROYAL HORTICULTURAL SOCIETY OF IRELAND.

AUGUST 23.—The autumn show organised by the Royal Horticultural Society of Ireland was held on this date in Lord Iveagh's grounds, St. Stephen's Green, and was a great success. In all departments, including flowers, fruit and vegetables, the number of entries totalled 698, a very considerable advance upon the number for the autumn show of last year. The floral display was a particularly beautiful one, and one of the most interesting held under the auspices of the society for many years past. There was a splendid display in the Sweet Pea and Rose classes. In the former classes, one of the special features of the show was the exhibit sent in by Mr. EDWARD COWDY, Queenhall, Loughgall, which was awarded the challenge cup presented by Sir John G. Nutting, Bart. In the champion class for Sweet Peas, Mr. Cowdy's exhibit was awarded the society's Gold Medal. In the stove and greenhouse plant sections, the exhibits were of an extremely gratifying character judged from the standpoint of careful cultivation and excellence of results. In this section, the exhibits shown by Mr. F. A. MILLAR and Sir ERNEST COCHRANE were particularly deserving of notice, and won high commendation. In the Carnation class, the Watson Challenge Cup was awarded to Mrs. HELY-HUTCHINSON. Roses were very largely shown by private exhibitors and members of the trade, and the display in that department of the show was up to a very high standard. In the traders' sections, the displays of Roses made by Mr. HUGH DICKSON, Belfast, and Messrs. ALEXANDER DICKSON & SONS, LTD., Dublin, were particularly good. Messrs. W. DRUMMOND & SONS were awarded a Gold Medal for a very large, varied, and tastefully-arranged exhibit of hardy flowers, Shrubs, and Alpine plants, comprising some 300 species and varieties, some of which were quite new. A Gold Medal was also awarded to Mr. S. A. JONES, Forest Lodge, Gowran, County Kilkenny, for a large and varied collection of Gladioli. Messrs. CHARLES RAMSAY & SONS, Royal Nurseries, Ballsbridge, were awarded a Silver Medal for a collection of flowers and plants. Messrs. WATSON & SONS, Clontarf Nurseries were awarded a Silver Medal for a collection of border Carnations.

CARLISLE HORTICULTURAL.

AUGUST 31, SEPTEMBER 1.—The third annual show was held in the large Market Halls on these dates, and was a great success. There was an increased number of entries in all the classes, especially in those reserved for amateurs. Hardy flowers were scarcely so fine as usual, owing to the unfavourable weather, but fruit was of excellent quality, especially Apples shown by Mr. JOHN MILLIGAN, Scotby Lane, Carlisle. The county authorities (Mr. W. B. LITTLE, horticultural instructor) staged an exhibit of Apples and bottled fruits. There was keen competition in the vegetable classes, the competitors including Mr. EDWIN BECKETT, of Aldenham House Gardens, Hertfordshire.

Mr. HUGH DICKSON, Belfast, won the 1st prize for 36 blooms of Roses, distinct, and Mr. THOMAS PRIDE, Schoolhouse, Canonby, had the best exhibit of 12 Rose blooms. Sweet Peas were shown numerously; Mr. JOHN FLETCHER, Auchin Heath, Lanarkshire, had the winning stand in Mr. Robert Bolton's classes for 12 bunches, showing popular varieties. Messrs. Robert Sydenham, Ltd., Birmingham, also offered prizes for Sweet Peas, including a challenge cup. The

trophy was secured by Mr. GRAHAM, Morville, Carlisle. Mr. JOHN FLETCHER showed the best nine vases of Sweet Peas, Mr. EDWARD KEITH following.

Mr. GEORGE BOWNESS, Busby, proved the 1st prize winner in the classes for 12 vases of early-flowering Chrysanthemums and 24 varieties of Cactus-flowered Dahlias. Some good groups of hardy flowers were staged; for 12 kinds, Mr. J. HAY, Carlisle, won the 1st prize easily; 2nd, Mr. JOHN ROBERTSON, Carlisle.

In the fruit classes some excellent Grapes were seen. For two bunches of a black variety, Mr. WM. SCOTT, Eden Hall Gardens, Penrith, was the most successful exhibitor with Madresfield Court; 2nd, Mr. EDWARD KEITH with Black Alicante; Mr. H. SMITH, Keswick, showed the finest bunch of Black Hamburgh, and Mr. T. FIXTER had the best white Grapes.

In the vegetable classes some fine produce was seen. The Hon. VICARY GIBBS (gr. Mr. E. Beckett) proved irresistible in the class for a collection of 12 kinds.

There were numerous non-competitive exhibits, the more important being staged by Messrs. SUTTON & SONS, Reading (Large Gold Medal); Messrs. GEO. FAIRBAIN & SONS, Botcherby Nurseries (Large Gold Medal); Messrs. JOHN FORBES, LTD., Hawick (Gold Medal); Mr. JOHN MILLIGAN, Carlisle (Gold Medal); Messrs. LITTLE & BALLANTYNE (Silver-gilt Medal); Messrs. JOHN STORMONTH & SONS, Kirkbridge (Silver Medal); Messrs. CLARK BROS., Carlisle (Silver Medal); Messrs. HERD BROS., Penrith (Silver Medal); Messrs. ALEC McLAUGHLIN, Stranraer (Silver Medal); and Sir BENJAMIN SCOTT (Silver Medal).

ORSETT AND DISTRICT AGRICULTURAL AND HORTICULTURAL.

SEPTEMBER 8.—This society held its sixteenth annual show as usual in the park adjoining Orsett Hall, by the permission of the President, Major F. H. D. C. Whitmore. The show was, on the whole, an improvement upon those of previous years; the entries were more numerous, and the quality of the exhibits, in the majority of classes, was excellent. Hardy fruit is always a strong feature of the Orsett Show, and this year remarkably fine specimens of Apples were staged, the fruits being extra large, clean, and in some cases, coloured beautifully. In the class for a half-sieve of Apples, packed ready for market, Mr. T. RIDGEWELL, Orsett, was placed 1st, with fine examples of Worcester Pearmain; Mr. T. M. READ ANDREWS, Bulpham, was an excellent 2nd. For 12 fruits of Worcester Pearmain Mr. W. SUTTON, Orsett, was awarded the 1st prize, Mr. T. RIDGEWELL being 2nd, and these exhibitors won most of the prizes in other classes for Apples. In the class for four kinds of fruits Mr. CONINGSBY, Stanford le Hope, was awarded the 1st prize, staging good Plums, Morello Cherries, Figs, and Peas; Mr. W. SUTTON and Mr. T. RIDGEWELL being 2nd and 3rd respectively. Mr. NEIGHBOUR had the best four dishes of Peas. For four dishes of Plums Mr. W. SUTTON was placed 1st, staging fine fruits of Monarch, Diamond, Jefferson's and Victoria. Mr. C. CONINGSBY had the best two bunches of Grapes, staging Black Hamburgh; 2nd, Mr. C. BUTCHER, Grays, with Black Alicante. Mr. T. SUTTON had the best two dishes of Peas; Mr. C. HOWARD, Orsett, the best two dishes of Plums, and Mr. F. W. FOX the best single dish of Plums. Cut flowers, Dahlias, Asters, Roses and other hardy flowers were shown well, also button-hole sprays, table decorations, and vegetable-

NATIONAL CHRYSANTHEMUM.

TRIAL OF EARLY CHRYSANTHEMUMS.

SEPTEMBER 10.—On this date the members of the Floral Committee visited Messrs. W. Wells & Co.'s nurseries at Merstham, to inspect a trial of early-flowering Chrysanthemums. The following varieties were selected for distinction, and marked with three crosses:—Alexandra, Brezier's Beauty, Chestnut, Dorothy, Esther, Eva Graham, Dr. Ingram, Goldace, Hilda's Favourite, Lily Ovenden, Little Nell, Marie Corelli, Mary, Masterpiece, Nellie King, Parapan, Prolific, Ruby, and Sunset.

NATIONAL DAHLIA.

SEPTEMBER 7, 8.—Since the amalgamation of this Society with the London Dahlia Union two exhibitions have been held annually. The first one, which is usually the more important event, for the present season, took place, as in former years, at the Crystal Palace on these dates. The weather was fine, and the attendance on the opening day was greater than usual, but on Friday the number of visitors was small.

NURSERYMENS' CLASSES.

The Show varieties still take precedence in the schedule, and the largest class in this section was arranged for 48 blooms, distinct. There were three entries, the 1st prize being won by Mr. JOHN WALKER, Thame, whose best blooms were Chieftain (purplish-lilac), Blush Gem, T. W. Girdlestone (a grand variety of richest purple colour), Purple Prince, Daniel Cornish (reddish), Wm. Rawlings (crimson and purple), Mrs. Slack, Tom Jones, Mr. Glasscock, Southern Queen, John Hickling (a grand yellow variety), A. Rawlings (very choice), Standard, John Walker (one of the best of white show Dahlias), Mariner, Diadem, and Mrs. Langtry (generally good in this show). 2nd, Mr. S. MORTIMER, Rowledge, Farnham, Surrey, with large, but hardly so refined, blooms as in the 1st prize exhibit. Some of the best were Blush Gem, Glowworm (orange red), Pleasance, Chieftain, Tom Jones (creamy with a suffusion of pink), David Johnson, and Florence Tranter (a variety with pale-coloured florets edged with purple). 3rd, Mr. W. M. TRESEDER, Cardiff.

In the smaller class for 24 blooms distinct, there were two exhibitors. Mr. M. V. SEALE, Sevenoaks, and Messrs. KEYNES, WILLIAMS & Co., Salisbury, 1st and 2nd prizes being awarded in this order. The blooms in both cases were only mediocre in quality. Mr. SEALE'S best examples were Daniel Cornish, Duchess of York, Gracchus, Chieftain, Eclipse, and R. T. Rawlings; whilst a selection of Messrs. KEYNES, WILLIAMS & Co.'s varieties included Mr. Glasscock, R. T. Rawlings, Wm. Rawlings, John Walker, Keynes Al, Miss Ormonde, and Mrs. Langtry.

Fancy Dahlias.—There were two classes exclusively for fancy Dahlias, and one for show and fancy Dahlias intermixed. The largest class for fancies was arranged for 18 blooms distinct, and it attracted three exhibitors. Mr. JOHN WALKER secured the 1st prize with a good display. Outstanding varieties in his exhibit were T. W. Girdlestone, Rev. J. B. Cann, Wm. Shaldon, Mrs. Saunders, M. Campbell, Comedian, and John Cocker. 2nd, Mr. W. M. TRESEDER, with much smaller blooms, although Walter Spriggs, Hugh Austin, and Emin Pacha were very good. 3rd, Mr. S. MORTIMER.

For 12 blooms distinct Messrs. KEYNES, WILLIAMS & Co. led with a very creditable stand, having such sorts as Rev. J. B. Cann, Dandy, Mrs. Saunders, Henry Clark, Tom Perryman, Gold Crest, and Matthew Campbell. Mr. SEALE followed closely, having specially good flowers of Claret Cup, Nansen, and Mrs. Saunders.

The better of two exhibits of show and fancy Dahlias intermixed was exhibited by Messrs. J. CHEAL & SONS, Crawley, the other exhibitor being Messrs. W. M. PEMBERTON & SON, Bloxwich, Walsall.

Cactus Dahlias.—The most important class for Cactus varieties is that in which a Silver Challenge Cup, valued 15 guineas, is offered for the 1st prize. Messrs. JAMES STREDWICK & SONS, Silverhill, St. Leonards, again proved invincible, making the 8th consecutive win. It is usual for this firm to show in this class their principal novelties for the year, and on this occasion they exhibited 11 new varieties in the display. The finest of these is named after Dr. Roy Appleton, the florets being pink with a yellow base and very pointed, giving a star-like appearance to the flower, the other new ones were H. L. Brousson (with thread-like florets, coloured dark rose passing to white in the centre), Mrs. Douglas Flemming, Golden Eagle (golden yellow passing to bronze at the tips), Tokyo (salmon and yellow), Arrow (bronze), Irresistible (a very heavy bloom, with incurved florets suffused with rose on a yellow ground), Snowflake (white), Viscount (brick red), Albatross (white), and Crystal (soft rose tipped with white). The other blooms included one of H. H. Thomas, which was awarded the Silver Medal offered for the best Cactus-flowered Dahlia in the Nurserymen's classes.

2nd, Messrs. J. BURRELL & Co., who had also a very choice exhibit, a selection of their varieties being Oswald, Monarch, Conquest, Ivernia, Satisfaction, Stormer, and Glory of Wilts. 3rd, Messrs. J. CHEAL & SONS.

Mr. JOHN WALKER led in the class for 12 varieties shown in bunches of six blooms, followed by Mr. SEALE, with Messrs. KEYNES, WILLIAMS & Co. 3rd, these being the only exhibitors.

There was a keen competition for 48 blooms distinct shown on boards, and Messrs. STREDWICK & SONS won the premier prize with a grand stand of blooms, the 2nd prize exhibit, shown by Messrs. JAMES BURRELL & Co., was also remarkable for its high quality, and even the 3rd group prize was effective.

Mr. W. M. TRESEDER was placed 1st for 24 blooms distinct; 2nd, Mr. JOHN WALKER.

There were two exhibits in a class for 12 varieties of garden Cactus Dahlias, 6 blooms of each variety arranged in a vase with hardy foliage in grasses, Messrs. J. CHEAL & SONS and Mr. M. B. SEALE were the only exhibitors; the 1st and 2nd prizes being awarded in the order of their names. Messrs. CHEAL showed such sorts as Snowdon, Hon. Mrs. Grauville, Ivy Shoe-bridge, and Mrs. C. Foster, arranged with Eulalia zebrina, Berberis, Maples, and Asparagus.

Pompon Dahlias.—These were shown remarkably well, Mr. CHARLES TURNER winning in the largest class, which was for 24 varieties in bunches of 10 blooms each. He showed Annie Doncaster, Darkest of All, Portia, Queen of Whites, Guinevere, Wilfred, Mary, Phyllis, Sylvia, Zerlina, Ideal, Cyril, Little Mary, Ganymede, Bacchus, and others. 2nd, Messrs. J. CHEAL & SONS with Annie Doncaster, Marietta, Bacchus, Elsa, Nerissa, Ganymede, Ideal, Girlie, and Phyllis. 3rd, Mr. M. V. SEALE.

Messrs. J. BURRELL & Co. excelled with 12 varieties, followed by Mr. JOHN WALKER.

Single Dahlias were rather less refined than usual. There were three exhibitors in the class for 24 varieties. Messrs. J. CHEAL & SONS being the most successful with good blooms of Miss Roberts, Elaine (white), Columbine, Victoria, Leslie Seale, Alice Castle, Kitty, and Miss Morland. 2nd, Mr. M. V. SEALE.

Paeony-flowered Dahlias, shown in vases, appeared unobtainably. Geisha (reddish orange), Bella Donna (blush) and Bayard (red and yellow), shown in Mr. C. TURNER'S 1st prize group, appealed to us most.

AMATEUR CLASSES.

There was rather more competition amongst amateur exhibitors, there being in one class no fewer than 10 groups. For 24 blooms of Show and Fancy Dahlias, distinct. Mr. H. COOPER, the Hamlet, Chippenham, was placed 1st for shapely, well-coloured blooms of R. J. Rawlings, Rev. Cann, H. Rawlings, Mr. J. Downey, Mabel, Chieftain, Mr. Peter MacFensey, H. Keith, J. Walker, Mrs. Saunders, Mrs. Langtry, Norma, and others. 2nd, Mr. G. DRASLEY, Nag's Head Hill, St. George's, Bristol, with a very good lot, including Tom Jones, Chieftain, T. Astens, D. Johnson, Mrs. Saunders, R. T. Rawlings, J. Walker, Pleasance, Dandy, and A. Rawlings.

Mr. COOPER was also 1st for 12 Show Dahlias, distinct, having six competitors, his closest rival being Mr. A. ROBBINS, 5, Prospect Place, Keynsham. In the smaller class for six blooms, Mr. CHARLES LUCKIN, Pulborough, Sussex, beat two other competitors.

Mr. COOPER had an easy win in the class for 12 blooms for Fancy Dahlias, distinct, and Mr. COUSINS, Chippenham, Wilts, was equally successful in the class for six blooms.

The Silver Challenge Cup, offered by the Crystal Palace Co. for six vases of garden Cactus Dahlias intermingled with suitable foliage, was won by the Rev. ARTHUR BRIDGE, Worth Rectory, Three Bridges, Sussex, and he also carried off the Silver Challenge Cup offered for the best exhibit of nine varieties of Cactus Dahlias shown in bunches of three blooms. The flowers of Mr. W. Marshall, H. H. Thomas, C. E. Wilkins, Snowdon, Prima Donna, and Indomitable were all excellent. 2nd, Mr. F. GRINSTEAD, Beauport Park, Battle, with another choice collection.

Mr. F. H. CURRY, 35, Osborne Road, Palmer's Green, was 1st in the class for six varieties having good blooms of Wm. Marshall, Rev. T. W. Jamieson, Brigadier, C. E. Wilkins, and Evening Star; 2nd, Mr. ED. M. WELLY, Berkhamsted.

Mr. H. PEERMAN, Glencross, Nantwich, excelled for 24 blooms shown on boards; Mr. CHAS. LUCKIN for 12 blooms; and Mr. A. P. IRONSIDE, 43, Park Lane, Chippenham, for six blooms.

Other winners of 1st prizes in the amateur classes were Mr. ED. E. BARTON, Greenwich, and Mr. TOM JONES, Rnabon, Wales.

Mr. M. V. SEALE showed the best six blooms of a variety of show or fancy Dahlia in Arthur Rawlings, and Mr. G. MORTIMER the best six blooms of a Cactus variety in C. E. Wilkins. There was very keen competition in both cases.

AWARDS.

FIRST-CLASS CERTIFICATES.

Minerva (garden Cactus).—A stiff-stemmed variety, the blooms being wine-crimson with yellow centre. Shown by Mr. C. TURNER.

Dr. Roy Appleton (Cactus).—A blush-coloured bloom with a yellow centre, very large.

New York (Cactus).—A very buff coloured flower with incurving revolute florets.

Onward (Cactus).—A pink variety with twisted florets.

Sweet Briar (garden Cactus).—A variety with stout, erect stems, bearing pink flowers with white centres. These four were exhibited by Messrs. J. STREDWICK & SON.

Cardinal (single).—A fiery red variety with yellow disc.

Mrs. Joynton Hicks (single).—A bronze-yellow flower with a crimson disc.

Glow (pompon).—An elegant flower of a rosy-buff shade flushed with mauve. These three were shown by Messrs. J. CHEAL & SONS.

NON-COMPETITIVE EXHIBITS.

Large Gold Medals were awarded to Messrs. H. CANNELL & SONS for Dahlias, and HOBBIES, LTD., for Dahlias and Roses.

Gold Medals to Messrs. T. S. WARE, LTD., for Dahlias, and Mr. J. T. WEST for Dahlias.

Silver-gilt Medals to Mr. F. BRAZIER for hardy flowers and Chrysanthemums, Mr. JOHN E. KNIGHT for Dahlias, and Mr. C. TURNER for Dahlias.

TRIAL OF SINGLE DAHLIAS.

A large deputation of members of the National Dahlia Society, with Mr. E. Mawley, V.M.H., as chairman, visited Messrs. J. Cheal & Sons' nursery at Charlwood, Crawley, Sussex, on Monday, 12th inst., for the purpose of examining a large trial of single Dahlias, conducted under the auspices of the Society and grown by this firm. The varieties were specially tested to determine their merits for garden decoration, with some consideration as to their suitability for exhibition purposes. In most cases four to six plants were seen of each variety, but in a few cases there were only two plants. There were numerous varieties, and all of them had been grown without thinning. Some were but 2½ feet, others 3½ feet or intermediate, but the heights were regarded as of less importance than habit of growth, freedom of blooming, and general effect for garden decoration. The following were awarded three marks:—Butterfly, Snowdrop, Ensign, Lady Bonifant, Amy, Winona, Rosemary, Bridge, Owen Thomas, Fugi San, Columbine, Kitty, Leslie Seale, Miss Morland, Miss Roberts, Royal Sovereign, Peggy, Rosebank Scarlet, Vesuvius, Cardinal, Mrs. Joynton Hicks, Rosy Gem, Mrs. W. Hood, and Morning Glory.

SCOTTISH HORTICULTURAL.

SEPTEMBER 6.—The monthly meeting of this association was held at 5, St. Andrew Square, Edinburgh, on this date. Mr. Massie, one of the vice-presidents, occupied the chair, and there was an attendance of 75 members.

Mr. J. S. Brunton, chairman of the Perpetual-Flowering Carnation Society, read a paper on "The Perpetual-flowering Carnation: its Past, Present, and Future." He first glanced at the historical aspect of the subject, beginning with the 16th century, when the wild *Dianthus Caryophyllus* first found a place in gardens. By the end of the same century, the plant had developed into a "border" Carnation, of which the present-day border Carnations are the direct descendants. The tree or winter-flowering type, which they called Remountants, was introduced by the French,

and was generally ascribed to Dalmais, who was prominently identified with their cultivation about 1844; but recent investigations have shown that Remontant Carnations were grown in the South of France nearly a century earlier under the name of Mayonnaise Carnations. These Remontants were introduced into America by Chas. Marc, of New York, after 1852, and other French growers in America having taken up their improvement, varieties were raised which surpassed all previous ones. The French Remontants were entirely superseded, and, on the introduction of Peter Fisher's "Mrs. T. W. Lawson," it was sold for the record price of 300,000 dollars.

Dealing with the present, Mr. Brunton took the period from 1900 to 1910, and he asked what were the French, who in the early stages of the plant's development had scored all along the line, doing for the Carnation? In brilliancy of colouring their flowers surpassed all others, but they had one unpardonable defect—they were "bursters." He, however, was inclined to think that possibly we were sacrificing too much to obtain perfection of calyx, and though he was not prepared to advocate any falling away from the standard set up by British and American growers, he thought we should get some French blood into our present stocks. Dealing with the uses of the perpetual-flowering Carnation as a cut flower, a pot plant, and a bedding plant, he said that as a bedder it had found a place in a number of gardens. The growing of the plant for market purposes was one of the most important branches of commercial horticulture, and there were large areas of glass devoted to this industry in the neighbourhood of London and at Iver, Safron Walden, Cheltenham, Dunstable, Balcombe, and other towns. In Guernsey hundreds of thousands of plants were grown for the export of flowers for the British market. On the continent of Europe, as well as in South Africa and Australia, the cultivation of Carnations was rapidly increasing, and the American trade in them was enormous.

Speaking of the future, Mr. Brunton said that one of the chief aims in the past had been to obtain large-sized blooms. That would always be an object for consideration, but hybridists would have to restore the Clove-like fragrance which had been sacrificed in the quest for size, form, and colour.

The exhibits at the meeting included about 50 varieties of perpetual-flowering Carnations, shown by Messrs. Todd & Co., Edinburgh; Fancy Pansies and Violas were shown by Messrs. Dobbie & Co., Edinburgh; Gloxinias and Begonias by Miss Burton, Polton; and a collection of vegetables from the City of Edinburgh Distress Committee's farm at Murieston.

The paper for the meeting to be held on October 4 will be on "Diseases of Fruit Trees," by Dr. A. W. Borthwick, Royal Botanic Garden, Edinburgh.

The annual excursion of the association took place on August 13, when, by the kind permission of the Marquis of Tweeddale and the Earl of Wemyss, about 80 of the members visited Yester and Gosford.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

SEPTEMBER 12.—The monthly meeting of this society was held at the Royal Horticultural Hall, Westminster, on the above date. Mr. Thomas Winter occupied the chair. Six new members were elected. The amount of sick pay disbursed since the last meeting was announced as £29 14s.

The annual dinner will be held on October 6 at the Waldorf Hotel, Aldwych, W.C. Mr. Edward Sherwood will preside on this occasion.

AWARDS AT THE BRUSSELS EXHIBITION.—The list of awards issued by the Superior Jury, subject to confirmation by the Belgian Executive Committee of the Exhibition, is published in the *Times*. It includes the following awards made to agriculture and horticulture:—Class 43: Appliances and Processes used in Horticulture and Arboriculture.—Diploma of Honour: NORTH BRITISH RUBBER CO., LTD., Edinburgh. Gold Medal: Messrs. ALEXANDER SHANKS & SON, LTD., London. Class 46: Trees, Shrubs, Ornamental Plants and Flowers.—Gold Medal: Mr. C. ENGLEMAN, Essex. Class 43: Horticultural and Nursery Seeds and Stock.—Gold Medal: Messrs. SUTTON & SONS, Reading.

Obituary.

THOMAS FRAZER.—With great regret we record the death of Thomas Frazer, for the past seven years foreman in the Royal Horticultural Society's Gardens at Wisley. The death occurred on Wednesday, the 7th inst., after an illness of only 24 hours. He had not enjoyed good health for some years, but for the last few months he had felt better, so that the end was unexpected. He served his apprenticeship in gardening under Mr. R. Simpson, gardener to Mrs. Alfred Backhouse, at Pilmore gardens, Darlington. After this time he was for some time conservatory foreman, and afterwards foreman in the fruitforcing department at Duncombe Park, Helmsley. Three years were spent as general foreman at Heythrop Park and four years at Richings Park, Slough. From his boyhood, Mr. Frazer had a special liking for hardy flowers, and ultimately he decided to specialise in hardy herbaceous plants, spending periods at the nurseries of Messrs. Backhouse and Sons, York, Messrs. Dobbie & Co., Rothesay, and Messrs. J. Veitch & Sons, Langley. When the Royal Horticultural Society took over the Wisley gardens, Mr. Frazer was appointed foreman, and here he remained to the end,

THE LATE THOMAS FRAZER.

superintending the work in the wild garden and hardy plant departments and lecturing on practical gardening to the students. He was a man of keen observation, gifted with a wholesome sense of caustic humour, but, except to those who knew him intimately, he was a man of few words. He was esteemed for his straightforwardness and simple sincerity, whilst the young men at Wisley loved him for the willingness with which he always gave counsel and advice. He was 51 years of age. The funeral took place at Langley Churchyard, Slough, on Monday last.

WILLIAM CHARLES COOPER.—We regret to record the sudden death, from heart disease, on the 8th inst., of Mr. William Charles Cooper, in his 61st year. Deceased had been gardener to Alderman F. Budgen, Reigate, Surrey, for the past 26 years. He was one of the oldest members of the Reigate, Redhill and District Gardeners' Mutual Improvement Association, and he attended a committee meeting of this association only a few days before he died. He took a great interest also in the Borough of Reigate Cottage Garden and Horticultural Society, of which he was a member. He was a well-known judge at most of the local flower shows.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

- Mr. H. STOPS, for the past 64 years Gardener to T. W. THORNTON, Esq., Brockhall, Wealdon, and previously Foreman at King's Waldenbury, Hitchin, as Gardener to Capt. W. B. HARRISON, Aldershawe, Lichheld, Staffs.
- Mr. GEORGE DUNCAN, lately employed in Hyde Park, as Head Gardener at Radley College, Abingdon, Berks.
- Mr. W. G. NEWMAN, for the past 2 years Gardener to Col. BARRINGTON, and previously with Messrs. JAMES CARTER & CO., as Gardener to Mr. MACKLIN, Kingshill, Great Missenden, Buckinghamshire.
- Mr. J. C. JENSON, for the past 2 years Gardener at Bosworth House, Husbands Bosworth, Rugby, as Gardener to Rear Admiral BACON, Wolston Manor, Coventry.
- Mr. GEORGE WILFLEY, for the past 6 years Foreman in the Gardens of the Right Hon. A. J. BALFOUR, M.P., Whittingham, Prestonkirk, as Gardener to WALTER WEBB, Esq., Malquott, Ewhurst, near Guildford, Surrey.
- Mr. CHARLES FROTH'S appointment given in the issue for September 3, p. 199, should read as Gardener to Lt.-General FORD CALTHORPE, R.C.B., Perry Hall, Perry Barr, Birmingham.
- Mr. J. R. WRIGHT, for 12 years Gardener to F. E. WALKER, Esq., Ravenshoe Manor, Thirsk, Yorkshire, as Gardener to Sir ROBERT ROSE, Preston Hall, Stockton-on-Tees, Durham.
- Mr. J. PRICE, for the past 13 months Foreman in the gardens at Nork Park, Epsom, as Gardener to J. COLMAN, Esq., Wick Hall, Hove, Sussex. (Thanks for donation of 2s. to the R.G.O.F. box.—EDS.)
- Mr. C. F. MOWL, for the past 3 years and 4 months Gardener to Sir FRANCIS WINNINGTON, Bart., Stanford Court, Worcester, and previously for many years Gardener to the late Mrs. CHAS. EDWARDS, Dolserau Hall, Dolgelly, N. Wales, as Gardener to Lieut.-Col. G. F. SCOTT, Penmaenuch, Dolgelly, N. Wales.
- Mr. THOMAS IRONSIDE, for the past 3 years in the Gardens, Ragley Hall, Alcester, and previously at Lathom Gardens, Ormskirk, a Gardener to Miss COCHRANE, Seemcote, Chichester, Sussex. (Thanks for 1s. for the R.G.O.F. Eds.)
- Mr. WILLIAM WOOD, for the past 3 years General Foreman at Powerscourt Gardens, Linniskelly, as Gardener to J. O. JAMISON, Esq., Doldan, Clonsilla, Co. Dublin.
- Mr. THOMAS NEVILL, for 3 years Foreman at Doddington Park Gardens, Nantwich, as Gardener to Mrs. SCULLY, Culmington Manor, Craven Arms, Salop.
- Mr. A. E. I. ROBERTS, for nearly 6 years Gardener to H. PENT BRIDGEMAN, Esq., Sudeley Castle, as Gardener to F. S. PRICE, Esq., Middlemarch, Stoughton Drive, Leicester.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

••• *The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.*

ASTERS DYING: *C. G.* Your Asters are attacked by *Lipura ambulans*, one of the spring-tails. Soot and lime, as you suggest, are the most efficient remedies, especially if worked into the soil, as it is in this latter that the pests breed. They are most abundant in damp soil and wet seasons.

BARK INFESTED WITH INSECTS: *G. D. E.* The pieces of bark are badly attacked by a species of chermes. These belong to the green fly or aphid family. The trees should be washed with paraffin emulsion in the spring, and again later when the larvae are hatching out.

BEGONIA FLOWER MALFORMED: *A. C.* The blooms exhibit crested, a character that is fixed in some varieties.

BEGONIA GLOIRE DE LORRAINE: *J. H. C.* The injury is caused by an eelworm in the leaves—*Aphelenchus olesistus*. The pest breeds in the soil. Dust the stems when damp, and also the surface of the soil, with a mixture of Tobacco dust and flowers of sulphur.

CARNATIONS DISEASED: *A. I. M.* Carnation rust is present. If the plants are not blooming, spray the foliage with Bordeaux Mixture at half strength. Otherwise, sponge the leaves with a rose-red solution of permanganate of potash.

CLEMATIS FOR EXAMINATION: *Old Subscriber.* No American Blight is present on the specimen you send, but it has been injured by a mining maggot. Remove the surface soil, and replace it by fresh. Ammonia water can only be used when there is no crop on the land. One gallon in 25 gallons of water is the proper proportion.

CLUB-LIKE OUTGROWTHS ON PEA ROOTS: *Richmond.* The knots on the roots are normal productions. They are not due to inferior seed, nor are they a cause of failure of crop.

CORDON APPLE TREES: *E. C.* We advise you to take out the second row which was planted two years ago. Lift the trees when they have shed their foliage in the late autumn, and transplant and train them as you suggest. This will leave a clear space of 3 feet in the row between the trees that were planted three years ago, but, as no useful purpose will be served by allowing a space of more than 2 feet between the Cordons in the row, these should be rearranged. Take up every other tree, and plant two of the two-year-old trees, thus giving them all a space of 2 feet. Shorten the roots a little before replanting, and train the stems to the wires at the same angle as before. Thus trained the trees make a more fruitful growth than would be the case were they trained in an upright position: the slight check thus given to the flow of the sap causes the wood-buds to push more regularly into growth the entire length of the stems. Your views regarding the evils resulting from the crossing of the two rows of Cordons, as in your case, are quite correct.

CYANIDING PLANT HOUSES: *H. W.* The quantities given on p. 171 were intended for 1,000 cubic feet interior space.

FIG TREE FAILING TO FRUIT: *E. C.* A Fig tree planted against a south wall should bear fruit if the branches are properly thinned and the young growths pinched during the summer months. Your tree may have been allowed to make uninterrupted growth ever since it was planted, and this would account for its not bearing fruit. Fig trees should be pruned early in May, as soon as they begin to push into leaf. By pruning the trees at that season the wounds "bleed" very little, as the expanding leaves draw away the sap; moreover, it can then be determined which of the shoots are best furnished with embryo fruits. These should be retained, cutting away many of the old shoots that are not required to furnish the wall or trellis. Allow a space of 6 inches between the branches, which should be trained in the shape of a fan, laying in one shoot of the current year's growth between these. Pinch out the points of any extra strong shoots when about 2 feet long and the weaker ones at 18 inches. Even at this late date a judicious removal of superfluous growths of the current year would prove beneficial in admitting light and air to ripen up the remaining shoots. A little root pruning some time in September would also be helpful. Simply dig out a trench at about 2 feet from the stem of the tree, cutting away all roots found outside the 2 feet space, and working out some of the soil from under the base of the tree, so as to cut clean away any extra strong roots that are growing downward. Replace the soil with the addition of a little lime rubble or old plaster. Thus treated, your Fig tree should bear fruit next year, and a full crop the following and succeeding years.

GRAPES: *D. W. C. II.* There is no disease present. The unfavourable appearance of the berries is the result of wrong cultural treatment.

HARDY HERBACEOUS PERENNIALS: *J. E.* (1) The following kinds of herbaceous perennials will flower before the end of June: Aconitum Napellus and its varieties, Alstromeria aurantiaca, Anchusa italica, "Dropmore variety," Antheicum Liliago, Aquilegia of various kinds, Baptisia australis, Campanula latifolia macrantha, C. latifolia, C. persicifolia and varieties, Centaurea montana, Coreopsis grandiflora,

Delphinium in variety, Dictamnus albus, Eremurus robustus, Geum coccineum, Gypsophila paniculata, Hemerocallis flava, Iris laevigata, Lupinus polyphyllus, Enothera fruticosa, Paeonia albiflora, Penstemon atrosanguinea, Primula japonica, Scabiosa caucasica, and Thermopsis montana. (2) The best time to root shoots of Romneya Coulteri is in spring. Select portions of the roots, cut them into lengths of 3 inches, and insert them in sandy loam, so that the top of the cutting is placed well below the surface of the soil. If warmth is afforded, it will be an advantage, but the cuttings will also form roots in a cold frame kept closed.

MELON DISEASED: *Foreman.* The trouble is due to Melon-rot, caused by Sclerotium melophthorum. When quite young, the fruit should be sprayed with liver of sulphur at the strength of 1 ounce in two gallons of water. The disease usually occurs on the leaves first, and later passes on to the fruit. No disease is present on the Carnation.

NAMES OF FRUITS: *S. M.* Braudley's Seedling.—*W. D.* & *S.* Worcester Pearmain.—*Carl Dahl, Sweden.* Jargonelle, a well-known variety in this country.—*Constant Reader.* Nectarine Elrige.

NAMES OF PLANTS: *A. H. Crower.* 1. Rudbeckia laciniata fl. pl.; 2. Lonicera Periclymenum; 3. Veronica spicata; 4. Senecio compactus; 5. Solidago lanceolata.—*F. J. B.* 1. Chrysanthemum lacustre; 2. Sedum spectabile; 3. Centaurea ruber; 4. Helianthus autumnale purpureum; 5. Helianthus multiflorus fl. pl.; 6. Statice latifolia.—*J. D. H.* 5. Helichrysum Stoechas.—*R. C. Day.* Fraxinus Ornus, the Manna Ash.—*Shrubbery.* 1. Gymnocladus canadensis; 2. Calceolaria tinctoria; 3. Calluna vulgaris fl. pl. the double-flowered Ling.—*Old Subscriber.* 1, not found; 2. Cytisus capitatus; 3. Solidago virgaurea; 4. Erica cinerea; 5. Calluna vulgaris; 6. Linaria cymbalaria.—*A. T.* 1. Cistus villosus; 2. Hibiscus syriacus; 3. Clerodendron foetidum; 4. Verbascum phoeniceum album.—*S. H. H.* 1. Helianthus multiflorus maximus; 2. H. Soleil d'Or; 3. H. multiflorus fl. pl.; 4. H. multiflorus (type); 5. H. mollis; 6. Solidago virgaurea nana; 7. S. Shortii; 8. S. multiradiata; 9, 10 and 11, varieties of Aster Novae Belgii; 14. Sedum spectabile; 15. Probably Saxifraga (Megasea) cordifolia. Send when in flower.—*A. P.* Origanum sylvium.—*A. C. L.* Ginkgo biloba; Maidenhair Tree.—*Aria.* Cattleya Imperator (granulosa × labiata).—*P. H.* 1. Cochlioda sanguinea; 2. Odontoglossum Lindleyanum; 3. Ada aurantiaca; 4. Oncidium pubes.—*Foreman.* 1. Polypodium vulgare; 2. Adiantum Capillus veneris; 3. Lastrea rigida; 4. Asplenium trichomanes; 5. A. viride.—*G. M., Derby.* 1. Salanum nigrum; 2. Polygonum cuspidatum; 3. Hypericum Androsænum; 4. Rosa rugosa; 5. Aster serotina; 6. P. lyctichum angulare.—*P. E. N.* The Dendrobium was not found.

NECTARINE TREE UNSATISFACTORY: *A. B.* The tree is perfectly healthy, and no fungus or insect injury is present on the fruit. The trouble is due to some error in culture.

PALMY FLOWERED DAHLIA: *I. G.* The variety is pretty, but does not show any advance on those already in cultivation.

PEACHES DROPPING: *Constant Reader.* Your system of culture appears to be correct. The only reason that we can suggest for the fruits dropping is that they were fully ripe, as were those you sent us. If they dropped when quite hard, the trouble may be due to over-cropping. The variety received should have been ripe at least a week or two since, as fire-heat was provided earlier in the season.

PEACH SEA EGLE: *J. W.* This variety is never first-class, even when well grown. As your specimen only weighed 2½ ounces, owing, possibly, to over-cropping, or some other defect in the culture, we are not surprised at the lack of flavour. Fruits of this variety should weigh from 12 ounces to 14 ounces.

PLUMS AND NECTARINES GUMMING: *Dun.* Gumming may be arrested by the application of common salt. This should be sprinkled on the soil under the trees at intervals, arranging so that 3 lbs. of salt is used during a year.

ROSES DYING: *H. B. J.* The stems are attacked by the Rose canker fungus—Coniothyrium Fuckelii. When the canker first appears in the form of a reddish-purple stain on the bark, it should be painted over with Stockholm tar, to which a trace of creosote is added.

TENNIS LAWN: *G. G.* With a view to leaving your flower border and Laurel hedge undisturbed, as well as to economise labour, and, at the same time, preserve your Chestnut trees in a healthy condition, we should advise you to remove the necessary soil from the positions marked A and entrance side of tennis lawn on your sketch. Make the lawn nearly—if not quite—on a level with the low points (B, B, B, and the Chestnuts). The ground thus lowered may be made to slope in a straight longitudinal line inward, 18 inches from the surface of the flower border down to the newly-made horizontal plane, more or less, according to the natural run of the undisturbed ground. This sloping bank at the side and ends of the tennis lawn would not only afford support to the somewhat elevated flower border, but would also give a finish to the whole work when completed. The greensward entrance to the tennis lawn would be lowered for a distance of 10 feet or 12 feet in an outward curving direction, and about 6 feet wide, to correspond with the altered level of the tennis lawn, the soil sloping outward on either side to the natural level of the adjoining greensward. Cinders, coarse gravel, or brickbats broken into fairly small pieces and laid on evenly over the ground to the thickness of 4 or 5 inches would afford a good drainage. These materials should be covered with soil to the thickness of 9 or 10 inches, made firm and level, with a little fine soil on the top on which to relay the turves, that is if the grass is free from weeds. Otherwise, a good mixture of lawn grass seed should be sown evenly and fairly thickly, as soon as the ground is ready, say, the end of the present month, or early in October, scattering a little fine soil over the seed, raking it over with a fine rake, and afterwards rolling it, in order to compress the seed and soil, and, at the same time, produce a firm, even surface. If the seeds cannot be sown at the time indicated, let them be sown at about the end of February, or as early in March as the condition of the ground will permit of the work being done. If the old turves are good enough to relay, a mixture of fine soil and leaf-mould should be scattered over them, and brushed well about, so as to fill in the spaces between them and the newly-laid turves should be rolled frequently after rain, in order to produce a firm, even surface. The lawn should be ready for the tennis players next season. To raise the earth 4 feet high around the Chestnut trees would shorten their lives and mar their appearance in the near future. Should you find it necessary to raise the ground a foot or so at the spot marked B B B in your sketch plan, make a good, firm bank, sloping 2 or 3 feet in the direction of the plantation. This will be sufficient to resist any lateral pressure.

TOMATOS FAILING TO COLOUR: *Taffy.* The trouble is due to a lack of potash in the soil. Dress the ground with sulphate of potash.

TRANSPLANTING DENDROMECON RIGIDUM: *V. A Hyde.* This plant is more difficult to transplant than Romneya, and it is not advisable to shift your specimen if the plant is of fairly large size. It would be better to take some cuttings and grow them on in a pot. Cuttings of young wood taken off with a heel or small piece of the old stem will root in early summer if placed in a close, warm frame.

VEGETABLES FOR NORTHERN NIGERIA: *J. H. B.* Most of the quick maturing vegetables might possibly be grown in certain seasons. The following might be sent for trial:—Cabbage, Carrots, Cauliflowers, Peas, Parsnips, French Beans, Runner Beans, Spinach and Leeks.

SUMMER FLOWERS IN THE SOUTH-WEST.

THE indifferent weather experienced this summer, characterized as it was by a heavy rainfall and absence of sunshine, has rendered the garden a less agreeable resort than usual. In South Devon not a single spell of fine weather was experienced in the months of June, July and August, but rains and strong winds were frequent. The rain, however, had no adverse effect on the flowers which, indeed, owing to the absence of hot sunshine, remained in beauty for a longer period than usual. One of the most lovely sights in the garden during the summer was furnished by some plants of *Ipomoea rubro-cerulea* growing against a wall. These cover a space of about 7 feet in length and range from 6 feet to 9 feet in height. The seeds were sown in heat in May, and the seedlings were planted out in June, when they were about 18 inches high. They commenced to flower in July, and since that time fresh blossoms have expanded every morning. Painted wire netting is strained against the wall at a distance of 2 inches from it, and up this they have climbed, making many side shoots, and completely covering the wall. Every morning there are still 40 to 60 fresh flowers, and the sight of the expanse of sky-blue that they provide is very beautiful. On sunny

days the flowers commence to close and fade about noon, but on dull days they retain their beauty until 4 o'clock or later. In the first week of June, *Abutilon vitifolium* was at its best, the lavender-coloured type and the white variety being equally charming. In Devon and Cornwall there are many fine specimens, some of them being fully 20 feet in height, but it is not a long-lived plant, and amongst these large examples there are frequent deaths. *Agapanthus umbellatus*, which here forms huge clumps in the open, did not flower as profusely as usual, doubtless owing to the dull summer of last year. The blue type and its white variety, as well as the deciduous white species, are grown, and they are very handsome when in full flower. The Dropmore variety of *Anchusa italica* was a glorious sight, one great group about 6 feet across and 3 feet through being a sheet of the richest blue nearly 7 feet in height. *Salvia dichroa*, which had to be shifted into another garden last November, was only 7 feet in height this year, but it presented a pretty picture with its long flower-heads of lavender-blue and white flowers. This *Salvia* is a native of the Atlas Mountains, in North Africa, and, I believe, is not in commerce. I have, however, distributed seed to a number of friends. When in the zenith of its beauty it is quite the glory of the garden. *Jaborosa integrifolia* is a very little-known plant, but is worthy of a place in the garden. It is a native of Buenos Ayres, but here it is perfectly hardy. Every autumn it dies down and disappears entirely, but it produces fresh growth late in spring. It bears white blossoms strongly resembling those of *Nicotiana affinis*, which have a pleasant fragrance and are carried on stems about 8 inches in height. It is a tremendous spreader, and will quickly overwhelm less vigorous neighbours, unless rigidly kept within bounds. *Watsonia Ardernei* with white flowers, *W. rosea* with flesh-pink blossoms, and *W. Meriana* combined with scarlet blossoms all flowered well. *Cocinea* is a handsome plant, rivalling the brightest of the *Glaboli* in its colouring. The so-called Snowdrop Tree, *Clethra arborea*, from Madeira, moved in November, stood the shift well, and in August bore many branching flower-racemes with white, bell-shaped blossoms. It is a pretty sight when in bloom, and is perfectly hardy in the south-west. A fine specimen of *Fremontia californica* bore its deep-yellow, cup-shaped flowers for many weeks. This handsome shrub is rather a capricious plant, when it reaches a large size it is apt to die suddenly without any apparent cause. Numbers of fine plants have been lost in this manner.

In a neighbouring garden there is the finest specimen of the Chilean Nut, *Conyina Avellana*, in England. The tree is 22 feet in height and about 18 feet in diameter. Its large, deeply-cut leaves have a very ornamental appearance, and in September it bears hundreds of flower-spikes about 4 inches in length, each with some two dozen small, ivory-white blossoms with narrow, twisted petals and stamens half an inch long. The flowers are followed by fruits about the size of a marble, at first green and then crimson. The Fire Bush, *Embotrium coccineum*, was a glorious sight in Cornish gardens in June, large trees 40 feet in height being a blaze of vermillion and lighting up the

landscape with their vivid colour. It is not, apparently, a very long-lived tree, and many of the finest specimens have died. *Indigofera decora alba* is far superior in beauty to the better-known *I. Gerardiana*. When in full bloom and crowded with hundreds of its white blossoms it presents a charming sight. *Plagianthus Lyallii* bore its white blossoms, which much resemble the flowers of the wild Cherry Tree, in great abundance, and they were welcomed for indoor decoration. The plant originally came to me from New Zealand as a little rooted cutting in a tin box, but from the first it grew away vigorously, and is now 12 feet high. I have lately received a plant named *Plagianthus Lyallii grandiflora*, but whether it will differ from the type remains to be seen. A plant of *Mutisia decurrens*, which made good growth and flowered well for seven seasons, began to fail from some unexplained cause last summer and died in September. I managed to obtain another plant, which is doing well up to the present, but even if it succeeds it will be a year or two before it blooms. Last autumn I was given a plant of *Mutisia Clematis*, which has made enormous growth, being over 10 feet high and 15 feet across, but although I have been looking for flowers all the summer, not one has yet appeared. Another climber which has made exceptionally vigorous growth, but has not flowered, is *Pueraria Thunbergiana*. Its season's shoots now measure 21 feet, but there has been no sign of a flower. A plant in a friend's garden at Ryde behaves in the same manner. However, Mr. Gauntlett, who was here the other day, informed me that he had a plant at his old nursery at Redruth which flowers profusely every year, so I hope that mine will bear flowers another season. *Mitraria coccinea* was a splendid sight when covered with its scarlet, urn-shaped, drooping flowers. Here it is grown against a wall, but it also does well as a bush in the south-west. Being a native of the Island of Chiloe, which is said to be one of the wettest spots in the world, it requires an abundant supply of water during the spring and summer. *Bowkeria Gerardiana*, a fine specimen 7 feet 8 inches high and 7 feet through, stood the shift excellently, and has never flowered better than it did this summer, when it was literally covered with its white, Calceolaria-like, flattened blossoms. It is a handsome-flowering shrub, but is not yet, I believe, in commerce. The large shrub of *Buddleia Colvilei*, 10 feet high, which bloomed profusely last summer, unfortunately died after the shift, and has been replaced by one of its own seedlings, but this *Buddleia* will not, apparently, flower until it is about 8 feet high, so some time must elapse before the seedling blooms. Another plant that was lost was a very fine example of *Olearia nitida*, 8 feet in height, and as much through. This has also been replaced, but it will be a long time before its successor attains similar dimensions. *Lonicera Hildebrandtiana*, on a north-west wall, has been magnificent this year, and has borne quite 100 flower-clusters. The great blossoms, 6 inches long and 5 inches across at the mouth, are at first white, but ultimately change to rich orange, and they are deliciously scented. I at first thought, from what the late Rev. Henry Ewbank told me, that its position was too shady for it to flower, as it only gets the

FIG. 89.—*BIDENS DAHLIOIDES*, WHITE VARIETY, FROM SPECIMENS SUPPLIED BY MR. W. E. GUMBLETON.

sun for three hours in the day. However, it could not be a greater success. *Mandevilla suaveolens* is trained round a first-floor verandah, and from there spreads over a wall, and evidently appreciates the heat of the stones, for on the wall it flowers abundantly, whilst it rarely produces blooms on the verandah. *Semele androgyna*, of which there is a fine plant with growths 18 feet in length, has set fruit this year for the first time. *Tacsonia mixta quitensis*, put in as a plant 2 feet high last November, has made growths 15 feet long, but has not flowered, nor has *Actinidia chinensis*. The climbing Monkshood, *Aconitum Hemsleyanum*, grew 10 feet high, and produced a quantity of purple-blue blossoms on long, very slender, drooping stems. It is a pretty plant, and the flowers are valuable for indoor decoration. This season has been remarkable for the way in which a number of spring-flowering plants have bloomed a second time. *Choisya ternata* and *Pittosporum Tobira* are always autumn flowerers in the south-west, but this year other plants have followed their example. *Euryops virgineus*, which was a sheet of flower in March, is now again thickly set with blossom. *Abelia floribunda*, which was covered with bloom in the spring, came into flower again in August, and a large plant of *Lathyrus pubescens*, which bloomed abundantly in May, produced several flower-spikes in August and September. *Wynndham Fitzherbert*.

BIDENS DAHLIOIDES.

THE genus *Bidens* is a very extensive one, and members of it are found in most parts of the world, but rich as it is in number of species, few of these are decorative garden plants. The genus is represented in the British flora by *B. cernua* and *B. tripartita*, two weedy-looking species. An exception to the general character of this genus is the plant shown in the illustration at fig. 89, prepared from specimens which flowered in Mr. W. E. Gumbleton's garden at Belgrove, Co. Cork. In botanical characters *Bidens* is closely allied to *Cosmos* and *Dahlia*. It differs from *Cosmos* chiefly in not having any beaks in the achenes, otherwise they are very similar in habit and flowers. *B. dahlioides* has large, showy flowers; it grows about 2 feet high, and has pinnate leaves composed of 3 to 7 leaflets, and solitary flower heads produced on long peduncles. The flowers vary in colour from rose-purple to white, and are about 3 inches in diameter, the ray florets being $\frac{3}{4}$ of an inch wide. In habit the plant is very similar to the well-known *Cosmos diversifolius*, with the same *Dahlia*-like tubers produced from the base of the stem. In *Cosmos*, however, the ray florets are incised at the apex, while those of the *Bidens* are entire. *B. dahlioides* is a native of Mexico, and was found by Sereno Watson on the grassy slopes of Flor de Maria, growing at an elevation of 8,300 feet. Watson describes it as a new species in 1891 in the *Proceedings of the American Academy*, xxvi., p. 142. Mr. Gumbleton received seeds from Mr. Purpass, whilst Kew received some from Darmstadt Botanic Garden this spring. They were raised in heat and planted out as soon as they were large enough, commencing to flower in August, and being still in bloom. The plant is perennial, but will have to be stored in winter like a *Dahlia*, except in favourable situations. The variety figured had pure white flowers, but this form is very rare, for Mr. Gumbleton states that only 25 out of 500 seedlings had white flowers. The others were all shades of pink, purple, and rose. Mr. Gumbleton's plants have yielded mature seeds. *W. L.*

GARDENING AT THE JAPAN-BRITISH EXHIBITION.

THE Japan-British Exhibition at Shepherd's Bush, which is now drawing to a close, has been more than usually interesting to gardeners. The two gardens designed by Mr. H. Isawa, a celebrated Japanese landscape gardener, have been referred to on a previous occasion, when the details of their construction were described (see *Gard. Chron.*, April 16, p. 243). Whilst these gardens have attracted great attention, gardeners have found further features of interest in the display of Japanese plants, stone lanterns, and other ornaments characteristic of Japanese gardens, contributed by the Yokohama Nursery Co., the models of Japanese tea-gardens, the pigmy trees, and the general flower-gardening in the grounds of the exhibition, to which several nursery firms have contributed. The smaller

Most of the plants employed at Shepherd's Bush were imported direct from Japan, and many of them suffered from the effects of drought in transit; so much that they never recovered. There are to be seen large Conifers and some big Wisterias quite dead, and these mar the effect. Another fault is the employment of too many common shrubs, such as Privet and Aucuba. The plants which appear most at home are the beautiful *Sciadopitys verticillata* and, around the edge of the water, *Juniperus chinensis procumbens*. Other subjects that have grown fairly well are Maples, *Thuja obtusa*, *Azaleas*, *Cycas revoluta*, *Bambusa*, *Cupressus Lawsoniana*, *Nandina domestica*, *Lagerstromia indica*, *Paeonia Moutan*, *Lespedeza bicolor* (a common, autumn-flowering shrub in Japan, where it is known as Hagi), and *Liliums*, including *L. speciosum*, *L. auratum*, and *L. tigrinum*. The struc-

ture vary from 25 to 500 years. The plant that lends itself best to this system of training is *Thuja obtusa*, of which there is a very remarkable specimen in the "Garden of Peace." The plant illustrated in fig. 95, shown by the Yokohama Nursery Co., was awarded a silver cup offered by the Royal Horticultural Society for the finest example in the exhibition. A representative of the firm furnished us with the following details of the treatment of these plants:—

"During spring and summer it is preferable to keep them in a sunny, airy situation, where the wind passes freely through the branches. The soil should be kept moist, but not too wet. During the winter the trees should be placed in a cold greenhouse or unheated orangery, and the roots should be watered sparingly. Repotting is necessary once in two or three years, and the operation should be carried out in May.

FIG. 90.—"GARDEN OF PEACE" IN THE JAPAN-BRITISH EXHIBITION.

Photo by John Green.

of Mr. Isawa's gardens, known as "The Garden of Peace," is illustrated in fig. 90; the other, termed "The Floating Garden," in fig. 91. In judging these gardens it should be remembered that, in exhibits of a temporary character, it is difficult to prevent the appearance of artificiality. It is an easy task to build and plant, but the great factor in landscape formation is time. With age, the plants appear to adapt themselves to their places; rocks and stones get weather worn, and streams become overhung with trees and margined with flowers. The visitor, therefore, who expects to see a veritable Japanese garden, bodily transported, as it were, from some corner of Japan, is disappointed. The gardens have, no doubt, served to supply many a useful hint to those who contemplate the formation of a "Japanese" garden in this country.

ture scene in fig. 90 is a modern Japanese dwelling-house. The hog-backed bridge is a characteristic feature in Japanese scenery, and the garden contains many stone lanterns and pagodas, quaint arches, reed-covered summer-houses, lattice-work fencing in bamboo, pergolas covered with Wisterias, and other features generally associated with gardens in Japan. In fig. 92 is illustrated a collection of pigmy trees exhibited by the Yokohama Nursery Co. This firm exhibited 2,000 plants, the principal subjects being *Thuja obtusa*, *Pinus pentaphylla*, *P. massoniana*, *Larix leptolepis*, *Juniperus procumbens*, *J. rigida*, *Tsuga Sieboldii*, *Cryptomeria japonica*, *Acers*, *Quercus dentata*, *Styrax japonica*, *Lagerstromia indica*, *Punica Granatum* (Pomegranate), *Cerasus*, *Wistaria*, *Chaetagus cuneata*, *Zelkova Keakii*, *Euonymus alatus*, *Hedera* and *Bambusa*. The ages of some of

Lift the tree out of the pot, remove about one-third of the old soil, and replace it in the same pot, supplying rich, fresh soil. To maintain the dwarfness of the tree pinch back the young growths in spring and summer."

Some branched Cycads were brought to our notice. They are found growing deep in the soil, the branches being formed underground. These plants are rare and they are valued at from £10 to £20 each.

This Yokohama firm exhibits a fine collection of stone lanterns (see fig. 96) fashioned like those of a bygone age, the originals being now very scarce and eagerly sought after in Japan. They are made of granite, and were formerly lighted with oil lamps.

Miniature gardens, such as is illustrated in fig. 94, are another speciality of this firm. The model now reproduced is shown by the

City of Tokyo, and occupies only a few square feet on a table. It represents a tea-garden with streams of water and buildings. The tiny trees range in age from 130 to 150 years and they include *Pinus pentaphylla*, *Juniperus horizontalis*, *J. chinensis* var. *Byaku-shin*, *Acer pictum* var. *Takiwa Kaede*, *A. palmatum* var. *Tama-momiji*, *Bambusa* "Hakone-Kanchiku," *Zelkova acuminata*, *Cryptomeria japonica*, *Buxus sempervirens* var. *microphylla*, and *Cryptomeria japonica* var. *Birodo-sugi*. The stones were obtained from various parts of Japan. There is a companion model representing a palace garden with shrine and bridge, the whole modelled after the fashion of Japanese gardens in the fourteenth and fifteenth centuries.

To-day (Saturday) is Japan's national holiday, and the gardens and lagoons will be brightly decorated.

THE ROSARY.

OLD AND NEW VARIETIES.

A FRIEND made the remark recently that the new Roses had not the scent of the older varieties; and another expressed the opinion that there were no great improvements in the flowers themselves. The Gallica, Damask, Bourbon, and Provence varieties still appealed to them most, while only a few of the older varieties from other sections raised their enthusiasm. *Gloire de Dijon*, *General Jacqueminot*, *La France*, *Maréchal Niel*, and about a score of other old favourites being approved. They were aged people mainly, and no doubt many old remembrances crowded upon their minds when seeing the class of Roses described.

If we examine some of the old Roses and com-

or class of Rose is considered, there has been a vast improvement, and there seems every probability of this advance continuing. One has to search the country to find any quantity of nursery-grown "Old Damask." But, in freedom of flowering, hardiness, size and form, adaptability for special purposes and, above all, the beautiful and varied combinations of colour, the Roses of a generation ago cannot be compared to the newer ones. A. P.

ROSA WICHURAIANA.

ALTHOUGH *Rosa Wichuraiana* is largely employed on pergolas and other exposed structures, from the experience of a number of years I have learned that it is a mistake to plant this Rose in a draughty situation or in one where it is much exposed to strong winds. I grow a number of plants in different positions, and they succeed

FIG. 91.—"THE FLOATING GARDEN" AT THE JAPAN-BRITISH EXHIBITION.

(See p. 227.)

PYRUS CORONARIA FL. PL.

THE double variety of this species is worthy of a place among the best of the *Pyruses* remarkable for the beauty of their blossoms, as it possesses several desirable features. The typical *Pyrus coronaria* is a native of a considerable district in the United States, but it is most plentiful in Pennsylvania and Virginia. It there takes the place of our native Crab, from which it differs in several well-marked particulars. Among other distinctions are the partially-lobed leaves, the fact that it flowers very late, and the pleasing violet-like fragrance of the pink-tinged blossoms. The variety *flora plena* has bold, semi-double flowers about $1\frac{1}{2}$ inch in diameter, but in other respects they are the same as those of the type. While some forms of *Pyrus*, such as the Japanese *P. floribunda*, are planted extensively, the merits of *P. coronaria* are often overlooked. W.

pare their scent with modern varieties, it will be found that the newer ones are equally as fragrant. True there is something delightfully sweet in a flower of Tuscany, *Gloire de Dijon*, *La France*, or *General Jacqueminot*; but many prefer the perfume of *Viscountess Folkestone*, *Beryl*, *Mme. Ravary*, *Mme. Abel Chateau*, and scores of other new Roses that will readily occur to any Rose-lover.

With regard to the statement that there is no improvement in the blooms themselves, I think it was at the Crystal Palace, in 1894, that the late Lord Penzance put up several boxes of these old Roses. I was greatly interested in them, and must confess to lingering a greater while before them than at any other exhibit. My chief interest was in verifying the names of some I was uncertain about, and also because they were the ancestors of the glorious Roses in other parts of the show.

I contend that it matters little which section

best in the most sheltered place, where the plants produce long sprays of pliant branches covered with leaves of the glossiest and brightest green and deliciously fragrant flowers. In another place, a specimen is exposed to strong winds. This plant grows slowly, makes short and stunted branches, while the flowers are often imperfect and lack the beauty and some of the fragrance of those growing in more congenial conditions. In the other parts of my garden the same results can be seen in a lesser degree, according to the amount of exposure. The hybrids do not appear to be so tender; I have some of these in fully-exposed situations, and they are unaffected. The hybrid which suffers most in this respect is *Dorothy Perkins*, but it is not quite so susceptible to the effects of the draughts as the typical *Rosa Wichuraiana*. A few notes on the subject of wind and draught-resisting Roses from the pen of an experienced rosarian would be extremely valuable. S. A.

FRUIT REGISTER.

COLOURING OF GRAPES.

THERE are several causes for lack of colour in Grapes. Very heavy cropping may be responsible, and in this respect it is to be observed that what may prove an overcrop on one set of vines might be carried without injury by another set; again, much depends on the soil, locality, form of vinery, and present and previous treatment of the vines. A cause of weakness may sometimes be traced to insufficient foliage in comparison with the weight of fruit, or foliage which is comparatively thin or injured by insects.

Foliage pressing against the glass and thereby subject to sudden and wide variations of temperature; insufficient ventilation from the stoning period onwards and excessively high temperatures are all against the well-being of the vines. In some instances the borders are made too deep, so that the soil and many of the roots are insufficiently aerated; or the borders contain too much nitrogenous material when first made (I have known this to be the case when no farmyard or other manure has been used, but the turf from old pasture land, rich in fibre and used while quite fresh). Yet another cause of the berries not colouring properly is too much damping both of the foliage and the surface of the soil. The foliage, when saturated for long periods together, does not transpire properly, whilst the surface of the soil becomes pasty or perhaps slaty, and incapable of admitting sufficient air to the roots. Heavy mulchings of manure, especially of cow manure, also prevents both air and warmth reaching the roots.

All these, and some other reasons, including too much light, may be given for the deficient colouring of black Grapes, but there are cases where, though none of these faults can be discovered, the colouring is defective.

Having had the superintendence of several vineries for different people, my experience is considerable. In most cases, where the roots are not out of reach (they may be found sometimes to have deserted the prepared border and to have travelled 40 feet or more away), there has been an improvement in colour after a year or two of my taking charge of the vinery.

Accompanied by this improvement in colour, I find that there is a difference in the skin of the fruit. The red berries (not shanked, but perfect-looking ones, except in colour) have thin skins, which melt in the mouth; partially black berries have skins somewhat thicker, while the jet-black fruits have comparatively thick and tough skins. Allowance must be made for the different varieties. The skins of Gros Colman, West's St. Peter's, and Gros Guillaume (Barbarossa) are never thick or tough, but the blacker these Grapes are the thicker are the skins. Then as to flavour, the red ones may be perfectly sweet and melting, but there is an absence of that peculiar, refreshing, vinous flavour found in a perfect berry of Black Hamburg six weeks after it has begun to colour.

What can be the reason of the differences mentioned when none of the cultural faults alluded to can be detected?

There are many people who have not a palate sufficiently perfect to detect slight peculiarities of flavour. They will declare that a fruit which is sweet and juicy is deliciously flavoured when it is merely so much sugar and water. No fruit ever has its proper flavour unless it has its proper colour, and no black variety of Grape was ever perfect unless its colouring preceded its ripening. Black Grapes, supposing cultural details to be correct, colour best, as far as the southern and western counties are concerned, in cold houses. Even this season, I can instance Black Hamburgs which were perfectly black on August 9, and perfectly ripe on August 23, where no artificial heat was employed.

But what I desire to know is, whether a comparatively thin skin on what should be black

Grapes is a general accompaniment of want of colour.

There are some varieties, mostly inferior in quality, which develop colour under conditions which are not altogether the best. Such are Black Alicante, Gros Maroc, and Alnwick Seedling. But this is not the case with Madresfield Court or Black Hamburg. *Wm. Taylor, Bath.*

NEW OR NOTEWORTHY PLANTS.

MORMODES WOLTERIANA AND CATASETUM TENEBROSUM.

THESE are two new species of the group of Orchids, called appropriately by Reichenbach by the name Eborilugues or ivory-lipped Orchids, from Peruvia, which have flowered with Mr. P. Wolter, Magdeburg, the introducer. In habit of growth neither species has any particular features to distinguish it, but the flowers of one of the species are different from all the allied species, whilst those of the other are amongst the most striking flowers in the vast family of Orchids.

Mormodes Wolteriana resembles, at first sight, the well-known and rather polymorphous *Mormodes buccinator*, but differs therefrom in that, firstly, the lip is three lobed like that of *M. pardina*, quite a different species, and, secondly, the lip of the lower flower of the spike is nearly twice as large as in the upper flowers. The colour is somewhat similar to that of *M. buccinator* var. *aurantiaca*; the lip is hairy inside, and parts of the column are also hairy. The sepals and petals are spreading and more in the way of *M. buccinator*, not curved inwards like those of *M. pardina*. The inflorescence bears six flowers.

The flowers of *Catasetum tenebrum*, as I have called it, seem, at first sight, black with a greenish-yellow lip. Neither in *Cologyne pandurata* and its allies, nor in any other Orchid is the colour so nearly black. As seen through a lens, it is very deep purple-brown. The sepals and petals are nearly of the same size; they are oblong, shortly pointed, and slightly hollowed. Each is about 1 inch long, and a little more than ½ inch broad. The triangular lip also is flat, with a cordate base just below the column, and a little above the blunt apex there are two small callusities; the disc is slightly hollowed, and the border minutely denticulate. A very striking character of botanical value is the shortness of the two bristles of the column, scarcely exceeding one line in length, and so converging that they seem coherent at the ends. The plant is polliniferous, and the pollinia are thrown from the anther-bed at the slightest touch of the bristles. *Fr. Kraenzlin.*

* *MORMODES WOLTERIANA*, KRANZL, N. SP.—*Racemus* ad 10-florus, 12 cm. longus, thachis viridis, bractee parvae, triangulae, tenerae, fere 1 cm. longae; pedicelli ovariaque virides, ad 4 cm. longi, ovaria 6 sulcata. Sepala petalaeque paululum longiora, ovato-lanceolata, acuminata, margine revoluta, 3.3 v. 3.5 cm. longa, sepala basi 1 cm., petala 8 mm. lata, omnia unicoloria aurantiaco-brunnea, extus pallidiora. Labellum toto ambitu e basi cuneata v. brevi unguiculata rhombicum, sub anthesi involutum, trilobum, lobi laterales quam intermedius breviores, trianguli, acuti, v. intermedius acuminatus, discus medio obtuse carinatus, sparsissime pilosus; labellum florum inferiorum (6) ad 3 cm. longum, inter lobos laterales 2 cm. latum, satis firmum eodem colore quo sepala petalaeque, illud florum superiorum 1.8 cm. longum, vix 1.5 cm. latum, vitellinum, magis curvatum, multoque tenerius, gynostemium plerumque sub-strosum curvatum, dense velutinum. Flores inodori. Peruvia.—Imp. P. Wolter, Magdeburg. *Fr. Kraenzlin.*

† *CATASETUM TENEBROSUM*, KRANZL, N. SP.—*Racemus* strictus pauciflorus (in specimen meo 6-florus). Chachis viridis, sordide purpurea, bractee parvae, ovatae, acutae, virides, 1 cm. longae, ovaria cum pedicellis multo longiora, 2.5-3 cm. longa, atro-purpurea. Flores rigentes, patentissimi, sepala latissime oblonga, acuta, concava. Petala elliptica paulum angustiora, plana, apice subreflexa, omnia 2.5 cm. longa, 1.5 cm. lata, petala 1.2 cm. lata, adeo fusca, quod primo aspectu atra apparent. Labellum planum, toto ambitu cordatum, vix, apice crasso carnosum, obtusissimo callosio, basi callo transverso plano atoque callo luteo instructum, margine praesertim basin versus minute denticulatum, 2 cm. longum & basin versus 2.2 cm. latum, discus labellum leviter excavatus. Cirrhigynostemium brevius, filiforme, antice convergentes, ut sese tangant (est enim planta pollinifera). Flores 4 ad 4.5 cm. diam. Floret in Europa aestate. Peruvia—Imp. P. Wolter, Magdeburg. *Fr. Kraenzlin.*

COLONIAL NOTES.

FRUITING OF OROXYLUM INDICUM.

DURING a hurried visit to Trinidad in the last week of December, 1909, in the Queen's Park ("The Savannah"), I was attracted to a tree of *Oroxylum indicum*—small and puny in stature, and known to me for the past two decades—by the quantity of big, pod-like fruits it bore, in number and size quite out of proportion to that of the tree itself. I counted 36 fruits, but this did not include the entire crop. The tree was in a leafless state, and exposed to sunshine and high winds.

FRUITING OF ROUPELLIA GRATA.

A PLANT of this West Tropical African species was in full flower at the Tobago Botanic Station last December. When in Trinidad, at the end of the same month, I noticed objects resembling a large pair of bull's horns, attached to a climbing plant trained to an exposed fence at the St. Clair Experiment Station, and, upon closer inspection, I found it to be the fruits of this *Roupellia*. For the past 22 years I have been accustomed to see it flower each year in Grenada and Trinidad, but this is the first time I have noticed it in fruit. *W. E. Broadway.*

The Week's Work.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSELL, G.C.B., Moulton Paddocks, Newmarket.

Orchard House.—Plum trees in pots carrying late crops of ripening fruit require very careful attention. Liquid manure may be dispensed with, and in its place applications of clear water may be given as often as necessary. A fairly dry, buoyant atmosphere should be maintained, using a little fire heat during cool, damp weather, to cause the air to circulate. Allow each tree plenty of space and full exposure to the sunshine. As the fruit approaches maturity the supply of water to the roots may be lessened, giving merely sufficient to maintain the tree in a healthy condition.

Fig trees in pots.—Trees now yielding ripe fruits require a fairly high temperature in order to induce them to provide a moderate supply until the end of October. Maintain a temperature of 60° to 65° at night, with a proportionate increase during the day. Keep the roots well supplied with moisture, applying liquid manure alternately with clear water. Syringe the trees on fine days only, at other times a moist atmosphere must be maintained by damping the paths, and walls several times each day. Admit air early in the day when the weather is favourable, closing the house with a little sun heat on bright days. Endeavour to change the air inside the house every day. On dull, cold days the top ventilators may be opened slightly for about one hour during the middle of the day, using a little extra fire heat, if this is necessary, to maintain the requisite heat. Pinch the young growths to two or three leaves in order to encourage the fruits to swell. Insect pests are most likely to put in an appearance during dull, cold weather when considerable fire heat is employed. The most effective remedy is sponging with warm soapy water. Trees from which the fruit has been gathered need to be hardened off carefully before placing them out of doors, otherwise the sudden change in temperature may injure them.

Fig trees in borders.—Trees which have produced a second crop may now be fully exposed to the weather. Old-established trees will still derive some benefit from liquid manure, which will tend to strengthen the young wood for fruiting next season. If the growth is at all crowded, it will be advisable to thin out any shoots which will not be required for fruiting next season.

Early Fig house.—The wood being now fairly well matured, any necessary treatment the roots may require may be taken in hand at once, so that the border will become settled again before forcing takes place. Young trees or those which are inclined to make rank growth may be lifted and root-pruned, adding a good dressing of lime rubble to the soil during the process of replanting.

THE FLOWER GARDEN.

By F. BRIDGEMAN, Gardener to the Hon. VICARY GARDENS,
Abendon House, Hertfordshire.

Border Carnations.—The shoots of Border Carnations, which were layered as advised in a previous Calendar, should now be well rooted, and ready for removal from the parent plants. They may either be potted up or planted in the permanent positions they will occupy next season. The former method is to be recommended in districts where the soil is of a wet, cold nature, and where a cold frame from which wet can be excluded is available. Pots 3 inches in diameter are the most suitable, and the compost should consist of good loam, with a little leaf mould and a sprinkling of finely sifted old mortar rubble. Sever the newly rooted plants with a sharp knife and lift them with a hand-fork, taking care not to damage the roots more than can be helped. Pot them firmly in clean, well-drained pots, place the pots closely together,

tances of 15 inches, allowing 18 inches between the rows. Place a layer of finely-sifted under-ash's round each plant, and lightly dust them with soot in showery weather as a preventive of slugs.

General work.—At this time of the year every effort is needed to preserve the flower garden in a tidy condition. With the first touch of frost much clearing must be done. Where it is customary to grow such bulbs as Tulips and Narcissus in open breaks in the garden, the ground should be got in readiness for planting within the next few weeks. Dig the ground thoroughly well and work in a dressing of farm-yard manure, allowing the surface to remain rough until a favourable opportunity presents itself for preparing a fine tilth. If planted in drills in this manner, the various sections and varieties of Tulips make a fine blaze of colour, and they supply blooms for cutting. Where Agaves, Bays, and other plants of a tender

landsome, flowering shrub, and one which has a somewhat exotic appearance, although it is hardy. The *Lespedezas* are elegant late-flowering shrubs, with their clusters of Pea shaped flowers.

PLANTS UNDER GLASS.

By JOHN DUNCOMB, Gardener to JUSTICE PICKERSGILL, Esq.,
Bardon Hall, Westwood, Yorkshire.

Chrysanthemum.—These *Chrysanthemum* plants which are cultivated for providing blooms for exhibition purposes should be removed into light, well-ventilated structures, it being unwise to allow them to remain out-of-doors any longer. The houses should be thoroughly cleaned, and, in cases where this is practicable, a coal-ash base should be provided for the pots, this being a good preventive of damping in the florets. Let the plants be examined thoroughly, syringing them with a mild insecticide, and washing

FIG. 92. —PIGMY TREES SHOWN BY THE YOKOHAMA NURSERY COMPANY AT THE JAPAN-BRITISH EXHIBITION.

(See p. 228.)

and apply a good watering by means of a can with a fine rose. Keep the plants close for a time, and spray them lightly in favourable weather. When they have recovered from the shift, air must be admitted, and the lights may be removed in good weather. The plants should be examined occasionally, carefully removing any yellow foliage, and taking over the best of finely sifted under-ashes to keep the frame sweet. Where it is intended to plant them out at this season, the ground should be dug well, and a liberal quantity of decayed farm-yard manure applied, and, if the natural soil is deficient in lime, some old mortar rubble may be added in rather deep. Choose a favourable time for the work, and make the ground firm before planting. Put the plants in lines at dis-

nature are employed on the terrace walks, and other positions, these must be removed to their winter quarters, and on the first suitable occasion be given a good sponging with an effective insecticide. The present season has been unfavourable for the flowering of such plants as *Datura*, *Hydrangea*, *Plumbago*, *Gerbera*, and many others that may be plunged during the summer months in various positions, and be relied upon to flower well in good seasons. Continue to spray the foliage of any plants that may be affected with mildew.

Shrubs in flower.—At this season of the year few shrubs make a finer effect than *Hydrangea paniculata*, therefore it is especially useful for massing in large beds in the woodland or wild garden. *Clerodendron trichotomum* is another

the pots before removing them to the houses. Arrange the plants so that the flowers will be near to the glass, and allow every specimen sufficient room to prevent overcrowding. They will need to be examined every morning for the purpose of watering only those which are dry, and measures should be taken to get the stages and floors dry again before evening. When the florets begin to show colour, extra care will be needed to prevent draughts of cold air, whilst, at the same time, employing ventilation to keep the house in a sweet condition. Greater trouble in regard to damping is always experienced with plants which have been fed excessively with manures, especially if the feeding has been continued in the later stages of bud-development. Each bud should be securely tied to a

stake, which should be just long enough to reach to the underside of the bud. In the case of incurved varieties, it occasionally happens that the flowers appear overcrowded with florets, and it is beneficial to remove a few short florets from the centre of such flowers; but this is a delicate operation, and it can only be carried out properly by a man who has considerable experience. A little warmth in the water pipes is useful during damp and foggy weather. Occasional fumigations with a Nicotine compound should be practised, remembering that if aphides once get amongst the florets in the blooms it will be very difficult to eradicate them.

Decorative Chrysanthemums.—Plants which are cultivated for decorative purposes, or for supplying the market with cut blooms, will be the better for remaining out-of-doors as long as the weather continues favourable. In order to preserve them against damage by winds, each shoot must be secured to a stake. The roots may be given occasional top-dressings with a chemical fertiliser. For most purposes of decoration, Chrysanthemums are more effective in natural sprays, but if the blooms are wanted of larger size, disbudding must be practised as soon as the buds are large enough, leaving the best bud at the top of each shoot. Single varieties are specially effective in natural sprays, and their beauty is marred by thinning.

Lachenalia.—The bulbs of Lachenalias are now fully matured, and they may be repotted as circumstances permit. Lachenalias are especially adapted for cultivation in baskets, and they afford charming displays of yellow and orange colours, if the bulbs are planted at distances of 2 inches throughout the baskets. Another way of cultivating them is to put about half-a-dozen bulbs into a 5-inch pot, or shallow pans, measuring from 6 to 8 inches across, will accommodate a dozen bulbs each.

Narcissi.—These bulbs, being now procurable, may be potted or placed into shallow boxes. Certain varieties are very suitable for early forcing, including *Telamonus plenus*, *Emperor*, *Horsfieldii*, and *Golden Spur*. Among the newer varieties, *Gloey of Leyden* is one of the best. Like most bulbs intended for indoor culture, they should be plunged into sand or coal ashes until the bulbs form a number of roots. We usually plunge them on the space occupied during the summer months with Chrysanthemums. This position is exposed to severe frost, which is a benefit to bulbs that have to be forced.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Bath-rd, Surrey.

Cattleya, Pleione, &c.—Plants of *Cattleya Trianae*, *C. Mendelii*, *C. Warneri*, *C. labiata*, *C. Bowringiana*, *C. Harrisonia*, *C. Loddigesii*, also many late autumn and winter-flowering hybrids, having finished growing, will now need but little water at the root. The object of the grower should be to do all that is possible to induce these new growths to mature, and this may be done best by placing such plants at one end of the house, so that they may not be damped nearly so much between the pots as during the growing season, nor the blinds drawn over them, where there is stippling on the roof-glass. Where this stippling has been put on rather thickly, and has worn off but little, a good plan is to take a soft hand-brush and draw it very lightly over the glass, when it is quite dry, so as to leave on just sufficient only to soften the bright rays of direct sunshine. Afterwards see that all the dust is cleaned out of the roof gutters. It frequently happens at this time of the year in houses that are situated in low and enclosed positions, and which are insufficiently ventilated, that the thin, papery sheaths encircling the new pseudo-bulbs become almost transparent, and appear to have moisture behind them; this has often been the means of causing the bulb to decay. When this is first seen, it is advisable to keep the plants extra dry at the root for a few days, and also to see that the atmospheric moisture is lessened; but if under such treatment these damp-looking bracts or sheaths do not dry quickly, it is advisable to slit the sheath from top to bottom, and so let the moisture escape. If, on opening the sheath, it is found that the pseudo-bulb has already commenced to turn black, the affected part should be cut off, or the whole plant may be affected;

but if only a small part of the bulb is diseased, the decayed portion should be carefully removed with a sharp knife, and, by filling the cavity with dry, slacked lime, further injury may often be prevented. Such plants as *C. Mossae*, *C. crispa*, *C. Lawrenceana*, *C. lobata*, *Laelia purpurata*, and *L. tenebrosa*, that are now making their new growths should be kept supplied with water at the root. Owing to the increased ventilation in fine weather, and the additional light through the roof-glass, the plants will appear to dry quickly, but they must not be watered again till the whole of the compost has become properly dry. The new pseudo-bulbs of plants of *Laelia elegans* that have finished flowering are apt to decay if there is too much water at the root, and too little sunlight and ventilation. This fine old species will soon produce roots from the flowering growths. Any repotting may be attended to before these appear.

Pleione.—Suspended from the roof in a light position are the *Pleiones*, and such species as *P. maculata*, *P. lagenaria*, *P. Wallichii*, and *P. precox* have nearly completed their pseudo-bulbs. They should be well exposed to the light, and as soon as the leaves commence to turn yellow the supply of water must be lessened, the soil being kept just moist, so as to encourage the flowering growths. Immediately the foliage has fallen off the flower-buds will appear, and as the flowers commence to open, the compost should be kept comparatively dry, otherwise the delicate blooms soon lose their colour, become spotted, and damp off. These Orchids are very pretty for room decoration, and last longer there than when left in the moist Orchid houses; the drier air or deficient light does not affect them. The short rest in the dwelling-house is generally beneficial.

Butterfly Orchids.—The butterfly Orchids, *Oncidium Papilio* and *O. P. Kramerianum*, when grown in a light, airy position with the *Cattleyas*, thrive very well, and, if planted in shallow pans, suspended well up to the roof-glass, and with a thin layer of *Osmunda* fibre to root in, they make good bulbs and strong flowering stems. From the time these plants start into growth and till the flower-spikes are cut they need abundance of water at the root, but, while at rest, very little will suffice to keep them plump. At the present time these species are in bloom, and the flower stems will continue to produce flowers for a long period. As each flower fades, another bud takes its place; but, for the future welfare of the plant, it is advisable to remove the spikes after they have produced four or five flowers.

Chysis.—*C. aurea*, *C. bractescens*, *C. Limnitchii*, *C. Chelsonii*, *C. Sedenii*, and *C. lavis* should be suspended at the warmer end of the *Cattleya* house, or in the warmer division or plant stove, so as to enable the growths to finish quickly, and until these are completed and the leaves commence to change colour the plants will require plenty of root moisture. When well matured, they should be placed with the *Dendrobiums* in the resting house; they will need but very little water during winter.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of Northampton, Castle Ashby, Northamptonshire.

Root-pruning.—The time will soon arrive when this operation should be carried out, therefore, in gardens where root-pruning or lifting of trees has been decided upon, the necessary soil should be got in readiness. In most cases, a good loam is required in the largest quantity, but the operator must take into consideration the nature of the soil he has to deal with in order that he may supply anything that may be deficient. It may be necessary to add lime rubble, wood ashes, burnt soil, or other materials, but whatever is required, it should be got ready before the operation is commenced, so that it may proceed without any check. Root-pruning is practised for the purpose of restricting a tree's growth and thus increasing its fruitfulness. In the case of young trees, it is better to lift them entirely and replace the roots near to the surface. It is the larger trees which are consistently unproductive that should be root-pruned. When it is desired to lift a tree, commence by taking out a trench 2½ feet to 3 feet deep, at a reasonable distance from the stem which may vary from 2 feet to 3 feet, according to the size of the trees. Should the old soil be unsuitable,

remove as much of it as possible, and supply in its place good loam, laying out the roots carefully and evenly, and removing damaged roots by making clean cuts with a sharp knife. Make the soil quite firm by treading it as the work proceeds. In the root-pruning of large trees, a trench should be taken out at a suitable distance from the stem, and about 3 feet to 4 feet deep, carefully forking out the soil from under the roots, severing all those roots which are growing in a downward direction, and shortening all long, straggling roots. Where very large trees need root-pruning, it is better to prune half the roots one year and the remainder the next season. This will not cause such a severe check to the trees as it would if done all at one time. All fibrous roots should be preserved carefully and brought as near to the surface as possible. Tread the soil firmly, and finish off the work neatly. When the operation is completed, apply a copious watering to the roots to settle the soil, and syringe the trees regularly until the leaves fall. Both the lifting and root-pruning of trees may be commenced in October, or even earlier, provided the trees are not bearing fruits.

THE KITCHEN GARDEN.

By JOHN DESS, Kitchen Garden Foreman, Royal Gardens, Windsor.

Herbs for winter.—If a supply of green herbs is required in the winter, the best way is to set apart for them a portion of a pit where fire heat can be applied during cold weather. The Mint which was cut down a month ago, in preparation for forcing, should now be taken up very carefully, shaking all the soil from the roots. The roots should then be placed in a layer of fine soil over a very mild hot-bed of leaves. When the roots are in position the whole may be covered to the depth of 2 inches with finely-sifted leaf mould, which should be washed well among the roots with clear water applied at a temperature of 70°. Young shoots will soon begin to push forth, when sufficient air should be given to keep them from becoming drawn. The best roots for forcing are those produced from cuttings each year, being stronger than older plants. Chives may be grown in the same pit; on a gentle hotbed they will soon make fresh growth and continue to do so for some time, but further batches of roots may be placed in the bed as required throughout the winter. Fennel should be cut over, and placed in the pit without delay. This herb forces easily, and a supply may be had through the winter by placing a few clumps in moderate heat from time to time. Sweet Basil requires rather more heat, and should be grown in pots placed on a shelf near the glass in an atmospheric temperature of 65°. The soil for Sweet Basil should be composed of loam and peat in equal quantities, adding a sprinkling of rough sand. Sweet Marjoram may be kept in a cold frame until the approach of frost, but must then be moved to a pit in which a temperature of 40° can be maintained; air should be admitted freely. Chervil may be sown at the foot of a south wall in order to furnish green leaves as far into the winter as possible, and the latest sowing may be made in a cold pit at the same time, for furnishing a supply in severe weather.

Beet.—Beetroots should be lifted and stored away in some dry, frost-proof shed. Great care should be taken not to break the skin or injure the roots in any way, or the quality of the roots when cooked will not be satisfactory. Dry sand should be mixed freely amongst them to keep the roots in a crisp state.

Carrots.—These may be lifted and stored in the same way as Beet. Avoid placing large quantities together, or they may become heated and of no value. Carrots sown a month ago to stand the winter for pulling in March should be thinned to 3 inches apart. Young Carrots from this sowing will be much appreciated in March when the supply of old roots is nearly exhausted. Apply frequent dressings of soil during the autumn to encourage a free growth.

Potatoes.—Proceed with the lifting and storing of late Potatoes in dry weather, placing the tubers under cover in some dark place until their final sorting takes place, when they may be placed in neat clumps and covered with 4 inches of straw and 9 inches of soil. The latest batch will keep in better condition in clumps than in sheds, provided sufficient covering is available for their protection during severe frosts.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but left as a guarantee of good faith.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations. The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPTEMBER 27—

Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Arthur W. Hill, M.A., on "South America in its Relations to Horticulture.")

WEDNESDAY, SEPTEMBER 28—

Nat. Vegetable Soc. Exh. at Roy. Hort. Soc. Hall, Westminster.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—54.8°.

ACTUAL TEMPERATURES:—

LONDON.—(Wednesday, September 21 (6 P.M.): Max. 62°; Min. 43°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—(Thursday, September 22 (10 A.M.): Bai. 30.4; Temp. 58°; Weather—Sunshine.

PROVINCES.—(Wednesday, September 21: Max. 57° Cambridge; Min. 53° Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—

Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

THURSDAY AND FRIDAY—

Second and final portion of the "Clifton Hall" Collection of Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

Many plants are treated in gardens as annuals, which, strictly speaking, are biennials or even perennials. In such a category may be placed Antirrhinums, Pentstemons and Verbenas. Thus it is that judges at flower shows are sometimes placed in a difficulty through some of these doubtful kinds appearing in collections of annuals. The safest plan in such cases is to follow the rule laid down by the Royal Horticultural Society, which reads as follows:—"In this country those plants are to be considered 'annuals' which, naturally and ordinarily, begin and end their growth, ripen seed and die (irrespective of frost) within 12 months."

The difficulty of distinguishing strictly between annuals and biennials is so great, however, that it would be better not to attempt to separate them at competitive shows, but establish classes to include both. Until such is the case, judges must interpret the wording of the schedules literally, and disqualifications, which are always to be regretted, may be expected to happen occasionally. Our remarks in this article concern not only true hardy and half-hardy annuals, but also several plants which are treated as if they were annuals, although they are capable of living for a longer period than a year.

The most popular annual of the day is the Sweet Pea, but as we referred to the plant at

some considerable length in a recent issue, it may be passed without further comment on the present occasion.

About 30 years ago a break was discovered in the common Candytuft, and the novelty was distributed under various names, of which "New White Spiral" was one. It is still an inconstant variety, but the best strains produce something like 75 per cent. of plants which have the Hyacinth-flowered spikes. It is remarkable that this improved form of inflorescence has not yet been associated with any other colour in Candytuft! "Rose Cardinal," of a colour indicated by the name, is certainly a very distinct variety. It received the A.M. of the Royal Horticultural Society in 1901.

Mignonette has been improved much in recent years, and the best market types are far superior to the old, large-flowering varieties. The chief advance in regard to Poppies is found in the Shirley strain distributed by the Rev. W. Wilks. It is worthy of note that efforts which have been made to select the different colours of Shirley Poppies have met with considerable success. One wholesale house offers seeds of 16 different colours. American growers promise an improved strain of Shirley Poppies, but the varieties we have at present are so beautiful it is difficult to conceive any improvement upon them. In double Poppies the Improved Cardinal strain is excellent. From time to time Poppies from Continental sources are introduced as novelties, but they seldom meet with much appreciation.

Nemesia strumosa is an excellent addition to the half-hardy annuals, and since its introduction the strains have been improved much in habit by the introducers and others.

In Eschscholtzias, the selections of "erecta compacta" are great improvements on the old, loose-habited varieties, and there are now new rose and carmine shades, which are very beautiful.

Godetias and Clarkias have shown considerable improvement, especially Godetias, and the double-flowered type known as Godetia Schamini introduced some years ago from the Continent is a beautiful plant when well grown.

Marigolds are not universal favourites, though they are admired by many, and very fine strains of both the African and French types are obtainable, whilst the dwarf "Legion of Honour" is very useful in some bedding designs. The so-called Scotch Marigolds or Calendula have been shown well before the Royal Horticultural Society during the past summer, an Award of Merit being made to them. Centaureas may be classed amongst the most beautiful annuals, particularly the new selections known as "The Bride" and "Bridegroom." They are not so widely grown as they deserve.

The varieties of Cosmos, now that they can be got into bloom in July, have a great future before them. "Rose Queen," which was certificated recently by the Royal Horticultural Society, and "White Queen" are excellent types of this flower.

The Scabious is receiving considerable attention at the hands of some firms, and one strain has the distinction of having received a First-Class Certificate from the Royal Horticultural Society.

Antirrhinums are treated as annuals very

successfully by many cultivators, and this fact justifies our reference to them here. Those who have never seen a representative collection of Antirrhinums can hardly imagine the great range of colour and beauty the flowers exhibit. Some grow tall, others are of medium height, whilst several strains are quite dwarf. The colours range from the deepest crimson to white, and include nearly all shades of red, rose, pink, bronze, scarlet, yellow, and many charming combinations of these colours. Efforts are continually being made to associate the large, wide-mouthed type of flower with all the different colours.

Nasturtiums receive greater attention in America than in Britain, the reason being that the drier climate of the States is more conducive to flowering. In a season exceptionally dry and hot, Nasturtiums make a grand display in Britain, but in a wet one they have far too much foliage, whilst the display of flowers is comparatively meagre. Attention has been given in recent years, in this country and America, to raising varieties of both dwarf and tall Nasturtiums with variegated foliage, and some of the selections have met with appreciation, although, for our own part, we do not favour them.

In annual Chrysanthemums, some improvements have been obtained. It is desirable that cross breeders should select the single-flowered "Morning Star" type as a parent for their seedlings. The new selection known as incolorum "Snowball" is a commendable one, but the foot-stalks are not of sufficient length or strength.

Schizanthus Wisetonensis makes a graceful and beautiful pot plant, and its cultivation has quickly spread over all the country. Great improvement has also been made in Schizanthus grandiflorus.

Development is being carried on in Asters, Stocks, Phlox Drummondii, Larkspurs, and Zinnias by Continental seed growers. An early white Aster, introduced by an English firm a few years ago under the name of "Early Wonder," has achieved considerable popularity. Petunias and Salpiglossis are both worthy of more attention from cross-breeders than they receive. One of the most interesting and useful annuals which have come into public appreciation in the last few years is Kochia tricophylla, a graceful plant grown entirely for its beautiful foliage.

Dimorphotheca aurantiaca received an Award of Merit from the Royal Horticultural Society at the Temple Show in 1908. The colour is the richest orange, and its effect in sunshine is most dazzling. Its culture is easy, but seed, we understand, is not yet plentiful.

It is a satisfactory circumstance that gardeners are beginning to recognize that annuals must be cultivated very differently from the old-fashioned way. There is no better illustration than the modern method of Sweet Pea culture. Let cultivators once learn that most kinds of annuals will repay such careful and spacious culture as is now bestowed on Sweet Peas, and annuals will become increasingly popular. A few seeds sown thinly and transplanted carefully is no doubt the way to succeed, except with a few kinds, of which the Poppy is the best example. The Poppy and certain other annuals must be sown in the positions in which they will flower, and the plants must be thinned accordingly, because they cannot be transplanted.

successfully. An excellent illustration of the correct way to grow annuals is the method adopted by the best growers of Mignonette. Two, three or four seeds are sown in small pots; they are raised in the greenhouse or frame until the seedlings are about 4 inches high, when they are hardened and planted out. In this way much better results can be obtained from a packet of 100 seeds than from 10 times that number, if sown in the old style and the plants are allowed to grow too closely together.

It should be remembered by those who attempt to further improve annuals that it is necessary they should select from single plants. In the case of those species which can be propagated from cuttings, the best method is to cut back the special plant and instead of allowing it to seed, propagate all the cuttings which can be obtained. In the following season a small isolated bed should be planted with the true stock and seed saved exclusively from the plants so cultivated.

Emodi, grasses, including Phormis, and Sedges. The confines are formed of shrubberies, with a semi-wild display of flowering plants, Impatiens Roylei figuring largely. The lawns are broken up irregularly into small areas, each providing some new feature of interest. At one spot is a Bamboo garden, which contains several fine specimens, but some of the finest of these flowered about four years since and afterwards died, as is usual. Dotted about the grass are Aucuba, Cordylines, hardy Palms, Agapanthus umbellatus, Eucalyptus cordata, Magnolias, Wisterias, and several large plants of Arabis cachenneria, the last being finely in flower. Stone lanterns are placed at appropriate spots, and many of the plants being Japanese species, this part is known as the Japanese garden; the whole embraces about an acre. Notwithstanding the smoky atmosphere, the plants thrive abundantly. Readers will be glad to learn that the head gardener, Mr. DIXON, is recovering from his recent indisposition.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will

Exhibiting Japanese and Incurved Chrysanthemums," by Mr. H. J. JONES; (b) "The Use of Large Blooms in Floral Decoration," by Mr. R. F. FELTON, 7.30 p.m.; Paper by Mr. STEVENSON, entitled, "Late-struck Japanese Chrysanthemums for Exhibition."

HORTICULTURAL EDUCATION ASSOCIATION.—The fifth annual outing of the members of this association took place on the 15th and 16th inst., the *Times* Experimental Station being visited on the first, and the R.H.S. Gardens at Wisley on the second day. There were 19 members present (see fig. 93). Mr. FOSTER was the guide at Sutton Green, and he afterwards conducted the visitors to the delightful grounds and gardens of Sutton Place. At Wisley, Mr. CHITTENDEN and Mr. S. T. WRIGHT were the conductors, and they made the first time at command pass pleasantly and instructively. On the evening of the first day the annual dinner took place at Woking, Mr. WALTER P. WRIGHT, the secretary, taking the chair. The subsequent proceedings resolved themselves into a general debate on subjects in which

FIG. 93.—HORTICULTURAL EDUCATION ASSOCIATION.

Back row (reading from left to right), C. Martin, G. H. Hollingworth, Horace I. Wright, C. Wakely, T. G. Drew, A. E. Burgess, W. H. Neild, W. B. Little, J. Slack, C. Beiry, J. G. Murray, L. R. Harvey, I. Stonex, F. C. Farrow.
Front row—J. Lule, W. P. Wright, C. Foster, F. J. Chittenden, and J. C. Newsham.

OUR SUPPLEMENTARY ILLUSTRATION affords a view in the pleasure gardens at Holland House, Kensington, the residence of MARY Countess of ILCHESIER. These beautiful grounds embrace about 75 acres. Visitors to the summer exhibitions of the Royal Horticultural Society, which have been held for several years in the park attached to Holland House, have had opportunities of inspecting the private gardens and lawns, and many readers will be familiar with the scene shown in the illustration. In the foreground may be seen a water-basin, which forms one of a series of seven at different levels, the ground sloping considerably. They are fed by a stream, which flows from a rockery, and are planted with Nymphaeas and other aquatic plants. In one we observed several large clumps of *Pontederia cordata*, which is unharmed in mild winters. There are stepping stones in the water, and in one case the pond is spanned by a bridge, the sides of which are hidden by luxuriant growths of *Roses*, *Ampelopsis*, *Ipomea*, and *Polygonum Baldschuanicum*. The sides of the tiny lakes are bordered with flowering plants, including *Irises*, *Spiraea*, *Aruncus*, *Kniphofias*, *Liliums*, *Sedum Sieboldii*, *Salvias*, *Heucheras*, *Campanulas*, and other species. There are also clumps of *Fedophyllum*

take place on September 27. At the 5 o'clock meeting of Fellows a lecture on "South America in its Relations to Horticulture" will be delivered by Mr. A. W. HILL, M.A.

THE NATIONAL VEGETABLE SOCIETY.—Readers are reminded that the first exhibition of the National Vegetable Society will take place on Wednesday next, at the Royal Horticultural Hall, Vincent Square, Westminster. The event promises to be a very great success. Mr. GEORGE MONRO, V.M.H., who is giving the Society his warm support, will preside at the judges' luncheon. We hope that the exhibition will attract a large company of visitors.

NATIONAL CHRYSANTHEMUM SOCIETY.—The following is the draft programme for the Conference on Chrysanthemums which is to be held on December 5 next:—Afternoon session, 3 p.m.: Paper by Mr. NORMAN DAVIS, entitled, "The Culture of Japanese Chrysanthemums for Exhibition." 4 p.m.: Paper by Mr. W. HIGGS, entitled, "The Culture of Incurved Chrysanthemums for Exhibition." Evening session, 6.30 p.m.: Two short papers, viz.: (a) "Methods of

the members are interested. The officers for the ensuing year are Mr. F. J. CHITTENDEN (chairman) and Mr. W. P. WRIGHT (secretary). So little is heard of this association that it may be necessary to explain that the members include county instructors in horticulture and others.

NATIONAL HARDY PLANT SOCIETY.—We are informed that a meeting of persons interested in hardy plants was held recently in Edinburgh, Mr. MACSEER, the Chairman, explained the objects of the Society, and invited the meeting to express an opinion as to the desirability of including annuals within the scope of the Society. The meeting decided that it was not desirable to include annuals. A discussion then took place as to the amount of the subscription. The chairman thanked the meeting for their expressions of opinion, stating that it would be of great assistance to the Provisional Committee in framing the constitution of the Society. Mr. BORSKELL and Mr. BRUNTON also addressed the meeting. The following gentlemen were elected members of the Provisional Committee:—Mr. M. TOMB, Mr. BRYDON, Dr. MACWATT, and Mr. KIDD to represent Scotland.

SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE

LONDRES.—We have to record the publication of the annual *Bulletin* of this Society. For 21 years the French Horticultural Society of London has been doing a valuable work. Its genial president, Mr. GEO. SCHNEIDER, and his colleagues may well feel proud at the result of their long-continued efforts, and the *Bulletin* before us is ample testimony of the successful progress the Society has made. It has 700 members spread over all parts of the world. Its honorary president is M. PHILIPPE DE VILMORIN. The finances show a substantial balance in hand, due entirely to the able manner in which the Society has been managed, for the French Horticultural Society of London has never received a subsidy from the French Government. The contents of this year's issue may be briefly summarised as follows:—The frontispiece is a portrait of Sir ALBERT KAYE ROLLIE, who presided at the annual meeting last year. The portrait is accompanied by an appreciative biographical notice. The rules, list of members, library catalogue, balance-sheet, and the reports of monthly meetings all appear as usual. There is a full report of the annual dinner held last January at the Cafe Royal, when M. LAUBENOE DE LALAND, the French Consul-General, occupied the chair. Several of the principal speeches on that occasion are now published. One of the practical results of the monthly meetings is the reading of papers on horticultural subjects by the members, and some of these are printed in the *Bulletin*. The subjects include horticultural instruction in Belgium, Ericas in Germany, the Temple Show, the Cyclamen, the Croton and its culture, and Fern culture in England. To those members who have returned to France, or who have taken a position in some of the far distant parts of the world, this annual publication must be very welcome, reminding them of pleasant hours spent in this country and bearing evidence of the continued prosperity of the Society. Mr. GEO. SCHNEIDER, 17, Ikeld Road, Fulham Road, S.W., will be glad to furnish particulars of the Society to those desiring them.

WILD FLOWERS IN THE CITY OF LONDON.

We are informed that the Selborne Society has been investigating an interesting building site in Farringdon Street. Although this plot has only been cleared for about two years, no fewer than 23 species of flowering plants and Ferns have established themselves upon it. Mosses, Liverworts and others of the more lowly plants are also represented. Mr. J. C. STENSTONE is preparing a detailed list, which will be published in the October number of the *Selborne Magazine*.

THE SCENT OF ROSES.—Considerable notice has been taken in Scotland of some remarks made by the Countess of WEMYSS on the occasion of the opening of the annual show of the East Lothian Horticultural Society at Haddington, on September 9. The Countess offers a prize every year for the sweetest-scented Rose. In her opening address she referred to the subject, saying that she understood that some people laughed at her for offering this prize, thinking it must be difficult to distinguish the best among so many. After referring to the expression of Shakespeare "that which we call a Rose by any other name would smell as sweet," she said that the Rose from Karl Drusehki had no scent at all, and therefore the Rose of this particular name did not smell sweet. She considered that the quality of scent was by far the highest attribute a Rose could possess, for a Rose was nothing to her if it did not possess perfume.

WEED-KILLER SWALLOWED IN MISTAKE

FOR TEA.—According to the *Pharmaceutical Journal*, GEORGE A. KEEYES, a man in the employ of the Richmond Corporation, died on September 12 from the effects of poison taken whilst following his employment. KEEYES, who had been on the gardening staff of the Corporation for a number of years, left home for work as usual on the morning of September 12, and went to Kew Green, where he and others were to be engaged during the day. It was his custom to take a bottle of tea for breakfast, and at eight o'clock the men gathered together in a small shelter on the Green to have their usual meal. They were laughing and talking as usual, when KEEYES, who had placed his bottle of tea down by his side, had a drink, and almost immediately exclaimed to his stepson, who was one of the party, "I've been and took poison." By the time a doctor had arrived, there was no doubt that the man was in a serious condition, and he was taken to the Richmond Hospital. It appears that KEEYES had placed his bottle of tea close to a bottle of similar size and shape containing weed-killer. The man died late the same night.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

CHRYSANTHEMUM ALICE M. LOVE AND THE RUST FUNGUS.—Little is heard of the Chrysanthemum rust nowadays, not necessarily because it is any less troublesome than formerly, but because there is nothing new to be said or done in connection with it. I would point out, however, that the old variety Alice M. Love seems to be quite immune from this disease. I have seen it grown in the midst of thousands of other plants, most of them affected with the disease, and there has never appeared a speck of rust on Alice M. Love. So far as I know, this is the only variety which is immune from the pest, and that without any artificial remedies. It has, therefore, occurred to me that it might be worth while trying to discover the reason by making a comparative chemical analysis of the leaves or sap of this sort and those of other varieties. Thereby a valuable clue to a remedy might be discovered, for that there is some peculiar (so far as the Chrysanthemum is concerned) chemical constituent in the variety Alice M. Love seems evident. The physical texture of the leaves is softer and more delicate than ordinarily, and one would naturally expect the rust-spores to find an easy footing. There is also a peculiar appearance in the veins which frequently show a light yellow colour. F. C. S.

PERPETUAL-FLOWERING CARNATIONS IN THE NORTH.—Some growers advise growing perpetual-flowering Carnations in frames during the summer, but I find that the weather is so treacherous in the North of England that the safest plan is to grow them in the houses at every season of the year, with the exception that some are planted out to provide stock plants from which cuttings are taken. My method here is to plant out some old plants in June. In September, cuttings are taken from these, in preference to those grown inside. They root readily in an intermediate house. I usually get a box about 9 inches in depth, half fill it with leaf-soil passed through a ½-inch sieve, and plunge the 3-inch pots, each containing half-a-dozen cuttings, almost to the rim, covering the box with a piece of glass. They are shaded lightly from bright sunshine until they are rooted, when air and light are admitted gradually. Afterwards, they are placed in a light position near the glass, until they require potting singly into 3-inch pots. The point of the growth is pinched, when the plants are about 6 inches high, to encourage breaks. As soon as the breaks are starting to grow, the plants are ready for a shift into 5 and 6 inch pots, according to the strength of the varieties. For this potting the compost should consist of good loam, leaf-mould, old mortar rubble, and a sprinkling of soot. As the growths advance, the pinching is continued, at intervals of a few days, until the end of July, to ensure a succession of bloom. When they are well-rooted in

these pots, but before they become potbound, they are shifted into 8-inch and 9-inch pots, using a similar compost to the last, but in a rougher state, and adding to a barrow-load of the compost sufficient wood ashes to fill a 7-inch pot. The potting is done very firmly. By the end of July, the plants should be strong, with numerous growths, ready to begin flowering at the beginning of September. I find that in 8-inch and 9-inch pots they carry better flowers all the year round than if restricted to 6-inch pots. For stimulants, soot water is used chiefly, and farm-yard manure water occasionally. I use Carvita as a preventive against rust, and fumigation is carried out to prevent red spider, thrip, and green fly. The plants are shaded only on very hot days, or the flowers would soon lose their colour. In winter, an atmospheric temperature of 50° to 55° is maintained at night, and air is admitted at all times in such a manner as not to cause cold draughts. J. Herdman, *Under Fell Gardens, Burton, Westmorland.*

THE BEST METHOD OF STORING CARROTS.

I am surprised that so experienced a cultivator as Mr. J. Dunn (see p. 181) should recommend the storing of Carrots in a shed, and, still more, that they should be so buried in sand as to exclude the light. If Carrots are completely buried either in soil or sand, their "tops" or growth buds soon decay, and the decay spreads to the root. When roots are stored in large quantities they may become heated, but this is not altogether responsible for the frequent scarcity of stored Carrots in spring. Those who are in the habit of examining stores of these roots cannot fail to notice that the roots having exposed tops are generally sound. Mr. H. W. Ward had probably noticed this, for when, in March, 1895, I went as foreman to Longford Castle, most of the Carrots were stored thickly in rows in the open air, their slightly green tops protruding from the ashes or soil in which they were embedded. The quality of the roots was first-rate, and not a decayed specimen was to be seen among them. These results were so superior to those generally obtained by storing in a cool, dry shed and covering with sand that I have since practised Mr. Ward's method, and recommend it to others. Before a severe frost, a sufficient quantity for immediate use can be taken out of the ashes and placed under cover. J. Comber, *Nyman's Gardens, Handcross.*

My reason for recommending storage in a cool, dry shed is because I have found such roots to retain their colour better than those allowed to remain in the open, either in soil or ashes. I am aware that some gardeners store their Carrots by planting them closely together in a south border, but exposure to rain in a mild season causes them to make fresh growth, which, in my opinion, depreciates their colour and value. Carrots sown last April (and my note referred to these) should be lifted and stored in a place protected from rain as soon as possible. Carrots intended for spring supplies are still in full growth here, and they will be allowed to remain in the ground until their foliage shows signs of ripening, when they will be lifted and stored as recommended in my previous note. John Dunn, *Royal Gardens, Windsor.*

BEAUTY IN NATURE.—In the *Pall Mall Gazette* of September 13 there appeared some comments upon the letter of Mr. N. E. Brown in your issue of the 3rd inst., describing the hidden beauty of a certain rare Asclepiad. I have addressed the following letter to the editor of the *Pall Mall Gazette* on the subject:—"Dear Sir,—My attention has been drawn to some interesting speculation in your issue of the 13th on the subject of the hidden beauty of a certain flower (*Pectinaria asperiflora*) and the impossibility of reconciling this with the Darwinian theory that we owe all the beauty of flowers to insects. The only suggestion which your writer of 'Naturalist Notes' is able to make in conformity with that theory is that, the flower is decadent at the present day and now hides useless glories which once were visible and useful. How long will it be, I wonder, before our men of science will recognise that there is a force of life in all nature which makes for beauty and harmony, and that it is the same force of life which in man—the highest thing in nature—makes for goodness and sympathy. These are only parallel expressions of the same force of life, which religion can recognise as the Spirit of God working in nature; but men of science

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

SEPTEMBER 15.—*President*: Prof. G. S. Boulger, F.L.S. (in the Chair), and Messrs. J. T. Bennett-Poe, A. Worsley, W. Hales and F. J. Chittenden (hon. sec.).

Fruit of Hippastrum calyptratum.—Mr. WORSLEY showed a mature fruit of *Hippastrum calyptratum*, drawing attention to the membranous ring which, attached to the style and the top of the ovary, is separable at maturity intact, and to the deep lobing of the fruit at the base, which is not shown in published figures, these having apparently been prepared from immature fruits.

Plantago media bracteata.—Messrs. BARR & SONS sent an excellent specimen of this plant, in which the bracts are so enlarged that they form a dense rosette of closely-packed and evidently spirally-arranged ovate, green leaves at the apex of the peduncle. The axis elongates but very slightly as it gets older.

Maize inflorescences.—Mr. A. TURNER, Chelmsford, sent staminate inflorescences of Maize, in which some of the flowers had been replaced by

distinct varieties with hereditary characters, originating solely from the "direct action" of stiff or light soils, illustrating Darwin's contention that varieties arise "without the aid of selection."

The influence of starvation on sex.—Prof. HENSLOW also wrote as follows:—It is well known that the male flowers of monoecious trees, as Oaks, are generally on the more slender shoots than the females. So, too, in dioecious herbs the females are, as a rule, on stronger plants than the males. The following experience illustrates both these facts. Finding *Mercurialis annua* to be an abundant weed in the allotment grounds at Hythe, I collected some seed and sowed it very thickly in two 3½-inch pots. In one, of a total of 25 seedlings, 16 were male and 9 female. In the others, there were 64 plants, of these 39 were male and 10 female, the remainder were too starved to produce flowers at all. The 55 males, therefore, were 74 per cent, and the females only 26. Not one of the plants was above 4 inches in height, but the females were decidedly stouter than the more slender males.

Hybrid Primula.—Messrs. JAS. VEITCH & SONS sent a plant of *Primula japonica* × *P. Bulleyana*, which they had named *P. × Briscoei*. The habit of the plant, which was of vigorous

insist in fixing their thoughts upon the phenomena of matter only, ignoring the force which manifestly animates all matter. If they would open their minds to this, all difficulties would vanish from the biological problems upon which so much misdirected intellect is wasted.—Yours, &c." I have ventured to quote this letter to you because I know that there must be thousands among your readers surrounded daily with the beauties of nature in their gardens, who must feel how utterly inadequate the dry-as-dust theories of recent science are to explain the ceaseless tendency of beautiful things to become more beautiful under care. Recognise that the innate force of life makes for beauty in nature, as it makes for goodness in man, and you can see the Spirit of God working around you every hour of every day. This will be the fundamental truth of the science of the future. E. Kay Robinson, Editor "The Countryside Monthly," 210, Strand, W.C.

DESTRUCTION OF WASPS.—I saw it stated some time ago in your pages that cyanide of potassium provided a good means of destroying wasps' nests, and I have since found it most thoroughly effective. There was a particularly strong colony in a Yew bush close to the house, which caused us great annoyance, so I got 2 ounces of cyanide from the druggist, and dissolved it in a quart of

FIG. 94.—MODEL GARDEN SHOWN AT THE JAPAN-BRITISH EXHIBITION BY THE CITY OF TOKYO MUNICIPAL AUTHORITIES.

(See p. 227.)

[Photograph by J. G. G.]

boiling water just before using it, mixing it in a garden pail, and applying it with a large brass syringe. The gardener syringed the nest by candle-light at night, and another man at the same time broke it down with a hoe. We are much bothered with wasps taking up their abode in a large head of turf laid up to rot. We have tried all kinds of remedies, such as boiling water, burning sulphur, blowing up with gunpowder, tar, &c., but none proved a success, and eventually the nests had to be dug out, yet we no sooner got rid of one than another appeared. Now, as we have found the cyanide of potassium so successful, I would like to know if it would injure the soil for potting purposes, or if it results merely in fumes that will pass off in time? L. S. E. [The cyanide of potassium will not injure the potting soil.—Eus.]

EFFECT OF ALUM ON PLANTS.—Having read somewhere that powdered alum kept off slugs and did no harm to any plant, I powdered *Cyananthus lobatus* with it—the effect is remarkable: the plant looks far less healthy than it did, and I shall anxiously await its re-appearance in March, but the colour of the flower has been changed from the ordinary purple to a blue corresponding most nearly to royal blue. A. C. B.

pistillate ones and branching cobs, some of the branches of which bore staminate instead of pistillate flowers.

Fasciation in Vegetable Marrow.—Mr. W. H. MASTIN, Haslemere, sent an example of a fasciated stem of Vegetable Marrow about 4.5 inches broad.

Reversion in Radishes.—The Rev. Prof. HENSLOW, V.M.H., sent the following communication:—Pliny tells us that the Greeks discovered how to turn the Rape into the Turnip by sowing the seed in a very heavy soil. M. Langnet de Sivny found that the seeds of short-rooted Carrots, when sown in the alluvial deposits in France, yielded immediately in the first generation long-rooted plants. M. Carrière found that seeds of the wild Radish (*Raphanus Raphanistrum*) gave a majority of long roots in the light soil near Paris, but Turnip forms in a heavy soil in the South of France. I sowed the seed of the Turnip-Radish in a prepared, very light soil: of 50 plants 20 were long-rooted, and 10 produced the normal forms, thus corroborating M. L. de Sivny's experience. The point to notice is that as the Turnip and long-rooted Radish come true, as a rule, from seed, as well as the short and long Carrots, &c. We have here

growth, was that of *P. japonica*, but the scape resembled *P. pulverulenta*, and the flowers were in colour and form more like those of *P. pulverulenta*.

WOODSTOCK AGRICULTURAL AND HORTICULTURAL.

SEPTEMBER 15.—This old-established society held its annual show on this date in Blenheim Park, and near to the Palace. The horticultural exhibits were of excellent quality throughout, especially the fruits, vegetables, and Dahlias. The Royal Horticultural Society offered medals for non-competitive exhibits.

Mr. JOHN WALKER, Thame, arranged on a space of 180 superficial feet an exhibit of Show, Fancy, Single and Pompon Dahlias. A Silver Medal was awarded. Another fine display was made by Mr. E. HICKS, Wallingford, who staged some 50 boxes of garden Roses of variety. Mr. J. MATTHEW and Messrs. F. TAYLOR & SONS also staged Roses. Messrs. GARDINER & ADAMS, Mr. CHARLES TURNER, and Messrs. J. H. WHITE & Co., Worcester, staged hardy flowers.

The finest non-competitive group consisted of Orchids, Carnations, and other exotic plants from the gardens at Blenheim Palace. It occupied the

whole of the central ground space of one of the large marquees, upwards of 700 superficial feet. In addition to this display the DUKE of MANTON showed a collection of about 50 dishes of dessert fruit, which included large clusters of Black Alicante Grapes, Lord Palmerston and Dymond Peaches, Stanwick Nectarines, and Pears' Non-such Apples; also a large collection of vegetables. A Gold Medal was awarded these collective exhibits.

In the competitive classes, fruit made a splendid show. For a decorated table, 10 feet by 3 feet, F. J. MYERS, Esq. (gr. Mr. F. Bush), was awarded the 1st prize, having Diamond Jubilee and Muscat of Alexandria Grapes, Melon, Peaches, Nectarines, and other fruits; 2nd, Mrs. BRADSHAW (gr. Mr. R. Wadhams).

In Messrs. Sutton & Sons' class for a collection of six kinds of vegetables there was keen competition. The 1st prize was won by Mrs. BRADSHAW; 2nd, Mr. T. SURMAN.

Dinner-table decorations were so good that three extra awards were made.

The secretary is Mr. T. D. Hughes.

NATIONAL ROSE.

SEPTEMBER 15.—The autumn exhibition of the National Rose Society was held on this date in the Royal Horticultural Society's Hall, Vincent Square, Westminster. Although the low temperatures and copious rains of this summer have affected most flowers adversely, Roses were never more satisfactory than this year, and in proof of this we may point to Thursday's festival. Seldom have so many blooms of fine proportions and perfect condition been brought together at an autumn Rose show. There were several new Roses, including seedlings and sports.

NURSERYMEN'S CLASSES.

For 36 blooms, distinct, the 1st prize was won by Messrs. JAS. COCKER & SONS, Aberdeen, with a splendid exhibit, which included the following varieties:—Avoca, Mme. M. Soupert, Gustave Piganeau (an extraordinarily fine bloom), Jas. Hill, Capt. Hayward, Mme. Eugene Verdier (a grand example), Hugh Dickson (a very superior bloom), Mrs. McKee (the finest white Rose noted), Louis van Houtte, Duc de Rohan (a fine flower), Betty, A. K. Williams, Lyon-Rose, Auguste Rigotard, W. Shean, Souvenir M. Rodocanachi, Mme. Caroline Testout, Phariser, J. Stuart Mill, Helen Keller, Dr. Andry, Mrs. John Laing, General Jacqueminot, Killarney, Liberty, White Lady, Prince Arthur, Frau Karl Druschki, La France, '89, Gustave Grunerwald, Earl Dufferin, Mrs. S. Clark, Marquise de Londonderry, Gladys Barkness (a very choice example), and Ben Cant. 2nd, Messrs. ADAMS & CRAIGMIE, Fernielea Nursery, Rubislaw, Aberdeen, with a capital exhibit, fresh, and in the best of condition; still, many points behind the 1st prize lot. We may name the following as being the finer flowers:—Mme. Eugene Verdier, Mme. Lelièvre Delaplace (a deep-crimson bloom of a fine form), Mme. Wagram, Comtesse de Turenne (a lovely blush-coloured Rose, of large size), Hugh Dickson, Lyon-Rose, John Cuff (of a rich, rose tint), Mme. Caroline Testout (without a blemish), Chas. Graham, Gloire de Chedane, Mrs. J. Laing, and Richmond. 3rd, Mr. W. FERGUSON, Dunfermline. There were seven competitors.

In a class for 36 varieties, three or more trusses of each, the 1st prize was awarded to Mr. J. MATTOCK, Headington, Oxford, who showed choice varieties, arranged as a sloping bank, of bunches containing 20 blooms in each. The following varieties were the more conspicuous:—Lyon-Rose, Mr. Jas. Hill, Mme. Antoine Mari (a delicate, pink Rose, changing to white as it ages), White Maman Cochet, Hugh Dickson, Frau Karl Druschki, Mrs. J. Laing, Kaiserin Augusta Victoria, Ben Cant, Marie van Houtte (an exquisite flower), Mme. Melange Soupert, Rhea Reid, La Tosca, Phariser, and Mrs. Sherman Crawford. 2nd, Messrs. F. CANT & Co., Bradswick, Colchester, who had a group with a similar arrangement of the flowers. The finer varieties were Lady Ashtown, Perle von Godesberg (a flat bloom of a creamy white tint), White Maman Cochet, Mrs. Theodore Roosevelt, La Tosca Harry Kirk, Hugh Dickson, Lyon-Rose, Souvenir de Maria de Zayas (a rich crimson, well-filled bloom, of a flat form), Capt. Hayward, Antoine Rivoire, and Earl of Warwick.

For 18 blooms, distinct, Mr. G. PRINCE, Longworth, Berkshire, was placed 1st with somewhat indifferent blooms, but which included a fine one of Mrs. E. Mawley, for which a Silver Medal was awarded as being the best Tea Rose shown by a nurseryman. 2nd, Mr. HENRY DREW, Longworth, whose stand contained perfect examples of Mme. Constant Soupert, Auguste Comte, Mrs. E. Mawley, Niphotos, Medea, and Maman Cochet. 3rd, Messrs. ADAMS & CRAIGMIE, Fernielea Nursery, Rubislaw, Aberdeen. There were three other competitors in this class.

For 12 distinct varieties, seven blooms of each, occupying a space of 6 feet by 3 feet, Messrs. J. COCKER & SONS, Aberdeen, were 1st. Mr. HUGH DICKSON, Belfast, 2nd; and Mr. W. FERGUSON, Dunfermline, 3rd.

Mr. CHAS. TURNER, Slough, took the 1st prize in a class for 12 distinct varieties, Mr. J. CROSSLING, Penarth, following.

In a class for 12 varieties, distinct, shown in Bamboo stands, Mr. J. MATTOCK was awarded the 1st prize, having a fine display of blooms, arranged in the form of a fan. The finer flowers were those of Phyllis, Prince de Bulgarie, Coralina (very bright in colour), Mme. A. Chatenay, and Comtesse Festetics Hamilton. 2nd, Mr. H. DREW, Longworth, with a good display of blooms, but less striking than Mr. MATTOCK'S.

For 12 varieties of Polyantha Roses of dwarf habit, six trusses of each, the 1st prize was given to Mr. J. MATTOCK, who showed small bunches in vases of Eugene Lamesch, Mrs. Cutbush, Marie Pavié, Perle de Rouges, Schneewittchen, and

[Photograph by John Gregory.]

FIG. 95.—DWARFED TREE OF THUYA OBTUSA REPUTED TO BE 125 YEARS OLD.

(Awarded R.H.S. Silver Cup, being the finest example of a pigmy tree at the Japan-British Exhibition.)

(See p. 127.)

DECORATIVE ROSES.

For 24 distinct varieties, not fewer than three nor more than seven trusses of each variety, the 1st prize was made in favour of Mr. J. MATTOCK, who had choice blooms of Marie van Houtte, Lady Battisea, La Tosca, Irish Elegance, W. A. Richardson, Gottfried Keller, Mme. Dupuy Jannin, M. Paul Lede, Liberty, Simplicity, and Edm. Meyer. 2nd, Messrs. PAUL & SON, Cheshunt, with good blooms of Irish Glory, Dorothy Page Roberts, Perle d'Or (Polyantha), Peggy, La Tosca, Antoine Rivoire, Gustave Regis, and Léonie Lamesch. 3rd, Messrs. G. COOLING & SONS, Bath.

others. Messrs. F. CANT & Co., Colchester, were placed 2nd, and Mr. G. PRINCE 3rd.

GROUP OF ROSES.

In this competition the 1st prize fell to Messrs. HOBBS, LTD., East Dereham, for a pretty arrangement just a little too stagey; and the 2nd to Messrs. PAUL & SON, Cheshunt, for a group close by the recess, in which, among others, we observed the bright-looking and effective Lady Roberts and Lady Ashtown (an excellent bedding variety).

For a group of cut blooms shown on staging, Mr. F. M. BRADLEY, Peterborough, was 1st, his

most conspicuous flowers being the new Simplicity with big, white blooms, and extra large-flowered Frau Karl Druschki, J. B. Clark, Harry Kirk, and C. J. Graham. 2nd, Messrs. G. JACKMAN & SON, Woking, who had a closely-packed group, in which the Lyon-Rose, Betty, General McArthur, Marie van Houtte, Mme. Ravary, and the single-flowered variety Dainty were noted.

The 1st prize for a representative group of cut Roses, shown on staging, was taken by Mr. G. PRINCE, Longworth, for flowers of surpassing quality displayed with good taste. Especially effective were the combinations of white and pink, and white and dark crimson-coloured blooms. A Gold Medal was awarded this exhibitor. Messrs. GUNN & SONS, Olton, Birmingham, received the 2nd prize, which included the Society's Silver-gilt Medal. Messrs. J. JEFFERIES & SON, Cirencester, were awarded a special prize.

Messrs. B. R. CANT & SON, Colchester, showed a simple, sloping bank of Roses, and among them the new seedling H.T. St. Helena, a flower having cream-coloured petals towards the outside of the flower, and a pink suffusion on the inner ones. Another new introduction noted was Claudius, of a purplish crimson tint and fine shape.

THE KING'S ACRE NURSERIES, LTD. (late

with good examples of Mrs. J. Laing, Gladys Harkness, and Hugh Dickson. Mr. MORRIS, in this class, was awarded the Society's Silver Medal for a bloom of Mrs. W. J. Grant, as being the best H.T. shown by an amateur. The box of blooms in which this flower was found took the 3rd prize, the 2nd going to Mr. G. MOULES, of Hitchin, Herts.

In the class for 12 distinct varieties, in three or more trusses of each, the Rev. J. H. PEMBERTON, Havering-atte-Bower, was 1st, and Mr. E. DENISON, Cranford, Leamington, 2nd. For this competition the exhibits were required to be arranged so as to display, as far as possible, the foliage and habit of growth of each variety.

In the class for 12 blooms of Tea and Noisette Roses, distinct, open to all amateurs, irrespective of the number of plants they cultivate, the 1st prize was won by Mrs. B. FORTESCUE, with especially fine examples of Souvenir de Pierre Notting, Miles Kennedy, and Auguste Comte. 2nd, Rev. T. G. W. HENSTLOW, Stanton St. Quinton, Chippenham, with good blooms of Roberts, Maman Cochet, Lady Roberts, and others.

For 12 distinct varieties of decorative Roses, not fewer than three nor more than seven trusses of each variety, arranged on a space not to ex-

Mrs. Muir McKean, a flower having an elongated centre, of a bright crimson colour, with a purplish tinge. Dorothy Radcliffe, a Hybrid Tea, of a pale pink colour, and having a beautiful shape, was awarded a Silver-gilt Medal.

MESSRS. ALEXANDER DICKSON & SONS, LTD., Newtownards, showed a new Tea Rose, Mrs. Foley Hobbs, white, having a slight pink tinge on the centre petals. Examples of this variety were shown as cut from plants grown under glass and in the open ground. A Gold Medal was awarded.

Messrs. HUGH DICKSON & SON, Belfast, received a Silver-gilt Medal for H.T. Marchioness of Waterford, a globular flower, well filled with petals, the inner ones of a bright rose tint, the outer petals much paler, and reflexed at the edges. This firm also received a Silver-gilt Medal for H.T. Mrs. C. E. Allan, a blush-coloured Rose, having reflexed petals, the colour being more intense in the centre than elsewhere. It is a flower of large size.

Messrs. W. & R. FERGUSON, Brucefield, Dumfries, were awarded a Silver-gilt Medal for H.T. Mrs. Jas. Ferguson, a blush-coloured flower.

A Card of Commendation was awarded to Rev. J. H. PEMBERTON, Havering-atte-Bower, for Hybrid Musk Rose Daphne, which has a flowering season from June to November. It is stated to be proof against mildew. The flower is semi-double, of a delicate pink colour, becoming paler with age. The plant produces its blooms in bunches at the ends of the main shoots, which attain a length of 3 feet in some cases. The variety, when shown by the raiser at the meeting of the Royal Horticultural Society on August 31, 1910, obtained an Award of Merit.

PREMIER BLOOMS.

The Silver Medals offered for the best blooms were awarded as follows:—

Hybrid Tea, Tea, or Noisette var. (Nurserymen): Messrs. J. COCKER & SONS with H.P. Hugh Dickson; the same variety, shown by Mr. R. BARROWMAN, took the Silver Medal in the Amateurs' Classes.

Hybrid Tea Rose (Nurserymen): Messrs. J. COCKER & SONS, with Gladys Harkness. (Amateurs): Mr. E. W. MORRIS, with W. J. Grant.

Tea or Noisette Rose (Nurserymen): Mr. G. PRINCE, with Mrs. Edward Mawley. (Amateurs): Mrs. FORTESCUE, with White Maman Cochet.

VEGETABLE SHOW AT MANCHESTER.

SEPTEMBER 14—A competition arranged by Messrs. Dickson & Edmonson for the best vegetables grown by their cut roots was held on this date.

For four hills of Premier Onion there were 10 awards, the 1st prize being won by Mr. FITZPATRICK, The Lodge, Bedford (gr. Mr. Lysoe); 2nd, The Lady THORORA GUEST, Inwood, Templecombe (gr. Mr. Hester).

Mr. FITZPATRICK also showed the best dish of 25 pods of Scarlet Runner Beans; the best Matchless Carrots and the best Leeks; Mrs. WALTERS, Bearwood, Wokingham (gr. Mr. Barnes), the best six roots of Market Favourite Beet.

B. H. COLLINS, Esq., Dunblan, Timbridge Wells (gr. Mr. Caterer), showed the best bunch of Money-maker Tomato; 2nd, Mr. W. COX, The Gardens, Oakfield, Wembdon, Bridgwater.

Mr. W. FOLKES, Amptill, Beds., excelled in the class for three heads of Snowdon Cauliflower; 2nd, Hon. VICARY GIBBS, Aldenham House (gr. Mr. Beckett).

LORD BURNHAM, Hall Barn, Beaconsfield (gr. Mr. Johnson), was placed 1st for three heads of Selected Sugar Leaf Cabbage; 2nd, Duke of SUTHERLAND, Lilleshall, Newport (gr. Mr. Adams).

T. R. OWEN, Esq., The Glen, Haverfordwest (gr. Mr. Griffiths), won the 1st prize for six roots of Perfection Carrots.

The Hon. VICARY GIBBS, Elstree (gr. Mr. Beckett), had the finest Prize Pink Celery; 2nd, Earl SPENCER, Althorp (gr. Mr. Cole).

Earl SPENCER showed the best selected Parsnips; Lord BELPER, Kingston Hall, Derby (gr. Mr. Cooke), the best six roots of Manchester Market Turnip and the best pods of Gladstone Pea; and C. BLUNDELL, Esq., Halsall House, Ormskirk (gr. Mr. Guy), the best 30 pods of Hercules Pea.

FIG. 96.—STONE LANTERNS EXHIBITED BY THE YOKOHAMA NURSERY COMPANY, AT THE JAPAN-BRITISH EXHIBITION.

(See p. 227.)

Cranston's), Hereford, had constructed a sloping bank of Roses, the smoothness relieved by pyramids and cut blooms of various types of Roses, interspersed with small vases filled with cut blooms.

AMATEURS' CLASSES.

The 1st prize for 13 cut blooms, in distinct varieties, was won by Mr. G. A. HAMMOND, Cambrian House, Burgess Hill, who showed beautiful examples of Mme. Eugenie Verdier, Mildred Grant, Mme. Melanie Souperet, Horace Vernet, Bessie Brown, Frau Karl Druschki, Ulster, Mrs. Ed. Mawley, and Hugh Dickson. 2nd, Mr. E. M. EVERSFIELD, Denne Park, Horsham, with extra large flowers of J. B. Clark, Ulrich Brunner, Comte de Raimbaud, Mrs. J. Laing, and Mrs. Theodore Roosevelt.

For 12 blooms, distinct, the 1st prize was won by Mr. R. BARROWMAN, Rosebank Cottage, Bagey, N.B., whose flower of Hugh Dickson was awarded the Society's Silver Medal as being the best bloom of a H.P. variety. 2nd, Mrs. FORTESCUE, Dropmore, Maidenhead, with very fine blooms of Auguste Comte, Claudius, Countess of Derby, Horace Vernet, and Hugh Dickson.

Mr. UPTON, 16, Claremont Street, Leicester, excelled in the class for nine blooms, distinct,

ceed 5 feet by 3 feet, the 1st prize was won by Viscountess ENFIELD, Writtain Park, Enfield.

Hips of nine distinct species of Roses, shown with foliage, occupied the whole of one of the tables half the length of the Hall. The 1st prize was won by Messrs. G. PAUL & SON, Cheshunt; 2nd, Messrs. G. COILING & SONS, Bath; 3rd, Mr. G. PRINCE, Longworth.

Dinner-tables decorated with Roses were fairly numerous, and executed with much good taste. Any kind of cut foliage, Ferns, or grasses was allowed. Mrs. O. G. ORPEN, West Berghelt, Colchester, was declared the winner of the 1st prize, which included a Piece of Plate, for a table set off by bowls full of Lady Hillingdon Rose. Other winners of 1st prizes in the decorative classes were Mrs. G. C. SAWDAY, of Weybridge; Mrs. J. W. SMITH, of Bashey Heath; and Mrs. E. P. BURCHER, of Ipswich.

NEW SEEDLING ROSES.

The Society's Gold Medal was awarded to Messrs. M. GREEDY & SONS, Portadown, Ireland, for the variety Mrs. H. Stevens, a Tea Rose, white, with a pointed, central mass of petals, and of moderate size. This firm was awarded a Card of Commendation for H.T.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 19.—A meeting of the executive committee was held on Monday last at Carr's Restaurant, Strand; Mr. Thomas Bevan presiding.

The question was considered as to the desirability of the society participating in the International Horticultural Exhibition to be held in London in 1912, and it was resolved that prizes for displays of Chrysanthemums should be offered. The usual interim financial statement was presented, showing a substantial balance in hand for the period. With regard to the Chrysanthemum Show it was proposed to hold in connection with the Brussels Exhibition, it was announced that owing to the fire the building available for the show was now otherwise occupied, and that the Chrysanthemum Show would have to be abandoned. The International Autumn Show at Paris was next referred to. The president, Sir Albert Rollet, and Mr. Payne having been elected members of the jury.

Mr. Payne announced that he would be pleased to receive subscriptions for the fund being raised to erect a monument to the memory of the late Ernest Calvat.

The details of the conference to be held on December 5 were announced (see p. 233).

It was decided that the annual dinner shall be held as usual towards the end of November at the Holborn Restaurant. The judges for the October and November shows were elected. The election of new members concluded the business.

NATIONAL DAHLIA.

SEPTEMBER 20, 21.—The second exhibition of the above Society in the present season was held at the Royal Botanic Gardens, Regent's Park, on these dates. There was a keen competition in many of the principal classes. Trade displays were arranged in the corridor, whilst in the conservatory were exhibits forming a special competition for fruit preserved without sugar. The weather was fine, and there was a good attendance on both days.

NURSERYMEN'S CLASSES.

MR. JOHN WALKER, Thame, secured the premier honours for three varieties of six blooms each of Cactus Dahlias, shown in vases, put into commerce for the first time during 1908-9, staging Mercia, Echo, and Mrs. A. Dyer; Mr. M. V. SEALE, of Sevenoaks, won the 2nd prize; and Messrs. KEYNES, WILLIAMS & Co., Salisbury, the 3rd.

Pompon-Cactus Dahlias were well represented, the 1st prize being awarded to Messrs. J. BURRELL & Co., Cambridge, for a splendid exhibit embracing the varieties Coronation, Titus, W. Marshall, Alwyn, Nora, Mimna, Lena, Martha, Argus, Nani, Cheerful and Sweet; 2nd, Messrs. J. CHEAL & SONS; 3rd, Mr. M. V. SEALE.

MR. JOHN WALKER, Thame, excelled in the class for 24 blooms of Show Dahlias, distinct, displayed on boards. A selection of his blooms included Wm. Powell, James Cocker, Florence Tranter, Standard, Daniel Cornish, Portia, and Duchess of Albany. 2nd, Mr. S. MORTIMER, Rowlodge, Farnham; 3rd, Messrs. KEYNES, WILLIAMS & Co.

In the class for 12 varieties of Cactus Dahlias, shown in bunches of six blooms, Messrs. J. STREDWICK & SON, St. Leonards, proved the 1st prize winners, having excellent blooms of W. Marshall, The Earl, Indomitable, Red Admiral, Dr. Roy Appleton, Mrs. Douglas Fleming, H. H. Thomas, C. E. Wilkins, Golden Eagle, Satisfaction, H. L. Brousson and Jupiter. Messrs. J. CHEAL & SONS and J. BURRELL & Co. were placed 2nd and 3rd respectively.

Messrs. STREDWICK & SON also excelled in the class for 24 Cactus blooms, distinct, shown on boards, followed by Messrs. KEYNES, WILLIAMS & Co., with Messrs. J. BURRELL & Co. 3rd.

Pompon Dahlias in 12 varieties, grouped in bunches of 10 blooms, were well staged by Mr. CHARLES TURNER, Slough, who secured the leading award with clean, bright flowers of Bacchus, Ideal, Phyllis, Adelaide, Marietta, Nerissa, Mignon, Ganymede, Queen of Whites, Darkest of All, Mary and Cyril; 2nd, Messrs. J. BURRELL & Co.; and 3rd, Messrs. J. CHEAL & SONS.

The Dean Memorial Gold Medal offered in the trade classes for single Dahlias was secured by Messrs. J. CHEAL & SONS, who staged a handsome exhibit, especially good being the varieties

Cardinal, Lady Bountiful and Mrs. Joynson Hicks; 2nd, Mr. M. V. SEALE.

Mr. S. MORTIMER obtained the 1st prize in the class for new seedling Show or Fancy Dahlias with the variety Wm. Pemberton.

Mr. CHARLES TURNER had the finest Peony-flowered Dahlias and the best Giant Decorative varieties, securing the 1st prize in both classes.

AMATEURS' CLASSES.

The leading class for amateurs was for nine varieties of Cactus Dahlias in bunches of three blooms each. The 1st prize was secured by the Rev. ARTHUR BRIDGE, Worth Rectory, Three Bridges. This exhibitor had a fine collection, consisting of the varieties Harold Peerman, Satisfaction, Iolanthe, W. Marshall, H. H. Thomas, C. E. Wilkins, Red Admiral, Snowdon and Rev. T. W. Jamieson, Mr. F. GRINSTED, Beaufort Park, Battle, obtained the 2nd prize; and Sir JOHN KENNEDY, K.C.B., Holmhamst, Baldslow (gr. Mr. W. E. Peters), the 3rd prize.

For the best six blooms of any variety of either white or pink-flowered Cactus Dahlias, the Rev. ARTHUR BRIDGE again took the 1st prize, with Mr. CHAS. LUCKIN, Apsley, and E. E. BARTON, Greenwich, as winners of the 2nd and 3rd prizes respectively.

For six varieties of Cactus Dahlias, shown in bunches of three blooms, the president of the Society, Mr. EDWARD MAWLEY took leading honours with Beryl, Brigadier, Leda, Evening Star, Red Admiral, and Harold Peerman; 2nd, the Rev. ARTHUR BRIDGE; 3rd, Mr. G. STEVENSON, Chadworth Cottage, Esher.

In the class for four varieties, three blooms of each sort, shown on boards, Mr. F. H. CURRY, 35, Osborne Road, Palmer's Green, was placed 1st, with Mr. CHARLES LUCKIN and Mr. R. C. WILLIS following in the order of their names.

MR. JOHN HICKS, Bensham Manor Road, Thornton Heath, secured the 1st prize in the class for 12 blooms, distinct, shown on boards, with a fine, clean set of blooms; 2nd, Mr. G. DAVIDSON.

In the class for 12 blooms of Cactus Dahlias, arranged in vases for effect, there were nine entrants. Mr. E. MAWLEY secured the 1st prize for a charming vase of Dr. G. Gray, arranged with copper-coloured foliage; 2nd, Mr. JOHN HICKS.

The best 12 blooms of show Dahlias, distinct, exhibited on boards, were again shown by Mr. S. H. COOPER, Chippenham, who holds the Society's Champion Cup for show Dahlias; 2nd, Mr. A. ROBBINS, Keynsham.

Pompon Dahlias were well shown; in the class for six varieties in bunches of six blooms, Mr. G. DAVIDSON, Thornton Heath, was placed 1st; 2nd, Mr. A. P. IRONSIDES, of Chippenham.

The Dean Memorial Gold Medal, offered as the 1st prize for six varieties of single Dahlias, in bunches of six blooms, was secured by Mr. E. MAWLEY, with a good stand of well-finished blooms; the Rev. A. BRIDGE was placed 2nd.

FIRST-CLASS CERTIFICATES.

Dahlia American (Cactus), from Messrs. KEYNES, WILLIAMS & Co.—A fine, bold flower, having a white ground, splashed and striped with crimson.

D. Mrs. Douglas Fleming (Cactus).—A white flower with a greenish centre.

D. H. L. Brousson (Cactus).—A pleasing shade of rosy mauve, with lighter centre.

D. Flaystaff (garden Cactus).—A handsome flower, borne well above the foliage, and coloured rosy salmon.

D. White Ensign (garden Cactus).—A fine, bold, white flower, suitable for decoration. These varieties were shown by Messrs. J. STREDWICK & SON.

D. William Pemberton (Fancy).—A large, handsome flower, with yellow ground, splashed and striped with crimson.

D. Model (Show).—A full-sized flower, with white base; the florets are tipped and shaded with rosy purple. These two were shown by Mr. MORTIMER.

D. Pink Beauty (Pompon), from Messrs. J. CHEAL & SONS.—A pretty flower of a delicate shade of pale pink.

BOTTLED FRUITS.

In the bottled fruit competition, Mrs. V. BANKS, Grosvenor Square, secured the 1st prize for 12 bottles of various fruits preserved in pure water only; 2nd, Mrs. L. BIRKINSNAW, Retford.

For six bottles, Mrs. E. BECKETT, Aldenham House Gardens, Elstree, took the 1st prize, and for three bottles Mrs. V. BANKS was again successful.

NON-COMPETITIVE AWARDS.

Large Gold Medals were awarded to Messrs. HOBBS, LTD., for Dahlias and Roses; Messrs. T. S. WARE, LTD., for Dahlias; Messrs. BAKER'S, for Dahlias; and Mr. J. T. WEST, for Dahlias.

Gold Medals to Messrs. S. SPOONER & SONS, for a collection of hardy fruits; and to Mr. J. E. KNIGHT, for Dahlias.

Silver gilt Medals to Mr. CHARLES TURNER and Messrs. WHITELEGG & PAGE, both for collections of Peony-flowered Dahlias.

Obituary.

THE LATE MAX LEICHTLIN.—The name of Max Leichtlin, whose death at the age of 80 years we announced a fortnight ago, is doubtless familiar to many of our readers on account of its association with numerous species of plants which Leichtlin introduced to cultivation. At the same time, very few people in this country know anything respecting his personality or the life he lived at Baden-Baden. For this reason, the following information, supplied by Mr. H. J. Elwes, will be read with interest:—

Max Leichtlin was born at Karlsruhe in October, 1831. He obtained his first experience in horticulture in the celebrated nursery of Louis van Houtte at Ghent. I know very little of his early life, but he told me that, after spending some time in South America, he returned penniless to Dublin, and there found employment, under the late Dr. Moore, at the Royal Botanic Gardens, Glasnevin. His great ability was soon recognised, and Dr. Moore wished him to stay at Glasnevin, but after a year or so he returned to Germany, and lived at Karlsruhe, where his father owned a paper factory. He soon began to grow plants, and in 1867 his name was first mentioned by Sir Joseph Hooker, who named *Lilium Leichtlinii* after him. When I began my Monograph of *Lilium* a few years later, I found in Max Leichtlin my best guide in all questions relating to the culture of Lilies. In 1833 he was honoured by the dedication of a volume of the *Botanical Magazine*, and, between 1870 and 1903, I find no fewer than 35 plants figured in that work which were introduced by him. Leichtlin was an excellent correspondent, and he wrote very good English. If his correspondence has been preserved, it would be worth while to make a selection of it for publication, as it would be certain to contain much information about the introduction and history of many choice, hardy plants. Tulips, Irises, and Gladioli were perhaps his favourites, next to Lilies; for a time he grew a collection of Nerines, but he never cared much for anything that could not be grown out-of-doors, although he used frames largely for nurturing his seedlings. He had little or no space for the cultivation of shrubs and trees, but he knew a good deal about them, nor did he show much interest in florists' flowers. Leichtlin introduced the lovely *Gladioli principes*, and afterwards crossed it with various garden sorts, thus raising the race which was distributed as *G. Childsii* by an American nurseryman.

Indeed, few of the numerous growers of hardy plants know the extent to which they are indebted to Leichtlin for the introduction of many choice bulbous and tuberous-rooted plants which were quite unknown when I began gardening in 1872. At about that time Leichtlin had moved from his native town to Baden-Baden, where he had a villa situated on a steep hill-side. The garden consisted of a series of small terraces, but surely so small a garden never before contained so great a number of choice plants. Leichtlin soon realised that, as he was going to do all the skilled work himself, he must be very careful in selecting his plants for cultivation. In many cases, when he had succeeded in introducing, propagating and distributing a new or rare plant, he did not continue its cultivation unless he saw a good chance of improving it by hybridisation or selection. Though he was always a comparatively poor man, he was so generous with correspondents that he was able to procure from

various countries and from the botanic and private gardens in Europe any plant they possessed. He grew a few of the choicest herbaceous and Alpine plants for his own pleasure. As a cultivator and propagator of such plants, I have never known his equal, though perhaps the late Mr. T. Atkins, of Painswick, my first instructor in horticulture, was almost as clever. The climate of Baden-Baden has a warmer and more sunny summer, and a more genial spring and colder winter than England, therefore the plants of Syria, Turkestan and Chile thrive with Leichtlin. I first visited him in 1874, and continued to do so at intervals for many years. The recollection of these visits affords me much pleasure, for Leichtlin was a man of so open-hearted, genial, and sociable a character, that, though peculiar in his habits, he was a real friend. His mode of life was very simple; he lived alone, and always went to the St. Petersburg Hotel for his meals, insisting on treating me as his guest there. On one occasion, when I expostulated at his ordering the best room in the house for Mrs. Elwes and myself, he pretended that it was his father's house, and that it made no difference to him what the rooms cost. In his garden he always worked in his shirt-sleeves and bareheaded. If I admired a rare plant, he would insist on dividing it with me, saying that if he lost it, I should send it back to him. He was "hail fellow well met" with all the coachmen and innkeepers of the country, with whom he had frequent jokes in the Baden patois, and on our drives in the forest he would stop at his friends' houses, at intervals, to taste the best wine, of which he was very fond, although he was a sober man. On his too rare visits to England he visited Kew, Glasnevin, Edinburgh, Bilton, and a few private gardens, where he was always welcome. It was a pleasure to his friends when he found a plant that he really wanted. When, in order to pay the heavy expenses which he incurred, he began to publish a catalogue and sell surplus plants, it always contained novelties which were unobtainable elsewhere. But he had neither liking nor fitness for the commercial side of horticulture, and he died quite a poor man, having been obliged to part with the valuable botanical books he had possessed in his more prosperous days.

LIST OF PLANTS IN BOTANICAL MAGAZINE INTRODUCED BY MAX LEICHTLIN.

Year.	Tab.	Name of Plant.	Habitat.
1870	5862	Calochortus Leichtlinii	California
1871	5912	Milla capitata	"
1872	5989	Brodiaea multiflora	"
—	5976	Calochortus elegans	"
1876	6264	Fritillaria recurva	"
—	6236	Milla Leichtlinii	Chile
1877	6287	Caniassia Leichtlinii	California
1878	6337	Lilium cordifolium	Japan
1881	6553	Kniphofia avatica maxima	South Africa
1882	6650	Lilium Parryi	California
—	6651	Haberlea rhodopensis	Bulgaria
1883	6716	Kniphofia Leichtlinii	Abyssinia
1884	6822	Hyaacinthus azureus	Ash Minor
1885	6825	Allium giganteum (in part)	Turkestan
1886	6853	Muscari Szovitsianum	Ash Minor
1888	6994	Allium Suworowi	Turkestan
—	7025	Iris Korolkowi (in part)	"
1890	7145	Iris sibirica	Armenia
1891	7181	Colchicum Sibthorpii	Greece
—	7193	Tulipa Sintenesii	Armenia
1892	7249	Passiflora coccinea	Chile (Hawa)
1843	7276	Iris Hookeriana	N.W. Himalaya
1895	7440	Tulipa violacea	Persia
1896	7500	Fritillaria nobilis	Armenia
—	7432	Incarvillea Delavayi	Yunnan
1897	7570	Kniphofia breviflora	South Africa
—	7547	Lycoris squamigera	Japan
1899	7644	Kniphofia Tuckeri	South Africa
1900	7740	Crocus Alexandri	Bulgaria
—	7706	Kniphofia rufa	South Africa
—	7714	Campanula mirabilis	Caucasus
1901	7791	Glaucolobos sulphureus	South Africa
1902	7832	Kniphofia multiflora	"
—	7867	Iris Gatesii	Kurdistan
1903	8173	Codonopsis convolvulacea	N.W. Himalaya

He also introduced Agave protuberans, Primula rosea, Junkaea Helldreichii, Ostrowskia magnifica, Meconopsis aculeata, Tecophilea cyanocrocus, and many species of Tulipa and Crocus. Leichtlin was the first to raise improved seedling Aubrietias, the best of them being A. Leichtlinii. H. J. Elwes.

MRS. GEORGE.—The wife of Mr. James George, horticultural sundriesman, died on the 10th inst., at 14, Redgrave Road, Putney, at the age of 78.

THOMAS MILNE.—We regret to record the death in Aberdeen, on September 13, of Mr. Thomas Milne, nurseryman and florist. Mr. Milne, who had reached the age of 87 years, was associated with the nursery business all his life, his father having been engaged in the same vocation. Deceased formerly cultivated land which is now covered by houses; it was then known as Glenburnie. In addition to his activities in gardening, Mr. Milne did a large amount of tree-planting. He planted the Hill of Nigg, adjacent to Aberdeen, and carried out extensive work of a similar kind in the Garioch district of Aberdeenshire. It was, however, as a successful cultivator of market garden produce that Mr. Milne was known best. He was a man of the highest integrity of character, and he possessed a genial temperament and an agreeable manner. A large number of apprentices received his tuition, and Mr. Milne's advice, counsel and example have stood them in good stead in their careers. As he was one of the oldest, so Mr. Milne was one of the most esteemed citizens of Aberdeen. The funeral, which took place on Friday at St. Peter's Cemetery, Aberdeen, was very largely attended. Mr. Milne is survived by a widow and family, one of his sons being the United Free Church minister of Knockando, whilst the other is engaged in the teaching profession. K.

MRS. BEDFORD.—Mr. F. Bedford, gardener to Bertram H. Barton, Esq., Straffan House, County Kildare, suffered a bereavement in the death of his wife on Tuesday last, the 20th inst. Mrs. Bedford's death followed upon a stroke, which occurred on the 5th inst.

DEBATING SOCIETIES.

WATFORD AMATEURS' & GARDENERS'.—The monthly meeting was held at St. Andrews Schools on the 9th inst.; R. A. Thorpe, Esq., occupied the chair. Mr. W. J. Pritchard, of Elstree Gardens, gave a lecture on "Preparing, Packing, and Staging Vegetables and Flowers for Exhibition."

STIRLING & DISTRICT HORTICULTURAL.—The monthly meetings were resumed on the 13th inst., Mr. Geo. Petrie, presided; the meeting being well attended. Five new members were elected. Being "Hospital Night" many flowers were brought by the members, and these were afterwards distributed amongst institutions in the town. The lecturer for the evening was Mr. Alex. Thomson, Dean Gardens, Edinburgh, his subject being "Early-flowering Chrysanthemums." His remarks were chiefly from a market-grower's point of view.

BATH GARDENERS'.—The first fortnightly meeting of the winter session was held in the Foresters Hall, Bath Street, on Monday, September 12, under the presidency of Mr. T. Parrott (chairman). Special prizes were offered to under gardeners for the best essays on "Strawberries for Forcing." The first prize was awarded to Mr. H. Trimbe, and the second prize to Mr. E. H. Matthews.

WARGRAVE AND DISTRICT GARDENERS'.—The winter session commenced on Wednesday evening, September 14, when Mr. T. Tunbridge, of "Three Elms" Gardens, Remeiham, read a paper on "Annuals," limiting his remarks to those most useful for supplying cut flowers and remaining a long time in bloom. Cultural directions as to the best soil and the methods of seed sowing were given respecting most of the subjects mentioned, which included Sweet Peas, Zinnias, Salpiglossis, Clarkia, Gaillardia, Scabious, Godetia, Schizanthus, Mignonne, Aster, Stock, Lobelia, Phlox Drummondii, Petunia, Nicotiana and Grasses. A number of vases of cut blooms of many of the plants enumerated served to make the paper additionally instructive.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending September 17, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather was again fair and dry during the greater part of the period. Slight showers were, however, experienced in most localities, and a heavy fall of rain was reported in the south-eastern and central counties of England on Wednesday, a thunderstorm occurring in and around London on the afternoon of the same day.

The temperature remained below the average in all districts. The highest of the maxima were recorded on the 11th except in the north and north-east, and ranged from 69° in England N.W., and 67° in several other districts to 64° in Ireland S. The lowest of the minima occurred on very variable dates. In Scotland E. (at West Linton on the 16th) the thermometer fell to 30°, but elsewhere the readings ranged from 34° in England N.E. and N.W. to 42° in Ireland S., and to 47° in the English Channel. The lowest grass readings reported were 28° at West Linton and Balmoral, 29° at Huddersfield, and 30° at Newton Rigg, Burnley, Sheffield, and Llangamarch Wells, as well as at Markree Castle.

The mean temperature of the sea.—On the coast generally the water was rather warmer than during the corresponding week of last year. The means for the week ranged from 61° at Newport, and about 60° on the east and south-east coasts of England and at Seaford to about 53° off the north and north-east coasts of Scotland.

The rainfall was considerably in excess of the normal in England E., but was less than the average elsewhere, the drought being large in the west and north. In Ireland and the north-western parts of Great Britain the total fall was less than 0.05 inch. At several stations in Scotland and Ireland, as well as at Holyhead, Aspatia, and Manchester the week was quite rainless.

The bright sunshine was less than the average over the greater part of England, but exceeded it in the north and west of Scotland, and also in the north of Ireland. The percentage of the possible duration ranged from 42 in Scotland W., 38 in Scotland N., and 36 in England N.W. to 24 in England E., and 14 in the Midland Counties.

THE WEATHER IN WEST HERTS

Week ending September 21.

A cold and unsteady week.—In the early part of the week the days were cold and the nights warm for the time of year, but the last two nights as well as the days have been cold. On the last night the exposed thermometer fell 2° below the freezing point. The ground still remains cold, the temperature at 2 feet deep being 3° colder and at 1 foot deep 5° colder than is seasonable. A third of an inch of rain fell on the 14th, but since then the weather has been dry. That the ground is also becoming dry is shown by the fact that no measurable percolation has come through either of the soil gauges for nearly three weeks. The sun shone on an average for 2 hours 8 minutes a day, which is less than half the average daily duration of bright sunshine in the middle of September. Light easterly winds have alone prevailed during the week, and the direction has been almost exclusively some northerly or easterly point of the compass. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 7 per cent. Since the beginning of the month the barometer has remained high and remarkably steady. E. M., Lerkhamsted September 21, 1910.

••• The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as supplementary illustrations in this Journal.

APRICOTS ROTTING: *T. H.* The roots of your Apricots may have entered some unsuitable subsoil. If this is so, you must root-prune them and lay some of the principal roots nearer to the surface in some fresh soil. Place plenty of broken bricks or some similar material in the bottom of the border to ensure perfect drainage, and mix plenty of brick-rubble with the soil. Rotting is sometimes caused by such insects as flies, wasps, wood-lice and earwigs biting the fruits just when they commence to ripen. The winged insects may be trapped by placing jars of beer and sugar about the trees, and earwigs are easily caught in hollow Bean-stalks, whilst the wood-lice will conceal themselves in hollowed pieces of Potato if these are placed at the base of the trees. The rotting may possibly be due to the presence of a fungus, but this cannot be determined unless fruits are sent us for examination.

BEDDING ROSES: *A Reader.* The choice of suitable Roses is so great, it is not an easy matter to select one only of each colour. Fran Karl Dunschki would perhaps grow too tall for you, but it is the best white flower, apart from the lamentable lack of perfume. White Pet is a good dwarf bedding Rose, and it continues in flower throughout the entire season. Richmond is a good red variety, and Mme. Abel Chateau a capital pink Rose. Twelve suitable varieties for pots are as follows:—Niphetos, Sunrise, Catherine Mermel, Bridesmaid, Richmond, Kaiserin Augusta Victoria, Liberty, Le Progrès, Anna Olivier, The Bride, Caroline Testout, and Paule des Jardins.

BORDEAUX MIXTURE: *M. A. T.* A simple method of preparing the Bordeaux mixture is given in the new edition of the *Calendar of Garden Operations*, obtainable from our Publishing Department. It is as follows:—Dissolve in a large wooden or earthenware tub 2 lbs. of sulphate of copper (blue vitriol) in two gallons of hot water. Then put 2 lbs. of freshly-slaked lime into another tub with two gallons of water, so that a creamy fluid is made. Then pour the lime solution into the copper solution and stir well. Add 20 gallons of water and continue to stir. The mixture (which should be of a blue colour) is applied with a syringe or a special form of spraying machine. The latest information on Bordeaux mixture, being the results obtained by Mr. Spencer Pickering, at the Woburn Experimental Farm, is given in *Gardeners' Chronicle*, March 19 and 25, 1910.

CARNATION SPORTING: *R. L., Edinburgh.* A Carnation shoot such as you send bearing a heavy-edged picotee and a self-coloured flower is an unusual occurrence, but it is not the first instance of the kind.

CELERY DISEASED: *G. G. B., Sussex, and C. P.* The disease is caused by the fungus *Septoria Petroselinii* var. *Apil.* Spray with the Bordeaux mixture. Next year, spray before the damage is done; it will save the foliage, and the mixture is quite safe to use. Do not plant Celery on the same ground for a season or two. The disease appears to be very common this year.

CHALK AND POWDERED STONE: *Schrood.* Chalk would not benefit Violets greatly unless the soil was inclined to be sour. Wood ashes are usually obtained from garden fires; they contain a considerable quantity of potash. With regard to the value of decayed Broccoli or Cauliflower leaves as manure, beyond supplying humus, they would have no very high manurial value. Powdered stone would, in some cases, supply lime. Chalk may be obtained from the builders' merchants. Your best plan is to obtain a copy of *Chemistry of the Garden*, by H. H. Cousins, price 1s. 1½d., free by post. We do not know the gentleman to whom you refer.

CREOSOTE ON PLANT STAGES: *A. W.* Open the ventilators to the fullest extent and keep the house as dry as possible. Cover the staging with fine, dry ashes, soil or sand, and replace it with fresh after a few days. In a week or two the effects of the creosote should be considerably lessened. It would be advisable to place a thick layer of sand or ashes on the stages when the plants are housed, replacing it at intervals. We do not undertake to reply by post.

DOUGLAS FIR: *H. B.* The "gouty" outgrowths are caused by an insect allied to *Chermes*, which causes American blight in Apples. Petroleum emulsion, if applied vigorously, might do good. Cut out and burn the affected branches as far as possible.

FELLOWSHIP OF THE LINNEAN SOCIETY: *R. B., Caversham.* Every candidate for admission to Fellowship of the Linnean Society must be proposed by three or more Fellows, who must state his qualifications, name in full, rank, profession, and residence. Before a candidate is proposed, it is the duty of the proposer to make known to him that, if elected, he cannot be admitted until he shall have paid the admission fee of £6, and one annual contribution of £5, and he may compound at any time by one payment of £45, in lieu of all future annual subscriptions; but if he be not usually resident in Britain, the composition of £45 must at once be paid, or an order given upon a London agent for the payment of the annual subscriptions as they become due. Every person elected a Fellow is required to appear personally to be admitted, within six months after his election, or within such further time as, upon special application, the Council may grant. The general meetings of the Society are appointed to be held on the third Thursday in January, the first and third Thursdays in February, March, and April (no meeting in the week before or after Easter), the first Thursday in May, and on the first and third Thursdays in June, November, and December, at eight o'clock in the evening; and any member may introduce a friend, by inscribing his name in the list of visitors. The anniversary meeting for the election of Council and officers is held at 3 p.m. on May 24, or on the following day, if the 24th should happen to be a Sunday or Bank Holiday.

GRAPES UNSATISFACTORY: *A. W. P.* There is no disease in the bunches. The berries have failed to "finish" properly, because of some unsuitable conditions, which only those on the spot can determine.

LILAC AND LAVERNUM: *A. B.* What you take for a Laburnum is *Piptanthus nepalensis*. The large terminal bud would most probably furnish a flower spray next season. The top buds on the Lilac shoots may develop flowers, but much will depend on the season, which, so far, has not been favourable to the wood ripening.

LIME ON PASTURE LAND: *W. H.* Ground lime, unslacked, acts beneficially on the humus of pasture land at once, by virtue of its caustic properties. The lime quickly absorbs oxygen and moisture from the atmosphere, and then becomes converted into carbonate of lime. The first heavy rain washes the lime into the turf of the pasture, but it descends very slowly into the soil, so that the full effect of a dressing of quick-lime on grass land is seldom seen until the second year after application.

NAMES OF FRUITS: *F. C. P.* Pear, probably Williams's Bon Chrétien; send another fruit if possible, as the specimen was damaged in the post.—*T. S.* Apple Duchess's Favourite.—*E. K.* Plums, (yellow) Jefferson, (red) Pond's Seedling.—*H. J.* 1. Lord Derby; 2. Harvey's Requette; 3. Grenadier; 4. Lord Suffolk.

NAMES OF PLANTS: *A. B. H.* 1. Clematis *Viticella alba*; 2. *Helenium autumnale cupreum*; 3. *Erodium chelanthifolium*; 4. *Senecio diuvarum*; 5. *Sedum maximum*; 6. *Eupatorium purpureum*; 7. *Dianthus chinensis* var.; 8. *Vitis*, sp. not recognised.—*R. Madleton.* 1. *Helenium autumnale grandiflora*; 2. *H. a. striatum*; 3. *Helianthus rigidus*; 4. *Boltonia asteroides decurrens*; 5. *Aster dumosus*.—*B. A.* 1. *Statice latifolia*; 2. *Lonicera sempervirens*; 3. *Enonymum cupreum*; 4. *Nepeta Mussini*; 5. *Geranium sanguineum*.—*I. McKay.* *Callistephus hortensis* (annual).—*F. A. E.* *Tropaeolum canariensis*.—*J. A. J.* *Escallonia monte-*

vidensis (syn. *floribunda*).—*T. H. H.* and *Tom Coker.* We do not undertake to name varieties of Dahhas, or other varieties of florists' flowers.—*G. F.* Send the Chrysanthemums to some grower who has means of comparing them with his named plants.—*Bide, Fernham.* Lotus *Tetragonolobus*.—*S. & Co.* Garden seedlings of *Gnothera* (*Godetia*) *amœna*.—*H. Jones.* A species of *Encephalartos*, probably *E. Hildebrandtii*.—*Foreman.* *Chironia linoidea*.—*W. B.* The variety of *Kerria japonica* in your garden is the variegated form. Probably the typical form was not planted.—*W. P.* 1. *Strelitzia Regina*; 2. *Polygonum Baldschuanicum*.—*B. A.* 1. *Oncidium cheiroporum*; 2. *Pleurothallis rubens*; 3. *Ocotelea diaphana*; 4. *Masdevallia simula*; 5. *Odontoglossum odoratum*; 6. *Bitrenaria aurantiaca*.—*L. G. P.* *Bignonia capreolata*.—*A. W.* 1. *Ceanothus azureus*; 2. *Hypericum patulum*; 3. *Adonis aestivalis*; 4. *Thalictrum minus*; 5, send again when in flower.—*A. C. J.* 1. *Coleogyne Massangana*, so far as we can judge by the two with red flowers received; it should have a long, pendulous raceme of flowers; 2. *Hyoscyamus niger* (*Hembane*); 3. *Jasminum gracile*.—*H.* *Bulbophyllum grandiflorum*.—*P. H.* *Catasetum maculatum*.—*F. D. Hervault.* The *Vanda* is the variety you name. The plant would probably root better if you kept it cool during the winter, and put it in the warm house again early in the spring of next year.

NETTARINE: *W. C.* No disease is present, and the trouble must be looked for in some other direction. Probably immature wood is responsible.

PEACH WALBURTON'S ADMIRABLE: *T. H.* Although this variety is grown successfully in some garden, it is a partial failure in others. It frequently sheds many of its flower buds during winter and early spring, and later, just prior to the stoning process, the fruits usually drop very freely. You will do well to replace it with a more reliable sort. Marchioness of Downshire, Princess of Wales and the new variety Peregrine are all excellent late-fruiting Peaches.

ROSE LEAVES: *Enquire.* *H. W.*, and *T. S.* The Rose leaves are affected with the rust fungus, *Phragmidium subcorticatum*. The disease is at the medospore stage, but in the spring, powdery, orange-coloured patches are formed. Spray the plants with dilute Bordeaux mixture or ammoniated carbonate of copper solution. Collect and burn all the fallen leaves this autumn, and in the spring spray the plants before the buds expand with sulphate of copper at a strength of 2 ounces in 3 gallons of water.

SAND GARDEN: *R. B., Birkdale.* Instead of placing the material from the cess-pool at once into the holes, it will be better to form a heap on the level mixing some garden soil along with the cess-pool's clearings. The heap should be turned over occasionally, and a little lime mixed with it. After a few months the compost might be used with advantage for most garden crops.

SEEDING CARNATION: *A. E. H.* The variety possesses little merit, and is no advance on others already in cultivation. We do not undertake to reply by post.

SWEET PEA SPIKE WITH SEVEN FLOWERS: *G. H. L.* This is not a record. Specimens have been sent us bearing more flowers than this. See also *Gard. Chron.*, August 14, 1909, p. 118.

VINE LEAVES WITH WARTY GROWTH: *A. F.* The warts are not due to disease, but are outgrowths caused by an excessive amount of moisture in the atmosphere. The humid condition of the house, with, probably, a rich supply of food, have caused an abnormal development of leaf-tissue, so that intumescence has resulted. Maintain drier conditions and open the ventilators freely.

IRIS NEPALENSIS AND ITS NEIGHBOURS.

THE name nepalensis was apparently first applied to an Iris by D. Don in his *Prodromus Floræ Nepalensis*, which was published in London in 1825, and the description there given of the rootstock as resembling that of a *Hemerocallis* leaves little doubt as to the identity of the plant described. Confusion has, however, arisen with regard to the name because it seems to have been given by Wallich to a fine form of *I. germanica* with concolor blackish-red flowers, which is also a native of Nepal. The latter has been sent to me direct from that country, and is obviously identical, except in colour, with the common European type of *I. germanica*. Further confusion has been brought about within the last two or three years by the action of an Indian botanical garden, which distributed, under the name of nepalensis, some plants of *Iris tectorum*, which were obtained from the Shan Hills of Burma in mistake for a species akin to *I. nepalensis*, to which reference will be made later.

The rootstock of the true plant in its resting state consists merely of a bud or growing point surrounded by the fibrous remains of old

leaves, and having attached to its base about half-a-dozen whitish, tuberous roots, which are usually cylindrical, of about the diameter of a goose-quill. Sometimes, however, these roots are swollen towards their lower ends, but whether this peculiarity is the mark of a local variety or merely the effect of the nature of the soil in which the plant has been growing, is still a matter of conjecture. At any rate, these swellings are conspicuous on the roots of a number of plants, which I received from a Nepal valley to the north of Katmandu, whereas there is no sign of them either on a root from the neighbourhood of Simla or on the 30 or 40 seedlings that I have raised from the Simla plant. My original plant has now survived four seasons here, and has flowered regularly for the last three years. I have found it best to lift the plants when the leaves wither in October, and store them, for the winter, under cover in dry sand. At the beginning of March they are planted out in a soil of peat, leaf-mould and old cow manure in a somewhat snoken position, where watering can be done easily if there is drought.

Iris nepalensis is peculiar in many ways. It is by far the latest of all to appear above the ground, for there is no sign of it until about the beginning of June. Once, however, the slender point of the leaves is through the ground, growth is so rapid that the flowers open about the middle of July. The colour is a pale lavender produced by light violet veins on a whitish ground. All the six segments are of a delicate texture, and droop at about the same angle. The falls bear a yellow crest, which is divided up into fine hair-like points, and it is a pity that the individual flowers are so fugitive that they open and fade in the course of the same day. In respect of its seeds also, *I. nepalensis* stands by itself. The seed proper, which is more or less spherical, has attached to it, along one side and projecting at either end, a kind of wing-like appendage of much lighter colour than itself. The seed, I find, germinates very readily about the time when the mature plants begin to make visible growth. At the end of their first season, the young plants consist of two or three small, whitish tubers attached together at the apex.

The home of this Iris is on the southern slopes of the Himalaya, at any rate, from Simla to Nepal, and its range appears to be continued far to the east, for it is abundant in Western Yunnan, where it has been collected in recent years by the Abbé Ducloux, and also by Messrs. Forrest and Wilson. The curious appearance of the tuberous roots in the dried herbarium specimens collected by the first-named misled a French botanist into describing this Iris as *I. yunnanensis* of the *Hemerodactylus* section, of which the Southern European *I. tuberosa* is the only representative. But this name can only rank as a synonym of nepalensis. The roots are in no way similar to the tubers of *I. tuberosa*, which are rather rhizomes than roots in the strict sense.

Reference has already been made to a Burmese Iris. This is a plant of the same nature as the type *I. nepalensis*, differing chiefly by the fact that the flowers are practically sessile, while the stem of nepalensis is 6-12 inches in length. The dwarf plant is also much more floriferous, and was named *Collettii*, after its discoverer, Sir Henry

Collett. It appears to be identical with Sir Michael Foster's *Letha* variety of nepalensis, which came from the Letha range in the Shan Hills. Curiously enough, this plant also occurs in Yunnan, where it has been collected by the same three botanists. It has also been rebaptised in France as *I. Duclouxii*, and also wrongly described as a *Hemerodactylus*. Unfortunately, this plant is not apparently in cultivation, but it was Foster's experience that it was vastly easier to manage than *I. nepalensis* itself, and, as it is very floriferous, its re-introduction is certainly to be desired.

At first sight these two Irises appear to stand quite apart from all others, with no connecting links, which might represent stages in the transition to another group. There exists, however, in Western China and Thibet, a small class of three Irises, *tigridia*, *Bunge*, *pandurata*, *Maxim.*, and *Potaninii*, *Maxim.*, not one of which, unfortunately, is known to be in cultivation, so that we have to fall back for information on herbarium specimens, which, in the case of Irises and other monocotyledons, are seldom entirely satisfactory. All these three species agree in having roots of a special type intermediate between those of an ordinary bearded Iris, and the tubers of nepalensis. This feature separates them at once from the western species, which they, in other respects, most closely resemble, namely, *pumila*, *rubro-marginata*, and *chameiris*. It is just possible that this small group does really represent an intermediate stage between nepalensis and *Collettii* and the ordinary pogoniris.

I. pandurata is only differentiated by Maximowicz from *I. tigridia* by the fact that its spathes are two-flowered, but specimens from the natural habitat show that both one and two-flowered stems are borne by the same individual plants, and it seems probable that it is really only a strong-growing local variety of *I. tigridia*. The latter has a stem of some 4 inches in length, and purple flowers with a variegated beard. *I. Potaninii* is stemless, with a lengthy, tapering tube, as in the true *I. pumila*, and the flowers are usually, if not always, yellow.

I. Potaninii, on the contrary, is probably entitled to the distinction of being the species that has reached the greatest elevation of the whole genus, for it grows on the tops of passes in Central Thibet at the height of 16,300-17,800 feet. The flowers of Thorold's specimens, gathered in 1891, were so imperfect that a new Iris *Thoroldii*, of the *Apogon* section, was published by Baker in Hooker's *Icones Plantarum*, No. 2,302, but others gathered in 1892, by Rockhill, show the beard quite clearly, and appear identical with Potanin's specimens from Kansu and Przewalski's from Northern Thibet. Among the latter there occurs the purple-flowered form, which seems always to be found sooner or later among those species of Irises in which yellow flowers predominate.

If these species are eventually brought into cultivation, it may well be that fuller knowledge of them will show that their affinity to *I. nepalensis* is not as close as dried herbarium specimens seem to indicate; and now that so many new plants from Western China are making their way into our gardens, may hope to obtain these interesting Irises. W. R. Dykes, *Charterhouse, Godalming*.

NOTES FROM A "FRENCH" GARDEN.

A PORTION of the spent manure from the old Melon, Cucumber and other hot-beds, should be sifted well and stored in a shed or other shelter ready for use during wet weather. In new gardens, where the ordinary soil has been used for the crops in the frames, it will be noticed in many instances that the manure is not thoroughly decayed. This is due mainly to the thick layer of soil preventing the air from reaching it. In such cases, the grower should turn over the manure as often as possible to have it in a good condition for use in the spring. The surplus of the decayed manure, intended for top dressings in the open ground next season, should be stacked in small heaps to prevent a second fermentation, which would cause scumming. The beds intended for growing the seedling Lettuces and Cauliflowers are ready for planting, and the cloches, having been cleansed thoroughly, are arranged in their positions. The first sowing of Lettuce "Little Gott" (white or black seeds) should be made on October 1. The Cos Lettuces White, Green, and Grey of Paris, and Passion Lettuce are sown in the order named at regular

quarters, allowing four plants for each cloche. The bed is first top-dressed heavily with well-decayed manure. This batch must be grown very hardy, and ventilation must be afforded whenever possible. The Onions are now being planted out. The beds must be levelled well to facilitate the pricking out of the plants as they are extremely small. They are set very close, and the soil is made firm about the roots. *P. Aquinas.*

TREES AND SHRUBS.

FEIJOA SELLOWIANA.

IF the flowers of this shrub, which open in this country, possessed the colouring attributed to them in Nicholson's *Dictionary of Gardening* they would be gorgeously beautiful. But, although they fall short of this, no other wall shrub, except perhaps the Pomegranate, bears such interesting and showy flowers as those of Feijoa Sellowiana. The solitary, axillary Myrtle-like flowers are considerably larger than those of the common Myrtle, and they are

tree, there are very few places in these islands where it could be grown in this way with any likelihood of success, therefore the protection of a wall is essential. The fruit, which does not seem to ripen under cultivation, is described as being yellowish-green, egg-shaped, Guava-like, richly perfumed, and of a delicious, aromatic, spicy flavour. *A. C. Bartlett.*

COLCHICUM VERATRIFOLIUM.

AMONG the finest of the Colchicums, or Meadow Saffrons, is one which was distributed from the Continent under the name of *C. veratrifolium* (see fig. 97). It does not differ much from some of the forms of *C. speciosum*, but it comes earlier into flower with me than any of these, being in succession to one I grow as *C. Bertolonii*, which is the earliest in my garden. *C. veratrifolium* has large and handsome flowers about the size of *C. speciosum*, but darker-coloured than the fine variety of that species known as *rubrum*. The foliage is large and handsome, resembling in general character *A. veratrum*, but less massive.

Like other Colchicums, this plant seems to prefer a rather heavy soil, and it succeeds well in grass, in the wild garden, and in the border. Colchicums should not be planted in any place to which cattle have access, as the plants are poisonous. The flowers appear to be poisonous even to bees, or, at least, they have such a narcotic effect upon them that many bees die if they happen to remain on the flowers for any length of time. The value of these large-flowered Meadow Saffrons for the decoration of the garden in autumn is not sufficiently well known. *S. Arnott.*

NOTICES OF BOOKS.

ROCK GARDENS.*

THE cult of the rock garden is a fashionable one just now, and many books have been written, rather, it would seem, with a view to the profit of the author and publisher than for the would-be rock gardener. Mr. Meredith's book does not belong to this—unfortunately large—class. It is safe to say that it is one of the best of the really practical works which have been written, and we can cordially recommend it to everyone who is embarking, or has already embarked, on this fascinating branch of horticulture.

The fact that Mr. Moore, of Glasnevin, has contributed an introduction is enough to awaken favourable anticipations in the reader, nor will he be disappointed on a closer acquaintance with its author. An essentially practical treatment pervades the whole, and the writer is describing what he knows at first hand. The hints as to construction of rock and bog gardens are reliable, and the guide to an estimation of the cost likely to be incurred ought to be appreciated.

The chapter on propagation will be read with interest by many who are apt to be alarmed by the prices of Alpines as indicated by catalogues, and the cultural directions strike us as apt and to the point.

The second part of the book contains "lists" of plants suitable for different situations, but it must not be thought that the author has been content merely to give a string of names to answer this purpose. Many of the notes attached to the species are of considerable value, and if Mr. Meredith's suggestions fail to command the assent of everyone who has himself grown the plants, it must be remembered that Alpines are "kittle cattle," and what may prove suitable

* *Rock Gardens: How to Make and Maintain Them*, by Lewis B. Meredith; with an introduction by F. W. Moore. Williams and Norgate, 1910. Price 7s. 6d. net.

FIG. 97.—COLCHICUM VERATRIFOLIUM HORT.: FLOWERS FULLY-RED.

intervals till October 10. The seeds are sown at the rate of about 800 to 900 seeds per cloche, and they are covered with a thin layer of fine soil. No watering is necessary, but it is advisable to shade the cloches with a mat during bright sunshine. The seedlings should be pricked out as soon as they are large enough to handle. Thirty plants per cloche are sufficient; indeed, better results are obtained with 24 plants under each cloche, especially in the case of the variety White Passion. The beds for the Cauliflowers must be prepared as soon as possible for the plants which are now pricked out in frames, about 250 plants per light. When preparing these beds, the grower must bear in mind that they will not be shifted till late in March. When a second sowing of Cauliflowers is contemplated this can be made similarly to the first, but the lights must be kept closed till germination is well advanced. The Spinach raised six weeks ago has been thinned, and the soil hoed. The largest leaves will be removed during the next 10 or 12 days, as they are liable to be attacked by mildew during November. Lettuce "Little Gott" sown late in August is now ready for shifting into its final

beds on longer stalks. The century supplement of Nicholson's *Dictionary of Gardening* describes the flowers as having their petals tawny-coloured outside, and purplish-crimson within. No mention is made of the numerous stamens, which have bright yellow anthers mounted on long, brilliant-red filaments. All the flowers I have seen have white and very much reflexed petals, but probably the sunshine of Brazil develops the brighter colouring of the flowers in that country. Even if the shrub did not bear attractive flowers it would be well worth growing for its handsome, deep-green leaves, which, on a healthy specimen, are fully 3 inches long. The best plants I have seen were grown in yellow loam, and were trained against a southern wall. Under these conditions the species made fine, healthy branches. They require liberal waterings during hot, dry weather until the beginning of August, from which time attention should be paid towards ripening the growth already made; otherwise the plant is almost certain to be injured by the first severe frosts. Although the natural habit of Feijoa is that of an erect shrub or small

treatment for them in one locality may lead to disaster in another, where climate and other conditions are different. We note that he recommends culture in light, sandy soil for *Potentilla nitida*. We have ourselves found that a calcareous medium with peat and leaf mould give the best results, and, as the plant is a limestone one, occurring abundantly both in the Dolomites and in other calcareous mountain ranges in Europe, for example, the hills south-west of Dauphiny, this would seem to accord better with the natural conditions under which the plant flourishes. Again, although *Primula farinosa* is said to grow best in shade, this charming sub-Alpine is generally met with in the moist Alps, and in the north of England in the open, high meadows which correspond to them, exposed to the full sun. Accord-

THE PHYSIC GARDEN, CHELSEA.

This old-world garden has been much altered and improved since the advent of the 20th century. In fact, but for the arrangements of the long parallelograms of the beds of plants being after something of the same pattern as I remember them for the last 50 years, the place is scarcely recognisable, so greatly has it improved since the appointment of the present curator, Mr. William Hales, in 1899. The dilapidated glasshouses have been removed and replaced by a number of commodious, span-roofed greenhouses and stoves, together with their complementary brickpits, which must soon be increased in number if the collection of plants is to be much augmented, for even now there is considerable overcrowding to be observed in some of them. There

Chelsea from Lord Cheyne in 1712 (the Physic Garden being part of the estate), and in 1722 he granted it to the Apothecaries in perpetuity on certain specified conditions.

Climatic conditions had not improved with the extension of London, and the Apothecaries' Company became desirous of getting rid of what had become a costly anachronism; but the condition of Sir Hans Sloane's bequest rendered any such alienation extremely difficult, as it provided in the conveyance that, in case of failure to keep up the premises as a physic garden, and to send 50 dried specimens of distinct plants grown in the garden annually to the Royal Society, the same should pass to the latter body, and, failing them, to the College of Physicians. In 1887 the suggestion was made that the garden should be purchased and preserved as an open

FIG. 98.—THE PHYSIC GARDEN, CHELSEA.

[Photograph by H. N. King.]

ing to our own experience, given the appropriate conditions of soil moisture, far finer flowers are produced under full exposure to light than in partial shade.

We note that the origin of *Saxifraga Bogdii* is given as the result of a cross between *S. arvensis* and *S. Burseriana*. There is, however, some doubt as to this, and Mr. E. H. Jenkins has maintained, with some show of probability, that the real parents were *S. Burseriana* and *S. Rocheliana* (see *Gardeners' Chronicle*, vol. xli, p. 95).

There are a few obvious slips in the text, e.g., where *Saracenia* is called an Orchid (p. 342), but they do not seriously detract from the merits of one of the best books on Alpines and their cultivation which we have seen.

appears to be a large increase in the species of medicinal and commercial plants, and of species used in the lecture-room by the botanical demonstrators. This gratifying fact testifies to the increasing usefulness of the garden as a teaching centre. The laboratory is well supplied with apparatus for experimental work, and is light, large, and lofty.

In the open air beds (see fig. 100), cleanliness and orderliness are everywhere apparent, and the numerous genera, species, and varieties of plants grow with as much luxuriance as is compatible with the climatic conditions prevailing in London. The land on which the garden is laid out was leased to the Apothecaries' Company from Charles Cheyne (afterwards Lord Cheyne) in 1675. Sir Hans Sloane purchased the manor of

space by the parish, as a local commemoration of the late Queen Victoria's reign; but it was stated on high legal authority that even if the three societies should agree to such a course, it would be incumbent on them to obtain the highest possible value for the land as a building site, and devote the proceeds to some objects in accordance with the spirit of the original bequest. Fortunately, however, means were found whereby this interesting old garden could be continued, under the City Parochial Foundation Trustees, and, with modified conditions as an open space, in accordance with the spirit of its original foundation.

Of the four Cedars of Lebanon planted in 1655 (see *Gard. Chron.*, Aug. 25, 1900, fig. 42), two were cut down in 1771, their timber, though

decayed, realising £23. The third died in 1878, and the last of them was taken down a few years ago. In 1795 the girth of the two that then remained was, respectively, 12 feet and 13 feet, at a height of 5 feet.

The statue of Sir Hans Sloane (see fig. 99), by Michael Rysbrach, still stands in the middle of the garden. It was erected by the Apothecaries' Company, "with grateful hearts and general consent," and is a good example of its kind. The annals of the garden, from its first mention in the archives of the Society of Apothecaries, in 1675, down to 1820, were carefully collected by Henry Field, one of its members, and printed by the Count in the latter year. They contain biographies of the principal demonstrators and gardeners, with many particulars of plants, glass-houses, wharf, barge-house, and other features. P. M.

NURSERY NOTES.

MESSRS. WALLACE & CO., COLCHESTER.

(See Supplementary Illustration.)

KILNFIELD GARDENS, the name of the nursery grounds of this firm, are within almost a stone's throw of the station of the Great Eastern Railway Company. The numerous brick fields in the neighbourhood at once give the clue to the name of Kilnfield Gardens, and also to the nature of the soil. The nursery proper, constituting the older portion of the establishment, is situated on slightly rising ground, approached by a level crossing over the railway. The ground slopes on the south side towards the bed of the river Colne; in the meadows between the railway and the stream, Messrs. Wallace have acquired additional land, and they have formed a water and bog-garden along the banks of the stream.

Late summer finds a wealth of showy plants in bloom. Many, such as Pentstemons, Michaelmas Daisies, Phloxes, Gladioli, Rudbeckias, Montbretias, Erigerons, and Liliums, are in great masses, presenting fine sheets of colour. Others of rarer and choicer species, including many Alpine gems, are grown in frames or small unheated houses. They do not need protection from cold, but a little shelter from excessive rains is an advantage for propagating purposes. These frames are constructed very simply, the majority having sides formed of old railway sleepers. Others are merely open beds, extra well drained, and with stone boundaries. In one of the frames we observed, on a recent visit, a collection of rare Saxifragas, including *S. florulenta*, *S. Probynii*, *S. Petracchii*, *S. Boydii*, *S. Stribunvi*, *S. Paulinae compacta*, *S. latina* and *S. Ferdinand Coburgii*. *Viola hederacea* was in flower, the blooms being deep purple tipped with white; unfortunately, the plant is not perfectly hardy in this country. A form of *Linaria pallida* with extra large blooms was conspicuous. A fine batch of *Iris albopurpurea* var. *colchesterensis*, which received an Award of Merit from the R.H.S. on June 25 last, has been cultivated from three tiny seedlings. *Lobelia linnaeoides* is a rare New Zealand species with creeping stems. *Daphne rupestris* is a difficult plant to cultivate, but there was seen a good batch of it, and another of *Erodium chrysanthum*, which has rosettes of grey, pinnate leaves, and bright yellow flowers. *Tanacka radicans* forms a neat trailing plant, with flowers like white plumes. *Sedum brevifolium* had the appearance of beads strung together, so closely are the globular leaves set on the stems. A hybrid *Campanula*, *C. Stansfieldii*, was observed in bloom, the bells being a fine blue colour, and large in comparison with the size of the plant. *Morisia hypogea*, *Lychnis Lagascae*, bearing pink blossoms; the

scarce *Gentiana bavarica*, *Dracocephalum botryoides*; *Michauxia Tchihatcheffii*, *Wahlenbergia graminiflora*, *Dianthus calpinus*, *Hypericum reptans*, with pale-yellow flowers, *Alyssum Moellendorffianum*, the yellow flowers showing well against the pretty grey foliage; *Dianthus neglectus* and *Achillea Kellersii*, with foliage like a *Santolina*, are a few of the more interesting subjects noticed. In open beds were seen *Campanula pusilla*, still in flower, being one of the latest of its race in bloom, although commencing in July; *Berberis Wilsonae*, a charming shrub, bearing coral red berries; *Perowskya atriplicifolia* (Russian Sage); *Haplocarpha scaposa*, like a glorified Dandelion; *Achillea ageratum*, bearing heads of yellow blossoms; *Phytolacca campanuloides*, with mauve-lilac petals; *Potentilla alba*, like a Lupin in leaf, and flowering late in the season; *Veronica exaltata*, resembling a large form of *V. spicata*, with a showy spike of blue flowers; *Potentilla arguta*, having creamy, yellow blossoms, and *Acanthus spinosus*, a dwarf species with handsome, Thistle-like foliage.

Kuiphofias form one of the specialities of the

compare with *Aster Amellus* and its forms, such as the lovely *Bessarabeus* (blue) or *Riverslee* (carmine). Other beautiful varieties are *Hilda Morris*, with striking blue flowers; *Decima*, a fine white form; *Mme. Gauchault*, rosy pink; *Beauty of Colwall*, of the *Novi Belgii* section, with double flowers, of a charming blue shade; *Thompsonii*, quite distinct from other varieties, blue-flowered; *Ringdove*, of the *A. ericoides* type, with sprays of light blue flowers; *Maidenhood*, with white Daisy-like blooms; *Star Shower*, another pretty white variety; *Daydream*, *Novelty*, *Prosperine*, *Captivation*, *Perry's Favourite*, pink; *Ideale*, *St. Egwin*, and *Lil Fardell*.

Amongst *Pentstemons* *Myddleton Gem*, pink; *Southgate Gem*, scarlet; and *Newbury Gem*, carmine-red, are all good, whilst *Killermanii* is a fine purple variety, excellent for massing. *Gregor Mendel* has maroon flowers and dark coloured stems, the spike being very large. It was too late to see the collection of *Iris* in bloom, but one, *Mrs. Alan Gray*, had lingered in flower, and was giving a touch of

FIG. 99.—VIEW IN THE CHELSEA PHYSIC GARDEN, SHOWING THE MONUMENT TO SIR HANS SLOANE.

firm, and they have some remarkably showy hybrids between *K. multiflora* and *K. Nelsonii*. The flowers of the seedlings range from almost white to coral red. There are also seedlings from *K. rufa*, and these were blooming for a second time this season, the first flowers being produced in July: the variety *Gold Elsie*, which obtained an Award of Merit from the R.H.S., one of the finest. *Erigerons* are showy plants, and the variety *Quakeress* is an improvement on the old *E. speciosus*. A large batch of *Rudbeckia Newmanii* was in bloom; this beautiful perennial should be cultivated in all gardens; it is especially valuable for furnishing cut blooms. The darker-flowered forms of *Sedum* spectabile include the variety *atropurpurea*. *Sedum maximum* is another useful garden species, the spikes of rosy flowers with red centres being very pretty. The dwarf form of *Polygonum cuspidatum*, known as *compactum*, makes a fine subject for the water-side; several large beds were white with their axillary inflorescences. The blooms turn pink with age, and in the spring the growths are tinted red. The perennial *Asters* were at the height of their season. To our liking nothing can

blue colour. *Eryngium tripartitum* was coloured blue from its summit to the ground level, stem and flowers alike. The plants, seen in the mass, were very effective, and it is also of value for decorative purposes. Some of the autumn-flowering *Crocuses*, such as *Colchicum speciosum* and its much-improved variety *Aitchinsonii*, also *C. cilicium*, were expanding their pale-blue flowers, and some seedlings gave the impression that they were hybrids of these.

Gladioli in large beds, including the popular blue-shaded varieties, of which *Baron Jules Dubot* was at its best stage of flowering, were still showy. The hybrids of *G. primulinus* are characterised by soft tones, mainly self colours, in which the yellow of *G. primulinus* has toned down the reds and purples. These are especially effective by the water-side, where they are as charming as Japanese *Iris*es earlier in the season. It is feared that they are not sufficiently hardy to withstand the winter in this country, but some plants will remain to test this.

Of the *Kuiphofias* we have already spoken, but in the lower nursery were large numbers of species and seedlings. The small-growing

K. breviflora has a spike of yellow flowers, but those of *K. Nelsonii* are as red as sealing-wax. Messrs. Wallace are selecting forms with glowing orange-red inflorescences. The newer *Montbretias* are cultivated in great numbers, including *Hereward*, *Prometheus*, *Norvic* and others, raised at Westwick Gardens by Mr. Geo. Davison.

In one corner of these lower gardens is a collection of shrubs suitable for planting on rock-gardens. We can only enumerate some of the more striking, such as *Berberis Darwinii* nana, *B. dulcis* nana compacta, hybrids of *B. stenophylla* and *B. Wallichiana*, *Abies pumila* pygmaea, *A. Remontii*, *Amygdalis nanus*, *Genista anxanatica*, *Ericas* in variety, *Veronica epacridea*, very distinct, *V. cypressoides*, *V. Armstrongii*, *V. salicornioides*, *Thuja occidentalis* Little Gem, *Retinospora leptoclada*, *Pinus sylvestris* *Beurvonensis*, *P. s. globosa*, *P. Cembra*, *Pernettyas*, *Olearia stellulata*, *Juniperus sabina* prostrata, *J. s. tamariscifolia*, *Hypericums* in variety, *Gaultheria procumbens*, *G. nummularia* and *Alpine Rhododendrons*. The boundary to this part of the nursery has a dry wall that is planted with a variety of suitable species, and beyond is the water garden. This has been altered somewhat since our last visit, and now, instead of a series of oblong ponds, an irregular lake and stream give a less formal appearance. On a bright autumn day the scene in this water-garden is enchanting. Most of the flowering plants were over, but some will prolong the season of blossom until the approach of winter. Nothing is more handsome just now than the hybrids of *Gladiolus primulinus* referred to. These, with clumps of *Mimulus luteus*, *Lobelia cardinalis*, *L. syphilitica*, *Senecio tanguticus*, *Cimicifuga simplex*, *Myosotis*, *Anemone japonica*, *Trollius caucasicus*, *Nymphaeas*, *Ranunculus lingua*, *Primula pulverulenta*, *Spiraeas* and *Astilbes*, were the principal subjects in flower. Overhanging these were the tall seed-vessels of those whose glories had beautified the scene earlier, in a setting of brown leafage. Rushes, Reeds and Grasses seemed to bar the way everywhere, and the general effect was wild but beautiful.

THE SUPPLEMENTARY ILLUSTRATION.

Messrs. Wallace's exhibit at the last Holland House Show (see illustration), took the form of an old English border, associated with water-gardening. In the top of the picture is seen the raised flower border, with a retaining wall in front and a paved walk. In the centre was a recess with a stone seat, and the plants at this spot were all sweet-smelling species. At the back of the border were spikes of *Eremuri*, principally hybrids of *E. Bungei* and *E. Olga*; raised by the late Sir Michael Foster, tall *Delphiniums*, *Iris* of the aurea and gigantea types; *Liliums* in variety, including *L. Szovitzianum*, *L. Hansonii*, and *L. pardalinum*, together with a selection of early summer flowering perennials. In the crevices of the wall were *Campanulas*: *C. garganica*, *C. g. alba*, *C. pusilla*, *C. p. alba*, and *C. turbinata grandiflora*, *Dianthus*es of sorts with *Sedums*, *Saxifragas* and *Sempervivums* in great numbers. The bottom picture shows the *Iris* garden, with the stepping stones in the water. Massed with the *Iris*es were various forms of *Spiraea*, and numerous hardy Ferns.

SEEDLING POTATOS AT READING.

On a recent visit to Messrs. Sutton & Sons' seed farm at Reading I saw as many as 1,200 roots of second-year seedling Potatos, all from carefully-planned crosses. The roots had just been lifted, and each was laid out for careful comparison. The crosses were made in 1908, and the seed was sown in 1909. From the 1909 seedlings 1,200 were selected for further cultivation, and one tuber only of each, ranging in size from an Acorn to a Walnut. The planting was done this spring on open, farm land, not dug, but ploughed, the testing was to be of the severest kind. The collection of seedlings included a few varieties with coloured skins, but the great majority were

white, and they varied in shape from a true kidney to round, with others of intermediate forms. Many of these single roots showed wonderful productiveness, some having from 30 to 36 tubers, and weighing together as much as 7 lb. The selecting from this batch of those to be grown again next year was a very difficult task, as the average excellence was high, yet the number was reduced to about 70 sorts. These will be submitted to a further trial, and the number again reduced, with a view to getting really first-class varieties for commerce.

Whilst these second-year seedlings were seen only in single roots, there were numerous varieties in other parts of the farm that were of the third and fourth years from seed, and were growing in rows containing from 12 to 15 plants of each variety. In these cases also, the tubers were planted on ploughed land and in ploughed furrows just as is seen in ordinary field culture. The farm soil is rather shallow on a deep bed of gravel, and is far from being ideal soil for Potato culture. These circumstances render the trial of the older seedlings all the more valuable, because each variety was left to show

many of these seedlings with rows from picked seed tubers of *Up to Date*, *Windsor Castle*, and other well-known varieties, and to note how greatly they excelled these named varieties in the amount of crop and in the form of tuber. It may be mentioned that duplicate stocks of all the seedlings are in cultivation in Scotland, where another trial is being made. A. D.

BRITISH HEATHS IN THE GARDEN.

BRITISH Heaths, though fastidious to some extent in their likes and dislikes of soil and situation, may often be established in places far remote from those in which they grow naturally. A sandy soil is, of course, the one they most delight in, but they may be grown with some success in a poor loam if sand be added, or even grit from the roadside, and they will also thrive on a fairly retentive clay or loam if something of a lighter nature is mixed with it. A gravelly soil suits them well, but sand should be added if the gravel is too coarse in nature, or it is at all inclined to be sticky, as it is

FIG. 100.—THE CHELSEA PHYSIC GARDEN. PLANTS OF THE NATURAL ORDERS GROUPED TOGETHER IN BEDS.

its special characteristics without undue stimulation. Here again a process of rigid selection was employed, marks being given to those of outstanding excellence. Apart from beauty of form, which was very manifest in most cases, productiveness was remarkable. Not least striking was the general absence of disease in the tubers, although most of the haulm had been destroyed. It may be said that disease-resistance is natural to seedling Potatos, but, on the contrary, experience has shown that such is not the case. To be capable of resisting disease in such a season as the present, seedling Potatos must have strong disease-resisting powers. Messrs. Sutton have, from the time of the introduction of their famous *Magnum Bonum*, constantly aimed to produce disease-resisting Potatos. In dry seasons cultivators are too apt to treat the fungus with indifference, but when its destructiveness is made so manifest as this season, then the Potato grounds themselves cry out for some power to check its ravages. It may be that the constant raising of new, hardy varieties from seed will be more effective than any other means.

It was interesting to compare the produce of

apt to be in clayey districts. Though Heaths will thrive in a comparatively shallow soil, it will always be found that they do best if given a fair opportunity to push their roots to a fair depth, and any border specially made for them should not be less than a foot deep. Some kinds do best in very dry, sloping situations, fully exposed to the weather; others take more kindly to low, damp places, and appreciate a certain amount of shade.

Erica ciliaris.—The fringed, or ciliated Heath, is by far the most handsome of our native species. It is a very local plant, but in some parts of Cornwall and Dorsetshire is as common as *E. cinerea* is in most parts of the kingdom. The fringed Heath has large purple flowers and rich green foliage. It prefers a dry situation, and blooms in June and July.

E. cinerea.—The common, or fine-leaved Heath, familiar to everyone, when seen in perfection, as it may be on some of the south-country moorlands, is a magnificent plant. Like *E. ciliaris*, it enjoys best a dry, sunny place, and it is one of the most easily established species.

E. vagans.—Another very beautiful Heath is the Cornish Heath, which grows abundantly in parts of Cornwall and also in the littoral districts of co. Waterford. This is a large, strong-growing species, which flowers throughout the summer and early autumn, making a fine show. One of its advantages is that it is very prone to white variation in the flowers.

E. tetralix.—A very common but less striking species is the cross-leaved Heath, which prefers a rather damp situation, although it will exist in company with *E. cinerea* on drier soil. *E. tetralix* is welcome because it blooms early, its pale, pink flowers often being in evidence quite early in June. In its white form, as it may sometimes be seen on moors and commons, it is a charming plant.

E. mediterranea.—The Mediterranean Heath is so called because it was introduced to this country from Spain, but it also grows wild in Mayo and Galway. It is sometimes known, therefore, as the Irish Heath. As a garden plant it has long been cultivated. In a congenial situation it makes a fine, bushy plant, and its flesh-coloured flowers are pleasing, if not so striking as those of some other kinds. The only other British species is Mackay's Heath (*E. Mackayi*), which is regarded as a sub-species, and is found only in co. Galway.

Calluna vulgaris.—The common Ling, or Heather, is too well known to require more than passing mention, but on account of its beauty and great variety in colouring, it is well worthy of a place in the garden. In some parts it is found wild with pure white flowers, and at various stages of its growth the common form passes through all the shades of rose, mauve, and purple. A handsome double form of this plant, with almost red flowers, is found in some districts of Cornwall.

In attempting to establish these moorland plants in gardens, it is essential to remove the roots, with an extra large ball of soil attached, early in November, and the operation of transplanting should never be attempted in dry weather. After planting, the border should be trodden as firmly as possible, and, in the absence of rain, water must be given freely. B.

FRUIT REGISTER.

RENOVATION OF OLD PEAR TREES

In many gardens there are wall fruit trees which have long since passed their best condition of fruiting. Such trees would be better replaced by younger specimens, but, from reasons of sentiment, generally, the gardener is not permitted to destroy them. In many cases the owner expects the same amount of fruit from these veterans as they produced when younger, and, if the quality is deficient, the gardener is blamed. Old Pear trees of this description are especially common, and the following hints on their temporary renovation may prove useful.

Sometimes a compromise can be effected whereby the grower is enabled to destroy the oldest of the trees and plant others in their stead. If the remainder are subjected to a judicious spur pruning and the roots are lifted as far as possible and supplied with fresh compost, they may be induced to continue to yield fruits of medium quality. Autumn is the best season to commence operations; first, a trench should be opened some 9 feet distant from the stem of the tree. All roots encountered at this point should be severed, but those nearer the stem must be preserved without injuring them. Such as are found plant enough may be pegged back out of the way, and kept covered with mats, which should be damped frequently, but those which are too stubborn to be thus treated should have some old canvas or haybands wrapped around them and be kept damped also. A good ball of soil should be left undisturbed some 3 feet or 4 feet distant

around the stem, but the precaution should be taken to ascertain if there are roots beneath it. To do this, it will be necessary to excavate beneath one-half of the ball at one time, ramming the soil again as firmly as possible before operating on the other half. Any downward-growing roots must be severed close up to the ball. Before laying out the roots afresh, all broken ends should be severed smoothly, and the thick, fibreless roots may be notched here and there to encourage the development of new roots. They should then be laid in the new compost in a nearly horizontal position, and covered with the finer particles of soil. The new compost may consist for the most part of good, turfy loam, with ashes and charred material from the garden fire, some burnt soil or ballast, and lime rubble. If the loam is of good quality, $\frac{1}{2}$ cwt. of bone meal and the same weight of $\frac{1}{2}$ inch bones to about 10 cart-loads of soil, will suffice to enrich the whole, but if the loam is inclined to be poor, a little well-rotted farmyard manure may be included. Tread the ground firmly as the trench is filled in, and when the work is completed well water the soil and apply a mulch. The operation of spur-pruning should be spread over two or three seasons, so as to avoid giving the trees too great a check, which would be the case if it were done at one time. Every alternate branch may be dealt with at first, or every other spur may be removed on all the branches at the first pruning. Then either one-half of the remainder, or the whole, just as may be deemed advisable, may be dispensed with the year following. There are two ways of dealing with the spurs which are to be dispensed with. The one is to cut them back to within an inch of the main branch; the other, to remove them entirely. Equally as good results are to be obtained by the application of the one method as the other, for in both cases numerous young growths will result, and these may be made to form new spurs. By these means the branches will, in the course of a few seasons, become entirely re-clothed with short, robust, fruiting spurs, which will yield good, if not large fruits. To encourage the formation of roots near the surface, summer mulching and feeding with artificial manures, in addition to affording water in hot, dry weather, with an occasional soaking of liquid manure, must be carried out. When the roots are feeding near the surface in warm soil, the quality of the fruits is much improved. A. W.

The Week's Work.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

The treatment of bedding plants.—The removal of the summer bedding plants and their subsequent treatment will now engage the attention of most gardeners. Those plants which will be used for a similar purpose next year must be treated with every care, but many of the soft-wooded plants are of no further use, and these should be removed to the rubbish heap. Standard plants of Fuchsias, Pelargoniums, Lantanas and Streptosolen Jamesoni that were plunged in their pots, should have the roots trimmed off from the pots, the pots washed, and the plants pruned to the hard wood. They should then be placed closely together in a cool house or deep pit. Occasional syringings when the weather is fine, and shade from bright sunshine will assist the plants to recover from the severe check. Those which were knocked out of the pots before planting should be put into pots of the smallest size possible. Plants of tuberous-rooted Begonias should be laid out thinly and protected from rain in a cool place, where plenty of light may reach them, until they are dried off, when these may be stored away in boxes of sand, carefully labelling any varieties it is wished to keep distinct. Old stools of Pelargoniums should be potted up into 5-inch pots and cut back. *Lobelia cardinalis* and its varieties should be cut down, and the tubers boxed up and placed in a cool house. Cannas need to be lifted

and placed in some frost-proof position, where these may rest during the winter months. In respect to *Echeveria secunda glauca*, we make a practice of sorting the individual plants into their sizes; they are afterwards banked up with a setting of soil, in a slanting direction towards a low wall of a greenhouse in a southern aspect. These do not require any other attention beyond covering them in frosty weather with a few mats. Should exceptionally hard weather set in, we apply a further covering in the shape of a layer of Wheat straw. The plants of *E. secunda glauca major* and *E. farinosa* are boxed up and placed in a dry greenhouse. Any decayed leaves that form from time to time are removed promptly.

General work.—Attention must be directed from time to time to the cuttings of bedding and other plants. The Pelargonium cuttings which were placed in boxes out-of-doors must now be removed to another position, preferably to frames which have a flow and return pipe; the boxes should be elevated as near to the glass as is possible. Give abundance of air, and allow a slight heat in the water pipes. Cuttings that were struck in heat must be removed, as the roots are formed, to cooler quarters, and the longest shoots pinched. Keep the growth as sturdy as possible. Give air to cuttings of Pentstemons and Calceolarias when these have formed roots. Choose a dry day for gathering seed of Pentstemons and any other plants, and lay the spikes out thinly on trays to dry, afterwards bunching them and suspending them in a cool, dry structure. The pleasure grounds require frequent sweepings. Clean out all drains in the carriage drives, walks and other places. Get in a stock of mats for winter protection, and in wet weather they may be tied in a neat manner. Obtain plenty of bracken, and place it in a dry shed for use as a protecting material.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Gathering and storing of fruit.—Mid-season and late varieties of Apples and Pears should not be gathered until the stalks part readily from the trees. These fruits are very scarce this season, and extra care should be taken in harvesting them, as they are sure to be valuable during the coming winter. Select sound fruits only for storing; any that are bruised, small, or deformed should be used for present consumption. As each variety is placed in the fruit room, see that it is correctly labelled. In gathering, avoid the common error of placing too many fruits one on top of the other, as those at the bottom of the basket are liable to be bruised if a heavy weight is pressing on them. Any specimens intended for exhibition purposes should be placed by themselves in the fruit-room.

Nuts.—Like all other fruits this season Cob Nuts and Filberts are very late in maturing. They should be gathered as soon as the kernels are brown on the outside. If they are allowed to remain after they are ripe they commence to drop, and many are lost. Nuts should be stored on a cold floor, where the conditions are moist, but not where rats or mice can reach them. Where squirrels are plentiful these will soon clear the whole crop of Nuts unless measures are taken to prevent them.

Plums.—Late fruiting varieties should be examined at intervals, and the ripe fruits gathered. Birds and wasps often attack the best fruits as soon as they are ripe, and this must be guarded against. Plums may be kept in a good condition after they are gathered by placing them, in a single layer, on fish netting stretched tight in a cool, well-ventilated room.

General work.—Any trees which are infested with insects should be sprayed with some suitable insecticide directly the crop is gathered. Nets that are no longer required should be dried in fine weather, and stored until another season. They may be hung in a dry loft either from the walls or from the roof. All mulching materials about the roots of fruit trees, if it has not been removed already, should be taken away, in order that the sun and air may exercise their influences on the borders. Where the soil about fruit trees has been trodden upon, it will be advisable to lightly fork it up.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH TICKLERGILL, Esq.,
Bardon Hill, Westwood, Yorkshire.

Euphorbia fulgens (jacquiniiflora).—Plants of this species should be exposed to the sunlight as much as possible, keeping them near to the glass, in order to induce sturdy, short-jointed growths. In cases where some of the shoots have been bent downwards for the purpose of forming specimen plants, this treatment should not be continued later than this date, it being necessary that the plants assume a natural shape before the flowering season commences. At the present stage of growth, a little top-dressing of some approved chemical manure and occasional waterings with soot-water are beneficial. It is now necessary to exercise greater care in the watering, for any excess of moisture at the roots at this season will have serious effects. The flowering shoots may be looped up to a neat, green stake placed in the centre of the pot. Keep a sharp lookout for Brown scale, and see that the plants are perfectly clean before the first flowers open.

Hippeastrum (Amaryllis).—When the bulbs of Hippeastrums have become thoroughly matured, they should be stored away in a cool greenhouse, where frost cannot enter. They may remain in this condition during the winter, but it will be necessary to examine them at intervals, affording sufficient water to prevent the bulbs from shrivelling. Seedlings should be examined carefully, with a view to repotting those likely to require more root room before the new year. These will require a rather moist, warm atmosphere, but not sufficient to induce much root-action or top-growth during winter. Ventilation must be practised, but in such a manner as to prevent cold draughts reaching the seedlings.

Alocasia.—Plants of *Alocasia* having now nearly completed their growth for the present season, attention must be directed to the matter of ripening up the tubers before the advent of winter. For this purpose there must be a slight reduction in the supply of water to the roots, and the plants should be placed in elevated positions, where they will be exposed to the light and air. As the foliage ripens, the tubers may be allowed to remain in their pots, and the pots can be placed in a dry position in the stove for the winter. *Alocasia Sanderiana* requires exceptional treatment. It succeeds best if treated, not as a deciduous plant, but rather as one which retains its foliage through the year. It should be given occasional waterings at the root, and it must not suffer excessive dryness at any season.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TRAVOR LAWRENCE,
Bart., Burford, Surrey.

Sobralia.—Such *Sobralias* as *S. macrantha*, *S. m. alba* (syn. *Kienastiana*), *S. Lowii*, *S. Ruckertii*, *S. virginialis*, *S. albo-violacea*, *S. Wilsoniana*, *S. Holfordii*, *S. Warscewiczii*, the new *S. Cliftonii*, and the hybrids *S. Veitchii*, *S. Americana*, *S. Wiganiae*, and *S. Colmaniae* form a good representative collection. Where such a collection is cultivated, as here at Burford, there is maintained, with short intervals, a supply of bloom from May until the present time. Those now in flower include *S. Lindenii* and *S. Warscewiczii*. Any necessary repotting may be done at this season, giving first attention to those which bloomed early. All the *Sobralias* are very strong growers, and they require plenty of pot room. Large specimens may be divided at this season, and any plants that need a larger receptacle through having been in a pot-bound condition for a long time, may be afforded a liberal shift as soon as the new breaks commence to show themselves, using a compost of fibrous loam, *Osmunda* fibre, and *Sphagnum*-moss in equal parts. It is necessary to cut up the *Osmunda* and *Sphagnum* moderately fine, for if used in a rough state, it will not readily mix with the loam. Provide good drainage, and in the potting sprinkle a few handfuls of fine crocks amongst the soil. Press the compost moderately firm, leaving a space of half-an-inch below the rim of the pot for affording water. It is not always desirable to repot a *Sobralia* immediately it has filled its pot with roots, as the plants would then soon become too large and unwieldy. Such root-bound plants will flower well and keep in good condition for years if they are afforded plenty of water at all times, with an occasional watering with weak cow-

manure. For some time after root-disturbance the soil must not be kept very moist. Place the plants at one end of the intermediate house, where they will get plenty of head room and not near enough to the roof-glass to be injured in very cold weather. Arranged well up to the light against the back wall of a three-quarter span, or a lean-to house is a very suitable position for them. As the leaves commence to change colour, cut the old stems down to the roots, then tie the young growths out clear of each other, so that each one will be exposed to the light and air. The repotted plants should not be interfered with in this way, it being preferable to defer the operation till the plants are growing vigorously.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to SIR ERNEST CASSELL,
G.C.B., Moulton Paddocks, Newmarket.

Tomatos.—The plants for fruiting in winter are now nicely established in the soil, and they are carrying several trusses of fruit. They require a fairly dry, airy atmosphere with a temperature of 55° to 60° at night. Watering should be done with care in the early part of the day, but it is not desirable to apply stimulants during the autumn and winter months. Allow each plant ample space so as to expose it to the sun and light, and wash the roof glass as often as may be necessary to remove any smut or filth which would obstruct the light. On sunny days the plants may be tapped or slightly shaken to assist in distributing the pollen. All lateral growths should be kept pinched off. For raising plants to fruit early next season, a pinch of seed should be sown in a gentle heat, and the seedlings should be pricked off into small pots when they are large enough to be handled, wintering them on a shelf near the glass in an intermediate house or in the house that contains the winter fruiting *Tomatos*. These autumn-raised plants should be ready for planting in their fruiting quarters early in the year, and they may be expected to bear fruit several weeks earlier than plants raised in spring.

Vineries.—Vineries containing ripening Grapes will now require careful ventilation, or the shortening days and cold, damp nights will result in the berries being affected with mould and rot. As these late crops are generally required to hang upon the vines for some time, it is necessary that they should mature thoroughly. Encourage the ripening process by a judicious use of fire-heat and maintain a dry, warm atmosphere. On sunny days admit air freely, but if the weather is dull and foggy open both top and side ventilators very slightly only, and maintain sufficient heat in the water pipes to keep the temperature about 60°. To check evaporation, save frequent waterings, and prevent the dust rising, a mulch of clean straw may be applied to the border.

Ripening the wood.—Young vines, and those which from various causes have excessively strong, sappy growths, usually retain their foliage longer than is desirable. Afford full ventilation and keep a gentle heat in the water-pipes during dull weather. It will also help the lower buds considerably if the laterals are shortened to about half their length. To assist the ripening, the roots should be kept in a fairly dry state, but never allow the border to get dust-dry. Any mulching of litter or manure which has been applied to the outside borders earlier in the season may be removed to let the border sweeten before applying a winter covering.

THE KITCHEN GARDEN.

By JOHN DUNS, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Peas.—Peas raised in June and now swelling their pods require liberal supplies of weak liquid manure from the farmyard every four or five days in order to hasten their development. If liquid manure is not available, the ground about the plants should be dusted freely with guano or some artificial manure, following this with an application of clear water, which should be allowed to remain in the sunshine for some time before use. When the latest Peas have set a few pods on each plant, the tops may be pinched out with advantage and liberal supplies of water applied to the roots. If the plants are growing through the sides of the rows of sticks additional supports should be given to

keep them in an upright position, and to allow the free passage of air between the rows. The only pest likely to trouble the cultivator now will be sparrows, and these may be guarded against by covering the rows with Strawberry nets. Every effort should be made to continue this crop as far into October as possible. From sowings made here early in June we are gathering good pods every day. *Autocrat* is our latest variety, and it seldom fails to give satisfaction.

French Beans.—The plants in the open garden should be afforded protection on cold nights. If any spare lights are available, these make the best covering, and should be raised at least 6 inches above the plants. By the use of such lights, the supply of Beans may sometimes be continued long after the first nip of frost has injured the rest of the vegetation.

French Beans in pits.—If seeds were sown late in July, the plants in unheated pits will be well in flower by this date, and should have the lights placed over them each night and removed again in the morning. The plants should be watered freely in the early part of the day so that the surface moisture may evaporate before the evening, especially if the weather is cold. Later plants in heated pits may be treated in the same way until frost sets in, when a little heat may be employed. A sowing may now be made in pots for fruiting at about the third week in November. Pots 7 inches in diameter are the most suitable for this crop, and the soil should consist of loam two-thirds and leaf-soil one-third. It should be made moderately firm, and seven seeds may be placed in each pot, covering them 1 inch deep with fine soil; the pots may be placed in a temperature of 60° until the young plants appear, when they should be placed near the glass and syringed twice each day.

Lettuce.—Lettuce seed may be sown either in a cold pit or in a border with a warm aspect where some protection can be given from snow and severe frost. The plants should afford a supply in April, and they will be much hardier than plants raised in spring and grown in pits. Hardy Hammersmith, Stanstead Park, and Brown Cos are good varieties for this purpose.

Mushroom beds.—Continue to collect manure and prepare beds for succession. Lay the manure in a dry shed and turn it frequently. Beds spawned now should afford supplies about the middle of November; these beds should be at least 1 foot deep when ready for spawning, as at this season they lose their heat much quicker than in summer. After spawning, the beds should be covered a few inches deep with straw to hinder evaporation.

THE APIARY.

By CHLOEIS.

The honey season 1910.—The past season has been very disheartening to beekeepers, and last year was nearly as bad. But in every branch of business some years are apt to prove failures, and the beekeeper should take heart, and do his utmost to make the coming year a successful one. Since my note on feeding appeared (see p. 181), I have examined three apiaries, and have found several colonies destroyed through starvation. Very few hives have sufficient honey to provide the bees with food through the winter, and feeding must be practised.

Queens.—The present is a good time to purchase queens, as they are cheap. Follow the directions given in the issue for July 22. Italian queens are also cheap now, and may be similarly introduced. Remember that Italian bees do not produce good section honey; it looks watery as the cappings are close to the honey, but for producing honey for extraction they are unequalled. The pure Ligurian bees show three upper bands of bright and yellow on the abdomen.

Driven bees.—In most country places there are cottagers who still keep bees in straw skeps. The bees in these hives may usually be had for the asking. They may be added to those hives which are weak. First smoke the hives and then remove the quilts, shaking in some fresh bees and smoking them down. By this means time is saved, for when bees are thrown down in front of a hive, they lodge under the shelter.

A warning.—Those who are feeding will do well to have the entrances of the hives so adjusted that only one bee may enter at one time. This will check robbing.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unacknowledged communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, OCTOBER 1—

Soc. Franc. d'Hort. de Londres meet.

TUESDAY, OCTOBER 4—Scottish Hort. Assoc. meet.

WEDNESDAY, OCTOBER 5—

Nat. Chrys. Soc. Exh. at Crystal Palace (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—52.8°.

ACTUAL TEMPERATURES.—

LONDON.—Wednesday, September 28 (6 P.M.): Max. 75°; Min. 48°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, September 29 (10 A.M.): Bar. 29.9; Temp. 66°; H. 6.0—Sunshine.

PROVINCES.—Thursday, September 28: Max. 68° Cambridge; Min. 51° Ireland N.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—

Dutch Bulb, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

TUESDAY AND WEDNESDAY—

Twenty-ninth Annual Sale of Nursery Stock, at Sunningdale Nurseries, Windle-ham, Surrey, by Protheroe & Morris, at 12.30.

TUESDAY TO FRIDAY—

Clearance Sale of 100,000 Fruit Trees and other Stock, at St. John's Nurseries, Worcester, by Protheroe & Morris, at 11.30.

WEDNESDAY—

Bulbs, at 1; Azaleas, Palms, &c., at 5; at 67 & 68, Cheapside, E.C., by Protheroe and Morris.

THURSDAY AND FRIDAY—

Clearance Sale of Nursery Stock, at Tunbridge Wells Nurseries, Tunbridge Wells, by Messrs. Crapps & Son, Ltd., by Protheroe & Morris, at 11.30.

FRIDAY—

Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Diseases of Gooseberry Bushes.

The rapid spread of American Gooseberry-mildew in this country has tended to withdraw attention from the two other diseases of Gooseberry bushes, one of which, at any rate, is responsible for considerable losses to fruit-growers. The more frequent disease of the two is caused by that omnivorous pest, *Botrytis cinerea*, while the other is presumably due to *Cytosporina Ribis*, a fungus whose nearest relatives are harmless saprophytes. The disease caused by the *Botrytis* was first described by Miss Smith, and recently Salmon has called attention to it in a practical manner in the *Journal of the Board of Agriculture* (April, 1910). The other disease was originally reported from Holland by Van Hall. Both of these diseases have recently been investigated by Brooks and Bartlett in detail, the results of their researches being published in the *Annals Mycological* (April, 1910). Their work deals with the loss of berries in Cambridgeshire, where the fruit-growing industry is year by year becoming of greater importance.

The disease due to *Botrytis* is sometimes called "die-back" by growers, the name

being due to the fact that in many cases the younger branches are first affected. The presence of this disease is most evident in the spring, when the foliage of affected branches is found to be wilting. The basal parts of such branches at this period of the year generally show innumerable tufts of the conidiophores of *Botrytis* bursting through the bark. These fructifications arise from the black sclerotia of this fungus, which are embedded in the bark. Branches which have been killed by the disease can be readily broken off at the point of union with the main stem. Infection spreads from the base of an affected branch into other branches, so that in the course of a few years the whole bush is destroyed. If the main stem of the bush becomes girdled by the fungus, death ensues. Gooseberry bushes seem to suffer from this disease independently of the kind of soil and situation. The most heavily-cropping varieties of bushes are the kinds most often affected, Whinham's Industry and Keepsake being particularly liable to attack.

The mycelium of *Botrytis* has been found to be present in the wood as well as in the bark of affected branches. Its presence in the vessels of the wood enables it to spread rapidly, either downwards or upwards. The wilting of the foliage, which is so common a feature of this disease, is doubtless due to the presence of the hyphae in the vessels, and the consequent interference with the rise of the transpiration current.

Inoculation experiments made by placing the developing mycelium of this fungus in the stems of healthy bushes resulted in the production of the usual symptoms of the disease, and subsequently in the death of the inoculated branches.

It was formerly thought that *Botrytis* entered the bushes by means of a wound at soil level, but we now know that, in several cases at any rate, this pest begins its attack in the upper parts of the bush, and subsequently travels downwards. Several observers have shown that it is rare for the spores of *Botrytis cinerea* to cause directly the infection of healthy tissues; more frequently *Botrytis* begins its development where saprophytic nourishment is available, and causes only at a later stage the destruction of living tissues by the secretion of some poisonous substance in advance of its own growth.

Although there is still some obscurity with regard to the mode of infection of Gooseberry bushes in nature by *Botrytis*, there is no doubt that the attack may begin in a variety of ways. Brooks and Bartlett have suggested that this fungus may follow an attack of green-fly, and, possibly, of scale insects also; and that young shoots killed by late frosts provide a favourable starting point for the disease in question. The fungus may begin to spread from old bud scales, and from flowers which have not set fruit. Other possible modes of infection have also been suggested. Salmon has observed occasionally that the berries are affected. It is likely that in such cases infection has resulted directly, as in the disease of Grapes caused by the same fungus.

The only remedial measure that can be suggested for this disease is the removal and burning of affected bushes, spraying being usually of little avail against such an insidious pest as *Botrytis*. It is highly probable

that the disease would not be nearly so prevalent as it is if it were the custom to burn all bushes showing branches with wilted foliage. At present little attention is paid to this matter, and diseased bushes are frequently left *in situ* until every part is dead, and long after sclerotia have been developed. It should be borne in mind that when these bodies germinate they afford abundant opportunities for the spread of the disease.

A Gooseberry bush attacked by the other disease, to which reference was made at the beginning of this article, shows symptoms which are very similar to those evoked by *Botrytis*. Either the whole bush, or one of the larger branches springing from near the base of the plant, dies somewhat suddenly. If, however, the stem of the affected part is cut across it is seen that the discoloration of the wood is proceeding in a manner differing from that which occurs when the disease is due to *Botrytis*. Furthermore, if pieces of wood are taken at the junction of healthy and diseased tissues and are kept under suitable conditions, the fruit bodies of *Cytosporina Ribis* develop, whereas from a stem attacked by *Botrytis* the conidiophores of the latter fungus arise. The fruit bodies of *Cytosporina Ribis* were observed last autumn upon diseased branches of bushes in the plantations, the masses of spores being extruded in the form of delicate yellow tendrils. Until the present it has not been possible to induce the spores of *Cytosporina* to germinate, so infection experiments have not yet been performed. Hence, all that can be said as yet is that this disease is probably due to *Cytosporina Ribis*. This disease is nearly always associated with the presence of a wound, frequently found at soil level, and it is highly probable that the attack originates at such a point. Affected bushes should be burnt, and care should be taken, in cultivating the soil between the rows, to avoid making wounds in the bushes.

A careless policy in regard to such diseases as are here described generally leads to serious losses. When growers can be persuaded to grub and burn affected bushes more rapidly than they do at present, a valuable lesson in plant sanitation will have been learnt. Some already pull up diseased bushes, but often their good intention is spoilt by allowing the bushes to lie about on the ground for a considerable time before putting them on the fire.

NATIONAL CHRYSANTHEMUM SOCIETY.—The Society's early exhibition will be held at the Crystal Palace on Wednesday next, October 5.

PRESENTATION TO A NURSERY EMPLOYÉ.—Mr. HUGH NIXON, who is severing his connection with Messrs. FELL & Co.'s, Royal Nurseries, Hexham, after 24½ years service, was presented on the 21st ult. by members of the firm and his fellow employés with souvenirs on the occasion of his leaving for British Columbia.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY.—The 24th anniversary dinner will be held at the Waldorf Hotel, Aldwych, on Thursday, October 6 at 6.30 p.m. The chair will be taken by Mr. EDWARD SHERWOOD. The secretary, Mr. W. COLLINS, 9, Martindale Road, Balham, S.W., will be glad to hear not later than Tuesday, October 4, from those intending to be present.

HORTICULTURAL INSTRUCTION AT THE SOUTH-WESTERN POLYTECHNIC INSTITUTE.

A course of horticultural instruction is given at the South-Western Polytechnic Institute, Chels. a. The course consists of lectures and practical work on Tuesday evenings, 7 to 10 p.m., conducted by Mr. H. J. JEFFERY, A.R.C.S., together with practical demonstrations on gardening operations at the Chelsea Physic Garden, under the supervision of Mr. HALLS (the Curator), on Saturday afternoons. A course of lectures on technical or economic botany, by Dr. S. E. CHANDLER, is given on Wednesdays from 7 to 10 p.m. A copy of the syllabus of either course can be obtained from the Institute.

PRESENTATION TO A GARDENER.—Mr. F. CLIPSTONE, who is resigning his position as gardener at Dingley, Market Harborough, after 18 years' service, was the recipient of a gift from the members of the garden staff on the 21st ult.

FORESTRY APPOINTMENT FOR ABERDEEN STUDENT.—An appointment has been conferred on Mr. F. G. SPRING, a diploma student, of the Aberdeen and North of Scotland College of Agriculture, in the shape of an assistantship to the Director of Agriculture and Superintendent of the Government plantations in the Federated Malay States, at a salary commencing at £360 per annum.

A NEW JOURNAL FOR ORCHIDISTS.—We have been favoured with a copy of the first issue of a new monthly journal devoted entirely to Orchids. The editor is Mr. J. GURNEY WILSON, a well-known member of the Orchid Committee of the Royal Horticultural Society. The *Orchid World* consists of 32 pages of matter and advertisements, and it is printed on very good paper, especially suited for reproducing half-tone illustrations, though scarcely so pleasant to the reader as paper which is less glazed. The editor contributes an interesting article on Sir TREVOR LAWRENCE'S collection at Burford, and this is accompanied by a first-class portrait of Sir TREVOR LAWRENCE himself. Mr. H. G. ALEXANDER has an article on *Vanda cordata*, accompanied by excellent illustrations of this lovely species. "Rare Native Orchids" is treated by Mr. A. D. WEBSTER. Other features include notices of books, descriptions of new Orchids, reports of meetings of the R.H.S. Society's Orchid Committee. The issue will be distributed on Wednesday, October 5, and the price is 1s., post free. We hope that this latest enterprise will help to still further popularise Orchid culture, and we wish it every success.

NORTH BRITISH STATION GARDENS.—The awards have just been issued in connection with the prizes offered by the North British Railway Company for the best-kept station gardens. They are divided into four classes, the winners in the first receiving £4 each; the second £3; the third £2; and the fourth £1. The following are in the first class:—Mr. BLACKWOOD, Alva; Mr. NAIN, Armadale; Mr. MULLIGAN, Barrasford; Mr. FERGUSON, Burch; Mr. NAHER, Chalkfoot; Mr. TURNBULL, Chirpside; Mr. STEWART, Cuppit; Mr. BELL, Duns; Mr. BRYDON, Edgoh; Mr. STEVENSON, Heleburgh; Mr. GRANT, Hillfoot; Mr. HEND, Kinross Junction; Mr. SCOTT, Marchmont; Mr. ARMSTRONG, Middleton; Mr. SPIERS, Row; Mr. RENFREW, St. Monans; Mr. WANN, Slamannan; Mr. CUTHBERTSON, Strathblain; Mr. MURDOCH, Summerston, and Mr. WATERSTON, Winton. There are no fewer than 40 in the second class.

TRADE NOTICE.

Mr. J. Taylor, for many years with Messrs. Sander & Sons, St. Albans, will in future represent Messrs. Mansell & Hatcher, Ltd., Rawdon, Yorkshire.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

THE LATE MAX LEICHTLIN.—I have read with great interest Mr. H. J. Elwes' remarks in your last issue on the late Max Leichtlin. As a boy, I heard Leichtlin's name mentioned frequently by my father, and always in connection with some new plant. I had the pleasure of making his acquaintance some few years since in the lovely town of Baden-Baden, where he had resided for so long; but it was very evident then that his health was giving way, and he was soon afterwards obliged to give up his garden, from which he had introduced so many new plants to cultivation. His lists of new plants were eagerly opened and read, and such was the confidence placed in his judgment, that many a plant was entirely disposed of within a few days of its being offered. The popularity of hardy plants to-day is partly due to the work of Max Leichtlin, and others who have passed away. But men are soon forgotten, unless some permanent memorial is founded to them, some scheme should be promoted so that the name of Max Leichtlin may still be remembered amongst us. The following names of plants introduced by him occur to me as I write, in addition to those mentioned by Mr. Elwes:—*Aster subcoruleus*, *Kniphofia Nelsonii*, *K. hybrida Triumph*, *Star of Baden*, and other *Kniphofias*;

THE LATE MAX LEICHTLIN.

some very fine named seedlings of *Iris reticulata*, *Tropaeolum polyphyllum Leichtlinii*, *Liatris graminifolia Dubia*; a Chinese form of *Lilium giganteum*, which at one time grew finely at Burford Lodge; *Andrietta Lavender*, a fine seedling, and one of the last plants listed by him. Turning over some old papers, I have just come across a small plant list issued by my father in 1874. When speaking of *Lilium dalmanicum* (Catani), he mentions: "I have secured the whole stock of this magnificent Lily, collected at great trouble and expense by that indelible botanist Mr. Max Leichtlin." *B. W. Wallace, Colchester.*

THE MUD BEETLE IN ABERDEENSHIRE.—Considerable injury has been done by the mud beetle (*Helophorus rugosus*) to the Turnip crops in the Deeside district of Aberdeenshire. In one part especially—Dunnis—the leaves of the plants may be seen holed, as if riddled with shot, over a considerable area. The pest is well known in England and Wales, but it is not so common in Scotland; yet, from the districts of the Tweed, Forth, and Solway come reports of its appearance there this season. *Helophorus rugosus* does considerable damage both as a grub and as a beetle. The leaves of the Turnip may be eaten, the leaf stalks may be holed and tunnelled, or the roots themselves may be gnawed and tunnelled on the outer surface, and especially in the upper

part. The holes thus made afford entry to rain and fungal diseases. In an official pamphlet, the Board of Agriculture thus describes the pest:—"The adult insect measures about a quarter of an inch, is oval, oblong, and somewhat broad. The colour is dark-reddish, often obscured by a covering of mud. The wing-covers show here and there dark markings. The legs are pale red, and the antennae of the beetle somewhat thickened towards the top. The grub has a dark-coloured head and brownish jaws. The three segments behind the head each carry a pair of legs. On the upper surface of these thoracic segments is a dark, transverse curved line; whilst down the back of the remaining segments there are two rows of large, square spots, with rows of smaller spots below and down each side. The body ends in two processes." It is strange, so far as Scotland is concerned, that all the complaints made concerning the ravages of this pest on Turnips have come from Aberdeenshire. *W. K.*

TARRED ROADS INJURIOUS TO PLANT LIFE.

At the recent International Road Congress held at Brussels, an important discussion took place as to the effects of tarred roads on vegetation. As would naturally be expected, considerable difference of opinion exists between the motorist and the horticulturist, the former hailing the advent of the tarred road as a boon, while the latter asserts that the particles of tar now disseminated by passing vehicles are decidedly injurious to trees and shrubs. It is a recognised fact that plant life has already suffered much from tarred roads in the Bois de Boulogne; and in several parts of London—two in particular—plants that at one time succeeded admirably have been discarded, owing to the composition and treatment of the roadways. Dust did comparatively little harm, and it was readily washed from the foliage by rains, but the particles of tar and fumes given off from most of the artificially-prepared roadways have been found injurious to plants growing in close proximity. In the case of trees and shrubs brown spots usually appear on the leaves, after which the leaves gradually wither and fall; but in the case of some bedding plants the effect is quicker, the foliage in a few days appearing as if seared by frost or fire. The effects are most pronounced in warm, dry weather, and trees and shrubs, from their stronger constitution, are better able to withstand the fumes and deposit of tarry dust than is the case with tender bedding plants. During the past two years some experiments have been undertaken in order to find out which bedding plants are best suited for withstanding the injurious effects of tarred and creosoted wood pavements, and the fumes of petrol. *Pelargoniums* evidently fare worst of all, and soon lose their leaves, whereas in the same bed *Calceolarias* and *Antirrhinums* seem to be affected but little. *A. D. Webster.*

THE BEST METHOD OF STORING CARROTS

(see p. 254).—This is evidently a case of "different men, different methods." My own experience has led me to adopt a plan which does not wholly agree with the practice of either of your correspondents. I have found Carrots to keep best when they are stored in a shed in moderately-dry sand, with their tops exposed to the air. In this manner the roots keep well and sound, with a loss of colour, until the return of spring forces them to push their flower-spikes. By that time there are plenty of next season's roots available for use. In a moist climate like that of Cornwall, it is not advisable to store Carrots out of doors, for, under these conditions, they would soon make fresh growths, and deteriorate. *A. C. Bartlett, Pincarrow Gardens, Cornwall.*

CEANOTHUS GLOIRE DE VERSAILLES.—This charming autumn-flowering shrub might well be planted more freely. It grows and flowers well in good, ordinary soil, especially if not of a too-clayey nature. When planted in front of a wall or building formed of limestone, and allowed to grow out therefrom, its dull-green foliage and pale-blue flowers harmonise well. The picture is more complete when golden Yew or golden Box are associated with it. As showing its hardihood in this country, I may mention that it does well at the York Nurseries, Wiggill Park, and Bramham Park. *Yorkshire Gardener.*

BOTTLED GRAPES. Now that the art of bottling fruit for culinary purposes is so general, and so easily accomplished with satisfactory results, it has occurred to me that bottling would be a very good means to keep up the market price of home-grown Grapes. For bottling they could be cut singly from the bunch, with a short stalk attached, and they should prove a useful addition in the store cupboard, for there are many ways in which Grapes are used in the kitchen. But, so far, I have never heard of Grapes being bottled. *H. R.*

BIDENS DAHLIOIDES (see p. 226) — The writer of the descriptive note on the above-named pretty Mexican plant in your last issue made a slight error in saying that I had received the seeds of it from Herr Purpus direct, as it was to Messrs. Artindale, of Nethergreen, Ramoer, Sheffield, that the seeds were sent, and from whom I bought a couple of tubers in a dormant state. They must, therefore, be considered as the introducers of the plant into cultivation, and should any of your readers wish to add it to their collection, they should apply to this firm. I should also think that they will be able to offer seed of it for next spring's sowing if their many plants have ripened seed as freely as my two have done. It will be interesting to see if the colours reproduce themselves true from seed, as I consider the white form a much better and more beautiful plant than the pale, rose-coloured one. *W. E. Gumberton.*

HARDINESS OF WICHURAIANA ROSES.—On p. 223 *S. A.* invites a few notes upon the hardiness of these Roses. I cannot endorse his view that they are not suitable for exposed situations. No Rose enjoys such a position, but surely none is more capable of growing in bleak and wind-swept quarters than Dorothy Perkins and the many beautiful Hybrids of the Wichuraiana type. It is strange to learn that *S. A.* finds the hybrids more hardy, as many of these are raised from varieties more tender than the typical *Rosa Wichuraiana*. Roses I find most suitable for exposed positions are the Scotch Briers, followed by the *R. rugosa*, which, if single and somewhat fleeting, gives a succession of blooms. Wind does not affect the foliage of these to the same extent as the others. *S. A.* remarks "In the other parts of my garden the same results can be seen in a lesser degree according to the amount of exposure." This sentence explains the whole of the difficulty, for although the Rose enjoys an open position, a bleak and draughty corner is most unsuitable. *A. P.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 27.—The usual fortnightly meeting was held on Tuesday last in the Society's Hall, Vincent Square, Westminster. The exhibition was one of the largest seen this year, both the annexes being called into requisition. Displays of fruits and vegetables were more numerous than usual. But no reward was made to a novelty in this section.

The principal floral groups, other than Orchids, were of Dahlias, Roses and hardy flowers, the latter predominating. The FLORAL COMMITTEE conferred one First-class Certificate and 12 Awards of Merit. The ORCHID COMMITTEE granted one First-class Certificate and four Awards of Merit.

At the 3 o'clock meeting in the Lecture room, an address on "South America in its Relation to Horticulture" was given by Mr. A. W. Hill, M.A.

Floral Committee.

Present: W. Marshall, Esq. (Chairman); and Messrs. Henry B. May, T. W. Turner, W. G. Baker, W. J. James, Jno. Green, W. J. Bean, G. Reuthe, Chas. E. Pearson, A. Turner, J. Jennings, W. Cuthbertson, C. Blck, Jas. Douglas, R. Hooper Pearson, J. T. Bennett-Poe, H. J.

Jones, W. P. Thomson, George Paul, E. H. Jenkins, Jas. Walker, E. A. Bowles, A. Kingsmill, Jas. Hudson, Ed. Mawley, F. Page Roberts, W. Howe, C. R. Fielder, H. J. Cuthbush, and R. W. Wallace.

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, showed miscellaneous greenhouse flowering plants. They displayed several fine hybrid Rhododendrons of the javanico-jasminiflorum type, the handsomest being known as Baroness Henry Schroder, with flowers of flesh tint. Others specially good were javanicum (citron-red) and Taylori (pink). The exhibit also included a showy batch of *Nerine Bowdenii*; varieties of *Streptocarpus*, shown in batches of distinct colours, the blue and white varieties being remarkably good; and a large assortment of *Bouvardias*, such as President

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, showed *Veronicas* of the large-flowered *Andersonii* type, in batches of named varieties. Some of the best were *Crimson King*; *La Merveilleuse*, mauve; *Lena*, purple; *Mont Blanc*, white; *Splendens*, mauve; *Violette*, violet; *Eveline*, pink; and *Attraction*, deep violet. They were arranged in a setting of choice decorative Ferns. (Silver Banksian Medal.)

Messrs. T. S. WARE, LTD., Feltham, Middlesex, showed a large bank of tuberous-rooted *Begonias*, embracing a good selection of named varieties, as well as numerous seedlings. Adjoining these, this firm showed bunches of hardy perennial flowers. (Silver-gilt Flora Medal.)

Mr. A. L. GWILLIM, Cambria Nursery, New Eltham, showed a considerable number of large-flowered *Begonias* of the tuberous-rooted section.

FIG. 102.—CYPRIPEDIUM "SHOGUN," AWARDED R.H.S. FIRST-CLASS CERTIFICATE ON TUESDAY LAST.

Cleveland, scarlet; *Priory Beauty*, pink; *Vreelandii*, white; *Maiden's Blush*, pink; *Alfred Neuner*, with double, white flowers, and *Bridesmaid*, pink, also with double flowers. (Silver Flora Medal.)

Mr. FRANK LILLEY, Nurseryman, Guernsey, showed the handsome *Amaryllis belladonna* major, finely in flower; *Nerine Bowdenii*, *N. cornucopia* major, a variety of *N. Fothergillii*, with richer red blooms, and earlier in flowering; also *Schizostylis coccinea* and a few other bulbous flowers. (Bronze Flora Medal.)

Messrs. STUART LOW & Co., Enfield, exhibited varieties of perpetual-blooming *Carnations*, including some splendid blooms of the new Lady Alington variety raised from *Britannia* × *White Perfection*. (Silver Banksian Medal.)

Messrs. PAUL & SON, Old Nurseries, Cheshunt, exhibited sprays of interesting and uncommon trees and shrubs. In some species, for example, such as *Cercidiphyllum japonicum*, *Spiraea assurgens*, *Pyrus nigrus*, and *Berberis Thunbergii* the autumn tinting was very rich. Others of special interest were *Elaeagnus argentea*, *Pyrus foliolosa*, with handsome pinnate leaves; *Pyrus Sorbus cuspidata*, *Catalpa Koenigii*, with golden leaves; *Sambucus alba marmorata* and the double-flowered form of *Prunus Pissardii*. (Silver Banksian Medal.)

Mr. L. R. RUSSELL, Richmond, showed a large group of *Clematis* and hardy *Fuchsias* of the *Riccartonii* type. Some of these latter were as showy as greenhouse varieties; the most notable was *Mme. Cornuillon*, having a large white

corolla; tricolor, with a pink corolla and purple-violet petals, is also pretty. Fuchsia microphylla, with small, light rose-coloured blossoms, and *F. pumila*, were both interesting. Amongst the Clematis none was finer than the variety Lady Northcliffe, with flowers of lavender-blue. President, deep blue, is another of much merit. (Silver Flora Medal.)

ROSES.

The most important display of Roses was made by Messrs. W. PAUL & SON, Waltham Cross. The blooms were arranged in round baskets and occupied the whole of one side of a large table. A selection of the best varieties included Mme. Leon Pain, White Maman Cochet, two of the finest autumn Roses; Hugo Roller, Phariser, Frau Karl Druschki, Charlotte Klemm, Phyllis, a Polyantha Rose with rose-carmine blooms in large sprays; Gustave Grunerwald, Ecarlate, La Tosca, Souvenir du President Carnot, Hugh

Mr. G. PRINCE, Oxford, showed blooms of Maman Cochet Irish Elegance, Frau Karl Druschki, Earl of Warwick, and other varieties. (Silver Banksian Medal.)

DAHLIAS.

One entire side of a long table was occupied by Messrs. CHEAL & SONS, Lowfield Nurseries, Crawley, with cut blooms of Dahlias of all sections. The Peony flowered varieties were displayed in many colours, and show boxes were filled with single-flowered varieties, pretty in colour and regular in form. Their show of Cactus varieties was likewise very good. (Silver Flora Medal.)

Mr. J. T. WEST, Tower Hill Nursery, Brentwood, made a bright show with Dahlias of the Cactus class and Pompons. Of the Cactus varieties, Rev. J. W. Jamieson (a flower of yellow and rose-pink colours), Oswald (a bright scarlet

Mawley (a beautiful, pure yellow variety), Phobus (clear yellow, a good garden variety), Ruby Grinstead (of a bright yellow colour, changing to rosy fawn), and Thomas Wilson (reddish fawn, tinged with amber). Among the Peony-flowered varieties, we may mention Dr. van Gorkum (white-shaded rose), Glory of Baarn (delicate pink), Hugo de Vries (bronz orange), and Nora Lindsay (dove-coloured, shaded with pink). (Silver-gilt Banksian Medal.)

Mr. J. B. RIDING, nurserymen, Chingford, Essex, showed Dahlias, including varieties of the "collarett" type. The flowers of these are like single Dahlias with a circle of raised florets in the centre. The finer were Mons. L. Ferard (crimson and white), Maurice Rivoire (crimson), Souvenir de Bernadeau (rose, with a yellow "collar"), Mme. Forrier (pansy blue), and Corbeille de Feu (scarlet, with a yellow "collar"). These varieties are popular on the Continent, but they are not much known in this country.

CHRYSANTHEMUMS AND HARDY BORDER PLANTS.

MESSRS. W. WELLS & CO., Mersham, Surrey, showed Chrysanthemums of the early-flowering class, in association with hardy perennials as cut flowers. Of Chrysanthemums, mention may be made of the yellow and orange-coloured Miss Balfour Melville (a variety having reflexed, thread-like florets), Minnie Carpenter (reddish-orange in colour, also reflexed), Dolly Reeves (of a lilac tint), J. B. Duvoir (small, and likewise of a shade of lilac), October Gold, Richard (single-flowered of magenta colour), Normandie (pale lilac, a large bloom, with reflexed florets), and Leslie (a bright yellow flower). (Silver Banksian Medal.)

Mr. MAURICE PRICHARD, Christchurch, Hampshire, showed a miscellaneous collection of hardy herbaceous perennials as cut blooms, an exhibit which was bright with colour. There were Pernettyas loaded with their coloured fruits, Crinum Powellii, Asters (Michaelmas Daisies), shrubby Phloxes, many flower-heads of Kniphofia, the white-flowered Cimicifuga simplex, and others. (Bronze Banksian Medal.)

Mr. J. BOX, Lindfield, Sussex, arranged a large ground-floor group so as to form a sloping bank of flowers against the wall. There were great bouquets of Asters, others of Heleniums in orange and brown colours, which contrasted in a striking manner with the blue, white, and purple Asters. About 40 spikes of Gladiolus America formed two great bouquets, greatly enhancing the attractiveness of the whole. The arrangement of this group was excellent, particularly as regards the grouping of the Gladioli. (Silver-gilt Banksian Medal.)

Mr. AMOS PERRY, the Hardy Plant Farm, Enfield, made a fine show with groups of Helenium Riverton Gem, with flowers of brown and yellow, Rudbeckia nitida Herbstone, Aster lino-syris, Pyrethrum roseum superbum, Papaver orientale, P. Mrs. Perry, and P. Queen Alexandra, Artemisia lactiflora (a plant bearing small, white flowers in panicles in great profusion), and a large number of inflorescences of Delphiniums.

MESSRS. BAKERS, Wolverhampton, were exhibitors of a small group of Phloxes, perennial Asters, Anemone japonica in variety, Heleniums, Viola cornuta purpurea, early-flowering Chrysanthemums, and masses of Kniphofias.

MESSRS. R. H. BATH, LTD., Floral Farms, Wisbech, had an exhibit of Chrysanthemums of the early-flowering class, of which Rose d'Arrest (of a pale blush tint), Normandie, Golden Glow, and Lillie were the more effective varieties in regard to colouring.

MESSRS. H. J. JONES, LTD., Ryecroft Nurseries, Hither Green, showed perennial Asters in quantity; the more showy varieties were C. A. Anderson, Mrs. H. J. Jones, T. S. Ware, K. E. Pulling, Mrs. Hanson Morris, Lil Fardell, Fairfield, and Precocité. (Silver Flora Medal.)

MESSRS. G. & A. CLARK, LTD., Dover, staged an assortment of hardy perennial flowers. We noticed a fine batch of the pretty Cimicifuga simplex, well-flowered plants of Leonotis Leoninus, a selection of good Kniphofias, Geum Mrs. Bradshaw, a fine scarlet variety with double flowers; and select varieties of border Asters. (Silver Banksian Medal.)

Mr. H. F. ROBSON, Alexandria Nurseries, Ham, Surrey, staged early-blooming Chrysanthemums of the decorative type, in considerable numbers and variety. (Bronze Banksian Medal.)

FIG. 103.—COLLECTION OF VEGETABLES AWARDED THE FIRST PRIZE OFFERED BY THE DUKE OF PORTLAND AT THE NATIONAL VEGETABLE SOCIETY'S SHOW.

Dickson, Lyon Rose, and Mrs. John Laing. (Silver-Gilt Flora Medal.)

MESSRS. SAMUEL McGREY & SON, Portadown, Ireland, showed a group of Roses, the blooms being of excellent quality. They had many new sorts, amongst which we remarked Ethel Malcolm, H.T., ivory-white, flushed with rose colour in the centre; Mrs. Arthur E. E. Coxhead, H.T., a fine red Rose; Mrs. Edward J. Holland, H.T., salmon-rose; Mrs. Herbert Stevens, T., white, with a tinge of colour in the centre, and Mrs. Wakefield Christie Miller, H.T., blush, shaded with salmon. (Silver Flora Medal.)

Messrs. B. R. CANT & SONS, Colchester, exhibited Roses, such sorts as Rose du Barri, White Maman Cochet, Claudius, Hugh Dickson, and General MacArthur being very fine for the time of year.

Messrs. F. CANT & CO., Colchester, also showed a selection of Roses, having epergnes and vases filled with popular varieties.

flower), Nelson (of a purple-crimson tint), Primrose Queen, H. H. Thomas (scarlet), and Beryl (orange and scarlet) were the more beautiful varieties; and of the Pompons mention may be made of the varieties Nerissa, Lassie, Laddie, George Ireland, and Annie Doncaster. (Silver Banksian Medal.)

Mr. S. MORTIMER, Rowledge, Farnham, showed six blooms of the show variety Lemon, a flower of perfect shape, moderate in size, and of a tint described by its name. The same exhibitor showed a very large Dahlia of the Fancy class, having florets of orange and yellow colours, blotched irregularly with crimson.

MESSRS. CARTER, PAGE & CO., London Wall, exhibited Dahlias of nearly all classes of the flower. Handsome Cactus-flowered varieties were observed in Australian (of a rich purple colour, a large, striking flower), J. H. Jackson (dark maroon), Leda (violet-rose, with a creamy base, the tips of the florets being rose-pink), Mrs.

Mr. FRANK BRAZIER, Caterham, filled one corner of the hall with a bright exhibit of reasonable hardy flowers, arranged with much taste. There was a good selection of border Phloxes, Michaelmas Daisies, Lilies, Pentstemons, Chrysanthemums, and similar subjects, with several vines carrying tinted foliage. (Silver Banksian Medal.)

A large group of hardy flowers was staged by Messrs. GEO. BERNARD & Co., Maidstone. The majority were varieties of border Asters, but there were also good vases of Pentstemons, Lilium auratum and Anemone japonica. (Silver Banksian Medal.)

Messrs. WM. CUTBUSH & SON, Highgate, staged a large exhibit of hardy perennials, mainly varieties of border Asters, with Pentstemons, Poppies, Solidagos, Phloxes, Polygonum

meches in length, and are oppositely disposed on the branches, the margins being toothed. The growth and fruiting are very free, and the plant is quite hardy. (From Messrs. JAMES VEITCH & SONS, LTD., Chelsea.)

AWARDS OF MERIT.

Lobelia cardinalis Gloire de St. Anne's.—This handsome variety is a seedling raised from crossing Finely and Lord Ardilaun. The brilliant, crimson-scarlet flowers are very striking and of larger size than those usually seen; the stems are tall and downy. (Shown by Lady ARDILAUN, St. Anne's, Clontarf, Co. Dublin; gr. Mr. A. Campbell.)

Dahlia Flagstaff (Cactus).—A variety of rose and yellow colour. (From Messrs. J. STREDWICK & SON, St. Leonards.)

Rose Mrs. Herbert Stevens (Tea).—A superb, white variety, with faint creamy tinge.

Rose Dorothy Ratcliffe (H.T.).—A handsome variety, with more than a suspicion of the Lyon Rose colouring. Indeed, it may be described as a pale form of this popular sort, having handsome, well-cupped flowers.

Rose Ethel Malcolm (H.T.).—The colour of this fine Rose is blush pink. (These Roses were exhibited by Messrs. MCGREEDY & SONS, Portadown, Ireland.)

Solidago spectabilis.—A distinct and good form growing about 2½ feet high, and having rich, golden-yellow flowers in erect, almost pyramidal panicles. (From Messrs. PAUL & SON, Old Nurseries, Chesham.)

Chrysanthemum Hollicot Pearl White.—A

FIG. 104.—THE FIRST PRIZE COLLECTION IN MR. SRS. WOOD AND SON'S CLASS AT THE NATIONAL VEGETABLE SOCIETY'S SHOW.

amplexicaule, Anemone japonica and others. (Silver Banksian Medal.)

Messrs. R. H. BATH, LTD., Wisbech, staged reasonable hardy flowers and border varieties of Chrysanthemums. (Bronze Flora Medal.)

The Misses HOPKINS, Mere Gardens, Shepperton, arranged a small and select group of border and Alpine flowers.

AWARDS

FIRST CLASS CLIMBER.

Edurum Henri.—A hardy species from China. The plant was about 4 feet in height, of dense, bushy habit, and crowded with axillary clusters of scarlet and black fruits. The young leaves are slightly grooved and bronzy-tinted; in the more mature state they are flat and of pale green colour. They measure 4 to 6

Carnation Lady Alington.—A self pink variety of the largest size, the calyx in no instance exhibiting any sign of bursting. The flowers are fragrant and the petals pleasingly crimped. (Shown by Messrs. STUART LOW & CO., Enfield.)

Phlox Ellen Willmott.—A good and distinct novelty of dwarf habit of growth. The flowers are self coloured and of the shade known as French grey. (From Messrs. GUNN & SONS, Olton, Warwickshire.)

Aster Peggy Ballard.—A dwarf growing Michaelmas Daisy best described as a miniature and profusely-flowered Beauty of Colwall. The newcomer is smaller in all its parts, and should prove a welcome addition to the double-flowered section. (From Mr. E. BALLARD, Colwall.)

pure-white variety with incurving florets—a "Western King" transposed to the early-flowering section.

Chrysanthemum Hollicot Golden.—A rich-yellow, well-built flower.

Chrysanthemum Betty Spark.—The colour is reddish-lilac, the flower-head of good size. (The Chrysanthemums were exhibited by Mr. W. ROOFS, Cranford, Middlesex.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, Sir Jeremiah Colman, Bart., Henry Little, R. G. Thwaites, Stuart Low, F. Sauder, F. G. Hanbury, A. A. McBean, C. H.

Curtis, W. Cobb, J. Charlesworth, J. Cypher, W. H. Hatcher, W. P. Bound, H. G. Alexander, A. Dye, H. Ballantine, J. W. Potter, Garney Wilson, William Bolton, de B. Crawshaw, and J. Leeman.

Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander), showed a selection of *Cypripediums*, including the charming *C. Actæus Bianca*, the finest *Cypripedium* of its type and the first to depose its beautiful parent, *C. insigne Sanderae*, from its place as first favourite in the yellow and pure white class; *C. nitens-Leeanum Hannibal*, the finely-shaped *C. Germaine Opoix* Westonbirt variety; *C. Gaston Bultel* "Edward VII.," a perfect flower tinged with rose-purple; the new *C. Shogun* and *Cattleya Dirce magnifica*. (See Awards.)

Sir JEREMIAH COLMAN, Bart., Gatton Park, (gr. Mr. Collier), staged an elegant little group of varieties of *Dendrobium Phalenopsis Schröderianum*, which secured a Silver Banksian Medal. The gems of the selection were two plants of the very handsome *D. Phalenopsis "Gatton Park variety,"* with white flowers of perfect form with the faintest lavender shade, and violet lines on the lip, the wholly white-flowered *D. P. hololeuca*, the pink-tinted *D. P. delicatum*, two or three dark forms, and three of the typical *D. Phalenopsis* commonly known as *D. Statterianum*, which has much of the rose colour and form of *D. bigibulum*.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkin), sent *Cattleya "The Canon"* (*Mantini* × *Dowiana aurea*), a secondary cross of *C. D. aurea*, which results in a flower resembling a finely-coloured *C. Mantinii* (*Bowringiana* × *Dowiana*) of the large size of *C. aurea*. The sepals and petals are rose-purple, the lip broad, ruby-crimson, veined from the base with golden yellow.

R. G. THWAITES, Esq., Streatham (gr. Mr. J. M. Black), showed a neat group, principally hybrids of his raising, for which a Silver Banksian Medal was awarded. We noticed several specimens of *Odontioda Thwaitesii* with flowers varying in tint from rosy-mauve to claret-purple. A new hybrid was seen in *Sophrora-Lælia Ortoniana* (*S. grandiflora* × *L. Diana*), a dwarf plant with a large cherry-red flower in several tints, the base of the lip being yellow with purple lines. Others observed were several *Odontioda Bradshawia*, *Cattleya Fabia*, one of the showiest and most useful of *Cattleyas*; the new *C. Rimpelliana* (*Hardyana* × *superba*), a very finely-coloured hybrid; and *C. Gaskelliana alba*.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), showed several fine specimens of *Cypripedium H. S. Goodson*, a large flower of good shape; the deep-red *Odontioda Devossiana*, and *O. Craveniana*.

Messrs. CHARLESWORTH & Co., Haywards Heath, whose stand always includes some novelties, were awarded a Silver Flora Medal for an excellent group, in which the most remarkable plant was the unique *Miltoniada Harwoodii*, which was previously awarded a Certificate of Appreciation in its immature condition. It results from crossing *Miltoniada vexillaria* and *Cochlioda Noezliana*. The flowers are both pretty and distinct, the equal sepals and petals being of a deep-red colour and arranged fan-like above the large, rose-tinted lip, with yellow crest. The next in importance was *Cattleya Luegeae*, and the body of the group was made up of a showy selection, including some pretty, new *Odontoglossums*; varieties of *Lælio-Cattleya blechleyensis*, *L. C. G. C. Whitelegge* var. *pallida*, *L. C. St. Gothard*; *Cattleya Iris* varieties, *C. Chamberlainiana*, *C. Venus*, and *Zygopetalum Roeblingianum*.

Messrs SANDER & SONS, St Albans, were awarded a Silver Flora Medal for a good group of *Lælio-Cattleyas*, *Brasso-Cattleyas* and *Cattleyas*. Noticeable plants were the very singular *Cattleya Abeliana*, collected in Fern, with creamy-yellow flowers speckled with purple on the lip; a very dark form of *Lælio-Cattleya Berthe Fournier*, several of the new *Lælio-Cattleya Walter Gott* (*C. bicolor* × *L. C. blechleyensis*), which in Messrs. SANDERS' original type has the shape of *Cattleya Iris*; *L. C. Binotti* (*L. pumila* × *C. bicolor*), with elongated lip of a dark-purple colour; various hybrid *Odontoglossums*, and the distinct *Phaius Cooperi*.

Messrs. STUART LOW & Co., Bush Hill Park, had the most extensive and varied group, for which a Silver Flora Medal was awarded. At the back were the bright-yellow *Oncidium oblongatum*, *O. Marshallianum* and other *Onci-*

cidiums, and in front were fine forms of *Cattleya Adula*, *C. Iris*, *Brasso-Cattleya Mrs. J. Leemann*, and the white and fragrant *Brasso-Cattleya Pocahontas*, *Cattleya Fabia*, a selection of *Masdevallias*, including the purple *M. calura*, *M. cucullata*, *M. muscosa*, *M. indifica*, *M. ephippium*, the yellow *Cypripedium Rosetti*, and other *Cypripediums*; *Cycnoches peruvianum*, well-flowered plants of *Vanda Kimballiana*, the pink and white *Codia macrostachya* with three flower-spikes; *Cirrhopetalum Roxburghii*, *Bifrenaria tetragona*, the claret-tipped *Dendrobium sanguinolentum*, *Bulbophyllum biflorum* and other interesting species.

Messrs. MANSELL & HATCHER, Rawdon, Yorkshire, secured a Silver Banksian Medal for a pretty group of *Lælio-Cattleyas*, together with finely coloured forms of *Cattleya Iris*. *L. C. rubens superba* is a handsome flower of rose-pink sepals and petals and magenta-purple lip, quite the best of its class; varieties of *Lælia pumila*, several *Brasso-Cattleyas*, the large, white *Angulora eburnea*, *Oncidium Kramerii*, and selections of *Odontoglossum* and *Cypripediums* were also shown.

Messrs. WILLIAM BULL & SONS, Chelsea, were awarded a Silver Banksian Medal for a group consisting principally of *Cattleya Pittiana*. With these were noted a light-coloured form of *Odontioda Wils nii* (*vulcanica* × *Pescatorei*), shown by R. G. THWAITES, Esq., at the last meeting, and a variety of *Cattleya McMastersii* (*Mendeli* × *Schilleriana*), first flowered by Sir Jeremiah Colman, Bart., in 1906, which has cream-white sepals and petals with well-displayed purple front lobe to the lip.

G. RAE FRASER, Esq., Pigott's Manor, Letchmore Heath, Watford, sent a female flower of a *Catasatum*, the species of which could not be accurately determined without male flowers.

Messrs. JAS. CYRER & SONS, Cheltenham, staged a small group of *Dendrobium Phalenopsis*, *Sophrora-Lælia Cattleya Medea*, *Miltonia vexillaria Leopoldii*, the dark and richly coloured *Cypripedium Titius superbum* and other *Cypripediums*, *Masdevallia corniculata*, *M. Carderi*, *M. nidifica*, some *Brasso-Cattleyas*, *Lælio-Cattleyas*, and others.

Messrs. J. & A. A. McBEAN, Cooksbridge, showed a fine dark form of *Cypripedium Germaine Opoix*.

Messrs. STANLEY & Co., Southgate, sent a selection of the pretty *Cattleya iridescens* and *Lælio-Cattleya Walter Gott*, with less perfectly formed flowers than those previously shown, the strain showing more of *L. C. blechleyensis*.

Mr. E. V. Low, Vale Bridge, Haywards Heath, staged a small group, which included a good *Cypripedium King Edward VII.* (*Rothschildiana* × *nitens*), the clear, greenish-yellow and white *C. Rosettii*, *C. insigne Sanderae*, *C. William Lloyd superbum*, *Cattleya Elvina*, and some well-flowered plants of *Cypripedium Fairrianum*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cypripedium Shogun (*parentage unknown*), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander).—A noble flower, resembling in some degree *C. Aeson giganteum*, but with more white in the dorsal pal. The dorsal sepal, more than 3 inches across, is pale yellowish-green, with the upper third white, all but the margin bearing dark purple spots. The sepals and petals are yellow, tinged and veined with brownish-purple.

AWARDS OF MERIT.

Cattleya Dirce magnifica (*Warce wiczii* × *Fulcan*), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O.—A beautiful and large flower of a rosy-mauve colour, the lip being rose-purple with very thin gold lines from the base.

Lælia Digestiana (*Jongheana alba* × *flava*), from WILLIAM THOMPSON, Esq., Stone, Stafford (gr. Mr. W. Stevens).—In form, this hybrid closely approaches *L. Jongheana alba*, the sepals and petals being white, and the lip dark yellow.

Phaius Cooperi, from Messrs. SANDER & SON.—The singular and pretty species which received a Botanical Certificate at the meeting held on January 11, 1910. The flowers are equal to those of *P. grandifolius*; sepals and petals arranged fan-like, mahogany red, with narrow, white mar-

gin; the lip is white, with purple marks in the tube.

Cattleya Luegeae (*Enid* × *Dowiana Rosita*), from Messrs. CHARLESWORTH & Co.—A grand flower, resembling a very fine *C. Fabia*. The broad sepals and petals are bright magenta-rose, veined with a darker tint. The broad, crimped lip of ruby-purple colour, has attractive gold veining from the base.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (Chairman); and Messrs. A. H. Pearson, J. Cheal, H. S. Rivers, W. Bates, W. Pope, A. R. Allan, H. Parr, C. Foster, W. H. Divers, G. Reynolds, P. C. M. Veitch, G. Kelt, F. Perkins, G. Wythes, J. Davies, G. Woodward, J. Harrison, O. Thomas, and A. Dean.

W. GAY, Esq., Higham, Canterbury (gr. Mr. Munday), exhibited a dish of Brunswick Figs from a tree in the open 200 years old. (Cultural Commendation.)

Mrs. PEARCY, Eding, sent a red, corrugated Apple under the name of Flowery Town. It was recognised as an old Devonshire variety of no merit.

Messrs. DOBBIE & Co., Edinburgh, showed a Melon named Dobbie's Victoria. It is a scarlet-fleshed variety, and very handsomely netted. The fruit was rather over ripe.

H. R. H. PRINCE OF REUSS, Gera, Germany, exhibited several thick, long, whitish Cucumbers, under the name of Abundance, as grown in Germany for preserving purposes. The flesh was very thick, solid, and white. (Silver Banksian Medal.)

THE KING'S ACRE NURSERIES, Hereford, staged on the floor of the Hall a superb lot of fruit trees in pots, including Peaches, Plums, Grapes, Apples, Pears, and Figs. Many of the Apple and Pear trees were heavily fruited, and two vines of Black Alicante Grape carried some 16 bunches each. Of Peaches, we noticed Thos. Rivers, Princess of Wales, and Marquis of Downshire. Good Plums were seen in Cook's Golden Drop and Late Orange. Pears included St. Luke, Beurre Balthé, Marie Louise, Pimston Duchess, Beurre Chagrain, Beurre Focqueray, Durondeau, Easter Beurre, Le Lectier, Dayem du Cancee, Beurre Diel, Maguete, and General Todleben. Of Apples, there were Newton Wonder, Bismarck, Wealthy, Emperor Alexander, The Queen, Mrs. Phillimore, Collini, and other varieties. (Silver gilt Knightian Medal.)

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, again exhibited fruits of their new kitchen Apple Rev. W. Wilks, and also of the new dessert variety St. Edward.

E. G. MORTON, Esq., Adbstone (gr. Mr. T. Stevenson), set up a singularly attractive group of Gourds, both ornamental and edible varieties. There were giant Pumpkins and Squashes, and smaller ones in a variety of forms and colouring. (Silver gilt Knightian Medal.)

Messrs. DOBBIE & Co., Edinburgh, staged 44 baskets of very evenly-selected Potato tubers. These latter were excellent specimens representing the best kinds in commerce. (Silver gilt Knightian Medal.)

Mr. W. E. SANDS, Hillsborough, Ireland, showed a collection of Potatoes grown specially for seed purposes, the tubers being of medium size. (Silver Banksian Medal.)

Messrs. G. MASSEY & SONS, Spalding, put up a large collection of vegetables, but the roots were not named. (Silver Banksian Medal.)

Messrs. J. HARRISON & SONS, Leicester, showed their white Cabbage Little Wonder, a rather large-hearted variety, and a variety of Savoy.

A remarkable exhibit of uncommon vegetables was made by Messrs. SUTTON & SONS, Reading. The collection embraced Courve Tronchuda, various Spinaches, including Perpetual, New Zealand, Green and Red Orache, and the pretty *Chenopodium amanticolor*. Also various red and yellow Capsicums; Green Corn Cobs (Maize), Chicory, Chirk Castle Turnips, Butter and variegated Runner Beans, Fir Apple Potatoes, white and purple Aubergines, *Stachys tuberosa*, Celeriac, and others. This firm showed on another table a collection of Runner Beans, including All Best of All, Prize Winner, Sutton's Scarlet, Mammoth White, Tender and True, Princess of Wales, Epicure, Earliest of All, Stringless, and Golden Butter. (Silver gilt Knightian Medal.)

Messrs. JAS. VEITCH & SONS, Chelsea, exhibited a fine collection of vegetables, the arrangement being excellent. There were capital heads of Celery of the varieties Superb White, Early Rose, Lulham Prize, and Major Clarke's Red. Invicta Tomatos, Ailsa Craig and Main Crop Onions, self-protecting Cauliflowers, Selected Red, Blood Red, Improved Black, Cheltenham Black and Globe Beets, superb Hollow Crown Parsnips, Lyon and Musselberg Leeks, Drumhead and Rosette Coleworts, Matchless Carrots, Hackwood Park Success Runner Beans, Autocrat Peas, and various Savoyes completed the display. (Silver-gilt Knightian Medal.)

NATIONAL VEGETABLE.

SEPTEMBER 26.—The first annual show of this newly-established society was held on the above date in the Royal Horticultural Society's Hall, Westminster. The hall was practically filled to its utmost capacity with produce from all parts of the country. Generally speaking, the quality of the vegetables was exceedingly good, but here and there, as might be expected in a gathering of such magnitude, some inferior produce was staged.

SOCIETY'S CLASSES.—Mr. W. GAIGER secured the leading award in the Society's class for nine distinct kinds. The exhibit was of outstanding merit, with practically every dish up to the best standard. Ailsa Craig Onions, Best of All Scarlet Runners, Up-to-date Potatos, Gladstone Peas, and Autumn Giant Cauliflowers were particularly good. The 2nd position was taken by Earl SPENCER (gr. Mr. Cole), who showed splendid Carrots, Onions, Parsnips, and Celery; 3rd, J. KEW, Esq., Loudwater, Rickmansworth (gr. Mr. T. Avery).

There were no fewer than 10 competitors in the Society's class for three distinct kinds, and the premier position was won handsomely by Mr. T. JONES, who had Autumn Giant Cauliflowers, Ailsa Craig Onions, and a seedling Potato, all in splendid condition. 2nd, Mr. W. G. WORTH, 26, Stratfield Road, Summerstown, Oxford; 3rd, Mr. JAS. SMITH, 29, Northolt Road, Harrow.

Twelve competitors entered in the Society's class for six vegetables, distinct, and Mr. H. KEEP, Aldermaston, Reading, was placed 1st, with a good exhibit; Mr. W. COLEMAN, Hunter Street, Buckingham, was 2nd; and Mr. C. F. JENDES 3rd.

Mr. T. JONES, Bryn Penylan, Ruabon, was

TON and ASHTEAD SOCIETIES secured the prizes in the order named.

In the class for six dishes of Tomatos, distinct, the Duke of WELLINGTON, Strathfieldsaye, Berks. (gr. Mr. A. G. Nicholls), was awarded the 1st prize for Winter Beauty, Magnum Bonum, Al, Eclipse, Princess of Wales, and Satisfaction, all in grand form; Mr. J. HUDSON was placed 2nd, and Mr. E. BECKETT 3rd.

SMALL HOLDING'S CLASS.—A class was arranged for those having small holdings, not exceeding 20 acres or less than 2 acres.

The schedule required six distinct kinds to be shown in peck baskets as for market, and Cauliflowers, Turnips, Carrots and Potatos were imperative. Mr. T. KING, New Road, Bromham, Wilts., easily won the 1st prize, followed by Mr. A. E. FORTH, Bishopsthorpe.

Mr. T. KING was the only exhibitor in the class for six kinds of vegetables or salads in market baskets, and again he showed creditable produce.

THE "COUNTRY LIFE" CLASS.—This was designed to encourage the cultivation of the lesser-grown vegetables, and called for eight kinds to be chosen from a specified list printed in the schedule. There were five exhibitors, of whom

FIG. 105.—MESSRS. SUTTON AND SON'S EXHIBIT, AT THE NATIONAL VEGETABLE SOCIETY'S SHOW.

One regrettable feature in the display was the number of exhibitors who had not taken the trouble to name the varieties; this omission lessened the interest and value of the collections. The promoters of the exhibition deserve all credit for the grand produce which they brought together, but the arrangement of the classes left something to be desired, and it was difficult for anyone properly to enjoy or criticise the individual exhibits, owing to the accidental manner in which they were staged. Mr. Quick, the secretary, worked hard, but he required the assistance of more experienced helpers.

THE PRESIDENT'S CLASS.—The President, the Duke of Portland, offered prizes in a class for 12 distinct kinds of vegetables. There were four exhibitors, and the Duke's gardener, Mr. Jas. Gibson, secured the premier award with one of the finest groups he has ever staged (see fig. 105). Every dish was perfect. There were Superb Pink Celery, Autumn Mammoth Cauliflower, Prizetaker Leek, Tender and True Parsnip, Ailsa Craig Onion, Sutton's Black Beet, Selected Duke of Albany Pea, New Red Intermediate Carrot, Best of All Scarlet Runner, Dwarf Gem Brussel Sprout, Perfection Tomato, and Superlative Potato. The 2nd prize was won by Mr. J. HUDSON, Leicester.

1st for six Onions, having grand bulbs of Ailsa Craig. Mr. J. F. HALL, School Lane, Little Marton, Blackpool, won the 1st prize for two dishes of Potatos with Palmeny Hero and King Edward VII. Mr. T. JONES was ahead for three dishes of Potatos, having handsome examples of The Provost, King Edward VII., and Windsor Castle.

Mr. J. B. ROBINSON, Great Barford, St. Neots, was 1st for six Parsnips; Mr. T. JONES for three Cauliflowers; Mr. J. McCULLOCH, Perth, for six Turnips; Mr. G. GASH, Grantham, for Scarlet Runners; Mr. H. KEEP for Peas; Mr. W. H. WILSON, Twyford, for a pair of Vegetable Marrows; Mr. J. F. HALL for a dish of Tomatos; and Mr. C. ABBOTT, Sumbury, for a dish of Shallots. Mr. T. JONES won the 1st prize for Celery with grand examples of Dobbie's Favourite Pink.

Mr. F. C. JENDES, Spencer Road, Horsham, was placed 1st for four kinds of herbs.

Mr. W. MESSON, Alfred Street, Grantham, excelled in the class for six Carrots with Hobbies' Intermediate, and Mr. T. JONES for six Beet with Dobbie's Purple.

The class designed by Mr. Alex. Dean, Chairman of Committee, for the Cottage Garden Societies of Surrey brought five exhibits, but they were of no great merit. SOUTH PARK and SIDLOW, BEDDINGTON and CARSAL-

the Hon. VICARY GIBBS was easily 1st with Conve Tronchuda, Celeriac, Maize, Butter Beans, Salsify, Golden Ball Turnips, Seakale, Beat and Cardoon; 2nd, Mr. W. FOLKES, Amptill, and 3rd, Mr. W. J. LOJJOIT, Heston Farm, Hounslow.

NURSERYMEN'S CLASSES.—The Hon. VICARY GIBBS, Aldenham House, Elstree, Herts. (gr. Mr. E. Beckett), was the only exhibitor in Messrs. Wood & Son's class for a collection of vegetables. The group was varied in character, and there was not a single weak dish. Onions, Carrots, Cauliflowers, Parsnips, Potatos, Cabbages, Celery and Leeks were magnificent (see fig. 104).

Three growers contested the class in which the prizes were given by the same firm for six kinds, distinct, and the 1st prize was won by Mr. G. HOBDAY, Havering Road, Romford, who showed finely. The Right Hon. T. F. HALSEY, Gaddesden Place, Hemel Hempstead (gr. Mr. A. Falkes), was a good 2nd; Miss LANGWORTHY, Guy's House, Holyport, Maidenhead (gr. Mr. E. J. Brown), being 3rd.

Messrs. R. Sydenham, Ltd., Birmingham, offered prizes for a collection of 12 distinct kinds, and there were four competitors, of whom Earl SPENCER, Althorp Park, Northampton (gr. Mr. S. Cole), was placed 1st (see fig. 106). It was a handsome group, comprising Clayworth Prize

Celery, Autumn Giant Cauliflower, Lyon Leek, New Scarlet Intermediate Carrot, Up-to-Date Potato, Ailsa Craig Onion, Pragnell's Exhibition Beet, Hollow Crown Parsnip, and other kinds. The Rev. D. TURNER, Woburn Park, Weybridge (gr. Mr. A. Basile), was placed 2nd, and Mr. W. FORTIKES 3rd. The 1st prize in this firm's smaller class was easily won by Mr. T. JONES, Bryn Penylan, Ruabon; Mr. E. DEAKIN, Hay Mill, Birmingham, the only other competitor, received the 2nd prize.

Mr. J. HIBSON was easily 1st for six dishes of Potatoes, having Windsor Castle, White City, King Edward VII., Ideal, Superlative, and Supreme in perfect form; 2nd, Mr. J. HIBSON; Mr. S. COLE 3rd. There were 16 exhibitors in this class, the prizes being given by Messrs. Clay & Son.

Mrs. DENISON, Little Gaddesden, Berkhamsted (gr. Mr. A. G. Gentle), for Parsnips; Mr. T. ANTHONY, Lea Rig, Broxbourne, for Golden Ball Turnips (perfect specimens); Mr. A. G. GENTLE for New Purple Beet; Mr. T. ANTHONY for Model Turnip; Mr. A. G. GENTLE for Golden Globe Onions; and Mr. J. HIBSON for two dishes of Potatoes. The quality of the produce throughout these classes was remarkably good.

Messrs. Dickson & Robinson offered prizes in the following 13 classes. Mr. T. ABBOTT, The Holme, Regent's Park, was 1st for two bunches of Moneymaker Tomato; Rt. Hon. Lord CURZON, Hackwood Park, Basingstoke (gr. Mr. F. West), for Premier Onion; C. F. RAPHAEL, Esq., Porter's Park, Shenley (gr. Mr. A. Grubb), for Hercules Peas; Marquis of NORTHAMPTON, Castle Ashby, Northampton (gr. Mr. A. Seale),

Nursery, Chelsea, contributed a varied collection representative of the most valuable vegetables in use at this season of the year. Among the notable dishes were Self-protecting Broccoli, Rosette and Drumhead Coleworts, Dwarf Green Curled and Early Dwarf Umi Savoys, Rousham Park Hero, Ailsa Craig, and Maincrop Onions, Invieta Tomatos, Red Globe Turnips, Lyon Selected Leek, Hackwood Park Runner Beans, Autocrat Peas, Hollow Crown Parsnips, with Radishes, Shallots, Salsify, Garlic, and other kinds. (Gold Medal.)

A magnificent group of vegetables was arranged by Messrs. SUTTON & SONS, Reading (see figs. 105). The outstanding features were quality, variety, and attractive arrangement, the latter demonstrating the fact that vegetables can be made extremely attractive. Among the less

FIG. 106.—THE FIRST PRIZE EXHIBIT IN MESSRS. R. SYDENHAM'S CLASS FOR COLLECTIONS, AT THE NATIONAL VEGETABLE SOCIETY'S SHOW.

The Marquis of NORTHAMPTON was 1st in Messrs. Clibran's class for three heads of pink Celery.

In Messrs. Barr's class for a collection of seven kinds of vegetables, H. T. TATHAM, Esq., Kendall Hall, Elstree (gr. Mr. W. Gaiger), was placed 1st, but Mr. HOBDAY'S 2nd prize exhibit was little, if any, less meritorious. Both showed good individual dishes, and arranged them well.

Mr. G. HOBDAY took the lead in Messrs. J. Cheal & Son's class for a collection of eight kinds. His Onions, Cauliflowers, Celery, Scarlet Runners and Potatoes were especially good. Mrs. VON HARTMANN, Wimblehurst, Horsham (gr. Mr. T. Sparkes), was 2nd; and ALLAN SCOTT, Esq., Holbrook Park, Horsham (gr. Mr. T. Daney), 3rd.

Messrs. Dobbie & Co. offered prizes for individual dishes of vegetables, and secured splendid competition in all the classes. Mr. T. HETHERINGTON, Fourstones, Northumberland, won the 1st prize for International Prize Leeks;

for Giant Exhibition Scarlet Runners; Mr. RAPHAEL for Exhibition Leeks; Marquis of NORTHAMPTON for Prize Pink Celery; the Duke of NEWCASTLE, Clumber, Worksop (gr. Mr. S. Barber), for Perfection Intermediate Carrots; R. H. COMYNS, Esq., Heath Farm House, Watford (gr. Mr. H. Waterton), for Market Favorite Beet; Mr. T. JONES for Staghorn Cabbage Lettuce; Mr. RAPHAEL for Snowden Cauliflower; Mr. H. WATERTON for Manchester Market Turnip; Mr. W. FORTIKES for Sugar Loaf Cabbage; and Mr. F. WEST for Hollow Crown Parsnip.

Messrs. G. Massey & Son offered prizes for a dish of Universal Potatoes, Mr. A. G. GENTLE taking the lead; for Ailsa Craig Onion Mr. G. SCOURFIELD, Neath, Glamorgan, excelled; and for Improved Black Beet Mr. A. G. GENTLE secured the 1st prize.

NON-COMPETITIVE EXHIBITS

Messrs. J. VEITCH & SONS, LTD., Royal Exotic

popular kinds were Gourds, Capsicums, Egg Plants, Indian Corn, Florence Fennel, Australian and American Cresses, while the more important crops were represented by Broccoles, Spinach, Scarlet Runners, Cucumbers, Potatoes, Carrots, Cabbages, Turnips, Mushrooms, Tomatos, Onions, Beet, Brussels Sprouts, Leeks, Celery, Globe Artichokes, Parsnips, and Carrots. The entire collection comprised 113 dishes. The same firm also showed an excellent and interesting collection of Runner Peas. (Gold Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, were represented by a handsome exhibit of admirably-grown produce. Standard Bearer and Solid Pink Celery, Crimson Globe, Crimston's Excelsior and Ailsa Craig Onions, green and white vegetable Marrows, Jersey Lily, Golden Nugget, and Covent Garden Snowball Turnips, Royal, French, and Runner Beans, Autumn Mammoth Cauliflower, Globe Artichokes, and Leeks were the more conspicuous. (Gold Medal.)

A remarkable collection of vegetable Marrows

and Gourds was arranged by E. A. MOCATTA, Esq., Woburn Place, Adlestone (gr. Mr. T. Stevenson). There were about 50 varieties of numerous sizes, shapes, and colours, the whole of the fruits weighing upwards of one ton. (Gold Medal.)

Messrs. R. VEITCH & SON, Exeter, had a representative group of s. asonable vegetables. There were grand examples of Cranston's Excelsior and Ailsa Craig Onions, Lady Llewellyn and Davanha Seedling Potatos, Red Garden Globe and Model Turnips, Veitch's Glory Tomatos, Self Protecting Broccoli, Western Express, Autocrat, and Gladstone Peas, New Intermediate Carrots, Sulham Prize Pink Celery, and climbing French Beans. (Silver gilt Medal.)

Mr. W. E. SANDS, Hillsborough, Co. Down, contributed a collection of Potatos, including such varieties as Eclipse, Up-to-date, Colleen, Irish Queen, Erin's Best, Emerald Queen, Shamrock, Midlothian Early, and Cottar. (Silver Medal.)

Garden sundries were shown by Messrs. Wood & Son, Wood Green. There were sprayers, manures, soils, and insecticides, as well as other useful appliances.

Messrs. D. DOWEL & SON, Ravenscourt Avenue, Hammersmith, sent a number of bowls suitable for growing Bulbs in moss fibre.

Mr. A. HAMILTON, Great Portland Street, sent handsome teak and oak plant tubs.

From the "Times" Experimental Station, Sutton Green, Guildford, the Director, Mr. C. Foster, showed a representative collection of market produce, including Onions, Potatos, Carrots, Lettuces, Tomatos, Turnips, Beet, Cauliflowers, and Swedes.

No fewer than 43 varieties of Potatos were shown in separate baskets by Messrs. DOBBIE & Co., Edinburgh. The tubers were of superb quality, and handsomely staged for effect. Some of the best varieties were Duke of York, Table Talk, Factor, Sir John Llewellyn, Midlothian Early, British Queen, Lady Llewellyn, Chapman, Britannia, Exhibition Red Kidney, Queen of the Veldt, Climax, Herd Laddie, Edgacote Purple, Crimson Beauty, King Edward VII., and Waverley. (Gold Medal.)

NATIONAL DAHLIA.

SEPTEMBER 27.—The Floral Committee made the following awards on this date:—

FIRST-CLASS CERTIFICATES.

Dahlia The Moor (Pompon).—The colour is deep maroon crimson, and the flower is slightly above the average size. From Mr. S. MORTIMER, Farnham, Surrey.

D. Loveliness (garden Cactus or decorative).—The colour is bright pink, the florets slightly veined with white. The flowers are developed well above the foliage on rigid stems. From Mr. CHARLES TURNER, Slough.

D. Kingfisher (Cactus).—A handsome flower of deep mauve colour and of best exhibition form.

D. Golden Eagle (Cactus).—The ground colour is yellow, a suffusion of rose and tawn running through the florets and increasing in intensity as the tips are reached. These two varieties were exhibited by Messrs. J. STREDWICK & SON, St. Leonards.

Obituary.

GEORGE STARK.—On Friday, September 23 after a painful illness, which lasted nearly a year, Mr. George Stark died at Great Ryburgh, Norfolk, in the 66th year of his age. Up to the time of embarking in business, deceased was a gardener. During recent years, the firm of G. Stark & Son has raised and introduced many new varieties of Sweet Peas. Mr. Arthur G. Stark, who was a partner with his father, will continue the business. *H. J. W.*

JOHN GARRETT.—We regret to record the death on September 21 of Mr. John Garrett, late gardener to Lord Redesdale at Batsford Park, and for the past six months gardener at Cornbury, Charlbury. He was seized with a stroke early in the day, and passed away without regaining consciousness. Mr. Garrett was gardener at Batsford Park for more than 24 years, leaving there when the place was let by Lord Redesdale. During his period of service at Batsford, the

gardens were practically remodelled, the kitchen gardens being freshly planted with fruit trees, new herbaceous borders made, and the famous wild-garden created, besides a range of glass-houses erected. The Bamboos at Batsford are unrivalled in this country, and the pleasure grounds contain many rare shrubs and trees. Previously to going to Batsford, Mr. Garrett was employed as foreman in the ornamental department at Kew Gardens. Whilst at Kew, he was associated with the late Mr. George Nicholson in compiling the *Dictionary of Gardening*. He was greatly esteemed by all who knew him, and his loss is deeply felt by his present and past employers. The funeral took place on Monday, September 26, at Charlbury Cemetery; all the employes on the Cornbury estate attended, and also many friends. He leaves a widow, but no family.

ENQUIRIES AND REPLIES.

AGED WALNUT TREES.—Can any reader of the *Gardeners' Chronicle* state the best method of improving the condition of some fine old trees, particularly Chestnuts, which I have known for 60 years in my garden? The Chestnuts are showing signs of decay, have scarcely flowered at all the last few years, and the leaves are much eaten by caterpillars. I am told that by a judicious system of trenching renewed life can be imparted to old trees. If any of your readers will give me the benefit of their experience in this work I should be most grateful to them. I may add that I am a daughter of the late Joseph Paxton, but have no recollection that my father dealt with any branch of forestry in his horticultural writings. *Rosa Markham, Tipton House, Chesterfield.*

If the trees are attacked by a parasitic fungus in the trunk little or nothing can be done, but it is more likely that their decline is due to impoverishment of the soil. If the ground is covered with grass this should be removed from about the trunk as far as the branches extend; the ground should then be lightly forked over, taking care not to damage the roots more than necessary, the idea being to open up the surface of the soil so that air and moisture can enter. A top-dressing from 4 to 6 inches thick should be spread over the top, and this should consist of three parts good loam and one part rotted manure—preferably cow-dung. When the surface soil has been broken up some idea can be formed as to whether the roots have suffered through dryness—which happens frequently if the surface has become hardened through long-continued trampling or other cause. This root-feeding is, as a rule, the most important part in tree renovation, but good may also be done by cleaning out dead and decaying branches, filling up holes in the trunk with cement, and sawing off decayed stumps. This method of tree treatment is fully described in an article by Mr. W. J. Bean, published in the *Gardeners' Chronicle* of April 14 and April 21, 1906.

ANSWERS TO CORRESPONDENTS.

CLOVER ON LAWN: *W. B. G.* Lawns and tennis courts on marly soils are exceedingly liable to be overrun by white Clover (*Trifolium repens*), which spreads rapidly by means of the creeping underground stems. Potash and phosphatic manures must therefore be avoided. You may apply at once 3 ounces of sulphate of ammonia per square yard of lawn, mixing it with sand for its more even distribution. In the early spring, say March, apply a liberal dressing of soot. This may have the effect of making the lawn appear unsightly for a time, but the grasses will quickly respond to the nitrogen of the soot and a dark-green grassy turf will result. The Clover dies out when excessive quantities of nitrogen are applied.

DAHLIAS: *J. Wiggins.* There are no signs of any insects or fungi having attacked the Dahlia shoots. This form of injury has been prevalent this season, and is probably due to physiological causes induced by unfavourable weather conditions. The same kind of injury has been prevalent on *Salvias*.

GOOSEBERRY DISEASE: *W. S. H., Letchworth.* The Gooseberry bushes have probably been attacked by the *Sclerotinia* disease, or "Die-back." Cut out and burn all dead branches from the bushes, and grub up and burn all dead bushes. If a bush or branch here and there "wilts" suddenly next summer, when in foliage, cut the branch out or grub up the bush before it is dead and destroy it by burning. There is no need to spray. Adopt the same measures in the case of the Currant bushes.

MAGNOLIA STELLATA: *J. E.* Magnolias do not like a too-free use of the knife. The best thing to do at the present time is to remove all dead and decaying wood, and defer a general thinning until early next summer. If the shoots are thick, a pointed hand-saw should be used, and the cuts pared round with a sharp knife, after which a dressing of coal tar should be laid on immediately.

MIGNONETTE: *A. H. D.* The appearance of the roots of the Mignonette suggests that the damage has been done by larvæ ("white grubs") of Chafer beetles. If on examination these are found, "Vaporite" may be employed to destroy them. The Violet leaf has been attacked by one of the "Leaf-spot" fungi; collect and burn the affected leaves now. Plants with young growths should be sprayed with liver of sulphur solution (1 ounce dissolved in 3 gallons of water).

Moss: *T. B.* The specimen sent is *Sagina procumbens*. Its presence usually indicates poor, dry soil. The best remedy is to fork it all out, give the lawn a good top-dressing with rich soil and sow fresh grass seed.

NAMES OF FRUITS. The names of fruits are unavoidably held over until next week.

NAMES OF PLANTS: *E. T.* *Campanula pumila* alba.—*W. M.* The double white flower is *Matricaria inodora* fl. pl. The *Michaelmas Daisy* was withered.—*Charles S. & Co.* The plant appears to be *Phacelia campanularia*, but no flower remained to assist identification.—*W. T.* 1, *Thuja orientalis* var. *pendula*; 2, *Tilia platyphyllos* var. *asplenifolia*; 3, *Acer platanoides* var. *laciniatum*; 4, *Taxus baccata* var. *adpressa*; 5, *Abies Lowiana*.—*W. H. D.* *Reineckea carnea* variegata.—*F. F.* 1, *Odontoglossum Andersonianum*; 2, *Oncidium flexuosum*; 3, *O. oblongatum*; 4, *Trichopilia coccinea*; 5, *Selaginella uncinata*; 6, *Pteris tremula*.—*H. A. Herts.* 1, *Bignonia radicans*; 2, *Calycanthus floridus*; 3, *Plumbago larpenae*.—*R. P.* 1, *Cattleya Harrisoniana*; 2, *Cypripedium selligerum*; 3, *Miltonia Clowesii*; 4, *Dendrobium chrysanthum*. The other flower is *Cyranthus sanguinea*.—*R. W.* 1, *Coreopsis tripteris*; 2, *Spirea japonica*.—*L. B. W.* 1, *Veronica aspiroca Prenja*; 2, *Aster amelloides*; 3, *Pteris cretica* var. *cristata*; 4, *Asplenium bulbiferum*; 5, not recognised.

OLEARIA HAASTII: *K. M. P. G., Holnecott.* It will be quite safe to cut the *Olearia* back into the old wood. The best time to do this is early in March.

SYCAMORE TREES SPLITTING THEIR BARK: *J. E. H.* No disease is present. The trees have become bark-bound, and the bark would not yield when the trunk increased in thickness. If the trunks could be sheltered from exposure it would be an advantage.

TOMATO DISEASED: *J. Palmer.* The Tomato plant is covered with *Botrytis cinerea*, a common mould. Bordeaux mixture will be the best specific to employ, as this will keep off as well *Cladosporium* ("rust") and *Phytophthora* ("blight"). Slake 4 lbs. of quicklime in 12½ gallons of water; dissolve 4 lbs. bluestone (copper sulphate) in 12½ gallons of water (in a wooden pail), and mix the two lots together to make 25 gallons of Bordeaux mixture. Apply the mixture in a fine spray.

POLLINATION OF "SPENCER" SWEET PEAS.

It is generally conceded, by workers amongst Sweet Peas, that, so far as this country is concerned, pollination owes little or nothing to insect agencies. It is held that fecundation is effected before the blossoms are fully developed, and therefore that no harm, in the way of cross-fertilisation from dissimilar varieties, can possibly take place. In the case of the old grandiflora type of Sweet Peas, this is undoubtedly the rule, but it is probable that, with some of the "Spencer" forms, insect agency in fertilisation has to be reckoned with. The trouble caused by unfixed stocks of many varieties of Spencer Sweet Peas is fairly general, although various reasons are assigned as to the cause. Apart from careless breeding, it is said that seed ripened in England is not likely to be untrue to type, because insects have not been found to be the cause of any trouble in inter-crossing. Now, the very fact that some of the new type of Sweet Peas are very poor seeders, is a proof that self-fertilisation is not so readily effected as is generally supposed. In the *Gardeners' Chronicle*, September 11, 1909, p. 185, it is stated in a note on the Sweet Pea seed crop:

"It would not be an exaggeration to say that some of the choicest Spencers do not yield a tenth of what the older varieties did, and this in a favourable season." Last year the crop was estimated at from one-twentieth to one-thirtieth less than that which the older varieties were wont to produce, and the result of the harvest fully justified this estimate. An examination of a typical Spencer flower favours the assumption that the seed crop will always be small as compared with that obtained from the older type of flower, even under suitable climatic conditions. In many new forms, even in the bud stage, before the anthers have dehisced, the stigma may be noticed protruding from, and rising considerably above, the carinal pouch. The brush of hairs upon the style just below the stigmatic point, which, in the ordinary way, should sweep up the pollen from the apex of the carina, is also exposed in many instances before dehiscence. The large expanded alae admit of no protection of the stigma either from weather or insects, and the fact of its rising so well above the fallen pollen must make self-fertilisation not so general an occurrence as is desirable. Granted that the stigma is pollinated, it must often be done so meagrely that its unprotected condition must render the operation abortive in many cases. This, coupled with the open carina, which in wet weather becomes full of water, is, of course, the cause of the poor seeding capacities of the large-flowering Spencer form of Sweet Pea. Where seed-pods are formed, I believe that, with some varieties, insect agency is, in large measure, responsible for the process; and this is certainly the cause of inter-crossing, especially where different varieties of the same type of flower are grown near to each other.

I do not propose to deal with all the insects that visit the flowers of the Spencer Sweet Pea—many of them can do no harm—but only to mention those the result of whose operations are found to be of some harm or good. There have been, I notice, many complaints this season regarding a small beetle which has been found in large numbers in the carina of the flowers. This is a member of the Curculionidae group, and is probably *Apion striatum* or *A. pisi*: I have not been able to identify it accurately, but it is either one or the other of those two species. The beetle feeds upon the pollen, and very frequently does damage by nibbling at the reproductive organs, the result being that water is admitted to the legume, and causes it to rot at a very young stage. This beetle is of a purely anthophilous character, and as it is of no consequence in fertilisation, it need not be considered further in that respect: but it is certainly productive of damage, not only as noted above, but by causing birds to tear the flower to pieces in order to secure it as food. The blue tits (*Parus corulens*) seem to be very fond of this beetle, and I have watched them removing one of the alae and tearing open the carina in order to reach it, totally destroying the flower in the process. Delpino mentions the genera *Apis*, *Bombus*, *Encera*, *Anthophora*, and *Xylocopa* as the chief fertilisers of the various forms of *Lathyrus*, but in Scotland I have only observed members of the second and third of these families at work upon the Sweet Pea, and always upon the Spencers, never on the old grandiflora forms.

The hive bee (*Apis mellifica*) has not a proboscis sufficiently long to enable it to deal with this flower, but, on the other hand, the humble bees (*Bombus*) are better equipped. I have watched their methods very closely this summer and autumn, and am convinced that they are undoubted factors in fertilisation. Dealing with the humble bees first, I find that two varieties of this genus cannot possibly effect fertilisation, although they are constant workers upon the flower. *Bombus terrestris* and *B. pratorum*, while they are large bees, as our indigenous bees go, have comparatively short but powerful probosces. They always, when at work, alight upon the dorsal surface of the vexillum, inserting their probosces right through the calyx into the interior of the carina at its conical point, and every blossom they visit will be found, upon inspection when the bee has finished, to have this little hole in the calyx. The other bees which I have noted as visitors to the flowers are *Bombus hortorum*, *B. lapidarius*, *B. agrorum*, *Anthophora pilipes*, *Psithyrus*, *Barbutellus*, and *P. vestalis*, each having a similar method of operating upon the blossoms. In contradistinction to the two first-mentioned bees, the others always alight between the alae, using the vexillum as a support while they are at work upon the carina and its contents. During these operations, the ventral part of the insect receives a dusting of pollen, which, of course, it carries to the next flower. Here it again alights immediately upon the exposed style, which receives upon its brush the pollen from the insect, and is therefore cross-pollinated. Provided the insect is working upon one variety of Pea, this is undoubtedly a good operation for the plant, but if other sorts are grown in close proximity, then we may expect to get mixtures. I have carefully emasculated the flowers of some "Spencers," and have had seed set by bees, carefully marking the blooms that were visited first by the insect immediately it had left the flowers of another variety growing near. I have also marked flowers that were not emasculated, but which also were visited first by the bees immediately they had left another variety, and where seed has set I think it is an undoubted example of cross-fertilisation by insect agency. I am not prepared at this stage to make any definite assertion, but I am personally convinced that crosses have been effected by these means. I have many instances under close observation, and it is noteworthy that seed did not begin to set upon my Peas until the bees began to operate regularly upon the blossoms. The climate of Scotland is by no means an ideal one for carrying on this work, the great difficulty being the ripening of the seed, more especially as this year the insects did not begin constant work upon the flowers until well in August. When crosses are effected even in this northern latitude by this method, we can readily understand how easily they may be obtained in the more genial climate of California. I have several varieties from seed ripened in that country, and find every one without exception full of rogues. I am strongly inclined to think that the bees are valuable agents in assisting the work of setting a good seed crop even in this country, but isolation of different colours of flowers may be necessary if the stock is required to remain perfectly true. This only applies to the Spencer types

with open carinas and protruding styles, and this type of flower is becoming more common and more apparent, for nearly all the choicest of the newer kinds show more and more the above characteristics, and indicate increasing danger of inter-crossing by bees. The formation of some of the newest forms of Spencers renders insect agency imperative if a paying seed crop is desired, and, failing this, pollination by hand may be necessary. This, of course, does not apply to every Spencer Pea, but a little observation will readily show the varieties that require it. *George M. Taylor, Mid-Lothian.*

GRAPES AT MOOR HALL, HARLOW.

THE three varieties of Grapes shown in fig. 107 were grown in the same vinery at Moor Hall, Harlow, the residence of John Baltour, Esq. (gr. Mr. A. Jefferies). They were exhibited at the Bishop's Stortford Show, on August 10 (the companion bunches of Black Hamburgh and Muscat of Alexandria are not reproduced), and gained the first prizes in the classes for two bunches of the respective varieties.

The bunches weighed 4 lbs. each, with the exception of Black Hamburgh, which turned the scale at 3½ lbs. Most gardeners experience a difficulty in producing high-quality Grapes, and especially of these three varieties, in the same vinery, and Mr. Jefferies is to be congratulated on his success, as for the past three or four years he has gained first honours at this show for these varieties. The bunches of Madresfield Court were specially fine, as a sample sent by Mr. Jefferies testified. The vinery is 50 feet long and the borders, 10 feet wide, are outside. They are raised above the level of their surroundings, are 2 feet 9 inches in depth and well drained, so that copious waterings may be afforded during the growing season of the vines. As the borders are outside, little watering is necessary at other seasons. The variety Muscat of Alexandria was planted five years ago, but Madresfield Court and Black Hamburgh have been seven years planted. Mr. Jefferies informs us that the front ventilators are never opened until the Grapes commence to colour, but fresh air is admitted as early as six a.m. at the top of the house, and shut off again in the afternoon, when the houses are well warmed with the sun's heat; a little fresh air is afterwards admitted throughout the night. Red spider usually makes its appearance on the foliage immediately after the bunches are thinned, but this pest is soon destroyed by the use of sulphur, which is puffed upon the undersides of the leaves by means of the "Ideal" Bellows.

SCOTLAND.

NON-PAYMENT OF PRIZE MONEY.

AN old-established Scottish horticultural society is this season in the unpleasant position of being unable to pay the prizes awarded at their recent show. Some of the prize-winners have received letters from the secretary to this effect, and considerable disappointment is felt on the subject. The society has suffered pecuniary embarrassment on former occasions, but it has usually managed to pay a portion of the money, and, in recent years, has paid the prize money in full. The position is worse this year than usual, and it appears to be due to the heavy loss incurred in connection with a programme of sports carried through on a separate day, but promoted by the society. A question has arisen regarding special prizes, and one competitor, who was awarded a sum of money given by a firm as a special prize, holds that he ought to receive this, as it was given for a specific purpose. It is likely that the society will recover its position; but the non-payment of prize money will prejudice the prospects of a future show. *S. A.*

NURSERY NOTES.

A PRETTY NURSERY IN S. WALES.

THE prettily-situated hardy plant nursery of Messrs. H. and W. Evans, at Llanishen, near Cardiff, has the great advantage of a natural stream of water flowing along one side. During a visit paid there at the end of July I observed *Aconitum Napellus* growing wild between the stream and the hedge. It had not been planted there, but was established, as it is in several of the woods in the vicinity of Cardiff and in the Ely valley. It is not often one sees such a rare plant growing naturally in a nursery

Oenothera speciosa rosea was a mass of pink, and had been so a month. Though somewhat rampant, it is a useful plant for the rock-garden when the wealth of May is over. *Veratrum nigrum*, with its spikes of blackish-red flowers 4 to 5 feet high, and large, ribbed leaves, is more handsome and rare than beautiful. *Astilbe* "Nuée Rose" was in full beauty, and has paler pink, much lighter and more graceful inflorescence than the newer "Queen Alexandra" and "Peach Blossom." *Campanula lactiflora* and its variety *alba* were very noticeable—they form excellent border plants, especially in half-shade. So were the beautiful creamy Papaveraceous annual *Platystemon californica*, the handsome

FIG. 107.—GRAPES GROWN AT MOOR HALL, ESSEX. TOP TWO BUNCHES, MADRESFIELD COURT; BOTTOM (RIGHT-HAND), MUSCAT OF ALEXANDRIA; (LEFT-HAND), BLACK HAMBURGH.

ground, though occasionally such a plant as the American *Veronica peregrina* is to be found as a weed. I have never seen this small *Veronica* except as a weed in gardens. Some 15 years ago I remember observing clumps of *Trollius europæus* growing thoroughly wild by the rapid, though muddy, River Taff, only a mile or two above the great city of Cardiff. It seemed strange to see a sub-Alpine plant in such a place and so close to the sea; and doubtless it there attained its most southern limit in Britain. *Sibthorpia europæa* is also found in the vicinity.

There were many interesting plants in bloom in Messrs. Evans's nursery, and the rich, red soil seemed to suit most of them. On the rockery,

blue *Platycodon Mariessii*, the *Kniphofia* (*Tritoma*) *rufa*, only 2 feet high, and two new hybrids, "Goldelse," pure yellow, and Torchlight, coral red, which form showy plants for the front of the border or large rock-work. The Rose "Lady Godiva," in all respects resembling the popular "Dorothy Perkins," but of a pale pink like the Carnation "Duchess of Fife," will be a favourite climbing Rose when better known.

Among other beautiful plants observed were *Potentilla Tonguei* (orange), *P. Dubia*, *Viola cornuta purpurea*, the yellow *Cistus algarvensis*, *Lindelia spectabilis*, and *Geranium lancastriense*, a dwarf and pretty form of *G. sanguineum* discovered in Lancashire. *H. S. T.*

ALLOTMENTS.

FEW better things have been done by those responsible for the government of our towns than the acquisition of land in their immediate neighbourhood for the purpose of allotments. A 10-rod plot or more means very much to the small householder, more than the cottage garden does to the cottager a hundred miles away in the country. Although not so picturesque as the cottage garden, an allotment is often a far better example of the splendid results of well-applied intensive culture. The holder, in the first place, has a keen liking for his plot; he quickly realises that he must get from it as much as he possibly can, and so he brings to bear a natural intelligence and a knowledge of his special requirements. Help and advice are received from more experienced holders, whose crops serve the less-experienced also as valuable object-lessons. It is the ability to use all produce to advantage that renders these allotments more useful than the small holdings away in the country, where it is extremely difficult to dispose of anything other than that required for home consumption. These remarks are the outcome of occasional inspections of a 15-acre field containing over 200 allotments. It is interesting and pleasurable to see many dozens of men busy on their plots after their ordinary day's work is done, and the excellent produce gives evidence alike of hard work, successful cultivation, and an intelligent system of cropping. This last is seen in the selection of the species and varieties both of vegetables and fruit that give the best results in a limited space, and also, in the case of vegetables, those which come most quickly to maturity and, consequently, give place quickly to other crops. Nearly all the vegetables in the 15 acres looked remarkably well, except Potatoes, where spraying had been neglected, and Carrots (the Short Horn and stump-rooted forms were good, but Main-crop varieties evidently wanted ground more deeply worked and lighter soil). Gooseberries and Red Currants are the favourite fruits, with occasional Apples and Plums in bush form. The necessity for protection against frost and birds is responsible for the absence of Strawberries, whilst Black Currants have been destroyed by "big bud." If, however, a general inspection of allotments led to the conclusion that an excellent system of culture was generally maintained, a chat with the holders gave the impression that somewhat hazy ideas still exist as to the various fungoid and insect pests with which they are troubled, and those who have the responsibility of lecturing to allotment holders during the winter months might give some attention to the subject of plant-disease. The advisability of spraying for the Potato disease and the vigorous application of soapsuds for aphids were recognised, but minute thrips on Peas were stigmatised as blight, and the agency of fly in producing the Onion maggot, also leaf-boring maggots of the Celery, Parsnip, and other things do not appear to be generally known, nor that the familiar Daddy-long-legs (Tipula) is responsible for the leatherjacket grub. The fact that fruit is very much less grown than vegetables is responsible for a limited knowledge of enemies, but pointing out the big gathering of red spider on Gooseberry foliage and the larvae of *Lampronia rubiella* eating out the heart of Raspberry shoots naturally led to queries as to the best means of combating the pests. Touching very briefly on flowers, it may be noted that there is a growing tendency to include a few in most of the allotments, and it is a pleasurable evening feature to see the head of the family trudging homewards with a posy on the top of his basket of vegetables, and the children with a small nosegay tightly clasped in hand. The commoner perennials are mostly grown, and annuals such as Sweet Peas, Mignonette, Virginia Stocks, and Godetias. A. G. B.

PHOENIX PARK, DUBLIN.

WHEN VISITING Ireland, the writer was prepared to find a "green isle" in the sense of luxurious vegetation, but was hardly prepared for its very general distribution, nor for the excellence and rarity of the subjects found in somewhat common cultivation. Calling at Whitefields, the headquarters of the Parks and Gardens Department, under his Majesty's Board of Works, Mr. Robert Anderson conducted me through the adjoining grounds. First of all, a grand plant of *Taxus Dovastonii*, with a circumference of 50 yards, arrested my attention, and near this was a handsome specimen of Perry's Silver Weeping Holly 20 feet high and about 12 feet through at the base; a pair of Gold English Yews, which might be called gigantic, and a *Taxus adpressa* 16 feet high and 32 yards in circumference gave further delight. Next to these was a beautiful plant of the rarely seen *Swammerdamia antennaria*, the flowers of which are scented like new-mown hay—this plant is 23 yards in circumference. A very ornamental, somewhat guarded *Cupressus macrocarpa*, probably one of the earliest introduced, measures, at 3 feet from the base, 24 feet round. This tree was rather badly damaged by a severe storm in 1902, when many fine trees were damaged in this country.

A plant deserving of far more general culture is *Muehlenbeckia complexa*, which Mr. Anderson has treated in a novel way, planting it in a large excavated tree stump standing a few feet from the ground. The plant stands 9 feet high, is bushy and highly ornamental. Other specimens are used largely in a small state as dot plants in the flower-beds.

Ilex diphyrea is a very distinct variety: a tree of this Holly was 20 feet high, and a fine tree of variegated Turkey Oak, 30 feet high, is a near companion. This latter tree is somewhat peculiar, having developed a broad platform like base, with a column-like growth as super-structure. A bush 16 feet high of *Berberis fascicularis* is attractive, and this too should be more generally grown.

Corypha australis (20 feet high and 20 years old), *Buxus balcanica* (20 feet), *Choisya ternata* in masses, *Piptanthus nepalensis*, and *Magnolia conspicua* in tree-like dimensions can but be named. The Whipcord Thuja—*Thuja orientalis pendula*—not often seen, is represented by a good specimen, and near it the not very sweetly-odorous "*Torreya myristica*." *Ilex Perado* and the Cork Oak (*Quercus Suber*) are fine trees, and a good tree of the double-flowering Horse Chestnut is much prized. Last our catalogue should become too lengthy, though there are many interesting subjects among the shrubs worthy of note both at Whitefields and at the various official residences, with the bare mention of a clean, handsome plant of *Cupressus torulosa*, 35 feet high, and a plant of *Drimys Winteri*, I will conclude my account of this part of the park. Passing through nursery and store grounds, large quantities of home-grown Narcissi and Tulips are seen, the bulbs being equal to the best produced in Holland.

Phoenix Park is a Royal possession of more than 1,700 acres, traversed by 20 miles of splendidly-kept roads, excellent alike for its commanding position and its variety of scenery. Beautifully wooded, it provides the ideal retreats for the various official residences and Government buildings, and southward the horizon is broken by a fine view of the Wicklow Hills.

The most frequented spot in the park is undoubtedly the "People's Gardens." The scene, in its gorgeous loveliness, made a deeper impression on me than anything in the way of summer bedding recently seen. Probably the boldness and the extent (20 acres) of the display are factors in creating this impression, for although there is no sense of crowding, there being great greenward stretches intervening between the beds, yet there is a massiveness which gives an air of noble grandeur.

Carpet bedding is represented by some very neat examples, and a large bed of succulents is

interesting. A very effective, oblong bed of considerable dimensions contained the popular *Begonia* "Major Hope," mixed with white *Viola Violetta*, dotted with large plants of *Fuchsia Mrs. Marshall*, and bordered with *Koniga maritima compactanana*. A similarly shaped bed, equally beautiful, had a groundwork of *Heliotrope Lord Roberts* and *Centaurea candidissima*, dotted with *Sutherlandia frutescens* and *Eucalyptus cordata*. Rather striking, too, was a mound-bed containing Ivy-leaved *Pelargonium Mme. Crousse*, the plants being a yard high and mixed with *Artemisia arborea*, interspersed with *Eucalyptus cordata*. A combination which was especially pleasing was of densely-flowered plants of *Bougainvillea glabra* and *Cassia corymbosa*. The trained plants of *Heliotropes*, 7 feet high and 4 feet across, were magnificent, whilst *Streptosolen Jamesonii* and *Calceolaria amplicaulis* were splendid in pyramid and bush form. *Lantana delicatissima*, trained in umbrella form over a ground of red *Salvias*, was also attractive, and among smaller dot plants which were conspicuous are the *Muehlenbeckia complexa* already referred to, *Acacia lophantha* and *A. verticillata*; *Gnaphalium microphylla* and the graceful Brazilian shrub *Jacaranda mimosaefolia*.

Reluctantly leaving this wealth of floral beauty and sorely tempted to look back, a glimpse of colouring over the brow of a shrubby eminence diverted my attention. Imagine a bed nearly resembling the letter V, 40 feet wide at the one end and in length about 100 feet, surrounded largely by plantations of evergreens—itsself a literal mass of Dorothy Perkins Rose—some on Larch tripods 12 and 14 feet high, a greater number being standards 6 feet tall, the groundwork of standards and tripods forming a beautiful undulating, unbroken display which baffles description. Such are a few of the many interesting features to be found in Phoenix Park, which reflect the greatest credit on the able superintendent, Mr. Robert Anderson. L.

A JOURNEY TO JAPAN.

(Continued from page 212.)

THE JAPAN IRIS AT HOME.

IT was the middle of June when I arrived in Japan, the time when the Japanese Iris, *I. Kämpferi* (Hano Shoba) is at its best. I stayed a few days at the International Buildings at Yokohama, until I had procured my Japanese lodgings at Tokyo. I walked along the shore to the south, enjoying the vegetation and passing nurseries containing all sorts of ill-treated plants. After about an hour's walk, I was very pleased to find myself amidst a most wonderfully laid-out Iris field, the road leading into a gentleman's garden, who throws open his garden to the public. The generous owner is Mr. T. Hara, and his Iris garden is only a part of his large gardens and park. The house is situated on a steep hill facing to the sea, whilst a little valley between the hills is laid out as a Japanese Plum (*Ume*) garden, and planted with herbaceous plants and shrubs. Near the Iris garden is a large lake with fine Water Lilies, and a pond with *Nelumbiums*. The garden contains a large number of summer-houses and shelters of many different kinds, and the whole forms a most artistically laid-out country seat which exhibits much taste. The Iris garden lies on either side of a main road, which is about 3 feet higher than the field, and the Irises are planted, for the most part, in regular beds with pathways between them so that the full beauty of the rich collection may be easily enjoyed. Although they are planted in regular beds and generally in separate varieties, mixed beds being only now and again interspersed, the whole field of colour was a most harmonious sight, and it did not give the impression of an assortment, but of a most wonderful picture. This is the way that Irises should be seen.

Between Yokohama and Tokyo, near Kamata Station, are the Iris grounds of the Yokohama Nursery Co.; they are planted in a manner that produces showy effects for the numerous visitors. But Horikiri, near Tokyo, and Yotsugi are the special places to go to enjoy Irises and see rare and fine novelties not grown elsewhere, but though Irises are also to be seen all along the Rice fields, fruit gardens, and round the lower parts of the town suburbs. Leaving Tokyo by boat, and proceeding up the river Sumida, Kanegashuty boat station is reached in about half-an-hour, and in another half-hour's walk or riksharide the very home of the Irises is reached. At Horikiri are several Iris gardens; the Kankayen is a flat garden, but the Mushiyen is of more interest. Low hills surround this

Riubi, deep purple and pale veins and yellow centre; this six-petalled variety is about 3 inches in diameter. Renjo-no-tama is a six-petalled, older variety of pale blue with white centre and well-fringed petals. Asakagura is a six-petalled novelty of a soft mauvy-red with blue centre and well-fringed petals; the stigmatic leaflets are pale blue, with violet margins. Tenjo-no-Kamuri is a very double variety with 15 to 20 large petals and six to eight stigmatic leaflets, the stamens are also metamorphosed to leaves. The colour is of a peculiar mauve-red with white. Hatsu-Kamuri is a novelty of deep velvety-blue colour with very marked soft-blue veins. It has three very large petals. Shiso Kajin, of very soft blue colour, has three very large petals. Shushi is a three-petalled novelty of deep velvety-blue col-

ours many queer Pines and fine Wistarias, besides other plants, and is of a rather less artistic appearance, but the Irises are the finest I saw. The firm also sells two collections of colour pictures of their Irises, each containing 50 varieties, one which includes the new sorts costs about 5s., the other, containing the 50 older varieties, 4s. The illustration in fig. 108 shows 16 of the finest varieties, the names being as follows:—1, Fuji no Akehono (Mount Fuji at Dawn); 2, Sazanami (Rippler); 3, Daishori (Great Victory); 4, Akashi none; 5, Surino Lashi gaki; 6, Kyonishiki (Brocade); 7, Gosho asobi (Play in the Imperial Palace); 8, Manazura (White-naped Crane); 9, Enbinowaza; 10, Godaishū (The Five Large Continents of the Globe); 11, Mine no matsukaze (The Wind through the Pine Trees on

FIG. 108.—VARIETIES OF IRIS KEMPFERI AT THE KANKAYEN GARDEN.

little garden, planted with curious-shaped old Pines. Tea is served in sheltered huts and under lofty covers. It is not after European taste nor are the large Beans (Soraname) boiled in salt water, though the biscuits (Layaku) are quite palatable. The best Irises are at the Kankayen (yen-garden), where Pines, many hundreds of years old, have looked upon many generations of Iris growers. The Pines are quite worth seeing when the Irises are not in bloom. This garden and the fields surrounding it are devoted strictly to Irises. The present owner was very pleased with the interest I showed in his plants, and he gave me of his best treasures. I mention a few of them.

Karako asobi (play of Chinese boys) is a deep cobalt blue flower with light, blue veins and yellow margin. The stigmatic leaflets are very much crested and of a deep blue, and make the flower appear to be double. It has six large petals. Shiroku-no-Asobi is of a pure, deep blue colour. Musashi garva (the river Musashi), with three very large petals; Hoojo, purple on light ground;

our; the three smaller inner petals are of deep velvety-maroon. O Yedo has three large petals of uniform sky-blue colour. There were also many varieties of great beauty not yet named.

KEY TO FIG. 108 (SEE TEXT).

The richest collection and the finest varieties I found at the Yoshinoen, at Yotsugi, about half-an-hour's walk from Horikiri. This garden con-

tains many queer Pines and fine Wistarias, besides other plants, and is of a rather less artistic appearance, but the Irises are the finest I saw. The flower is of deep velvety colour. Although we have a very good collection of varieties of I. Kempferi in Europe, the general exporting firms and dealers in Japan only send to Europe varieties which are grown here by the peasants along their Rice fields for the sake of the flowers, which are cut as buds and brought into the towns for sale. In the gardens at Horikiri and Yotsugi there are many fine varieties which are not sold at all, but are kept specially for the sight-seeing visitors, who pay five sen (a penny) for entry. They sip some tea, and the proprietors of the gardens make a considerable income from these sources. Fr. Honbl, Tokyo-Hongo

Kyo-nishiki has nine petals, the six outer ones standing low down, whilst the three inner ones rise higher up and form quite a second whorl. The flower is of deep velvety colour. Although we have a very good collection of varieties of I. Kempferi in Europe, the general exporting firms and dealers in Japan only send to Europe varieties which are grown here by the peasants along their Rice fields for the sake of the flowers, which are cut as buds and brought into the towns for sale. In the gardens at Horikiri and Yotsugi there are many fine varieties which are not sold at all, but are kept specially for the sight-seeing visitors, who pay five sen (a penny) for entry. They sip some tea, and the proprietors of the gardens make a considerable income from these sources. Fr. Honbl, Tokyo-Hongo

(To be continued.)

THE ROSARY.

SOME OF THE BEST HYBRID WICHURAIANA ROSES.

PERHAPS no other climbing and creeping Roses came into favour so quickly as the varieties of Wichuraiana. Dorothy Perkins and its many beautiful sports afford a good variety, but I wish to draw attention to others equally beautiful, and, in some cases, derivatives of *R. Wichuraiana*. The variety *Gardenia* provides blooms of clear, golden-yellow while in the bud stage, and is also one of the sweetest-scented Roses in cultivation. It is to be regretted that the petals, when expanded, lose their golden-yellow shade so completely. A very promising novelty is seen in *Aviateur Blériot*, which is the result of crossing William Allen Richardson with *Rosa Wichuraiana*. Not only is it quite distinct, but the petals retain their colour. It also has the great advantage of bearing large trusses; I have known William Allen Richardson to be very erratic in growth; this infusion of *Wichuraiana* blood is, however, not only likely to make its offspring more hardy, but, probably, a more reliable grower. A pleasing, primrose-yellow Rose is found in *François Foucard*; this variety also flowers again later in the season, but by no means so freely as in early summer. One of the very earliest to bloom, and one that continues to flower late, is *Réné André*, a cross from *L'Idéal*, from which it derives a pleasing perfume. Much of the unique shading found in *L'Idéal* is seen in the hybrid. It makes a perfect standard plant, and always gives satisfaction. A cross with that grand decorative Tea Rose, *Souvenir de Catherine Guillot*, named *Marco*, has been very good with us; carmine, orange and ruddy gold are intermingled in the petals. *Ernest Grandpierre* (*Wichuraiana* × *Perle des Jardins*) is good among the paler yellows, but the flowers are small and in corymbs. A selection of this section includes *Joseph Billiard*, *Alexandre Trimonillet*, *Edmund Proust*, *Elisa Robichon*, *Evergreen Gem*, *Leontaine Gervais*, and *La Perle*. A. P.

PLANT NOTES.

CHLOROPHYTUM COMOSUM.

THIS species, which is figured in *Natal Plants*, tab. 279, by Mr. J. Medley Wood, is flowering in the gardens of J. S. Berghem, Esq., at Belsize Court, Hampstead (gr. Mr. Page), the home of many interesting species. The plant is noteworthy in that it records the species from the neighbourhood of Lake Albert, Central Africa, the habitat given in *Natal Plants* being Natal, Manda 1,800 feet alt. and near Durban 150 feet alt. It is related to *Chlorophytum elatum*, but is distinct in some respects. The plant was imported from the Albert Nyanza amongst roots of *Crinum giganteum* Rattrayi and remained dormant until this year, when it flowered. The plant is of ornamental growth, the radical, linear, deep-green leaves being about 2 feet in length, and producing a branched inflorescence about 3 feet long, the small, white flowers, which do not last long, following each other in succession and producing occasional prolific growth.

Mr. J. Medley Wood, in the description accompanying the plate in *Natal Plants*, remarks: "The plant is really prolific, propagating itself very copiously by these tufts of linear leaves, the weight of which bends the stem or branches to the ground, where they readily take root, and the plant bears seeds very sparingly. The group of some dozens of plants from which the specimens were taken for drawing and description was observed for several weeks, but not a single capsule was formed."

This is not an uncommon circumstance with plants giving prolific growths, and in which this means of propagation and reproduction by seeds are alternative means. Thus probably the more numerous the prolific growths, the

less the need, or the power, to produce seed capsules, which would be more freely produced if for any reason the growths were not made. As seen in Mr. Berghem's specimen, the flowers, generally in fours, are so disposed that the first to flower has a longer pedicel than the others, and some of the former show the ovaries more developed than in the flowers with shorter pedicels. If the plant were in danger of perishing and without the means of perpetuation by prolific growths, it would probably mature seeds. J. B.

SONERILA.

OF the numerous species which constitute the genus *Sonerila*, there are, perhaps, only half-a-dozen worthy of cultivation. *Sonerila margaritacea*, *S. orientalis* and *S. speciosa*, with their varieties, and the hybrids—*François Marchand*, *Mme. Alesch*, *Silver Queen*, and *Souvenir de Mme. V. Houitte*, are a selection which are worthy of a place in any collection of stove plants; their ornamental foliage, dwarf, free-growing, procumbent habit making them especially useful for marginal rows, or for furnishing where space does not allow the use of larger subjects. The chief essentials to success in the culture of these plants are: a free, open compost, abundant supplies of moisture at the root and in the atmosphere; shade from strong sunlight, and a stove temperature. The stock may be increased by means of cuttings or by seeds; cuttings root readily if plunged in bottom heat. When these are rooted, they should be potted up singly into small pots, except that, in the case of the small foliage varieties, several plants in a pot will give a better effect. *Fred. W. Jeffery, Langside, N.B.*

NOTICES OF BOOKS.

GARDEN PLANNING.*

THE author confines himself mainly to the treatment of garden plots of limited area. The volume consists of about 300 pages, and is illustrated by 150 drawings and plans by the author. In a general way it is an excellent treatise, comprehensive, clearly written and showing, for the most part, an intimate acquaintance with the many practical details necessary in the laying-out and planting of small gardens, particularly where expense is the main consideration.

The work, divided into sections, commences with a discussion of the principles of garden design. Then in sequence follow discourses upon the site, the treatment of flat surfaces and slopes, the walls and drives and so on to the chapters on special sections, such as the rock-garden, water garden, and vegetable garden.

The text is interspersed with plans, sectional details and elevation drawings of subjects dealt with in the text. An appendix contains lists of shrubs and hardy flowers, with particulars relating to their height, colour of flower, and time of flowering.

Knowing the difficulties which attend the making of gardens of very limited space, as is common in town and suburban districts, I hesitate to criticise the book, for the author has evidently studied the matter well. But judging from most of the plans illustrated, he fails to show any striking originality of treatment of rectangular areas; on the contrary, all the designs are of so similar a stamp that they betray a poverty of ideas. It is assumed that a space bounded by straight lines must necessarily be laid out in a so-called formal manner with straight paths, borders, symmetrical beds and so on. It is surely a mistake to suppose that the best effects of a garden landscape, however small it may be, are derived solely from this style. Much as the meaningless, curved paths in flat-surfaced gardens are objected to, the equally meaningless repetition of straight lines are not conducive to such beautiful effects as are obtained by planting

* *Garden Planning*, by W. S. Rogers. (London: T. Fisher Unwin.) 1910.

in irregular masses. Moreover, if there is any art in making a small place appear larger than it really is, the straight-line treatment is not the way to produce this illusion.

An irregular treatment of planting in masses gives varieties of light and shade, besides diversity of skyline that cannot be obtained by a straight-line treatment, as the absence of in-and-out planting reduces all to one value.

The most skilful designer of gardens is he who can adapt either or both styles according to the particular circumstances of the case, and, at the same time possesses such a knowledge of his planting material that he can vary the appearance of his finished gardens, although they may be of the same size and outline and under the same conditions of soil and situation.

The lists in the appendix should have been more select; mere lists are bewildering to the amateur, and the columns of names in nurserymen's catalogues are hidden mysteries to the average possessor of small gardens.

Still, the book is one of the best of recent production, and cannot fail to be a useful aid to the ever-increasing class of small gardeners. W. G.

THE ALPINE GARDEN.

SAXIFRAGA VALDENSI.

I HAVE been sitting in front of this brilliant and precious little species for some hours, endeavouring to compile a description which shall enable the casual gardener to know whether he possesses the true plant, or merely the form of *S. cochlearis* which invariably masquerades under the name of *valdensis*. The distinction between *S. linguata* and *S. lantoscana* is also that between *S. valdensis* and *S. cochlearis minor*. *S. valdensis* is a very rare and curious species, absolutely distinct, and limited in its range, as its name implies, to a small tract in the Cottian Alps. Here it occurs only as a high Alpine, at some 7,500 feet, in cliffs of disintegrating granite, exposed to the fullest heat of the sun. *S. cochlearis* is much more common within its range, which, however, is limited to the eastern valleys of the Maritime Alps, and a few rare stations on the sea-board. It varies very greatly in form, and its miniature variety is the plant universally sold as *S. valdensis*. Yet differences as wide in botany as in geography separate the two plants, though Maw himself fell into this common confusion when he recorded *S. valdensis* for the cliffs above Tenda, in the very heart of the *cochlearis* country. But these rare species never intrude upon each other. *Cochlearis* occupies the valley of the Roja, *S. lantoscana* that of the Vésubie, *S. linguata* the upper glens of Tenda, *S. florulenta* the high range between the Ciriogia and the Fenestra. *Cochlearis*, too, is utterly distinct from *Valdensis* in habit and requirements; instead of being a high Alpine, it is a lowland plant, possessing the blazing valleys of Briga and the Roja, from which it hardly ascends; instead of being a granite plant it follows the usual rule of its kindred in preferring the mountain limestone.

In the first place, the cushions of *cochlearis*, however compact they may look, are always much looser and hollower in texture than those of *valdensis*; they also stand much higher from the ground. Each rosette expands by itself and leaves room for the others; a tidy, grey hillock results, which, however, it is easy to part. *S. valdensis*, on the other hand, makes the densest, hardest and most impenetrable dome that I know of among the silver Saxifrages. The colouring of *cochlearis*, in all forms, is of a light green, turned grey with a sort of silvery dust, which becomes most definite at the edges of the leaves; that of *valdensis* is a darkish blue grey, with very definite blobs of silver punctation round the margin of each leaf. The leaves of *cochlearis* are very thick, they stand up, broaden abruptly at their tips, and so abruptly fatten that their ends often give a diamond-shaped effect. The leaves of *valdensis* are not so thick, and

usually seem longer than those of cochlearis minor; they are more strap-shaped, with a rather smaller expansion, and, instead of standing up, lie so tightly pressed back upon each other that the cushions of *S. valdensis* present no point to the hand laid upon them. Seen side by side, no one could possibly confuse the two plants, and yet it is not easy to analyse the obvious differences that separate the rare, precious, definite species from the pretty little common varietal form. I cannot speak yet, unfortunately, as to the flowers of *valdensis*, for though, when I collected it, each plant was busily unfolding red little croziers thick with glandular hairs, all these "went off" in transit, leaving their beauty unchronicled for another year. In cultivation, *S. valdensis* has, however, already proved its value, and in many gardens hotter than mine will have an added value from its predilection for fierce sun-heat, and also, in yet other gardens, from its preference for primary formations, so rare among Silver Saxifrages. *Reginald Farrer.*

STACHYS CORSICA.

I was glad to see the interesting note on *Stachys corsica* by Mr. W. Irving, in his article on "Rare Corsican Plants," on p. 210. *S. corsica* is a little Alpine, which is now rarely seen, although it was fairly plentiful for a short time in some Alpine nurseries. Like many Corsican plants, it does not, however, prove very amenable to cultivation in the open, and a number of growers have lost their plants in winter, whilst only a few find it hardy over a series of years. In the open, it does best in a sandy soil, with stones and grit intermixed, and there it may stand mild winters, but the best position for it is in pans, as was stated by Mr. Irving. *S. Arnott, Sunnymoad, Dumfries.*

The Week's Work.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

The flower beds.—With the splendid weather of the past fortnight or more, the subjects in the flower beds are producing the finest display of the season. Many, such as Fuchsias, Lantanas, Swansonnias, and Pelargoniums are blooming in profusion. Give the plants copious supplies of water, and let this be done early in the day, so that the foliage may become dry before the evening. The plants in stone vases, on terraces, balustrades, &c., are also very beautiful just now. These must be well attended to in such matters as watering, staking, and removal of dead leaves and flowers in order to make them as attractive as possible.

Autumn tints in the shrubbery.—For several seasons past the autumnal tints of most trees and shrubs have not been very pronounced, but this year, judging by present appearances, the autumn foliage should be very beautiful. A complete list of trees and shrubs that give a display of leaf coloration in autumn would be a very lengthy one, but a few of the choicer may be enumerated. This includes varieties of Acer, Rhus, Spirea, Amelanchier, Parrotia persica, Liquidambar, Berberis Thunbergii, Euconymus, Cotoneaster, Quercus, Crataegus, Philodendron, Cornus, Vitis and Rubus.

Perennial Asters.—The varieties of Michaelmas Daisies are producing a grand display in the flower garden. They are especially valuable for producing cut blooms, and the flowers afford great variety of both colour and form. The plants are remarkably easily grown, and they may be planted at the back of the herbaceous border or in the front of shrubberies; indeed, their varying heights render them suitable for almost all positions. Their dwarf kinds of the Amellus section are particularly fine when massed.

General remarks.—The fine weather has favoured a good display of late Roses. Remove the faded flowers and keep the surface soil of the beds free from weeds. *Amaryllis Belladonna* is a beautiful autumn-flowering bulbous plant, but it does not succeed in all gardens. It requires a sunny site in a sheltered spot, the best position being at the foot of a wall. Autumn-flowering Chrysanthemums are blooming freely, and notes should be made of the most useful varieties. Keep the soil of the beds and borders

stirred with the Dutch hoe wherever possible, and tidy up the rockery by removing faded flowers, unnecessary shoots and weeds. Some choicer plants on the rockery will need to be protected from slugs and nothing is more suitable for the purpose than the guards made from perforated zinc. As the varieties of *Gladioli* mature, the bulbs should be lifted and dried. Cuttings of *Violet* inserted a few weeks since in cold frames will require plenty of fresh air. Syringe the young plants frequently to encourage a clean, free growth.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Cucumbers.—Cucumber plants which were put out early in August will now be nearly at the top of the trellis, and may now be allowed to carry a few fruits. At the same time, if the winter supply depends on this plantation, very little cropping must be attempted at present. It is better to maintain a small but regular supply through the winter than to punish the plants early in the season by growing more fruits than are required. If later plantations have been made there will be less fear of a break in the supply, but every effort should be made to encourage the development of these plants while there is sunshine, for this is indispensable in the cultivation of Cucumber plants to stand the winter. It is a comparatively easy matter to get Cucumbers through November and December, but not so easy to grow plants through the winter with sufficient vigour to maintain the supply through January and February. Plants for this purpose should be planted in September and grown in a night temperature of 65° without cropping until January, when they may be allowed to bear sufficient fruit for any ordinary establishment. When surface roots make their appearance, the bed should be lightly top dressed with loam and leaf-soil in equal quantities. Keep the plants thinned and regularly tied to the trellis so that light may reach every part of them. Prevent high temperatures in cold weather, and keep the atmosphere moist by syringing the walls several times daily.

Celery.—The earthing-up of the plants should be pushed forward whenever the foliage is dry enough for the work to be done. Previous to this, the beds should be examined, and, if the plants are dry at the roots, a thorough watering should be given before the soil is applied, for no greater mistake can be made with this crop than to earth up plants whilst the soil is dry at the roots. Tie the leaf stalks together with some soft material, which may be removed after the soil has been placed around the plants carefully with the hand. For the final earthing the soil may be placed as high about the plants as possible consistent with keeping it from the hearts.

Tomatos.—Fruits on plants out-of-doors should be gathered as soon as they are sufficiently coloured and placed in a cool, dry position where they will keep in a good condition for a long time. Tomatos planted against south walls should have spare lights placed in front of them and within 6 inches of the fruits. The lights may be fastened to the wall by means of rope. Plants in pots intended to furnish a supply of Tomatos till Christmas should be given an abundance of light and plenty of fresh air. A little more freedom of growth should be allowed than is permitted in the case of summer plants, or the growth of the fruit may be checked to a large degree. Water must be given carefully during dull weather. Early October is a good time to sow Tomato seed for early spring cropping, and if suitable pits are available ripe Tomatos may be had from plants of this sowing by the end of March or early in April. When the young seedlings are large enough to handle, they should be potted singly into 3-inch pots, and placed as near to the glass as possible, maintaining a temperature of 55°. Sutton's Winter Beauty, Kershaw's Premier and Frogmore Selected are reliable varieties for this batch.

Asparagus.—Plants intended for forcing in November should have the stems cut away as soon as the foliage shows signs of ripening. Prick up the surface of the bed carefully with the point of a fork and give a copious watering, so that the roots may be in a plump condition when the time for lifting arrives. Asparagus is amongst the easiest of vegetables to force, pro-

vided pits, where beds of leaves can be placed to the depth of 4 feet, are available. The leaves should be collected as soon as possible and placed together in order to ferment.

Seakale.—A small batch of plants may have their lower leaves removed to allow light and air to reach the crowns, so that by the end of October they may be ready for placing in the forcing pit.

Spinach.—The latest sowing of Spinach should now be large enough for thinning. Although these late plants will not require so much room as those of an earlier sowing, they will winter better, and their leaves will be larger if a space of 2 or 3 inches is allowed between the plants. The early sowing will benefit if the leaves are picked, whether they are required for use or not, as this will cause the plants to make a more robust growth that will be better able to withstand the winter. Keep the soil stirred between the rows with a hoe, and give a good dusting of soot on the approach of rain.

Celery.—These plants will benefit by liberal supplies of liquid manure, afforded at least once a week, whilst the weather is dry, so that good-sized bulbs may be formed before frosts appear.

Mushroom.—Beds spawned at the end of August will now be furnishing a few button-like Mushrooms. The soil should be examined before many Mushrooms appear, and if it is found to be dry a gentle watering of rain water may be given. The temperature of the house at this stage may be maintained at 55°, and the walls and floor should be frequently syringed in order to maintain a moist atmosphere.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Preparations for planting.—If many new fruit trees have to be planted, advantage should be taken of fine weather, to prepare the ground for this important operation, in order that it may be pushed forward as early as possible. The ground should be dug deeply; and, if there is not good natural drainage, artificial means of draining the land must be contrived. If the soil is poor, it may be improved by incorporating with it, as the digging proceeds, a compost consisting chiefly of good loam, with an addition of road scrapings, lime rubble and wood ashes; where stone fruits are being planted plenty of burnt soil and old mortar rubble should be worked in. In the case of Currants and Gooseberries or other small fruits, well decomposed animal manure may be dug in or used at planting time, but on no account should animal manures be used for large growing trees, such as Apples, Pears and Plums, as this induces them to make gross wood, lacking in fruiting qualities. The soil should be allowed to become settled before planting is commenced. Where it is possible, it is a good plan to have several cartloads of fairly dry and suitable compost placed under cover, and should the weather be wet when planting has to be done, a barrowful of this used to each tree will make the soil work much better, and will enable the planting to be taken in hand again several days sooner than otherwise it could be attempted. A selection of trees and varieties for planting should be made without delay, and the order placed early with a trustworthy nurseryman, so that the trees may be delivered immediately lifting operations are commenced. It is important to get the trees planted again before the roots suffer through dryness. Trees which have been sent a long distance by rail often arrive with their roots very dry, and it is a good plan to place them in a tank with the roots entirely under water for several hours; this will plump them up nicely before being heeled in or planted.

Pigs.—These have not done well this year owing chiefly to the damp and sunless season. The trees have made a good deal of growth, which has not had a fair chance to mature properly. Therefore, every effort should be made to assist the trees in this matter as much as possible. Cut out weak and unnecessary shoots, and thus prevent overcrowding of the growths, in order that those retained for fruiting next year may be well exposed to full air and sunshine. The weather during the past month has been most helpful in the maturing of the wood of all fruit trees.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Deciduous Calanthes.—Plants of *C. Veitchii* and others of the *C. vesita* section, including such hybrids as *C. Bryan*, *C. William Murray*, *C. Victoria Regina*, *C. burfordensis*, *C. Bella*, *C. Harrisii*, and *C. Sedenii* are now showing their flower-spikes from the base of the new pseudo-bulbs. The plants should be afforded as much space as possible and full exposure to the sunlight. If the plants can be arranged so that the leaves are within a foot of the roof-glass, so much the better, but they will need frequent waterings. They will only require a very thin shading during the middle hours of the day, and if the sun is shining directly on them, and the outside air is warm, plenty of ventilation may be afforded. The later-flowering varieties of the *C. Regnierii* section are also making up their new bulbs, and still need abundance of water at the root. The amount of damping down between the pots should be lessened gradually, so that by the time half of the flowers are open it may be discontinued. The night temperature should be kept at about 65° till the flower-buds begin to unfold, when it may decline a few degrees further.

Catasetum, Cynoches and Mormodes.—These plants should now be placed in the sunniest position available in the warmest house. At Burford, they are suspended well up to the roof-glass on the south side of the house. Any of these species now showing their flower-spikes require generous treatment until the spikes are cut, when the plants should be placed in a cooler, drier and more freely-ventilated house; but it is important that they should be exposed to the sunshine. Until the leaves have fallen they must be kept fairly moist at the root, and when the leaves commence to turn yellow the supply of water may be gradually lessened until it is discontinued. After that stage they will need but very little water to keep the bulbs plump until they again commence to grow in the spring. If the bulbs do not mature properly, or the plants are insufficiently rooted, the bulbs are apt to shrivel a little during the resting season, and must, therefore, be watered. It is of frequent occurrence with these plants that, after producing strong inflorescence, they soon commence to show another spike; this, however, should be pinched out as soon as it appears.

Thunia.—Owing to the lack of sunshine, the leaves of the *Thunias*, although the plants have been in the resting house for a long time, are still perfectly green. While the foliage remains so, the plants must still be supplied with water at the root, and it is a good plan to syringe the leaves when the sun is shining on them. Keep the leaves free from red spider by laying the plants down and syringing them with rather warm, soft-soapy water.

Lælia pumila.—Immediately the dwarf-growing *Lælia pumila* and its varieties *prestans*, *alba*, *margaritacea*, *Colmanii*, *Garton Park*, and *Low's Variety*, commence to send up their flowers, the plants should be removed from the cool house to a light position in the intermediate house, and liberal supplies of water at the root will be necessary until growth is completed, when the plants may be repotted if necessary. Small, shallow pans are very suitable for them, and only a very thin layer of *Osmunda* fibre and *Sphagnum*-moss is needed for the roots to grow in. Now that the nights have become colder, the *Chimæroid Masdevallias* should be removed to the intermediate house, where they should be suspended in the coolest and most airy part. They require plenty of water at the root at all times. These plants are always subjected to small yellow thrips and red spider, especially when in the warmer atmosphere, therefore they must be often taken down, and the leaves washed with a safe insecticide, taking care that none of the mixture gets to the roots or compost; also that after sponging the leaves should again be thoroughly washed with clean, soft water. Shade them always from the least direct sunshine.

Zygopetalum.—*Z. maxillare* is one of the few Orchids that thrive best when fastened to pieces of Tree Fern, upon which it is nearly always imported. The plant may be suspended in a moist, shady corner of the intermediate house, and be kept thoroughly moist at all times. Plants of the rare *Z. Ballii*, now starting to grow, may be repotted in a well-drained compost of

Osmunda fibre, *Polypodium* fibre and *Sphagnum*-moss in equal parts, cut up moderately fine. This plant thrives very well when arranged in a suitable position with the cool-growing *Cypripediums*, but the growths must be frequently examined for small yellow thrips, otherwise failure is sure to ensue. *Zygo-Colax Veitchii*, *Z.-C. Charlesworthii*, *Z.-C. Amesianus*, *Z.-C. leopardinus*, and *Z.-C. Wiganianus* require identical treatment. Other species and hybrids of the pseudo-bulbous section of *Zygopetalum* as *Z. Mackayi*, *Z. crinitum*, *Z. Clayi*, *Z. leucochilum*, *Z. Murrayianum*, *Z. Perrenoudii*, *Z. Sedenii*, *Z. Prothoracianum*, *Z. Burkei*, *Z. Jorisianum*, and *Z. Gottianum*, that are in full growth, will still require copious root waterings till growth is completed. A shady position in the intermediate house is the best place for them. *Z. rostratum* and *Z. Roeblingianum* thrive better when placed in a warmer temperature; both plants need plenty of water and shade. Owing to the creeping habit of the rhizomes, the growths quickly rise from the surface of the compost, and to afford the roots sufficient moisture it is advisable to spread a thickish layer of growing *Sphagnum*-moss over the surface of the soil, so that it may touch each young rhizome.

PLANTS UNDER GLASS.

By JOHN DONOGHEE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Tree or Perpetual flowering Carnation.—The plants should now be placed in their winter quarters. Avoid overcrowding on the stages, and take precautions to have both the plants and their surroundings scrupulously clean, an occasional washing of the glass both inside and outside being a great advantage. Beneficial results will follow if occasional waterings of clear soft water are afforded, as this will impart a deep, healthy colour to the foliage. Apply a top-dressing of some approved artificial fertiliser, and repeat the application fortnightly throughout the flowering season, taking care to avoid an overdose. The temperature of the house should be maintained at 55° at night, with an advance of 5° during the day. Ventilation must be afforded regularly, leaving the ventilators open a little during the night, and, in cold weather, on the opposite side to that from which the wind is blowing. An abundance of fresh air should be admitted during favourable weather, when the paths may be damped twice daily. Varieties of the *Souvenir de la Malmaison* type will be ready for repotting into 5 and 6-inch pots, according to the progress made since the last potting. The pots must be clean and dry, and have ample material for drainage. The potting compost should be of a slightly rougher nature than that used for the previous potting, adding mortar rubble or sandstone, and broken charcoal. Place the plants in a position as near to the glass as convenient, and allow as much ventilation as possible without causing cold winds to affect the foliage. Throughout the winter months the plants may be kept somewhat drier at the roots, but never allow them to suffer from excessive dryness. This type of *Carnation* is very subject to fungous diseases; but if the house is kept dry and well ventilated during the duller part of the year, diseases are not so troublesome. Specimen plants, if not already staked out, may be done without delay, as the growths are then more evenly disposed, and gain considerable advantage from the free circulation of air, and eventually become better ripened for standing the winter months. The temperature of the *Malmaison* house may be kept at about 45°, with an increase of 5° during the day.

Gesnera.—The ornamental-leaved *Gesneras* are exceedingly effective at this season of the year. They require a fair amount of warmth, and should be treated similar to the *Gloxinia*. Propagation is easily effected by division of the tuber, seeds, or cuttings; the cuttings may be inserted at any season of the year when a stove temperature is available. The *Gesnera* delights in a fibrous, peaty compost, and is a gross-feeding plant, therefore, when the pots are well filled with roots, afford a liberal supply of diluted liquid manure.

Glorinia.—Corms which are thoroughly ripened may be stored away in a dry, cool place, where the temperature does not fall below 45°. Seedlings which were raised during late spring for autumn flowering are producing a good display of bloom, and, in order to prolong their

season of flowering, it is advisable to apply liquid manure and sometimes a top-dressing of bone meal.

General work.—With the shortening days, the atmospheric temperatures of the plant-houses should be reduced gradually. In the stove, the temperature may be reduced a few degrees each week until 65° is reached, this being regarded as the minimum, except in very severe weather. Most plants are benefited by slightly drier conditions and greater exposure to the sunshine after the first day of October. Examine the permanent borders in which climbing plants or other species are growing, and let any such borders be renovated which require this treatment. The growths of the climbing plants may be shortened, and undesirable wood removed, for the purpose of admitting a greater degree of light to the plants which are growing in the structure. If climbing plants for stoves are cultivated in large pots or tubs, they may be removed to cooler and drier conditions.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSELL, G.C.B., Moulton Paddocks, Newmarket.

Peaches.—Late crops in cool houses and wall cases are now ripening, and the recent sunny weather, with liberal ventilation, has contributed to the development of high colour and good flavour. Any trees which have been cleared of fruit may be syringed freely with clear water occasionally as a preventive of red spider.

Peach trees for forcing.—Any such work as lifting, replanting and root pruning should be taken in hand without delay in order that the roots may become settled before forcing begins. Lifting must be done with care, preserving as many roots as possible, cutting back any strong tap roots and any which may get bruised or broken during the operation. The trees having been taken up and heeled in, any necessary alterations to the border may be proceeded with. The *Peach*, in common with other stone fruits, requires a fair proportion of lime in the soil, and this is best applied in the form of old mortar rubble. The bulk of the soil should consist of fibrous loam with lime, wood-ashes, a little rough leaf-mould and a sprinkling of crushed bones. The border ought to be trampled or beaten thoroughly firm as the work proceeds. When replanting a tree, keep the roots well up to the surface, deep planting being a common fault, and often the cause of indifferent crops. Young trees which have made rank, unfruitful wood will benefit by being lifted and root pruned, adding a liberal quantity of mortar rubble to the soil round the roots when replanting, but no manures of any kind. Old-established trees, on the contrary, may be given a rich top-dressing. Prick up and clear away any inert soil on the surface of the border, then apply a good thickness of chopped loam, to which has been added some lime rubble and a proportion of some good fertiliser. The whole should be made thoroughly firm, and a soaking of tepid water applied directly the operation is finished. Any painting of the woodwork or trellis inside the house may now be done. In many cases, *Peach* trees are trained too near the glass, the trellis should never be nearer than 18 inches. Towards the end of this month, the work of pruning and cleaning the trees in the earliest house may be done in readiness for closing the house in November. After pruning, let the trees be cleansed thoroughly with a solution of quassia and soft soap, using a sponge on the young wood and a soft scrubbing brush on the older and rougher parts of the stem. The glass, woodwork and trellis should be scrubbed with soap and warm water, and syringed afterwards with clean water. The walls may be given a coat of limewash, working it thoroughly into all the crevices. Whiting or any mixture containing it should not be used, as the regular syringing causes it to drop off on to the trees, which soon present a dirty appearance. One or two clots of fresh lime placed in water to dissolve and put on whilst warm will adhere almost as well as paint and, besides destroying any insect pests with which it comes in contact, will act as a disinfectant and fungicide. Other houses from which the crop has been cleared should be ventilated to the fullest extent. Keep the foliage in a clean, healthy state until mature and ready to fall off. See that the roots do not suffer through lack of water or many of the flower-buds will drop later.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, OCTOBER 10—
United Hort. Ben. & Prov. Soc. Com. meet.

TUESDAY, OCTOBER 11—
Roy. Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. B. Barker, on "Cider and Perry Fruits.") British Gard. Assoc. Ex. Council meet.

THURSDAY, OCTOBER 13—
Roy. Hort. Soc. Autumn Fruit Exh. (3 days), London Branch B.G.A. meet.

FRIDAY, OCTOBER 14—
Conference of Mutual Improvement Soc. at R.H.S. Hall.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—50° 6'.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, October 5 (6 P.M.): Max. 68°; Min. 50°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, October 6, (10 A.M.): Bar. 30.5; Temp. 59°; Weather—Sunshine.
PROVINCES.—Wednesday, October 5: Max 68° Oxford; Min. 54° Sligo.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY AND TUESDAY—
Nursery stock in variety at Hickmandias Nursery, Knockholt, Kent, by order of Mr. A. Waterman, by Protheroe & Morris, at 12.

WEDNESDAY—
Azaleas, Bays, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

WEDNESDAY, THURSDAY, AND FRIDAY—
Nursery Stock at The Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11.

FRIDAY—
Choice Established and Imported Orchids at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Yorkshire Gardeners.

It appears from a discussion which has taken place recently in the correspondence columns of the *Yorkshire Post*, that many horticulturists in that county are greatly exercised as to the desirability of establishing a horticultural society for the north of England. As might be expected in a discussion of this public character a number of more or less irrelevant matters have been introduced by one and another of the correspondents. Among some of the suggested functions of the proposed society are, the formation of a first-class botanical garden in Yorkshire, the publication of a gardening paper, and the onerous task of discovering remedies for gardeners' grievances!

The outstanding purpose, however, as gathered from the letters, is to create an influential society to be managed on lines similar to those adopted in the case of the Royal Horticultural Society. The correspondents maintain that such an institution with its monthly meetings would provide for gardeners and gardening in the north of England privileges which the R.H.S. offers to all its members who have opportunities of attending the fortnightly shows at Westminster. The proposed society would be so founded as to be something more than a mere institution carried on for the purpose of providing facilities for exhibiting and for the dis-

tribution of prize money among successful competitors. It appears to be thought that this function would still be carried on by the numerous local horticultural societies, and that these latter would not find in the larger institution a rival, but a source of considerable help, inasmuch as it would be a means of co-ordinating work that is now carried out by each society in its individual capacity.

There may be excellent reasons for the aspirations of Yorkshire horticulturists. In the first place, the distance of that county from London is considerable, and it may not be possible for any but the most favoured gardeners to attend the larger shows of the R.H.S., to say nothing of the fortnightly meetings where the best work of that Society is done. In these circumstances, they feel that they do not get the full advantage of their membership. In the second place, they have not the opportunities possessed by gardeners in the neighbourhood of London, of showing, by means of frequent public exhibits, their skill in their calling, and thereby making a reputation for themselves. Although they may be just as capable as the leading gardeners in the south, the northern gardeners are, from their lack of opportunity, necessarily less known in the gardening world. The existence of a northern horticultural society of repute would help, in no small measure, to remedy this state of affairs, and it might have the effect of bringing to the front men who would otherwise achieve less prominence. In addition to these considerations, it might be urged that a society, conducted on the lines indicated, if managed wisely and well, would have a valuable educational force in whatever part of the country it is established.

The first matter to be settled by those interested in the question, is one of finance. Can a sufficient sum of money be found to enable the proposed society to properly carry out the aims and ideals of its promoters? In this connection it has to be remembered that greater strength and influence are more often gained by the amalgamation of existing organisations than by the creation of additional ones. In Edinburgh, for instance, there is at present a weakness of purpose which may be traced in a large measure to the division of effort and greater expenditure which the maintenance of separate organisations involves. The proposal to amalgamate the Royal Caledonian Horticultural Society and the Scottish Horticultural Association, which have been made recently by many who are interested in both Institutions, would, in our opinion, prove of immense service to Scottish horticulture, inasmuch as the amalgamated bodies would have greater influence than they possess as separate societies. We cannot say whether this point of view has received due consideration from the Yorkshire correspondents, who appear to assume that the existing societies in the county and district would continue their present activities after the establishment of a new society. In any case it would seem to be necessary that the management committees of the local societies should have representatives upon the committee of the larger association, for in no other way would it be possible to obtain the support and prestige essential for a society of the kind now under discussion. This is the more obvious when

the complaints of the Yorkshire gardeners are correctly understood. There are already numerous shows held in the county every year, in Leeds, York, and other places, but they have not the importance that belongs to those of the Royal Horticultural Society. This fact seems to be the principal cause of dissatisfaction, and, if this is the case, the promoters must consider how they are to establish an association that would be influential enough to satisfy their aspirations. If such a thing is attempted it will be a great gain if the friendly offices and practical help of the Royal Horticultural Society can be obtained by affiliation or other means.

There is one point that is open to question, namely, whether it is desirable that such societies as that which is now proposed should make a practice of awarding certificates to novelties exhibited at the shows. The certificates and awards of the Royal Horticultural Society have a value to gardeners over the whole kingdom. They are awarded by large committees, the members of which have opportunities of inspecting every new introduction and hybrid of outstanding merit, because the R.H.S. meetings attract everything of this nature. If the distance from London prevents gardeners in certain districts from attending these shows, it may be thought that for this very reason they have not sufficient means of comparing novelties to enable them to make awards that would be generally accepted with confidence. At the same time, Certificates for good cultivation could very properly be awarded, and these would probably be just as much appreciated, as Awards of Merit by most of the exhibitors.

Sweet Peas.

In the present issue we publish two communications which have just been issued by the National Sweet Pea Society dealing with the classification of Sweet Peas and "too-much-alike" varieties. These lists are prepared by a committee of twelve amateur and trade growers, who meet at the Society's trials and examine carefully many hundreds of varieties which are grown under numbers. The classification list contains the best of modern Sweet Peas, except a few novelties which are being distributed for the first time this autumn. The list is useful to all engaged in floriculture, to seedsmen as well as growers, to amateurs as well as professional cultivators.

It is not necessarily the best variety, in every case, which appears at the top of the various classes in the classification of Sweet Peas, but in every case it is the variety which has come truest to type and colour in the Society's trials. We are glad that the committee has given due weight to a matter of such importance as fixity of stock. It must be disappointing to many every season who purchase a beautiful variety because it is attractively shown, only to find that in cultivation not 10 per cent. of the produce resemble the flower exhibited. This matter will right itself in time, because business will go to those whose stocks are noted for purity.

The list contains nearly 30 colour classes, but, as few people want to grow more than a dozen or eighteen at the most, how are they to decide which should be discarded? In our opinion, the 12 classes that will give

the most satisfaction are white, cream, blush, pink, cream-pink, Picotee-edged (two), orange-pink, salmon, scarlet, bicolor, and lavender. This selection embraces all the most charming shades. Anyone wishing to extend the list to 18 should include cerise, crimson, maroon, mauve, orange-scarlet, and carmine. In placing an order with a seedsman, no one will err greatly if he selects either of the two first varieties in the colour sections we have named.

In respect to the list of "too-much-alike"

included a First-class Certificate and Silver Medal to Stirling Stent, and Awards of Merit to Masterpiece, Mr. Hugh Dickson, Arthur Green, and Cherry Ripe. It has now been decided that the Society shall issue to the holders of these varieties special labels, to be affixed to their packets when selling the seeds, so that for one season raisers will reap the reward of their labours. Steps are also to be taken for the registration of novelties, as is done by the Perpetual-flowering Carnation Society.

somewhat rigid habit. The leaves are oblong or oblong-lanceolate, 3 inches to 5 inches long by about one-third as much in width; of stiff leathery texture, very lustrous dark green above, paler beneath, and furnished with stellate hairs on the mid rib and stalk; the margin is shallowly toothed, except at the base. The flowers are produced about midsummer in pyramidal panicles 2 inches to 4 inches long; they are about 1.5 cm. inch in diameter and dull white. The shrub owes its attractiveness as a garden plant to the abundant crop of bright, coral-red berries. Originally discovered by Dr. A. HENRY (after whom it is named) in the Patung district of Central China in 1887, it was introduced to this country by Mr. WILSON in 1901. Plants have been grown in the Coombe Wood Nursery since then without protection, and there is little doubt from the vigorous, healthy aspect of the plants there that it is a good grower and quite hardy in the average climate of the British Isles. The plant may be readily increased by means of cuttings. The supplementary illustration is reproduced from a photograph of the specimen which gained the Certificate.

ROYAL HORTICULTURAL SOCIETY.—The next meeting will be held in the Society's Hall, Vincent Square, Westminster, on Tuesday, October 11. At the 3 o'clock meeting in the Lecture Room an address on Cider and Perry Fruits will be given by Mr. B. T. P. BARKER, M.A. The great fruit exhibition will be held on October 13 and 14.

HORTICULTURAL CLUB.—The next house dinner of the club will take place on Tuesday, October 11, at 6 p.m., at the Hotel Windsor. Mr. GEORGE BUNYARD, V.M.H., will give an address on "Impressions of Carnac (Brittany), Its Dolmens, Alignments and Menhirs." The lecture will be illustrated with lantern slides.

FLOWERS IN SEASON.—Mr CHARLES DOWSON, Nurseryman, Middlesbrough-on-Tees, sends blooms of a seedling border Carnation, named Her Majesty Queen Mary. The flowers are yellow ground with reddish markings, not over-large and with calices that do not burst. The variety is said to be extremely free in blooming.

MONUMENT TO MENDEL.—A monument to GREGOR JOHANN MENDEL, who died at Brunn in 1884, was unveiled at Brunn on the 2nd inst. in the presence of the authorities and a large number of representatives of foreign institutions, including Professor BATESON, Director of the "Innes" Horticultural Station. At a banquet which was subsequently given, speeches were delivered in which appreciative references were made to MENDEL's contributions to the study of the theory of heredity.

BRITISH AND CONTINENTAL SALADS.—Mr. W. F. GILES, of Messrs. SUTTON & SONS, Reading, delivered a lecture before the National Amateur Gardeners' Association at Winchester House, Old Broad Street, E.C., on Monday evening last, entitled, "British and Continental Salad Plants." The lecture described practically all the plants used as salads in England and on the Continent, and these were illustrated by lantern slides.

VEGETABLES FOR THE HOSPITAL.—At the recent exhibition of the National Vegetable Society, exhibitors were asked by Mr. ALEX. DEAN, on behalf of the Society, to contribute what vegetables they could spare as a gift to St. Thomas's Hospital. The hospital authorities fetched them away during the evening, and, later, sent a letter of thanks to the Society for the large quantity of first-class vegetables thus presented to them.

FIG. 109.—VIBURNUM HENRYI IN FRUIT.

(See also Supplementary Illustration.)

varieties, it must not be supposed that the varieties bracketed together in the second list are quite the same. They are not very far from it in some cases, it is true, but they are only declared to be too much alike in order to obtain variety at the exhibitions, therefore it is not permissible to show two of the bracketed varieties on the same competitive stand.

Earlier in the season it was announced that the National Sweet Pea Society had made awards to five new Sweet Peas. These awards

OUR SUPPLEMENTARY ILLUSTRATION, *Viburnum Henryi*, was awarded a First-Class Certificate at the meeting of the Royal Horticultural Society on September 27 last. The genus *Viburnum*, as represented in gardens, has been much enriched by Mr. WILSON's travels in Western and Central China on behalf of Messrs. JAS. VERRILL & SONS, not only in the number of new species introduced, but more particularly in the new aspects of the genus that have been revealed. *V. Henryi* is one of the most distinct of the new species. It is an evergreen shrub, growing 10 feet high, stiffly branched, and of

CHARITABLE BEQUESTS BY A MARKET GARDENER.—The late Mr. EDWARD MATYEAR, market gardener, of the Crabtree Farm, Fulham Palace Road, has left 21 acres of land, with a river frontage of 500 feet, valued at £4,000 an acre, to King Edward's Hospital Fund. He has also left £500 each to the West London Hospital and the Lygon Almshouses, Fulham Palace Road, and £250 to Nazareth House, Hammersmith. Mr. MATYEAR, who was in his 73rd year, died in the West London Hospital, and was buried at Fulham on the 26th ult. He and his late father had farmed the Crabtree land for over 100 years.

THE REGISTRATION OF FLORAL NOVELTIES.—The Perpetual-flowering Carnation Society is the first floricultural society in this country to introduce the system of registering the names of novelties. The system is recommended for several reasons, but mainly for securing for the raiser the use of the name he has selected for his novelty, thus preventing a confusion which might otherwise arise on account of other firms employing the same name for a novelty raised by themselves. In each case, we believe, the name of the novelty is registered with the society by the raisers sending the name and a description of the flower to the society's secretary. The following British-raised seedlings of perpetual-flowering Carnations have been registered this year. The descriptions are supplied to us by the Secretary. By C. F. WALTERS, Balcombe, Sussex; Albert E. Manders, orange with red stripes; Edith Waters, cerise. By H. BURNETT, Guernsey, Aurora, buff marked with pink; Bridesmaid, deep salmon-pink; Countess of March, salmon-pink; Daphne, deep pink; Fortuna, yellow, inclined to buff; Marmion, cherry-red with picotee, white margin; Mikado, deep heliotrope at its best; Mrs. W. B. Clode, reddish-salmon; Mrs. W. J. Hunter, cherry-red; Mrs. Tatton, white, overlaid with pink and margined white; Orpheus, bright yellow ground, marked with pink and white; R. F. Felton, pink; Snowball, white, inclined to blush in centre on opening; Snow Queen, white (pure); Vulcan, buff, heavily marked with scarlet. By YOUNG & CO., Cheltenham, Duchess of Devonshire, bright crimson, after President colour; Lady Henderson, bright flesh-pink. By A. SMITH, Enfield Highway, Empire Day, pale salmon-pink. By W. H. LANCASHIRE, Guernsey, Emperor, a white ground flower, striped with carmine. By C. ENGLEMAN, Saffron Walden, Harlequin, yellow ground, heavily striped with red. By STUART LOW & CO., Bush Hill Park, Lady Dainty, overlaid purple; Rival, coral-red. By J. WORMALD, Harrogate, Pride of Wharfedale, mauve ground, marked with pink; The Socialist, scarlet. By HAYWARD MATHIAS, Medstead, Etna, bright orange-scarlet; Mascot, salmon-pink; O.K., blood-red; Pink Pearl rose. The secretary, Mr. HAYWARD MATHIAS, Lucerne, Stubbington, Fareham, reminds us that the society's winter show will be held in the Royal Horticultural Hall, London, on December 13.

CRYPTOGAMIC SOCIETY OF SCOTLAND.—The annual conference of the Cryptogamic Society of Scotland was opened at Crieff on September 27. The members engaged in the search for fungi in several woods, and some interesting finds were made. On the evening of the 23th, the annual business meeting of the society was held, under the presidency of Dr. A. W. BORTHWICK, Edinburgh. The report of the year's work was satisfactory. The following office bearers were elected, together with several other gentlemen as members of the council:—President, Mr. R. B. JOHNSTONE, Cambridge Drive, Glasgow; Secretary, Rev. Dr. PAIN, Edinburgh; Treasurer, Mr. W. C. CRAWFORD, Edinburgh. It was agreed to hold next year's conference at Moffat, Dumfriesshire.

NEW PARK FOR NORTH LONDON.—According to the *Times*, the Middlesex County Council has decided to contribute a sum not exceeding £5,000 towards the £20,000 required for the purchase of 60 acres of the Grovelands Estate, Winchmore Hill, which is being acquired by the Southgate District Council for the purpose of a public park. The park, which is in the centre of a building estate of 360 acres, is a portion of the Great Deer Park, which formerly extended to Enfield Chase, and was a favourite hunting-ground of James II. and Henry VIII. It is stated that, owing to its peculiar shape, the park will be known as the "Leg of Mutton Park."

YORKSHIRE FUNGUS FORAY.—The annual fungus foray of the Mycological Section of the Yorkshire Naturalists' Union was held at Sindsend, near Whitby, from September 17 to 22. Fungi were very abundant in Mulgrave Woods, and, notwithstanding that the present was the fourth visit of the society, six species of agarics new to the British flora were collected, and also one species only previously recorded from Jersey. *Mycena flavipes*, a very beautiful agaric, with a pink cap and clear yellow stem, was met with in fair quantity. This fungus was first observed as a British species in Mulgrave Woods about 25 years ago, and it has not been observed elsewhere in this country. The species was founded on specimens collected in the Jura district in France. Many other rare and interesting British species were found, and, taken altogether, the meeting proved most instructive, from both a systematic and an ecological standpoint. The success was largely due to the facilities afforded by the Rev. the Marquis of NORMANBY. In the evenings, discourses on mycological subjects were given by Mr. WAGER, F.R.S., Mr. CLARKE, Mr. GIBBS, and Mr. GEO. MASSEE. Mr. CHEESEMAN exhibited a collection of myxogastres collected in the Rocky Mountains, and Mr. CLARKE exhibited a large series of coloured drawings of fungi. The extensive and beautiful Mulgrave Woods, with their deep ravines and winding streams, always furnish an abundant fungus flora, independent of the season, which, to a great extent, determines its presence or absence in less-favoured localities.

ABUTILON THOMSONII.—The Curator of the Botanic Garden, Cambridge, states that he would be exceedingly grateful if any reader would kindly send him a few flowers of *Abutilon Thomsonii*. The pollen is needed for plant-breeding experiments, and the anthers should be on the point of bursting, with some a little riper. It may be necessary to point out that this plant has leaves mottled with yellow and flowers strongly veined like those of *A. striatum*. Another plant is sometimes wrongly known as *A. Thomsonii*. Mr. LYNCHE would also be grateful for a plant of *Gymnogramme trifoliata*.

PUBLICATIONS RECEIVED.—*A Simple Method of Bottling Fruit at Home*, by J. Stoney, with Recipes for Home-made Jams, by Mrs. Stoney. (Stafford: J. & C. Mort, Ltd.) Price 6s.—*British Rainfall, 1909*, by Hugh R. Mill. (London: Edward Stanford) Price 10s.—*The British Fern Gazette*, September, 1910, edited by C. T. Drury. (Westmoreland: The British Pteridological Society.)—*A Handbook of Tropical Gardening and Planting*, by H. F. Macmillan. (Colombo: H. W. Cave & Co.) Price 5s.—*Agricultural Bacteriology*, by John Percival, M.A., (London: Duckworth & Co.) Price 7s. 6d.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

COE'S GOLDEN DROP PLUM.—Plums are scarce this season, and those who are fortunate enough to have a crop of Coe's Golden Drop, on wall trees, should endeavour to keep some of the fruits in good condition until the middle of November. The fruits, as they approach maturity, must be carefully protected from wasps and rain. It is well, in making the daily gatherings, to go over the trees carefully, nipping out the ripest fruits with a pair of scissors. This will gradually thin the crop, and those fruits intended for late supplies will last all the longer. Dr. Hogg, in his *Fruit Manual*, refers to this Plum, and quotes from Lindley's *Guide to the Orchard*, "That by hanging the fruit in a dry, airy place, or wrapping in soft paper and keeping it dry, it will last a considerable time, and he (Lindley) has eaten it, when kept in this way, 12 months after it has been gathered." I have not proved it so lasting as this, but have frequently kept it in good condition and exhibited it as late as November. *R. P.*

HORTICULTURE IN YORKSHIRE.—Arising out of some correspondence in regard to establishing a horticultural society in Yorkshire, which has recently appeared in the *Yorkshire Post*, a correspondent offered £5 if a meeting could be arranged in Leeds during October. On September 30, about 50 horticulturists held a meeting at the Grand Central Hotel, Leeds, in order to elect a committee to carry a scheme into effect for the initiation of a horticultural society which shall, if possible, be incorporated with the Royal Horticultural Society. The committee met on October 3, and Mr. Allsop, City Parks Superintendent and chairman of the committee, announced that the Lord Mayor of Leeds had promised his support to the scheme, and that he extended an invitation to those interested to hold a mass meeting of Yorkshire horticulturists in the Lord Mayor's room on Tuesday, October 25. Further particulars will be advertised in due course. *John Donoghue.*

WILD FLOWERS IN LONDON.—It is curious to note how waste ground, even in the heart of London, becomes tenanted by wild flowers, and how greatly the flora of one district differs from that of another. Take, as examples, the large vacant plot of ground in the Strand, where, at the present time, no fewer than 28 species and varieties of plants may be found, while at Millbank nearly an equal number may be detected on the disused piece of ground behind the Tate Gallery. Again, in Farringdon Street, a small patch of land that has only been vacant for a short period contains 28 species, exclusive of grasses. The curious dissimilarity of the plants found on each of these three stations is remarkable. Amongst other plants the Willow Herb (*Epilobium angustifolium*) is plentiful in the Strand, while it is entirely wanting at Millbank, and two species are present at Farringdon Street that are absent from the other stations. At the Strand site, the plants which occur in greatest quantity and attract most notice are the Willow Herbs (*Epilobium hirsutum* and *E. angustifolium*), followed by the Yarrow (*Achillea*), Wild Balsam, Poppy, Silverweed (*Potentilla*), Coltsfoot (*Tussilago*), Feverfew (*Pyrethrum*), *Persicaria*, Charlock, and numerous weeds such as the Dandelion, Groundsel, Plantain, Chickweed, Daisy, several species of grasses and the Common Rush. Amongst woody plants occur the Willow and Wild Plum, while even Ferns are represented by a tuft of the common Bracken. The latter plant also occurs at Farringdon Street; and the Annual Poa (*P. annua*) is common to all three stations. The great majority of these plants, including the Composite, have undoubtedly been distributed by the wind, so that their presence even in the centre of London can readily be explained; but flat and heavy-seeded plants, such as the Poppy, Plantain, *Persicaria* and Plum, hardly lend themselves to such a method of distribution. The Plum fruit was probably thrown into the Strand grounds by a passer-by, while the Bracken may have found its way from Covent Garden Market. Sparrows and cats disseminate seeds freely, and it is surprising what a collection of wild plants may be got from a vanload of the sweepings of a London street, a fact

that is unfortunately well known to the users of such in the public parks and gardens. Whilst writing of wild flowers in London, it may be interesting to state that within 15 minutes walk of Oxford Circus the Cowslip (*Primula veris*) may still be seen growing in a truly wild state. *A. D. Webster.*

CELSIA CRETICA AS A SUMMER BEDDING PLANT (see fig. 110).—*Celsia cretica* is generally employed as a cool greenhouse or conservatory plant, but it forms also a most useful and pleasing subject for summer bedding or for massing in herbaceous borders, and in the forefront of shrubberies. The effect depends upon the plants being thoroughly well cultivated, so that each specimen will be capable of producing from four to eight strong stems that will flower pro-

very hard, and, collecting the trimmings as fast as they fall, burn them at once. If these maggots, which seem able to secrete themselves in the dead portion of the leaves, where no doubt they will hibernate, get into the soil, they will produce an army of perfect insects to propagate other maggots next year. It is strange that whilst the Celery or Parsnip fly or maggot has been so little in evidence this season, such a work of destruction should be proceeding in Privet leafage. *A.*

SEEDLING POTATOS.—On p. 245 your correspondent *A. D.* relates the methods of raising Potatos in an English nursery. This work is also done in Scotland on a very large scale, and some fine varieties have come from this side of the Border. As a personal instance of how difficult

ROSE FRAU KARL DRUSCHKI AS A BEDDER.

—It is a common complaint that this Rose grows too tall for bedding purposes. I have also heard a good deal of adverse criticism on its lack of perfume, and some on what is termed its "dead white." I have experienced some difficulty as to its growth; dwarf, budded plants have often made shoots 6 feet to 7 feet in length, notwithstanding the plants had been very lightly pruned, and growths 5 feet in length frequently develop from pegged-down plants. Three years ago I made a new Rose garden, and one bed was planted with about four dozen plants of Frau Karl Druschki. The preparation of the ground was delayed, and this necessitated heeling the plants in until the third week in February. When planting them in the bed the strong roots were somewhat severely pruned, the pruning of the shoots being left until the last week in March. The result was short, sturdy growths, and nearly every shoot produced an abundance of first-rate flowers. I have lifted the plants each February since with the same result, the growths never exceeding 20 inches, although they were hard pruned. It would be interesting to learn if any other Rose-grower has adopted this plan. *Wm. Partridge, Hovingham Hall Gardens, Yorkshire.*

CEANOTHUS GLOIRE DE VERSAILLES.—I

agree with *Yorkshire Gardener's* praise of this beautiful flowering shrub (see p. 249), believing it to be deserving of a more extended cultivation. It is the finest variety of *Ceanothus*, and, having grown it for more than 12 years in various situations and in widely-separated localities, I may state I have never seen it permanently injured by frost, therefore, no one need be afraid to plant it doubting its hardiness. The plant is not at all fastidious as to soil, but develops much better flowers under generous treatment. In favourable conditions, it will continue to bloom until late in the autumn. Pruning should be practised fairly severely in the spring, and, in cases where the plant is growing in a border and away from a wall, it is a good plan to thin out the young shoots early, retaining a reasonable number according to the size of the specimen. Fresh growths will develop strongly, and as these develop they should be tied loosely to a central stake, or rough winds may break off the slender shoots. A capital effect is gained by planting an isolated bed in a fairly-sheltered position, giving the plants plenty of room to develop. By planting thinly, on a groundwork of white *Violas* or similar plants, a charming combination is obtained. *J. G. W., Kent.*

THE EDINBURGH HORTICULTURAL SOCIETIES.

—If public interest in horticultural affairs were to be gauged by the state of the Royal Caledonian Horticultural Society and the Scottish Horticultural Association, then it would appear that a love of gardening in Scotland is on the wane. Nearly every show results in a financial loss, and the time has surely come for the executives of those two concerns to take a broader view of the situation. It is an opportune time to consider this subject, for this winter may see some change in Edinburgh. Amalgamation is proposed; but while this may ease the situation and cause a sense of security for the time being, it will not, by any means, popularise the exhibitions held in that city. The fact is, in a centre like Edinburgh, the ordinary competitive flower show is a failure, and the people expect to see more than competitive exhibits. The lines upon which the Royal Horticultural Society hold their fortnightly meetings in Vincent Square may be commended as what is necessary in Edinburgh. The experiment of holding a show three times a year, and eliminating, to a great extent, the competitive element, but inviting nurserymen in touch with popular demands to contribute exhibits, and award medals according to their excellence, would be worth trying, and, probably, they would receive more support from the public. Those in the majority in gardening to-day are not competitors. They want to see the best the floral world can give them, and, what is more, they are prepared to spend money to see it. The Edinburgh societies seem to have overlooked the fact that gardening is now the hobby of the masses, it is a democratic pastime, while their shows appeal only to those who compete or take an interest in competition. The competitive classes of the shows, too, are

FIG. 110.—CELSIA CRETICA AS A SUMMER BEDDING PLANT AT SEZINCOT.

fusely. The seeds should be sown in autumn, and the seedlings pricked out into boxes or a cold frame, finally placing the plants in beds or borders in the spring, where they are required to flower. *J. H. Dicey, Sezincot Gardens, Gloucestershire.*

MAGGOTS ON PRIVET.—Without discrimination as to variety or colour of leaf, a leaf-mining maggot is preying on the foliage of this shrub this season in the most destructive way; it is feared that, in many cases, the plants will be debilitated. If anyone will take the trouble to gather some of the affected leaves, split them open, and examine the affected parts he will find black excretions, and generally from one to eight white maggots. These vary in length from $\frac{1}{4}$ inch to $\frac{1}{2}$ inch. Spraying in such case would be of no use; the obvious course to take is to shear or prune all Privets, whether singly or as hedges,

it is to improve upon varieties in commerce, I may state that out of nearly 3,000 seedlings I raised from several well-considered crosses made in 1904, and grown on carefully since, only one was found of sufficient merit to warrant its being worked up for stock. It was submitted this season to the Royal Horticultural Society, and was not considered worthy of an award, but I question if Wisley is a desirable place to test a Potato. A variety which received an award there this season has been discarded for years in Scotland, and, on the contrary, one which has never received recognition from that quarter is now at the top in its class all over the kingdom. Although by no means new, at the trials of the National Vegetable Society this year it has, I notice, received three marks. Disease has occurred here in many instances amongst seedlings in the first year from seed. *G. M. T., Mid-Lothian.*

not popular. They only admit of gentlemen's gardeners' or wealthy amateurs' exhibits having any chance, and this phase of gardening is hopelessly in the minority in these days. The treatment by the management of nurserymen at Shrewsbury, and the schedule of that show may be recommended to our Edinburgh friends, and this, combined with a little more knowledge of public opinion, may help them to emulate their contemporaries in Shropshire. Let them remember that there are two classes of the community; it is hardly fair to cater for one, in the shape of prizes, and expect the other to pay the piper. Let them interest both sides, only let the interest be predominant for that class which now holds the purse, that is, the public. If the purely professional element could support the show it would be another matter. However, in Edinburgh, this is impossible, and, it being necessary to ask public support, it is desirable to see that the popular taste is catered for. G.

FEIJOA SELLOWIANA.—The difference in the colour of the flower, as seen by Mr. Bartlett (see p. 242) and the description in the *Dictionary of Gardening*, may be partially explained by an old pocket book note of mine. It was taken the first time I saw this Fejoa in bloom, namely, in the spring of 1904, the specimen being trained under the glass at the end of the economic house at Kew. The description reads thus: "The flowers are about 2 inches across, and composed of four fleshy petals of a curious hooded shape. These petals are purplish inside, and almost white on the exterior, but owing to their shape the interior is nearly hidden by the incurving of the edges, thus exposing the paler-tinted exterior. A striking feature of the flower is the cluster of long, slender filaments arranged in a brush-like fashion in the centre, a feature common to many other Myrtaceae plants. In this Fejoa they are bright red with yellow anthers." From this note it will be seen that the purplish inside is practically hidden by the lighter tint of the outside of the flower. Mr. Bartlett is fortunate in being able to grow this species out-of-doors; in most districts the plant must be given indoor culture. B.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

SEPTEMBER 26.—*Present*: Mr. E. A. Bowles, M.A., F.E.S. (in the Chair); Dr. J. A. Voelcker, M.A., Messrs. A. W. Sutton, V.M.H., A. W. Hill, M.A., J. Douglas, V.M.H., J. T. Bennett-Poë, M.A., A. Worsley, E. M. Holmes, R. Irwin Lynch, M.A., V.M.H., R. H. Pearson, W. Hales, J. Fraser, W. Cuthbertson, R. A. Rolfe, and F. J. Chittenden (hon. sec.).

Bulbs decaying.—A number of Narcissus bulbs teeming with bulb mites and in a decaying condition were received for examination. It seemed certain that the mites were the cause of the trouble, though doubt is sometimes cast upon this idea. On this point Mr. A. D. MICHAEL wrote: "I have investigated the question of the injury done by the bulb mite to the best of my ability, and for the purpose of tracing the life history have kept specimens frequently under observation in confinement throughout their whole development from egg to adult. I have found it best to feed them on sound, healthy bulbs, which they eat with avidity. . . . I have no doubt but that they attack healthy bulbs, and I look on the creatures as true destroyers." (See also *British Pyroglyphidae*, vol. ii., Ray Society, pp. 92-95.)

Catasetum sp.—Mr. G. RAE FRASER, of Letchmore Heath, sent a pistillate flower of a species of *Catasetum* from Bermuda, which Mr. ROLFE considered to be probably *C. macrocarpum*, but as the pistillate flowers of the different species of *Catasetum* are so similar to one another, there is a little doubt about the name, which can only be settled when the male flowers appear. The whole inflorescence has, by the kindness of Mr. FRASER, been deposited in the Kew Herbarium.

Variation in Euphorbia Cyparissias.—A well-marked example of fasciation in the stem of this *Euphorbia* was shown.

Museum preparations.—Dr. J. A. VOELCKER showed a section of a woody stem prepared in the same manner as those of zoological anatomical

specimens shown by him last year. The section was immersed in a fluid which rendered it practically transparent, and made its structure throughout evident to the eye, although the specimen was about $\frac{1}{8}$ inch thick. The mixture of oils and ethers, &c., which renders this mode of preparation possible, is the discovery of Prof. WERNER SPALTEHOLZ, of Leipzig University.

Oak galls.—Mr. J. FRASER showed a number of Oak galls from the common Oak, and commented upon the variety that may be found even upon a single leaf.

Variations in Rye Grass.—Mr. JOHN FRASER also showed some specimens of *Lolium multiflorum* (= *L. italicum*), which he had collected on a rubbish heap, to illustrate the wide variation in the form of the inflorescence of this species. One of them had the spikelets set very close together on the rachis, and was apparently the forma *cristatum* of C. T. Timm, a rare form analogous to the *Lolium perenne* var. *cristatum*, which is much more common. Another had a branch spike with two or three empty glumes at the base of each branch and scarcely-awned outer glumes, appearing to be a hybrid, probably between *Lolium multiflorum* and *Festuca pratensis*.

Variation in Acer.—From Mr. BEAMISH, of Glouthaune, Co. Cork, came a specimen of the Japanese Maple "*Likoniishke*," with branches showing very much the character of the stock upon which it had been grafted arising considerably above the place of grafting. It was thought probable that the variation might be due to the tendency of the variety to vary.

Frost injury.—The secretary produced a draft of the report on the damage done by frost during the winter 1908-9.

SOUTH AMERICAN HORTICULTURE.

THERE was a good attendance at the afternoon meeting of the Royal Horticultural Society, on September 27, to hear a lecture by Mr. A. W. Hill, M.A., on the relation of South America to horticulture. Mr. E. A. Bowles presided. Mr. Hill's remarks were mainly concerned with garden plants which are natives of South America. Dealing first with trees and shrubs, he said that *Araucaria imbricata* was discovered by Don Francisco Dondariarena, of the Spanish Navy, in 1780. It was introduced to this country by Archibald Menzies in 1796. Menzies sent some of the seeds to Sir Joseph Banks, and from these specimens were planted at Kew. It was a very scarce plant until the collector Lobb sent home a large consignment of seeds in 1844. Other South American Conifers are *A. brasiliensis*, *Libocedrus chilensis*, *L. tetragona*, *Fitzroya patagonica*, *Saxegothea conspicua*, *Prumnopitys elegans*, and some species of *Podocarpus*. Mr. Hill pointed out that Pine trees, so typical of the Northern hemisphere, are not met with south of Mexico. Of deciduous trees, species of *Fagus* (*Nothofagus*) include *F. obliqua*, *F. antartica*, and *F. betuloides*, *Terra del Fuego*. Among hardy shrubs, we owe many of our most useful introductions to Chili. *Azara microphylla* is found in Valdivia, and was sent home by Pearce whilst collecting for Messrs. Veitch & Son, Exeter. *Berberis Darwinii* was first discovered by Charles Darwin, and was introduced by Messrs. Veitch through their collector Lobb in 1849. This species and *B. empetrifolia*, the latter a native of the Straits of Magellan, are the parents of *B. stenophylla*, an accidental cross discovered in the nursery of Messrs. Fisher, Son, & Holmes, Handsworth, Sheffield. The beautiful *Berberidopsis*, which is such a feature in Cornish gardens, forms a link between the Natural Orders *Berberidaceae* and *Lardizabalaceae*. The latter Order is of interest since the genus *Lardizabala* is met with in Chili, but *Akebia* occurs only in China. *Embothrium coccineum*, the Flame Bush, first flowered in Exeter in 1853, and is a native of the regions of the Straits of Magellan. *Drimys Winteri* is another plant which first flowered at Exeter. *Desfontainea spinosa* was sent home by the collector Lobb. *Escallonia Philippiana* was discovered by Pearce in 1873. This is one of the parents of the beautiful *E. Langleyensis* raised by Seden, at Messrs. Jas. Veitch & Son's Langley Nursery. *Encryphia pinnatifida* was also introduced by Messrs. Veitch; the flowers are interesting, and have proved a puzzle to botanists, the plant having been placed in

several Natural Orders, including *Saxifragaceae*, *Hypericaceae*, and *Rosaceae*. Plants of *Encryphia* thrive best at Kew in peaty soils, planted among Heath. *Pernettya mucronata* is a native of the regions of the Straits of Magellan. *Fabiana imbricata* is a curious Heath-like shrub belonging to the N.O. *Solanaceae*. It is a native of Chili, and was discovered in 1838. *Tricuspidaria dependens* is also a native of that country. Amongst climbing plants from South America may be instanced *Lardizabala biternata* and *Streptosolen Jamesonii*, with its conspicuous orange-red flowers. *Streptosolen* was discovered by Lobb in 1847, in Northern Peru, at an elevation of 6,000 feet. This plant was lost to cultivation for many years after its first introduction, but plants were re-introduced in 1882. The genera *Stigmaphyllon*, *Malpighia*, *Tacsonia*, *Tecoma*, and *Tibouchina* (formerly known as *Pleroma*) give us some of our most useful greenhouse climbers; *Cantua buxifolia*, the "flor del Inca," is also a showy plant. Some of the *Abutilons* have been brought from Chili, and to this region we also owe *Lapageria*, *Bomarea*, and *Alstromeria*. *Lapageria rosea* was introduced by Mr. Richard Wheelwright in 1847, who sent plants to Kew, but the white variety was not sent home until 1860.

The *Begonias* of South America have given us the tuberous-rooted varieties now so popular. *B. boliviensis* was used by Seden in the production of the first hybrid tuberous-rooted *Begonias* in 1869. *B. Pearcei* has played a large part in the production of the garden varieties, and its influence can always be traced in the varieties with yellow flowers, *B. Veitchii*, *B. Davisii*, and *B. roseiflora* are also natives of South America, and have been used in the production of our cultivated forms. The first white forms of tuberous *Begonia* arose from selecting pale-coloured seedlings of *B. roseiflora*.

Of herbaceous plants two genera of special interest to gardeners, namely, *Calceolaria* and *Fuchsia*, are very common in South America. Over 200 species of *Calceolaria* are found in that country. Many of these were originally in cultivation, but the majority are now seldom met with in gardens. Mr. Hill mentioned specially *C. alba*, *C. integrifolia*, *C. fuchsifolia*, *C. rugosa*, *C. violacea*, and *C. virgata*. *Fuchsias* include *F. excorticata*, *F. procumbens*, *F. parvifolia*, *F. fulgens*, *F. arborescens*, *F. simplicianalis*, *F. triphylla*, *F. gracilis*, *F. macrostemma*, and *F. spectabilis*. The first *Fuchsia* is said to have been brought to England by a sailor at the end of the 18th century, and purchased by Mr. Lee, Nurseryman, at Hammersmith, who saw it in a cottage window. It was pointed out that the genus *Fuchsia* ranges from Mexico, through South America, to New Zealand, and that representatives of the *Calceolaria*, *C. Sinclairi*, &c., allied to *C. violacea*, also occur in New Zealand. Other herbaceous plants are *Tropaeolum majus*, *T. minus*, *T. peregrinum*, *T. speciosum*, *T. tuberosum*, *T. polyphyllum*, and *T. azureum*. Amongst annuals may be mentioned *Schizanthus*, *Salpiglossis*, *Petunia* and *Alonsoa*.

Several Alpine plants were enumerated as being natives of South America, including *Oxalis enneaphylla*, *O. adenophylla*, *Primula farinosa*, *Malvastrum campanulatum*, *Nierembergia*, *Nototriche*, and *Azorella Selago*. Other well-known garden plants from South America are *Gunnera manicata*, *G. magellanica*, closely allied to the New Zealand species *G. monoica*; *Gynerium* (*Pampas grass*), *Helianthura*, *Victoria regia*, *Browallia*, *Gloxinia*, *Gesnera*, *Heliotropium*, *Tillandsia*, *Bilbergia*, *Puya*, and *Ananas*.

L'UNION PROFESSIONNELLE INTERNATIONALE HORTICOLE.

SEPTEMBER 23.—A meeting of this new Union was held on this date at the headquarters of the *Chambre Syndicale des Horticulteurs Belges*, at Ghent. M. Arthur de Smet presided, and there were present Messrs. Turbat, René Barbier, S. Royer, Léon Chénault, Sauvage, Brault, H. Müller, Krelage, De Coene, Soupert, Wartel, Burvenich, Pynaert, Bonthuis and others. After the chairman had opened the proceedings, M. Turbat read letters from various delegates regretting their inability to attend. The rules drawn up at Haarlem were then considered, and when certain amendments had been made they were adopted. It was decided to hold the next meeting at Luxembourg at the end of July or beginning of

August, 1911. M. Soupert returned thanks for the honour done to Luxembourg in being selected for the next sitting. The election of the international board of officials resulted in the following appointments for one year:—President, M. Arthur de Smet; vice-president, M. Soupert; general secretary, M. Turbat; assistant secretary, M. Barbier; treasurer, M. Sauvage.

In the evening, M. Arthur de Smet presided at a banquet given to the visitors. At the upper table were Messrs. Müller, Krelage, Turbat, Ch. Pynaert, Soupert, E. Wartel, and Burvenich. Other guests were Messrs. Royer, Barbier, Kuyk, Romain de Smet, Bonthuis, Chenault, F. Spaë, Delaruy-Cardon, Closon, Bernard Spaë, Beernaert, P. van Acker, V. Vermeersch, E. De Cock, Jules De Cock, Louis Van Houtte, Sauvage, De Croene and Louis Gentil.

The chairman, after proposing the loyal toasts, said that they thanked the company for having attended to determine the establishment of the society. The work, began at Eisenbach, had been confirmed at Ghent, and henceforth when great questions relating to horticulture were discussed it would be before a tribunal of competent authorities who would be able to make the wishes of international horticulture known to the state.

M. Soupert said that the Union wished that in future nothing should be done in horticultural matters without their sanction. He concluded by thanking the Ghent members for their cordial welcome.

M. F. Burvenich followed. M. Pynaert responded for the Press. M. Sauvage complimented the gathering on the work they had accomplished. In these days of telephones, telegraph, &c., frontiers have ceased to exist, and they would all rejoice in the grand idea of brotherly union they had instituted.

M. Krelage spoke in appreciative terms of the appointment of M. Arthur de Smet as their chairman.

NATIONAL SWEET PEA.

The following details are furnished us by the Secretary. The lists have been prepared by the Floral Committee, and the General Committee has adopted them.

CLASSIFICATION OF SWEET PEAS.

The following is an up-to-date selection of varieties in commerce.

- BICOLOR.**
 - Arthur Unwin
 - Mrs. Andrew Ireland
 - Colleen
- BLUE.**
 - Flora Norton Spencer
 - Mrs. G. Charles
 - *Lord Nelson
- BLUSH.**
 - Mrs. Hardcastle Sykes
 - Princess Victoria
- CERISE.**
 - Cherry Ripe
 - Christie Unwin
 - *Coccinea
- CREAM, BUFF AND IVORY.**
 - Clara Curtis
 - Paradise Ivory
 - *James Grieve
- CREAM-PINK.**
 - Mrs. Hugh Dickson
 - Gladys Burt
 - Constance Oliver
- CRIMSON.**
 - King Edward Spencer
 - *King Edward VII.
- FANCY.**
 - *Sybil Eckford
- LAVENDER.**
 - Masterpiece
 - Asta Ohn
 - Frank Dolby
 - *Lady Grisell Hamilton
- LILAC SHADES.**
 - Mrs. R. H. Cairad
- MAGENTA.**
 - Memie Christie
- MARBLED.**
 - Clara Pierce
- MAROON.**
 - Nubian
 - Othello Spencer
 - Tom Bolton
 - *Hannah Dile
- MAUVE.**
 - Tennant Spencer
 - Helio-Paradise
 - *Miss. Walter Wehlt
- ORANGE-PINK.**
 - Helen Lewis
 - *Miss Willburt
- ORANGE-SCARLET.**
 - Dazzler
 - Edna Unwin
 - St. George
- PICOTEE EDGED.**
 - (Cream Ground.)
 - Mrs. C. W. Breadmore
 - Evelyn Henius
- PICOTEE EDGED.**
 - (White Ground.)
 - Elsie Herbert
 - Mrs. Townsend
 - *Dainty
- PINK AND SALMON PINK.**
 - Countess Spencer
 - Zarina
 - *Prima Donna
- ROSE AND CARMINE.**
 - John Ingman
 - Marie Corelli
 - *Prince of Wales
- SALMON SHADES.**
 - Earl Spencer
 - Nancy Peckia
 - *Henry Eckford
- SCARLET.**
 - Doris Burt
 - George Stark
 - (1908 med. stock)
 - *Queen Alexandra
- STRIPED AND FLAKED.**
 - (Purple and Blue.)
 - Suffragette
 - *Prince Olaf
- STRIPED AND FLAKED.**
 - (Red and Rose.)
 - America Spencer
 - Aurora Spencer
 - *Jessie Cuthbertson
- WHITE.**
 - Etta Dyke
 - Nora Unwin
 - *Dorothy Eckford

TOO-MUCH-LIKE VARIETIES.
The following varieties have been bracketed as too-much-alike. "Not more than one of the bracketed varieties may be shown on the same competitive stand at any exhibition of the National Sweet Pea Society." The names are placed in alphabetical order.

- BLUE.**
 - Anglian Blue
 - Flora Norton Spencer
 - Kathleen McGowan
 - Shawondase
 - Zephyr
- BLUSH.**
 - Bobby K.
 - Countess of Northbrook
 - Florence Morse Spencer
 - Mrs. Hardcastle Sykes
 - Princess Victoria
- BLUSH SPENCER.**
 - Lady Althorp
 - Mrs. T. G. Baker
 - Paradise Reamed
 - Sankey Spencer
- CHOCOLATE FLAKED.**
 - (President)
 - Scout Spencer
 - W. R. Beaver
- CREAM-PINK.**
 - A. B. Bantock
 - Earl of Plymouth
 - Holfast Belle
 - Mrs. Henry Bell
 - Mrs. Hugh Dickson
 - Mrs. Koutzahn
 - Queen (Sutton's)
 - Romani Raimi
 - W. T. Hutchins
- CREAM-PINK (deep).**
 - Anglian Pink
 - Doris Fisher
 - Miriam Beaver
 - Mrs. R. Hallam
 - Syria Lee
- CRIMSON.**
 - Dodwell F. Browne
 - G. C. Ward
 - King Alfonso
 - King Edward Spencer
 - Paradise Crimson
 - Rose Gilbert
 - Sunproof Crimson
 - Sunproof King Alfonso
 - The King
- IVORY.**
 - Paradise Beauty
 - Paradise Ivory
 - Queenie
 - Sea Foam
- LAVENDER.**
 - Asta Ohn
 - Frank Unwin
 - Masterpiece
 - Mrs. Chas. Foster

 - Anethyst
 - Empress
 - Helio-Paradise
 - Ida Townsend
 - Mrs. Walter Wright
- Queen of Norway** Spencer
- Tennant Spencer
- The Marquis
- Wenvoe Castle

MANCHESTER AND NORTH OF ENGLAND ORCHID

SEPTEMBER 8.—Committee present: E. Ashworth (Chairman); and Messrs. R. Ashworth, Arthur Ashton, Bolton, Cowan, Crombleholme, Cypher, Holmes, Keeling, Lee, Parker, Smith, Shill, Sauder, Thorp, Ward, and Weathers (hon. sec.).

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), staged a very bright group of plants, consisting principally of bright Cattleya and Laelia-Cattleya hybrids. The various forms of the beautiful Cattleya × Iris were particularly noticeable, and ranged in colour from pale straw to the deepest bronze. (Silver Medal.)

J. McCARTNEY, Esq., Bolton (gr. Mr. Holmes), exhibited Cattleya × Minucia Hey House var. and Cypripedium × Donald McCartney, the

latter a hybrid between C. × Gomerianum × C. ciliolare. Both plants received Awards of Merit.

The LIVERPOOL ORCHID & NURSERY Co., Gateacre, were awarded a Bronze Medal for a small group, consisting of forms of Odontoglossum crispum, O. Pescatorei, and other popular species. Cattleya × Rosetto (C. Schilleriana × C. Mendelii) was given an Award of Merit.

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), staged an excellent group, among which were several new plants. Odontoglossum × illustrissimum, a good cross between O. × Lambeauiana × O. × ardentissimum var. The Countess; and Cypripedium × Rosettii var. Lecanum—the latter quite the finest form yet seen in the north—received First-class Certificates. Cypripedium × Hitchens Plimpton var., Cattleya × Adula var. Wivelsfeldensis, C. × Venus var. Lecana, C. × Oriol, and C. × Crown Prince received Awards of Merit.

Mr. J. BIRCHENALL, Alderley Edge, exhibited Acimeta chrysantha (Award of Merit), and Chonhorhyncha limbriata. (Botanical Certificate.)

H. J. BROMHOF, Esq., Rainhill (gr. Mr. Morgan), was awarded a Silver Medal for a group of Cypripediums, mostly well-known forms.

Rev. J. CROMBLEHOLME, Clayton-le-Moors, exhibited several Cypripediums.

Col. RUTHERFORD, Blackburn (gr. Mr. Loft-house), was represented by a good group of mixed Orchids, all well grown.

Other exhibitors were Messrs. E. V. Low, W. SHACKLETON, KEELING & SON, and J. ROBSON, to whom the thanks of the Committee were accorded. P. H.

SEPTEMBER 22.—Committee present: Messrs. R. Ashworth (Chairman); Arthur, Bolton, Crombleholme, Cypher, Holmes, Lee, Parker, Stevens, Thorp, Ward, and Weathers (hon. sec.).

MESSRS. CYRER & SONS, Cheltenham, were awarded a Silver Medal for a group which contained a number of Cattleya hybrids, some well-grown examples of Vanda coerulea, Miltonia vexillaria, and some fine Pleiones.

Mr. J. ROBSON, Altrincham, exhibited a good variety of Cypripedium × Priam, a new hybrid Odontoglossum, which was not named, and Cypripedium × Ralfei

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), exhibited a very choice collection, containing several new plants. Miltonia × "W. R. Lee," a distinct new hybrid; Odontoglossum × "W. R. Lee," a hybrid between O. × amabile × ardentissimum; Cattleya × Phrygia (C. × Portia × C. Enid), C. × Priam (C. Harrisoniana × C. × callistoglossa), and Sappho-Cattleya-Laelia × Olive received Awards of Merit. Cattleya × amabile (C. speciosissima var. Stanley × C. fascinator var. albens) received a First-class Certificate.

E. ASHWORTH, Esq., Wilmslow (gr. Mr. Holbrook), was given a Cultural Certificate for a well-flowered example of Cattleya × Maronii.

W. THOMPSON, Esq., Stone (gr. Mr. Stevens), exhibited Laelia × De Gestiana var. Thompsonii, a beautiful albino hybrid from a cross between L. Jongheana × L. flava. This plant received a First-class Certificate.

MESSRS. STANLEY & Co., Southgate, exhibited a collection of Cattleya × iridescens, C. × i. var. splendens received an Award of Merit.

The Rev. J. CROMBLEHOLME, Clayton-le-Moors, exhibited Cypripedium × Ossulstonii var. seraphicum.

MESSRS. CHARLESWORTH & Co., Haywards Heath, exhibited a very richly-coloured Cattleya × Mrs. Pitt var. Charlesworthii, for which they received an Award of Merit.

J. J. HOLDEN, Esq., Southport (gr. Mr. Johnson), obtained an Award of Merit for a very pretty form of Odontoglossum × excellens called "Auburn House var."

G. S. BALL, Esq., Burton, Westmoreland (gr. Mr. Herdman), staged a group consisting principally of Cypripediums, to which a Silver Medal was awarded.

Notes of Thanks were given to Messrs. THE LIVERPOOL ORCHID AND NURSERY Co.; W. SHACKLETON, Bradford; J. McCARTNEY, Bolton; and J. BIRCHENALL, Alderley Edge, for various exhibits.

*An asterisk denotes a variety that is not waved.

NATIONAL CHRYSANTHEMUM.

OCTOBER 5. 6.—The early exhibition of this Society was held on the foregoing dates in the Crystal Palace, Sydenham. The weather was glorious, and the show proved an average display. Last season's early exhibition was dropped, but this fact did not affect the number of entries this year, which were about the same as usual. Fourteen novelties were submitted to the Floral Committee for awards, and of these eight received the Society's First-class Certificate.

The nurserymen's exhibits contributed largely to the success of the show. The arrangements were admirable under the management of the Secretary, Mr. R. A. Witty.

GROUP CLASS.

The first class in the schedule called for a display of Chrysanthemums, including plants and cut blooms, relieved with suitable plants and foliage of an ornamental character, the space allotted to each exhibitor being 14 feet by 7 feet.

There were two exhibits, one from Lady TATE, Park Hill, Streatham Common (gr. Mr. W. Howe), and another from Mr. FRANK BRAZIER, Nurseryman, Caterham. The 1st and 2nd prizes were awarded in the order given. The premier display included many large Japanese varieties as pot plants, with good blooms, in a setting of Bamboos, with tall Codæums as relief, and a border of Adiantum Ferns, Abutilons, dwarf Coleuses and Codæums. Mr. BRAZIER employed mainly decorative varieties staged in bamboo epergnes, with large Japanese blooms in the foreground and a row of dwarf yellow and other border kinds, margined with small Nephrolepis Ferns.

CUT BLOOMS (OPEN CLASSES).

There were four exhibits in the class for 12 blooms of Japanese varieties, distinct, shown on boards. Two of the displays were very close in point of merit. The 1st prize was made in favour of E. G. MOCATTA, Esq., Woburn Place, Addlestone (gr. Mr. T. Stevenson). All his blooms were of remarkably good quality, the finest being Mrs. E. Thorn, sulphur-yellow; Mrs. C. H. Totty, red, with golden reverse; Lady Talbot, a narrow-floreted yellow variety; Master James, red; Mrs. A. T. Miller, white; and Mary Farnworth, apricot-buff. The 2nd prize was awarded to Miss LONGWORTH, Gay's House, Holyport (gr. Mr. T. J. Broom), who showed Amarantha, Master James, Henry Perkins, Sappho, and others in fine form; 3rd, E. WORMALD, Esq., Grass Farm House, Finchley (gr. Mr. J. Kirkwood). The other exhibitor was Mr. MARTIN SILSBURY, Shanklin.

There were only two exhibits in the class for six blooms of Japanese varieties, and neither was remarkable for high quality. The 1st prize was awarded to ALFRED F. BLADES, Esq., Rookfields, Reigate (gr. Mr. F. Cordell), and the 2nd to W. H. STONE, Esq., Laurie Park, Sydenham (gr. Mr. P. W. Stevens). The finest blooms were Mrs. L. Thorn and Mrs. Geo. Mileham in the premier collection.

Mr. J. SMELLIE, Pansy Gardens, Busby, near Glasgow, won the 1st prize in the class for early-flowering Pompon varieties, shown in vases. Each exhibit contained 12 bunches, including not fewer than eight varieties. Mr. G. BOWNESS, Riverside Nursery, Busby, won the 2nd prize, these being the only competitors. Mr. SMELLIE showed Canariensis, La Luxemburg, bronze; Alice Butcher, dark terra-cotta; White St. Crouts; Early Blush, a showy pink-coloured variety; Scarlet Gem; Piercy's Seedling, bronzy-yellow; Blushing Bride, pink; Bronze Blushing Bride; Mignon, yellow; St. Crouts, white and pink; and Fiberta, the best of the yellow varieties shown. Mr. BOWNESS had similar varieties.

Mr. BOWNESS was the only exhibitor in the class for 12 bunches of early-flowering Chrysanthemums, not disbudded, showing excellent examples, all from the open garden, and with remarkably clear colours. This type of Chrysanthemum is the most suitable for border decoration; Mr. BOWNESS's selection embraced such pleasing sorts as Elstob Yellow (splendid); Roi des Blancs, Nina Blick, reddish-bronze; Miss Balfour Melville, bronze; Normandie, pink; and Wells's Scarlet. This exhibitor won the 1st prize in the classes for a vase of a bronze-coloured single variety with Eric, and for a vase of mixed single varieties.

OPEN CLASSES: DIVISION II.

The best of three exhibits of six bunches of early-flowering Pompons, distinct, was shown by Mr. J. SMELLIE, who had a grand display of such fine varieties as Blushing Bride, pink; Fiberta, yellow; La Luxemburg, bronze; and Scarlet Gem. 2nd, Mr. J. EMBERTON, Grove Road Nursery, Walthamstow.

There were also three exhibits of early-flowering Japanese or decorative varieties, grown out-of-doors; this was a very pretty class.

The 1st prize was awarded to Mr. J. EMBERTON for fresh, bright blooms of Hector, pink; Goacher's Crimson; Roi des Blancs, Lillie, pink; Wells's Scarlet, and Harrie, a splendid bronzy-yellow variety. 2nd, Mr. F. BRAZIER, with Nina Blick, Polly, Normandie, Province, Lillie, and Roi des Blancs.

The best vase of a Japanese variety was Master James, shown by E. G. MOCATTA, Esq., the blooms being especially good. 2nd, White Queen, shown by Madame STUART, The Convent, Roehampton (gr. Mr. A. Smith). The 3rd prize exhibit was also of this variety.

Mr. BRAZIER excelled in the class for a vase of a variety of early-flowering single Chrysanthemums with Brazier's Beauty, bluish pink. 2nd, Mr. BOWNESS, who, as already stated, excelled in the class for a vase of early-flowering single Chrysanthemums, arranged with other kinds of foliage, there being three other competitors. Mr. J. EMBERTON, Grove Road Nursery, Walthamstow, was awarded the 2nd prize.

AMATEURS' CLASSES.

Exhibits in this section were poor. Mr. C. FOX, Richmond Lodge, Tunbridge Wells, was the only exhibitor in the classes for six bunches of early-flowering Japanese varieties and six bunches of early-flowering Pompons.

There were two exhibits in the class for three vases of early-flowering varieties shown by Mr. FOX and Mr. J. CHAPMAN, Melrose, Laurie Park, Sydenham (gr. Mr. W. Webb), who were placed 1st and 2nd respectively.

Mrs. W. MASLIN showed the best epergne decorated with Chrysanthemums and ornamental foliage.

DECORATIVE CLASSES.

Tables decorated with Chrysanthemums were numerous. In Mr. J. WILLIAMS's class there were five competitors, the 1st prize being awarded to Mrs. A. ROBINSON, Park Hill, Carshalton, who employed bronze and yellow Chrysanthemums, with Ampelopsis, Rhus Cotinus, and sprays of Asparagus intermixed; 2nd, Mrs. W. MASLIN, Ongar Hill, Addlestone, Surrey.

Mrs. ROBINSON also excelled in the open class for table decorations, with a very choice arrangement; 2nd, W. H. STONE, Esq., Sydenham (gr. Mr. Stevens), who was placed 1st for three epergnes decorated with Chrysanthemums and sprays of other foliage.

Messrs. W. Wells & Co. offered prizes in a class for six vases, distinct, of Chrysanthemums grown from this firm's seeds. Miss NATHAN, Little Heath Wood, Potters Bar (gr. Mr. W. Newton), was the only exhibitor, being awarded the 3rd prize.

The best vase of autumn foliage and berries was displayed by Mrs. BREWSTER, and this lady also showed the best hand basket filled with Chrysanthemums.

Mr. A. H. COLE, 326, Camberwell New Road, London, was the only exhibitor of a table arranged with floral devices.

FIRST-CLASS CERTIFICATES.

Maud Williamson (Japanese).—A large bloom, of deep rose colour, with silver reverse. Shown by Messrs. J. STREDWICK & SON, St. Leonards.

Japan (Japanese).—A fine, large, yellow bloom of the best exhibition type.

Mikado 1910 (Japanese).—A bloom of rosy-crimson shade, with nankeen colour reverse. These two were shown by Mr. M. SILSBURY, Shanklin.

Debutanté (Decorative).—A white bloom, tinged with rose.

Miss Dorothy Ashley (Decorative).—A variety of deep pink colour, showing gold in the centre. These two from Messrs. LOWE & SHAWYER, nurserymen, Uxbridge.

Cranfordia (Decorative).—A fine, yellow variety, suitable for market purposes.

Betty Spare.—The blooms of this variety are a pleasing silvery-pink colour.

Miss Collier.—A good, white, market Chrysanthemum. These three were shown by Mr. W. ROOTS, Cranford.

NON-COMPETITIVE AWARDS.

Large Gold Medals were awarded to Mr. NORMAN DAVIS, Framfield, for Chrysanthemums, with Michaelmas Daisies and Solidago as a background. The large, yellow, Japanese Chrysanthemum Tom Edwards was prominent. Messrs. W. WELLS & Co., Merstham, for Chrysanthemums and hardy flowers; Messrs. H. J. JONES, LTD., Lewisham, for a very pretty display of Chrysanthemums and Michaelmas Daisies, including large vases of the yellow Japanese Chrysanthemum Mrs. L. Thorn; and Messrs. HOBBIES, LTD., Dereham, for Roses and Dahlias.

Gold Medal to Mr. F. BRAZIER, Caterham, for Chrysanthemums, Asters, Phloxes, and vines with coloured foliage.

Silver-gilt Medals to Messrs. J. CHEAL & SONS, Crawley, for Dahlias; Messrs. T. S. WARE, LTD., Feltham, for Dahlias and Pentstemons; and Messrs. DICKSON & ROBINSON, Manchester, for Chrysanthemums and Michaelmas Daisies.

Silver Medal to Messrs. H. CANNELL & SONS, Swanley, for Chrysanthemums.

Bronze Medal to Mr. T. WILLIAMS, Ealing, for table decorations.

DEBATING SOCIETIES.

CHARMINSTER GARDENERS.—The usual monthly meeting was held at Erimington on Monday, September 26, when a paper was read by Mr. W. H. Stone, gardener to Captain R. Dymond, of Brooklands, Charminster, on "Show, Regal, and Decorative Pelargoniums." He dealt with the propagation of the several varieties, from seeds and cuttings, and also gave details of their general treatment, and a list of the best sorts.

READING GARDENERS.—The opening meeting of the autumn session took place on Monday, September 26, at the Abbey Hall, Reading, the president, Mr. Alderman Parritt, occupying the chair. Eight new members were elected. Mr. Hart Synnot, D.S.O., B.Sc., Director of Agriculture and Horticulture at the Reading University College, was present, and expressed the pleasure it would give the college authorities to assist the association in any way that lay in their power. The announcement was received with applause. It was decided that a non-competitive exhibition, on the same lines as last year, be held during the latter part of November. The lecturer for the evening was Mr. H. C. Loader, The Gardens, Erieh Park, Reading, his subject being "Spring Bedding"—the arrangement of plants and bulbs for harmonious effect. Mr. Loader stated that in many gardens spring bedding seemed almost neglected. He then proceeded to deal with some causes of failure, warning his audience to avoid certain combinations which, though having a good appearance on paper, he had proved by experience to produce discord rather than harmony.

LOUGHBOROUGH GARDENERS.—The annual meeting of this association was held at the Town Hall, Loughborough, on September 28; Mr. J. T. Smith presided. The annual report stated that the membership was equal to last year's, and the list of vice-presidents was larger. The attendance at the meetings, though rather better than last year, was not so good as could be wished. In the essay competition on "Practical Gardening," the first prize was awarded to Mr. J. Tyrrell, of the Gardens, Cardiff Castle, for his paper on the "Wild Garden." Mr. Burder was re-elected president, and the members of the committee were re-elected, with the addition of Mr. J. H. Woolley, of Kegworth. Mr. Smith was appointed chairman. The secretary and treasurer were re-elected. The annual dinner was afterwards held at the Bull's Head Hotel.

BRISTOL AND DISTRICT GARDENERS.—A meeting was held on September 29, at St. John's Parish Rooms, Mr. Hayball in the chair. Mr. Gostling gave a paper on "Orchids." In the discussion which followed, the lecturer explained cultural details. Three new members were elected. Mr. Wall, of Melrose Nursery, Bath, exhibited several vases of winter-flowering Carnations, including Princess and Salmon Queen, two new varieties.

REDHILL AND REIGATE GARDENERS.—The first meeting of the winter session of this association was held in the Penrhyn Hall on Tuesday, September 27. The chair was occupied by Mr. T. W. Herbert. Eight new members were enrolled. The first meeting of the season is always "Hospital Night," when flowers, fruits, and vegetables are exhibited, these being afterwards sent to the local hospital. During the evening Mr. G. Duncan, Merstham House Gardens, gave an address on "Vegetable Culture."

PLYMOUTH AND DISTRICT GARDENERS.—The first monthly meeting for the session 1910-11 was held on Saturday, October 1, at the Nutley Grammar School, Plymouth. Mr. T. R. E. Olyer presided. In addition to a lecture by Mr. J. Wadlan, of South Wenbury Gardens, on "Vegetables for Exhibition," there was a members' competition. The lecturer gave practical hints on the planting and cultivation of the Onion, Potato, Broccoli, Cauliflower, Leek, and other vegetables. At the conclusion of the lecture the chairman presented the honorary secretary (Mr. W. S. E. Cholwell) with a copy of *Veitch's Manual of Compost* as an acknowledgement of his services to the association.

Obituary.

MRS. YOUNG.—Mr. John Young, head gardener at the Zoological Gardens, Regent's Park, has suffered a bereavement in the death of his wife, who passed away after a long and painful illness on September 19 in the 60th year of her age. The remains were interred at Hendon Cemetery on the 23rd ult. in the presence of her husband, family and numerous friends.

ANDREW HOGGAN.—The death of this well-known amateur gardener occurred at his home at Strathyre, Busby, near Glasgow, on September 22. Mr. Hoggan, who was 54 years of age, passed away in his sleep from heart failure. His favourite flowers were Chrysanthemums and Sweet Peas. He was a vice-president of the National Sweet Pea Society. He always exhibited successfully at the exhibitions of the National Chrysanthemum Society, and also at the Glasgow and Edinburgh shows. The funeral took place at Glasgow on the 26th ult.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending October 1, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The temperature was above the average, the excess being more than 4° in the north-eastern, eastern, and central parts of England, and nearly 4° in England N.W. The highest of the maxima occurred generally either on Wednesday or Saturday. In England E., and also at Westminster and Greenwich, the thermometer rose to 75°, and in several other English localities to 74°, but in Ireland and the north and west of Scotland there was no reading as high as 70°. The lowest of the minima were recorded on rather irregular dates, and ranged from 34° in Ireland N. and 35° in England N.E., and Ireland S. to 39° in Scotland E. and W., and to 48° in the English Channel. The lowest grass readings reported were 27° at Coehle Park (Morpeh), 28° at Llangunuaich Wells, 29° at West Linton, Sheffield, and Markree, and 31° at Crathes, Dumfries, and Newton Kigg.

The rainfall was less than the average, except in Ireland S., the deficit being large in most districts. At Yarmouth, Felixstowe, and Tunbridge Wells the week was rainless, and at several other stations in the eastern half of Great Britain the fall was less than 0.10 inch.

The bright sunshine exceeded the normal in most parts of England, but was less in England S.W. and the English Channel, as well as in Ireland and Scotland. The percentages of the possible duration ranged from 43 in England N.E. and E., 42 in the English Channel, and 41 in England S.E., to 22 in Scotland N. and E. and Ireland N., and to 20 in Scotland W.

THE WEATHER IN WEST HERTS

Week ending October 5.

The longest period of unseasonably warm weather for four months.—Throughout the last 12 days the temperature has been, in each case with one exception, above the average both during the daytime and at night—making this the longest spell of unseasonably warm weather since the middle of May. On three days during the same period the temperature in the warmest part of the day rose to or above 70°. The ground is now 2° warmer at 2 feet deep, and 4° warmer at 1 foot deep, than is seasonable. Rain fell on three days, but to the total depth of only a quarter of an inch, nearly all of which was deposited on the evening of the 1st day of the month. This fall was not sufficient to affect even the bare-soil gauge, through which there has been no measurable percolation for nearly three weeks. The sun shone on an average for four hours a day, or for nearly half an hour a day longer than is usual at this time of the year. The wind was high on one day, but during the rest of the week light airs and calms alone prevailed. The mean amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 3 per cent.

SEPTEMBER.

Exceptionally dry, calm and sunless, and very cold.—This was a very cold September, in fact, for a period of three weeks there was not a single warm day, and but few warm nights. Taking the month as a whole the days were as a rule cold, while the nights on the other hand were but slightly below the average in temperature. On the warmest day the temperature in the thermometer screen rose to 73°, which is a low extreme maximum for the month, and on the coldest night the exposed thermometer fell 4° below the freezing point, or only about 1° lower than the average extreme minimum for September. Rain fell on only eight days, a very small number for the month, and to the total depth of but half an inch, which is only a quarter of the average total fall for September. In fact, this was the driest month in Berkhamsted since February, 1909, or for 19 months, and also the driest September since 1865, or for 45 years. The sun shone on an average for 3½ hours a day, which is an hour a day short of the September average, and with the exception of the same month last year, the most sunless September for 14 years. With one exception this was the calmest September of which I have here any record. In the windiest hour the mean velocity only reached eight miles—a very low maximum for any month in the year. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a seasonable quantity for that hour by as much as 7 per cent.

THE SUMMER RAINFALL.

During the summer half of the present drainage year, ending September, 12½ inches of rain fell, which is an inch in defect of the average rainfall for the same six months in the last 54 years. During the period in question, April, July, and September were dry months, while May, June, and August had, on the other hand, a rainfall more or less in excess of the average. E. M., Berkhamsted, October 5, 1910.

ENQUIRIES AND REPLIES.

AGED WALNUT TREES (see p. 256).—The following is the best method of improving Horse Chestnut and other trees, especially when these are not very old:—Carefully remove from around the roots with a fork or pick, all loose earth, commencing at 10 yards from the trunk, and working inwards to about 3 yards or 4 yards of the stem. A depth of about 3 inches or 4 inches below the roots will be found ample to excavate. Replace the soil removed by equal parts of loam, leafsoil, and a small quantity of well-rotted manure. This compost should be carefully rammed beneath and around the roots, and brought up to the original level of the ground—the whole being made quite firm. Dead and dying branches should be cut back to the living wood, and all decayed matter removed from hollow trunks, the openings being covered by a piece of zinc to keep out the wet. Pollarding is sometimes recommended, but the trees should be examined by an expert before this is attempted. A. D. Webster.

TO DESTROY BATS.—Can any reader inform me how to destroy bats, either by catching or poisoning. J. S. H.

ANTS.—I am troubled greatly with ants. I have often seen them in glasshouses, especially in stoves, but never in such large numbers. They seem to be everywhere, in the potting shed, boiler house, and even in the kitchen and cellars of the dwelling house. I have tried several preparations sold as ant destroyers, but find them quite useless. Perhaps some reader will kindly help me. H. S.

ANSWERS TO CORRESPONDENTS.

APPLE: A. Stapleton, J. G. & Co., and E. C. The grub in the centre of the Apple shoot is the caterpillar of the Wood Leopard Moth

FIG. 111.—WOOD LEOPARD MOTH: ZEUZERA AESCULI.

(*Zeuzera aesculi*) (see fig. 111). It does but little harm—never becoming epidemic. Cut off and burn the attacked part. Board of Agriculture and Fisheries Leaflet No. 60 gives the life-history of this pest, and the leaflet may be

obtained, post free, from the Secretary, Board of Agriculture, 4, Whitehall Place, London.

BEGONIA GLOIRE DE LORRAINE: R. J. F. There is no fungus disease on the Begonia leaves sent. The trouble is due to excessive moisture in the atmosphere and at the roots.

BEGONIAS DYING: Geo. West. The Begonia plants sent are attacked by one of the rarer species of eelworm. The roots are badly affected, and it is doubtful if anything can be done now to save the plants; but you might try watering the soil with lime water (about 1 lb. of slake quicklime to 25 gallons of water). Allow the mixture to stand, stirring once or twice, then pour off, and use the clear liquid, which is lime water. Start next season with sterilised soil obtained by steaming or baking it.

BIG-BUD IN CURRANTS: Gillingham. Your communication regarding the presence of maggot in association with "big-bud" in the Black Currant is of much interest. We would point out, however, that the maggots in question are not the cause of the disease; they prey upon the mites (*Eriophyes ribis*), which are swarming in all of the buds sent to us for examination. The presence of this small, dipterous larva in mite-infested buds has already been recorded, but we do not remember to have seen them in so large a percentage of buds on any previous occasion.

CELERY DISEASED: W. K. The Celery leaves are infected with a fungus called *Cercospora apii*. Burn diseased leaves, and do not plant Celery on the same ground again for some years. The fungus in the Oak trunk is *Polyporus dryadens*. The trouble has gone too far to effect a cure.

CYCLAMEN: F. G. B. See reply to T. D. M. under "Muscarri Bulbs." The maggots appear later, and are not the primary cause of the trouble.

DWARF BEANS WITH TOUGH PODS: Mrs. C. A. M. The trouble is largely due to unsuitable soil and drought. The lack of moisture at the roots has caused the plants to hasten to the stage of seed production. We do not undertake to reply by post.

EURYA LATIFOLIA: *Plantsman*. The variegated leaves are attacked by a fungus disease. This is probably due to keeping the plant in a moister atmosphere than is good for it. It would be as well to transfer the plant to a well-ventilated greenhouse which has a hot-water pipe running through it. After this date syringing will be better discontinued.

FELLOWSHIP OF THE ROYAL HORTICULTURAL SOCIETY: J. L. A line addressed to the Secretary, Royal Horticultural Society, Vincent Square, Westminster, containing the name and address of the proposed new Fellow will suffice. Vide R.H.S. Book of Arrangements.

GLOXINIA: John T. The "rust" on the Gloxinia leaves is not caused by a fungus, but probably by some insect. A Nicotine wash, made of 1½ ounces of pure Nicotine (90 to 98 per cent.), 2 ounces of soft soap, and 10 gallons of water, will rid the plants of aphids, thrips, and similar pests.

INSECT FOR NAMING: J. B. One of the common "burying beetles" *Necrophorus vespillo*. This and all the allied species are carrion feeders.

IRIS DISEASED: A. B. C. The Iris is suffering from a bacterial disease. Cut away all affected portions of the rhizome, and mix superphosphate of lime with the soil before replanting.

IVY LEAVES: F. A. Edwards. The appearance of the Ivy leaves suggests damage by some minute insect, possibly a *Phytoptus*, though none was visible. The only practicable remedy is to cut the Ivy well back. The Celery is attacked by the fungus *Septoria Petroselinii* var. *apii*. Nothing can be done now except to burn the affected parts. Another season the disease can be prevented by spraying the foliage with Bordeaux Mixture (4 lbs. quicklime, 4 lbs. copper sulphate, 50 gallons water), the mixture to be applied in a fine spray before the disease appears.

LIME DRESSING FOR LAND: John Taylor. Thirty to forty bushels of quicklime to the acre is sufficient to arrest "club" in Winter Greens.

MELON LEAVES: Wm. Ford. The Melon leaves are too far decayed for the cause of the injury to be ascertained. Send some leaves which show the first signs of the disease.

MALFORMATIONS OF PEARS: *J. C. W. & Son, Ltd.* The specimens exhibit a not uncommon malformation, in which a flower-bearing branch has swelled to form a conical Pear-like mass which bears on its surface rows of fleshy rudimentary leaves. The leaves are represented for the most part merely by their bases which are brown and succulent, and contribute to the flesh of the malformed Pear. In some of the leaves, however, a leaf-stalk and a small blade are also present. All that can be said as to the cause of the malformation is that it is a result of some malady of unknown nature

FIG. 112.—MALFORMED PEARS.

undergone by the tree or the branch at the time of the development of the flower. As a result of the malady, the rudiments of embryonic tissue which should have produced the several parts of the flower have given rise instead to leaf-scales. When it is remembered that the edible part of a Pear consists of the hypertrophied flower-stalk, it can be understood that if there were a fusion between the tissue destined to form the latter and that whose business it was to form the several parts of the flower—sepals, petals, stamens and carpels—then the structures produced from these mixed rudiments might be expected to partake of the nature of flower-stalk and leaf.

MICHAELMAS DAISIES: *R. F.* Three excellent varieties of the *Aster ericoides* type which generally flower in September are as follow:—*Decorator*, white; *Ophir*, grey-blue, and *Osprey*, blue. Valuable varieties for flowering in September are *Star Shower*, white; *Charmer* or *Grey Dawn*, grey-blue, and *Simplicity* or *King Edward*, blue.

MUSCARI BULBS: *T. D. M.* The bulbs are destroyed by the bulb mite, which is present in the soil. Mix gas-line with the latter.

Names of Flowers, Fruits, and Plants.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time; they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. Correspondents not answered in one issue are requested to be so good as to consult the following numbers.

FRUITS: *A. S.* 1, *Scarlet Pearmain*; 2, *Margil*; 3, not recognised, probably a very

old local variety; 4, *Dumelow's Seedling* (syn. *Wellington*).—*J. Harris.* 1, *Ross Nonpareil*; 2, not recognised; 3, *Fearn's Pippin*; 4, *Sturmer Pippin*.—*Henry Ward.* *Williams' Bon Chrétien*.—*P. E.* 1, *Jefferson*; 2, decayed; 3, *Coe's Golden Drop*.—*L. Broughton.* 1, Not recognised; 2, *Benoni*.—*W. G. W.* 1, *Alfriston*; 2, *Cockle Pippin*; 3, *Bramley's Seedling*; 4, *Bachelor's Glory*; 5, deformed fruit, please send a better specimen; 6, not recognised; 7, *Tower of Glamis*; 8, *Reinette du Canada*; 9, *Waltham Abbey Seedling*; 10, *London Pippin*; 11, not recognised.—*J. Halsey.* The green Apple is *Winter Nonesuch*; please forward a sound fruit of the other variety, the one received was partly decayed; 1, *Plum Prince Englebert*; 2, not recognised.—*A. H. G., Theale.* 1, *Stirling Castle*; 2, *Worcester Pearmain*; 3, *Cox's Pomona*; 4, *Peasgood's Nonesuch*; 5, *Cullen*; the Pear was decayed.—*A. T.* 1, *Hanwell Souring*; 2, *Norfolk Beefing*; 3, *French Crab*; 4, *Hoary Morning*; 5, *Beauty of Kent*; 6, *Braddick's Nonpareil*; 7, *Cox's Orange Pippin*; 8, *Wyken* (syn. *Warwickshire Pippin*).—*J. D. M.* The Figs arrived in a state of pulp.—*Miss Lomax.* We cannot undertake to return fruit sent to us for naming. The green fruit is *Josephine de Malines*, the other is not developed properly.—*C. Ware.* 1, *Worcester Pearmain*; 2, *Warner's King*; 3, *Lady Henniker*; 4, *Gascoyne's Scarlet Seedling*; 5, *Sandringham*; 6, *Washington*.—*C. H.* The Pea is known as the *Purple-podded Pea*. The Apple is a very fine specimen; it has much the appearance of *Bramley's Seedling*, but is too sweet for that variety. It is probably *Baron Wolsley*.—*C. W. B.* The Peach arrived in a condition of pulp. Send other specimens not so ripe, and pick them with greater care.—*C. C.* The Pear was decayed; it is certainly not *Emile d'Heyst*.—*J. W.* *Nectarine Elruge*.—*W. W., Chelmsford.* A very nice Apple, possessing good size and flavour. Send six of the best fruits to the Royal Horticultural Society's Fruit and Vegetable Committee.—*C. E. M.* 1, *Dumelow's Seedling* (*Wellington*); 2, *Allington Pippin*; 3, *Winter Hawthornden*; 4, *Towers of Glamis*; 5, *Warner's King*; 6, *Queen Caroline*. Amellus*; 13, *Helianthus rigidus*; 14, *Dahlia "Glare of the Garden"*; 15, *Aster lynosyris*; 16, *Chrysanthemum maximum*.

NARCISUS BULBS: *A. P.* The trouble is due to the bulbs being imperfectly matured. There is no disease present.

NEW ZEALAND HORTICULTURAL PAPER: *J. L.* The *Journal of Horticulture*, published at Market Buildings, 44, William Street, Melbourne, Australia; price 6d. monthly.

OAK LEAVES DISFIGURED: *Wm. Clarke.* The injuries on the Oak leaves are not due to any fungus or insect attack, but are caused by some climatic conditions. They may be expected not to occur in other seasons.

PAPER-WHITE NARCISSUS AFTER FORCING: *C. L.* In an ordinary way, the bulbs of these are of little value after forcing. The depth of planting has little to do with their subsequent behaviour, and even in the hands of the specialist the bulbs take some time to recover. They are subjects suited to a warmer climate than our own, hence their slow recovery.

PEAR SHOOTS INJURED: *W. L. Littlewood.* The pest which has attacked the Pear shoots is the "slug worm" (*Eriocampa limacina*). It can be kept perfectly in check by spraying early in the season with arsenate of lead (best used in the form of Swift's Arsenate of Lead Paste). There was no need to cut down the tree. A full account of this pest is given in Leaflet No. 62 of the Board of Agriculture (free on application to the Secretary, 4, Whitehall Place, London).

PELARGONIUM WITH YELLOW LEAVES: *Constant Reader.* You do not specify the nature of the disease observed on the "Geranium." We conclude that the yellowing of the foliage is the "disease." No insect or fungus is present on the specimens sent; the yellowing of the foliage appears to be due to some cultural cause.—*C. Fletcher.* The Begonia is attacked by the very common mould *Botrytis cinerea*. The same disease attacks Pelargoniums and Vines. Do not allow any dead or decaying flowers, leaves, &c., to remain on any plants in the house. Spray the Begonias lightly with liver of sulphur solution (1 ounce to 3 gallons of water) before the flowers open. Keep the air as dry as possible, as *Botrytis* flourishes in a humid atmosphere. The example of *Galium splendens* sent was insufficient for purposes of examination; please send a larger piece, packed carefully.

ROSE SLUG WORM: *G. M.* To eradicate the Rose slug worm, remove the surface soil during the winter and replace it by fresh mould. The old infected soil should be deeply buried in some out-of-the-way part of the garden. For Violet see reply to *Miss Lees*.

SPIRÆA JAPONICA: *R. F.* The variety *Anthony Waterer*, when obtained true, is superior in colour to the variety known as *Bumalda*.

TURF DYING: *G. W.* Soak the turf thoroughly with a solution of sulphate of iron—1 lb. to 2 gallons of water, three times at intervals of a fortnight, commencing next March.

VIOLETS DISEASED: *Miss Lees.* The injury is caused by a fungus, *Cercospora violæ*. The diseased portions of the leaves fall out and infect the soil, and the only means of checking this complaint is to remove all the plants, pick off all diseased leaves, and plant in fresh soil.

WEED ON LAWN: *A. R.* Apparently *Prunella vulgaris*, but the specimens are not large enough for correct naming. In any case, the weed may be exterminated by application of a nitrogenous manure, which will cause the grasses to grow luxuriantly and crowd out the weeds.

WOODLICE IN ORCHID HOUSE: *F. G.* Clear out all rubbish which might harbour the woodlice and cleanse any of their haunts on the staging or underneath. If there are any inverted pots with plants raised on them, examine them and destroy any of the woodlice that may be found. If the insects are specially troublesome to certain plants in baskets or in pots, let the plants get tolerably dry and then immerse them in water until the woodlice appear, when they can be destroyed. Afterwards get some hollowed-out halves of Potatoes and place them hollow side downwards as traps. Examine them frequently and destroy the insects secreted in them.

AUTUMN FRUIT TOPICS.

THE autumn weather has been very favourable for fruit growers. The abundant sunshine of September, in the south, at least, has ripened late Apples splendidly, and never have they coloured more brilliantly. It is to be hoped that another effect will be found in the proper ripening of fruit-buds for next year's crop. The wet weather of the first half of the year promoted plenty of wood growth, and now we have had a dry and sunny month to ripen it. Never has there been less strong wind up to the end of September to blow Apples off the trees. There was a gale in the south on October 2, but it lasted for only a few hours. Again, for preparing land for fresh plantations, the conditions of the past month were perfect. For ploughing and sub-soiling, the land must not be too hard on the surface for the plough to enter it. Corn stubbles have become very hard recently, but were not so immediately after the crops had been cleared off the fields, and, besides, fruit is best planted after such crops as Potatos or pulse, which are either liberally manured or are in themselves nitrogen accumulators, and the land always works well in dry weather after such crops. For the numerous fruit growers who are also growers of Potatos, the dry weather has been a great advantage. In the south, Potatos for the most part are raised before the end of September, and this year, in consequence of the prevalence of disease, the crop was dug up, as a rule, earlier than usual.

THE APPLE CROP.

It would appear that this crop is more satisfactory than early expectations. In September, good fruits for cooking were making only 2s. 6d. or occasionally 2s. 3d. per half-sieve, which are very poor prices for large Apples in a season of short crops. London, as usual, was the worst of markets. Some excellent fruits of Warner's King sent there were given away at 1s. 9d. per half-sieve for the firsts and 1s. 3d. for the seconds. At another market, part of the same lot sent on the same day made 2s. 9d. and 1s. 6d. These Apples were thoroughly well graded and packed. In another case some "special firsts" of Lord Derby and Bramley's Seedling off young trees, every Apple extra large, made only 2s. 6d. per half-sieve. This was not in London, but in a much better market. The price was very disappointing, as the Apples were good enough for a show. Dessert Apples have sold well, but not much better than usual.

BLAMING FRUIT GROWERS.

The periodical censuring of British fruit growers has not been lacking in the daily and other papers this autumn. To a great extent it is of the character of a parrot cry, and probably most of it is written by men who really know nothing about the subject of marketing fruit, and who merely repeat what others have said. It relates chiefly to the grading and packing of fruit, and many of the remarks show ignorance of the circumstances. For example, one piece of criticism blames one fruit grower for not grading Plums and packing all but the worst in nice little boxes. This is all very well for dessert Plums, but for ordinary cookers it is absurd, so far as it relates to large growers, who often send 100 half-sieves in a day. They are packed in the field as they are picked, and despatched at once to market. To grade them would involve the employment of a great many extra hands, and in an ordinary season it would not pay, even if it would when prices were as high as they were in the season lately ended. When there is a fair crop, mid-season plums commonly make only 2s. to 3s. per half-sieve, and where there is a great crop large quantities go at 1s. to 1s. 6d. Such prices would not pay for grading or for non-returnable boxes, instead of the salesmen's half-sieves. It is a question, indeed, whether any Plums or Apples, other than choice dessert varieties, would pay for non-returnable boxes. As to Apples, the critics write as if none or hardly any of us grade and pack properly. No doubt there is still a great deal of careless and dishonest packing, but most of the extensive growers grade and pack well. The rubbish that outsiders see in Covent Garden is mainly the refuse left after all the good fruit of the day has been sold, as most of it is before our critics are out of bed. Again, it is nonsense to talk of half-sieves causing the bruising of Apples. If a strip of paper is placed inside the rim of a half-sieve, and a little hay or wool-wool is put in the bottom, the basket then being lined with tissue paper coloured to indicate grade, and so placed as to come over the top of the fruit when the packing is complete, and hay or wool-wool is put over the tissue, to be covered finally with newspaper or brown paper tied on, the fruit will travel well without bruising. Moreover, when made nicely level at the top,

well-graded Apples present as attractive an appearance in a half-sieve prepared as indicated as they do in any kind of package. But now for a little misgiving in reference to precise grading. Ever since I first grew Apples for market, I have graded carefully and honestly. My principal salesmen have often complimented me upon this fact. But I often doubt whether I am fairly repaid. Unless a grower becomes known as a good grader and honest packer, and the buyers of his fruit know who has sent it, how are they to be sure that they will find it as good in the lower part of the package as it is on the top? They are used to "topping," and allow for it when they buy. Thus they cannot tell that they need not make any such allowance in the case of packages sent by a careful and honest packer, unless they know him as such, and are informed when they have his fruit before them. Probably they are not told the name of the sender in one sale out of a hundred transactions, and if this is the case, the good and honest packer is not fairly rewarded for his care and good faith.

COUNSELS OF PERFECTION.

Mycologists and entomologists sometimes give impracticable advice. Currant leaf-spot is unfortunately a very common disease, and a very beautiful one. In addition to spraying against it, growers are advised to rake up and burn the fallen leaves. Fancy doing this on 20 or 30 acres! Even if the leaves could all be raked up at one time, the operation would be a tremendous one, especially as the leaves could not be burnt among the bushes, but would have to be carried by hand to the nearest roadway, and burnt there, or carted away. But as the leaves are gradually falling for about six weeks, half of them would be rotted and incorporated with the soil before all had fallen, if not raked up more than once. Is it certain that the disease lives in an infectious form on leaves rotted and mostly incorporated with the soil by cultivation, hoeing, or digging? If not, the herculean labour of collecting and burning is superfluous. In any case, two or three sprayings while the leaves are on the bushes would be infinitely less laborious than the collection of fallen leaves. *J. Southern Grower.*

NEW OR NOTEWORTHY PLANTS.

SOBRALIA BLANDA, KRANZL. N.SP.*

THIS new species of Sobralia flowered in the collection of Mr. Paul Wolter, Magdeburg, Wilhelmstadt, who informed me that he received it from England as a hybrid of doubtful parentage. After a careful examination, I found that the plant resembles, in nearly all characters, the true species, *S. Lindleyana*, Reichb. A notable difference, however, consists in the scales or bracts

* *SOBRALIA BLANDA*, KRANZL. N.SP.—Caulis stricti, ad 50 cm. alti, glaberrimi, foliosi. Foliorum vaginae glabrae, estriatae, 4.5 cm. longae, excepto folio supremo sub-floso, cujus vagina ampliata, laminae sessiles oblongae, acuminatae, 7-nervi, coriacea, 15-18 cm. longae, ad 6 cm. latae, supra 9 cm. longa, 3 cm. lata. Flores solitarii, succedanei ex vaginae foliaceae, viridibus, albo-marginatis glabris orientes. Flores candidi, labellum medio in disco aureum. Sepala lanceolata, 8 cm. longa, medio 1.8 cm. lata. Petala teneriora, oblongo-lanceolata, 7 cm. longa, medio 2.2 cm. lata. I labellum e basi cucinata valde dilatatum, trilobum, lobi laterales rotundati, lobus intermedius subquadratus, profunde lobulatus, margino bitus labelli dimidio undulatus, praesertim in lobo intermedio, discus lineis 5 elevatis rectis non proprie "cruciat" e basi medium usque decurrentibus (recurvatis, labellum 7 cm. longum, quo latissimum 4.5 m. latum, discus glaber, bevisseimo velutinus (nec papillosus nec pilosus) Gynostemium breve, strobila uncinata, tetrorsa.

of the flowers, which are short in *S. Lindleyana* but long and herbaceous (like *S. macrantha*) in *S. blanda*. The leaves of *S. Lindleyana* are said to be short and stiff, in *S. blanda* they are large and well developed. The flowers resemble those of *S. Liliastrum* and *S. Lindleyana*, especially in the white sepals and petals and the golden-yellow centre of the disc. The lines of the latter are a little higher than the surrounding area, but there is no proper crestring. The "rose-coloured dots," quoted by Reichenbach in the description of his *S. Lindleyana* are wanting. At first, I had some idea that it was an albino of some purplish-flowering species, but then the question arose what species? The number of *Sobralias* with cone-like inflorescences, herbaceous, glabrous bracts, large, broad leaves and glabrous, unspotted sheaths and a lip without a crest is small, and among these species there is none similar to this new one. As the plant was said to be a hybrid, I looked in the *Orchid Stud. Book*, and found nothing similar to it, the three hybrid *Sobralias* quoted in this work being totally different plants. The conclusion is, that we have to deal with a very pretty new species in the way of *S. Liliastrum* and *S. Lindleyana* (both species rather rare in collections), but belonging nearer to the *macrantha* group of *Sobralia*. It is a plant of medium size for a *Sobralia*, bears bright green, rather large leaves, and produces at intervals the clear white flowers which are of 15 c.m. diameter, when fully developed. The lip is also white, except the throat and the middle part of the disc, these parts being golden-yellow. The flowers last in perfection for one day or perhaps a little longer. Nothing is known as to its habitat. *P. Kraenzlin*.

PLANT NOTES.

THUNBERGIA NATALENSIS.

EVERY autumn I am more and more struck with the beauty of *Thunbergia natalensis*, yet it seems unknown even to those who have a wide acquaintance with good gardens. True the plant cannot be grown everywhere, for some young plants which I grew from seed and placed out last autumn all perished except those which were situated within a yard of a south wall, a distance which proved sufficient to save them. Here, the plant is grown in a bed made on the south side of a greenhouse, the bed is covered with lights all the winter, but the sides are open to the air. In this border, *Gerbera Jamesonii* is as happy as the *Thunbergia*, and grows to a great size. In the warmer corners of England in Devon and Cornwall, in South Wales, and in the south and west of Ireland, the *Thunbergia* ought to be thoroughly at home without any protection. The plant grows about 2 feet high, the flowers drooping horizontally and are large, 2 inches long, and handsome. The limb is blue or mauve and the tube yellow, forming a delightful combination of colours. It sets seeds with the greatest freedom. The seed vessels, when ripe, split open, and throw the seeds to a considerable distance. The blooms are useless in a cut state, as they fade almost at once, but the plant is an object of great beauty when in bloom, and provides a display for several weeks. *A. C. Bartholomew, Reading.*

LÆLIA DEGEESTIANA.

This variety (see fig. 113) was shown by Mr. William Thompson, Walton Grange, Stone, at the meeting of the Royal Horticultural Society on September 27, when it gained an Award of Merit. It belongs to the *Jongheana* section. The lip is a bright, rich yellow, that shows well against the white sepals and petals. The mixture of white and yellow was to be expected, seeing its parents were the beautiful *L. Jongheana alba* and *L. flava*.

NOTES FROM A "FRENCH" GARDEN.

THE transplanting of the seedling Lettuces is now being done. They are lifted from the seed beds, and the main roots are pinched off to induce the formation of side roots. In these gardens many thousands of Lettuces will be pricked out in the course of the next two or three weeks, and it may be useful to state the system adopted. The cloches are first set on the bed in three rows about 8 or 9 in each row. One of the outside rows is then removed, a board, 1 foot wide and 10 feet to 12 feet long, being placed along the row where the cloches stood. The workman kneels on this board, and pricks out those in the middle row, whilst another workman plants the outside rows. The Lettuces are planted in the order they were sown, the varieties being kept separate.

the same time as the Lettuces is now ready for blanching, by means of mats, hay or leaves.

At this time of the year it will be two or three weeks before the leaves are suitably blanched. The Batavian Green Endive will not be blanched until some time next month, as the leaves are much improved after they have experienced a slight frost. The Ox-heart Cabbages sown in August are ready for planting in their final quarters. They should be set 14 inches to 18 inches apart, in heavily manured ground, selecting a sheltered position whenever possible.

The Celery growing in the old manure beds should be blanched without delay, so that the manure may be ready soon for other crops. The Carrots sown in July are fit for pulling. Where plenty of room has been allowed and frequent waterings given, Carrots have grown well this

[Photograph by John Gregory.]

FIG. 113.—LÆLIA DEGEESTIANA: SEPALS AND PETALS, WHITE; LIP, YELLOW.
(R.H.S. Award of Merit on September 27.)

Sufficient room must be allowed for the second transplanting of the Cos Lettuces about the second fortnight of November. The grower will need to guard against slugs, which are very fond of young Lettuces; many of the pests may be caught in the early morning while they are still on the bell glasses. Mildew is often very troublesome and is best combated by growing the plants as hardy as possible, and covering the cloches only when frost is imminent. After the end of this month, a little ventilation may be allowed. Lettuces planted during the middle of August are ready for marketing, but the heads may be kept in good condition for two or three weeks longer, provided they are covered with lights, and receive ample ventilation both day and night. The batch of curled Endive set at

season, and their bunching will be a much easier matter than it was last year.

The fine weather of the last few weeks has been favourable to the French gardener: the decayed manure, which will form the soil for the hot beds, is in a splendid condition: all seedlings are clean and sturdy, and things generally are very favourable. The returns for the past season have not been remarkable. Prices for Melons have been 30 to 50 per cent. lower in Covent Garden than they were two years ago, but these sold to provincial retailers have given a good, average return. It must be remembered, however, that June and July were both cold and dull, and that fruits such as Melons are most largely consumed when the weather is hot; also there was an increased supply. *P. Aquatics.*

RARE PLANTS AT ALDENHAM.

The illustrations in figs. 114 and 115 are of two species of *Rubus*, which were included in the collection of seeds sent home by Wilson. They were planted in their present positions 12 months ago last spring, and have made excellent growth, the poles being quite 9 feet high. The long, trailing growths are extremely effective, but at the time the photographs were taken they had just been tied in.

RUBUS LAMBERTIANUS (fig. 115) is a vigorous grower, and the foliage develops a beautiful autumnal colour. The small, whitish flowers are only just forming in clusters at the terminals of the current year's growth. This species makes rapid growth and quickly covers a large space

FIG. 114.—*RUBUS ICHANGENSIS* IN ALDENHAM HOUSE GARDENS.

when planted in beds and allowed to trail on the ground naturally.

RUBUS ICHANGENSIS (fig. 114) is a most distinct and beautiful Bramble, with leaves of a striking metallic-like lustre, and conspicuous also because of their beautiful outline. So far, it has not flowered with us. This plant also makes excellent growth when allowed to trail over the surface of the ground.

PAULOWNIA sp.—The plant shown in fig. 116 is a new species of *Paulownia* which Wilson specially described in his letters to Prof. Sargent as being of great garden value. From the altitude at which it occurred it is expected to prove perfectly hardy. The flowers are described of a beautiful purple-violet colour. The accompanying illustration represents a young plant growing freely at Aldenham. *E. Beckott.*

THE ROSARY.

CULTURAL HINTS FOR OCTOBER.

THE plants in the beds and borders should be overhauled and worthless varieties removed. Where replanting is intended, the soil should, if practicable, be trenched and manured in readiness. Nearly all kinds of Roses prefer a stiff, loamy soil, a light sandy staple being of little use unless plenty of clay or heavy soil is incorporated with it, and short manure added. In some cases, it will be advisable to dispense with the natural soil altogether, and if it is replaced now, it should be in a suitable condition for planting at the end of this month, or early in November. New beds on lawns, &c., should be dealt with in the same

for the purpose. Those having black bark and crooked stems and also one-year saplings should be rejected. The stocks may be planted in double rows, 1 foot apart, allowing 8 inches from plant to plant, and a space of 3 feet between each pair of rows, so as to allow plenty of room for the operator when budding. Plant the roots about 6 inches deep, tread the ground firmly, and apply a surface mulch of manure.

ROSES OUT-OF-DOORS.

Roses can be had in flower outside from May to November, commencing in spring with the old-fashioned summer bloomers, such as Austrian and Persian Briars, hybrid China, Cabbage, Provence, Damask, Old Pink and Crested Moss, and varieties of *Rosa rugosa*. These will, in due course, be followed in bloom by the Ramblers, Hybrid perpetuals, Tea, Hybrid Tea varieties, and other classes. Beds of Roses planted with varieties of one colour are very effective, especially in lawns. They can be employed as dwarf plants, placed about 2 feet apart, with a few standards intermixed. A selection of the following may be employed for this style of bed. *Dwarf*: H.T. Lady Battersea, Souvenir de Thérèse Levet, and Liberty; *China*: Eugène de Beauharnais, Louis Philip and Queen of the Bedders, all of crimson shades; *Standards*: Merveille de Lyon, Madame Lacharme, Boule de Neige, or Frau Karl Druschki, of white shades. Another good combination is obtained by employing cream and white sorts such as (dwarf) White Maman Cochet, The Bride, Bessie Brown, Madame Hoste, Gustave Regis; (standard) shades of scarlet crimson, Captain Hayward, Prince Camille de Rohan, Ulrich Brummer, or Dupuy Jamain.

October is the best month for planting cuttings of hybrid perpetual, Climber and Rambler Roses. These strike best in a north aspect. Well ripened shoots of Hybrid and Tea Roses will root under a west wall, but some dry Fern should be shaken amongst them during very cold weather for protection from cold. The cuttings should be selected from hard, well-matured shoots. They should be about 8 inches or 9 inches long, and the cut made beneath a joint. The cuttings may be planted in rows in sandy soil, merely digging out a sloping trench about 1 foot deep, placing some leaf mould and sandy grit in the rows, and then covering the cuttings firmly about two-thirds of their depth. They can be either placed in single rows or in beds, made 4 feet wide, allowing a distance of 2 inches between the cuttings and 18 inches to 2 feet between the rows. Cuttings of Climbing and Rambling sorts may be made longer, and allowed a little more room in the rows. After the planting is finished, mulch the ground with half spent manure to a depth of 3 inches or 4 inches.

It will soon be time to pot up a stock of Roses for forcing—to bloom after Christmas and onwards. The most suitable for the purpose are the Tea and Hybrid Tea Roses. Maiden plants, carrying three or four well-ripened shoots, and plenty of fibrous roots, should be selected; 5 inch and 6 inch pots will be large enough. Those of the Hybrid Tea and China classes may be plunged outside in ashes until December, or until root action commences, when they may be brought into a light house and sparingly pruned. I have prepared a list of Dwarf Roses, suitable for forcing, as follows: (China, on own roots): Mrs. Bosanquet, Hermosa, (Gruss an Teplitz, Madame Fabyier, the old Cabbage Provence, the old Cabbage Moss Rose; (Teas and Hybrid Teas on the seedling Briar): Madame Falcot, Safrano, Niphotos, Homer, Marie Van Houtte, Madame Hoste, The Bride, Perle des Jardins, Richmond, and Liberty; (Hybrid Perpetuals on the Manetti stock): Antoine Ducher, Eugenie Verdier, Madame C. Wood, Mrs. John Laing, Madame Gabriel Luizet, Mrs. Sharman Crawford, Hugh Dickson, John Hopper, Margaret Dickson, Marie Baumann, Victor Verdier, Duchess of Albany, Countess of Oxford, Prince Camille de Rohan, and Senateur Vaisse. *J. D. G.*

NOTICES OF BOOKS.

AN AMERICAN BOOK ON SHRUBS.*

CONSIDERING the enormous extent of the United States and the variety of climatic conditions experienced there—from Maine to Florida on the east and to the arid climate of such States as Arizona and Nevada in the west—a work dealing with the shrubs that can be grown in the States would seem to be an ambitious effort. On looking through this book, however, we find that the term hardy, as applied therein, has mostly the same significance as it carries in this country. But sometimes plants are discussed that appear very strange to us in company with hardy shrubs, such, for instance, as *Phyllocactus* and *Mammillaria*. The limits of this work are, indeed, somewhat arbitrarily drawn, for though such genera as these are dealt with, many others with just as much right to be included are not mentioned. The interpretation of the word shrub is also somewhat elastic, and is made to include *Acer campestre* (often 40 feet to 70 feet high) and *Magnolia hypoleuca*, a timber-producing tree.

The chief feature of the book is the arrangement of the species of all but the smaller genera in keys. These keys are professedly intended to enable the reader to identify his shrub. The one great essential of a key, however, is that it should comprise all the species, but in this book only a small proportion of the species in many genera is mentioned. In *Rosa*, for instance, some 12 or 14 species are included, though quite four times as many are in cultivation. How is the student to know whether his plant is one of the omitted ones or not? *Rosa multiflora*, the type of a beautiful and distinct group of *Roses*, is not even mentioned. In reality, the planning and formation of keys for the identification of plants require a very searching and comprehensive study.

The arrangement of this book strikes us as unsatisfactory. The sequence of the genera is apparently that of Bentham and Hooker's *Genera Plantarum*, but there is no indication as to where one natural order ends and another begins. Then, owing to the system of keys adopted, the description of the shrub precedes its name, which we find it often troublesome to discover in the larger genera. English names have been manufactured, with the frequently unhappy results that attend this practice. What justification is there for calling *Rhus coriaria*, with its large, pinnate leaves, the "Blm-leaved Sumach"? Then, *Ficus creta* is called the "variable-leaved Rubber plant."

The book, nevertheless, has many good points; the illustrations, to the number of over 600, are remarkably true to nature, and should be distinctly helpful. The letterpress is singularly correct, and shows that the author has given his subject very close and intelligent study. We can only regret that the results have not been published in a more comprehensible form. The book is well printed, and, although comprising more than 350 pages, is less than 1 inch thick and light to handle.

TREES AND SHRUBS AT SYON. †

No garden of the present day has nobler traditions in relation to its trees and shrubs than Syon, and it was a happy idea of the Duchess of Northumberland to obtain the services of Mr. A. Bruce Jackson in preparing a list of the species at present in cultivation there. The compilation has been well done. Beside the botanical name, there are given also the popular

* *Ornamental Shrubs of the United States* (hardy, cultivated). By Austin Craig Apgar. (American Book Co., pp. 352.)

† *Syon House Trees and Shrubs*. By A. Bruce Jackson. (West, Newman & Co.) 1910. Small 8vo., pp. 83.

name and the native country of each species. The position of each specimen in the garden or park is also indicated, and the dimensions and history of the more notable examples are given. The list is in no way remarkable for rare specimens, all but a few being well-known subjects in English gardens. It is, however, of great interest on account of the fine development of many of the older examples. Probably no garden as near to Charing Cross possesses so many notable trees as Syon. In Loudon's great work, the Syon trees obtain frequent mention, and at the present time—more than 70 years later—Messrs. Elwes and Henry refer to them often in the statistical part of their work. Many of these specimens appear to have been planted in the 18th century, and we learn from the interesting historical preface that it is tolerably certain that much of the planting

THE GUNNERSBURY GARDENS.

MR. LEOPOLD DE ROTHSCHILD'S famous garden at Gunnersbury, with its many characteristic designs, contains such a variety of subjects that the general effects are but little affected by unfavourable seasons. Some of the showy flowers always provide sufficient colour. A visit made on October 1 in the garden attached to Gunnersbury House revealed a glorious display of flowers, and a great variety of autumn tints in the foliage of the trees. The varying shades of red and purple on the vine pergolas mingled with the late *Roses* and *Clematises*, and the view from the terrace across the soft, green surface of the pleasure ground stretching towards the lake containing *Water Lilies* of various tints was charming. From the terrace itself a touch of magnificent colour was seen on the roof of the old museum,

FIG. 115.—RUBUS LAMBERTIANUS IN ALDENHAM HOUSE GARDENS.

(See p. 275.)

was done under the superintendence of "Capability" Brown between 1750 and 1760.

The book is well and clearly printed, and is interleaved with blank pages for the addition of notes. It is remarkably free from typographical error. After a very careful inspection, we have only been able to detect one small slip, which is the omission of the capital letter in the specific name of *Quercus Vibrayeana*, whereas it is accorded in all other complimentary specific names.

It is to be hoped that the owners of other notable tree and shrub collections in the British Isles will prepare similar records. Such lists would have a great value to planters, whilst the lists of trees in gardens situated outside the zone of comparatively normal climatic conditions would possess a special interest. B.

where there were three tiers of the brilliant scarlet *Salvia* *Pride of Zurich*, faced by innumerable specimens of the rich scarlet *Tropæolum* *Ball of fire*, forming festoons of vivid colour over the face of the building almost to the border beneath, which was also bright with scarlet *Salvia*. The verandah at the entrance of the house was festooned with the *Tropæolum*, whilst the red berries on the *Cotoneaster* beside the pillars, the blossoms of *Pomegranates* and other brightly-coloured flowers all assisted in the general effect; the soft-green foliage of the flatly-trained huge specimens of scented-leaved *Pelargoniums* (see figs. 117 and 118, and Supplementary Illustration), the immense pyramidal *Myrtles*, the *Orange* trees, with finely-coloured fruits, arranged on the terrace helping to show up the

brilliant colours of the *Tropæolum* and *Salvias*. Within the covered way, some tall standard plants of *Datura Knightii* bore many large, pendulous white flowers. The large herbaceous border afforded a good example of bold planting in which the groups are effective at a considerable distance. The plants thus massed into groups included some of the newer varieties of Michaelmas Daisies, among which the bright rose-coloured Mrs. Rayner was conspicuous; *Helenium* "Riverton Gem," yellow and red; *Artemisia lactiflora*, with elegant white plumes; *Polygonum orientale*, of a deep rose tint; *Rudbeckia Newmannii*, *Sedum spectabile*, and *Canna* "King Humbert," with its fine, purple and green leaves and spikes of orange-red flowers. Dwarf *Chrysanthemums*, such as *Soleil d'Octobre*, *Horace Martin*, and *Harristanum*, planted thickly in large tubs made a fine show, and the Ivy-leaved *Pelargoniums*, beds of *Bego-*

the Transvaal Daisy, *Gerbera Jamesonii*—the plants raised from seeds at Gunnersbury have been established in the open ground for several years—a batch of deep, rosy-carmine-flowered *Amaryllis* *Belladonna*; some brightly-coloured *Ericas* in the Heath garden, and a bed of deep Tyrian-purple *Heliotrope* raised at Gunnersbury. In tanks, were observed blue-flowered *Nymphaea stellata* and the larger and deeper blue-flowered *N. pulcherrima*. Some pretty *Nerines* were also flowering in beds out-doors, and very pleasing was a bed of *Mesembryanthemum roseum*. In the old-time garden was a display of old-fashioned flowers, mostly annuals.

THE PLANT HOUSES.

The most striking feature in the Orchid houses was a stage filled with choice specimens of *Dendrobium formosum giganteum*, which grow with increasing vigour under Mr. Hudson's treatment.

and other showy-flowered Orchids. Another house was filled with *Vanda cœrulea*, a noble plant of a very handsome variety of *Cattleya* *Iris* with nine flowers; examples of *C. Armstrongia*, several specimens of *Lælio-Cattleya luminosa*, a handsome form of *C. Maronii*, *L.-C. callistoglossa*, pans of the vermilion-coloured *Habernaria militaris*, a good batch of the pretty *Oncidium ornithorhynchum*, and *O. varicosum*. In other houses, a pretty display was afforded by *Begonia* *Lady de Rothschild* and *B. Marie*; *Vinca rosea*, *V. alba*, *Nerine Bowdenii*, and other greenhouse flowers.

The fruit season at Gunnersbury House has been very satisfactory; on the fruit trees in pots were still hanging late varieties of Cherries and Plums. There were also seen numbers of Figs and Melons, whilst the fruit room contained a good supply of fruits. The cultivation of fruit trees in pots is largely practised in these gardens; about 1,200 trees are grown, and they are brought into heat in successional batches, some to produce fruits before and others after the outdoor crops are finished.

GUNNERSBURY PARK.

Passing along the terrace to the adjoining gardens under the care of Mr. Reynolds, a similarly lavish display of flowers was found. The terrace front is beautified by flowering Lilies in pots, *Pelargoniums*, and other showy flowers arranged with foliage plants. The view across the grounds at this spot, with the stately old Cedars and Pine trees is very beautiful. Commenting on some few plants which have not succeeded so well as usual this season, Mr. Leopold de Rothschild said that in his long experience such temporary failures must be expected, and that they are not always due to unfavourable seasons. Some things which fail in one place are often to be seen in the most satisfactory condition in another garden close at hand, although cultivated under precisely similar conditions.

The flower gardens, each with a separate design, provide a fine display of flowers. In one, *Heliotrope* is the principal feature. Beyond, is a long border planted with fragrant herbs. On the shady banks and beneath the trees are large patches of the blue-flowered *Crocus speciosus* and pink and white *Colchicums*. One large shrubbery is comprised wholly of ornamental, berried and fruiting species, whilst on pergolas the autumn coloured foliage of various species of vines prolongs the show of colour which was started by the *Wichuraiana* Roses growing with them.

In the Orchid houses in this part of the establishment, *Odontoglossums* are seen in a grand condition, some being in flower, and overhead are large pans of *Sophranitis*, one fine specimen being still in bloom. In the intermediate house, are *Cattleyas* and *Lælias*, and, in the warmer houses specimens of *Phalenopsis Rimestadiana* with 10 or 12 fine fleshy leaves and strong spikes of white flowers. One of the warm houses contains a large batch of *Vanda teres*. For many years the plants were unsatisfactory, and were shifted several times from one house to another, but not until they were placed in their present position were they perfectly satisfactory. In another house, a number of robust plants of *Lycaste Skinneri* are in bloom from an importation remarkable in that it has furnished several natural hybrids that have flowered. Several houses are filled with winter-flowering *Carnations*, the plants beginning to furnish their winter crop of blooms. Other subjects of interest in the plant houses include a batch of *Chironia ixifera*, the plants being a mass of pink flowers; *Begonia corallina*, *Gloriosa superba* and *Allamanda Hendersonii* trailing from the roof; *Amasonia punicea*, a good autumn-flowering plant, and the blue *Griffinia hyacinthina* blooming among other *Amaryllids*. In the many fruit houses are fine crops of Plums, Cherries, Melons, and other fruits. The combined gardens of Gunnersbury House and Gunnersbury Park afford one of the best examples of successful gardening near London. B.

FIG. 116.—A NEW SPECIES OF PAULOWNIA IN ALDENHAM HOUSE GARDENS.

(See p. 275.)

nias, edged with *Matricaria Golden Ball*, the bright-blue patches of *Crocus speciosus* planted beneath the trees, and the many other pretty arrangements were at their best. The great beds of *Rose Caroline Testout*, *Mme. Jules Grolez*, *La Tosca*, and other favourite Roses were finely in bloom.

The Japanese garden with its stepping-stone paths and bridges crossing the brook, its tropical scenes of Bamboos and Palms, its Lilies, *Primula japonica* and other Japanese plants which have thoroughly established themselves, gives a pleasing change. The *Primula* sheds its seeds naturally, and the seedlings soon produce flowers in masses. The Maples were assuming their autumn tints, and noticeable patches of colour in other parts of the garden were furnished by the brilliant scarlet flowers of

Some are seedlings raised at Gunnersbury from seeds discovered on an imported plant. The large, white flowers have a conspicuous yellow disc of the lip, varying from chrome-yellow to deep orange. Many fail to cultivate this plant satisfactorily, often because they arrest its growth for a period like the deciduous *Dendrobiums*, and give it a treatment too cool to suit its somewhat evergreen habit. Mr. Hudson keeps the plants warm and moist from springtime until October, affording a liberal supply of water until the growths are finished and the flower past. Throughout the winter they are still kept in a warm house, but are afforded a restricted supply of water until the new growths appear. In another house, was observed a fine batch of the orange-red flowered *Epidendrum vitellinum majus* in bloom; also plants of *Cattleya labiata*

SCENTED-LEAVED PELARGONIUMS.

THE sweet-scented Pelargonium is extremely useful in present-day gardening. Most of the varieties in cultivation are not valuable for their beauty as flowering plants, but there are some notable exceptions, namely, *Clorinda*, a variety which has become an accepted favourite; *Ardens*, a lesser-known variety, with scarlet flowers instead of the pleasing pink of *P. Clorinda*; *Chiswick Beauty*, which has flowers as large as *Clorinda*, and equally floriferous, the colour, a blush-pink with rosy veins; *Countess of Devon*, a perfect gem as a flowering plant, best, I think, described as a miniature fancy Pelargonium, with smaller shining foliage, deliciously scented; *Little Gem*, a dwarf plant with Lilac-coloured colours and *Little Pet*, a sport from *Little Gem*, but with rosy-pink flowers.

Amongst those sorts which are grown for the fragrance of their foliage there are several which may be turned to different uses. Those of robust growth, such as *P. capitatum* and *P. radula major* make splendid screens (see Supplementary Illustration), and as such we grow them

which produce small flowers, such as *P. capitatum*, *P. radula major*, *Attar of Roses*, *P. quercifolium* and its varieties, *P. viscosissimum*, as represented in *Pheasant's Foot*, *P. denticulatum major*, *P. filicifolium odoratum*, and others all thrive well without any pruning or drying off. These we treat in this way, keeping the growth continuously tied in, thus making the plants as large as we need them. In potting these, the potting should be done quite firmly, using the best loam with some leaf-mould, sand and lime rubble. These we never reduce at the ball, but merely top-dress well every spring. During the winter season, they are kept quite on the dry side, and this sweetens the soil.

Those that require a different treatment are *Clorinda* and others of the larger-flowering section. These thrive better if dried off as in the case of the show, fancy, and regal Pelargoniums. I have come reluctantly to this conclusion, for *Clorinda* will continue to flower right away into the autumn. Taking *Clorinda* as an example, if it is allowed to grow and flower continuously, as it will do when well cared for, the plant becomes exhausted, and for the following season is not so useful. The variety *Countess of Devon* is another case in point; this is a

serving as screens, and are as healthy and fresh when they come back as they were in spring.

List of varieties.—We grow the following varieties at Gunnersbury, *P. capitatum* (Rose-scented) is also grown largely. I am told, in the south of France, where its essential oil is used to adulterate *Attar of Roses*. *P. radula major* (Balsam-scented) is of similarly vigorous growth. These are the best two for growing into large specimens, either as fans, pyramids, or standards. *Clorinda* is better as a standard than in any other form. *Chiswick Beauty* has only been grown as a pyramid; it is a variety I obtained from the R.H.S. Gardens at Chiswick, hence its name. It is a valuable variety. *P. quercifolium*, the true oak-leaf Pelargonium, and the varieties *minor*, *Fair Helen*, and *Mrs. Douglas*. *P. tomentosum* (Peppermint-scented) is a well-known plant. I have a very distinct form, with darkly-veined leaves, one sent me by a keen amateur raiser in Shropshire; this is a very strong grower and will, I think, make a good fan-shaped plant. *Lady Plymouth* is best grown as a dwarf bush, and after about three years is not of much use. *P. viscosissimum* is represented by *Pheasant's Foot*, *filicifolium odoratum*, and *denticulatum major*. These all get somewhat dirty in the foliage when fogs occur. *P. fragrans* (Nutmeg-scented) is quite distinct, and has a strong perfume; it is best grown as a dwarf plant, but it wants renewing frequently. *P. ardens* is useful, both as a pot plant and for bedding. *Attar of Roses* resembles somewhat the perfume of that name in its fragrance; it is a compact grower, and makes a useful pyramid. *Countess of Devon*, as a dwarf plant, is unique. *Prince of Orange* is useful as a flowering plant, as well as for its fragrance; it is a rather delicate grower. *P. crispum* (Citron or Lemon-scented) and *P. crispum major* are both useful plants. Both *Little Gem* and *Little Pet* are useful as dwarf plants, and they flower freely. *Pretty Polly* is a well-known variety, quite unlike any other; it is more like a Show Pelargonium in miniature. It makes an excellent pyramidal plant and flowers freely.

We also grow two varieties, raised at Chiswick some years ago, namely, *Richard Dean* and *H. B. May*. These make very compact, neat, plants. The forms of *Unique* we have ceased to grow, and both *Shotesham Pet* and *Mrs. Kingsbury* are of no use to us. A rather delicate grower, called *Lady Mary*, we have lost; it was a pretty variety, with a refreshing perfume. *Jas. Hudson, V.M.H.*

FIG. 117.—PELARGONIUM CLORINDA.

at Gunnersbury, our largest specimen being some 10 feet across and nearly 8 feet in height. These varieties are also very effective when grown as "balloons." Again, as pyramids, these two varieties make useful terrace plants.

For plants of medium size and for pyramids, *P. quercifolium minor* and *P. q. Mrs. Douglas* are both useful varieties, so is the variety *Attar of Roses*.

Among plants of smaller and more bushy growth there are *P. fragrans*, *P. tomentosum*, *P. crispum major* and *Lady Plymouth*. *P. crispum* has an upright or pyramidal growth, but, strange though it may seem, *P. crispum major* is capable of forming a dwarf plant of bushy habit. *P. crispum*, however, refuses to be so treated, but makes a beautiful object when some 4 feet or more in height, and a foot or so in width. *P. crispum* is, moreover, one of the very best for cutting purposes. We have noted a peculiarity with respect to *P. tomentosum*, namely, that it thrives best in shade.

Cultivation.—In my experience the cultivation is of two kinds. Some sorts, and those chiefly

delicate grower, but one that flowers so freely, that the plants need to be given a rest. Young plants of *Clorinda* can always be brought on to succeed those that become weakened, but I am thinking more of this variety as a specimen than in any other form. *Chiswick Beauty* may be kept growing during the winter if necessary; it appears to be an exception to the rule being a robust, sturdy grower.

Pelargoniums as terrace plants.—It is as terrace plants that I find the scented-leaved Pelargoniums to be of greatest use. In this form they are very attractive, and their fragrance is refreshing, this latter quality being most noticeable after a shower of rain. Our large, fan-shaped examples do not require so much room during the winter as might be imagined. Being trained flat, they stand next a side wall with a walk in front.

The largest plants were raised from cuttings in 1895, and are still vigorous. These are sent to the town house in Park Lane, at the end of May, and they remain there until the first week in August. They stand in the garden,

FOOD FOR PLANTS.

THE water, of which plants, on an average, contain 70 per cent., is absorbed from the soil by the root-hairs of the growing plant.

Water forms the vehicle for the passage of the mineral matters, nitrogen compounds, potash, phosphates, lime, &c., which are distributed in solution to the leaves, stems, flowers, and fruit, and constitute, after the plant is burnt, what is called the ash.

Nitrogen is taken up by the root chiefly in the form of nitrates, and serves to form the proteins (albuminous substances) of the plant. After the roots, the leaves are the next most important organs of a plant. The millions of small openings or stomata found on the leaves allow of the passage of carbonic acid gas from the atmosphere, and from every 44 parts by weight of that gas the leaves get 12 of carbon to build up the organic constituents of the plant.

It seems incredible that growing plants should get almost the whole of their carbon from the four parts of carbonic acid that exist in 10,000 of air; but it can be understood, when we calculate that there are 2,160 lbs. of air overlying every square foot of land, and in that amount about 5½ ounces of carbon, which is equal to no less than 7 tons per acre.

Immediately a plant starts into active growth, its roots absorb water and its leaves carbonic

acid, and from these raw materials the green leaf exposed to sunshine manufactures sugar, and, subsequently, starch. Without light, the manufacturing machinery of the green leaf ceases to work, no sugar is formed and the plant has either to live on its capital or starve. So also without the green colouring matter, chlorophyll, for the formation of which iron is essential, the building-up of sugar by the plant does not take place.

In the soil, away from the light, myriads of small organisms, called bacteria, are acting on the humus constituents of the soil, changing them into nitric acid which unites with the potash, lime, magnesia, &c., in the soil to form nitrates.

This process is known as nitrification, and goes on most briskly in moist and porous soils, in the summer time or in glass-houses or conservatories, also when carbonate of lime is present, and at a depth not greater than 3 feet.

The nitrates thus formed or those supplied in artificial manures provide the nitrogen necessary to form the proteins in our growing crops. Besides these organic constituents, there are always found in plants more or less of potash, phosphoric acid, and lime. Hence it will be seen that if a soil is deficient in any of the mineral ingredients found in plants, or if these minerals are not in an available condition to be taken up by the root, plants growing in such soils must suffer, and a full yield and healthy growth are rendered impossible. *J. J. Willis, Harpenden.*

A TEA PLANTER'S COMPOUND.

THESE are few branches of agriculture or horticulture in which are found men whose former occupations have been more varied than are to be met with among tea planters. It may be said that there are as many different folk with as many different origins to be found in the tea industry as there are to be found in a gold mining camp. The writer has been many years connected with tea; so many years, in fact, as to have outlived nearly all his contemporaries. During these years he has met all sorts and conditions of men—soldiers, sailors, engineers, practical gardeners, and gentlemen (broken down and otherwise). There can be no doubt but that the tea industry in India is, to a certain extent, used as a dumping ground. The degenerate son must be got away from home, and if the family happens to have influence in the tea industry it is quite easy to get him dumped on a tea plantation. Some of these "undesirables" turn out well as planters, others make good sportsmen but fail at planting, whilst a great many more get packed home again. But no engineer can possibly get into "tea" unless he is possessed of an unblemished character, and the same rule applies to the practical gardener. There is a comparatively small percentage of the latter engaged in tea plantations, though the gardener is to be found here and there.

It may be asked, what has all this preamble to do with "A Tea Planter's Compound"? It was necessary in order to show that just as we have all sorts and conditions of planters, so we also have all sorts and conditions of compounds.

Compound is an Anglo-Indian term and simply means the enclosure around a bungalow residence. Inside this enclosure are usually found the vegetable garden, flower borders and beds, also fruit trees, and very often a tennis court. The writer has seen some magnificent compounds well furnished with all the best fruit and flowering trees and shrubs allowed to go to ruin just because the planter in charge of the tea garden for the time being knew nothing about these kind of things and cared less. Nevertheless, he has also known some very important experiments carried out in a compound.

Planters, as a rule, know little if anything about tropical agricultural matters previous to their going into "tea." Occasionally one comes in contact with a planter who has had a home train-

ing in technical agriculture, but such men are extremely few and far between. Of course the man possessing this knowledge to start with has by far and away the best of it as far as cultural matters are concerned, just as the engineer excels with his knowledge of machinery and buildings. The compound is usually in charge of a Mali (native gardener) whom we may compare to a garden labourer at home, with nothing of the latter's capacity for work, and the less said about his honesty the better. In the month of June there is a perfectly unlimited supply of the "Queen" Pineapples, besides Peaches, Lichis, Passion fruits and Mangoes. Occasionally a few Bananas are seen growing in the compound, but only of the very best varieties. These fruits can be bought so cheaply in the local bazaars that no one troubles to grow them. *An Old Correspondent.*

THE CROSS-FERTILISATION OF THE POTATO.

TREVIRANUS, in describing the genus *Solanum*, held that the flowers were generally fertilised by the style curving downwards to meet the anthers. Since the latter begin dehiscence at their apex and the style in many instances curves backwards to such a degree that it stands beneath the anthers in the line of the fall of the pollen, it is possible that self-fertilisation is thus accomplished. The well-marked homogamous condition of the flowers of *Solanum tuberosum* favours the hypothesis that, in cases where seed pods occur, they are generally the result of self-fertilisation, therefore, this able botanist and observer was not wholly wrong in this matter. However, in studying the question from observations made in this country, it is well to bear in mind that the plant is not a native. Self-fertilisation may be generally noticed to a large extent with certain varieties bearing coloured tubers, usually of a very coarse type which can hardly be said to be cultivated varieties in the sense in which we regard some of the best field and garden sorts. Those self-fertilising types conspicuous by their red or purple-skinned tubers, always inclined to a certain coarseness, are probably either the original type of *S. tuberosum* introduced into this country, or the seedling-produce of self-fertilised plants from those old varieties which have been carefully selected by the growers of olden days. Many of them are still to be seen, particularly in some districts of Scotland, and they exhibit characteristics which are not desirable in cultivated Potatoes; nevertheless several possess a fine flavour. It is unlikely that any of these old, free-seeding sorts are the product of cross-fertilisation by man. Cross-fertilisation by entomophilous agency is equally unlikely, for the flower does not secrete honey and is but rarely visited by insects, although careful observation has revealed the presence of small, black beetles belonging to the genus *Apion*. These beetles are found but seldom, and are probably there for the pollen which the flower contains; but as their excursions are confined to the base of the anthers where the shed pollen accumulates, it may be assumed that they do not assist in pollination. The coloured varieties mentioned, which are notable for their seed-yielding capacity, have usually lavender, mauve, or purple flowers; they belong to a distinct race of Potatoes, and for breeding purposes—if we except flavour—they may be set aside as of little value to the hybridist. When they are crossed with some of the best modern Potatoes, the progeny is too often either inclined to disease (*Phytophthora infestans*), or to run very much to root branches without tubers, which cultivators aptly term "runners."

In some modern varieties, a somewhat different state of affairs is observed. The absence of the seed pod and the paucity of pollen are two very marked features. Indeed, some kinds do not produce any pollen, and in some instances

where pollen is produced it is sterile. Careful experiments this season with that fine Potato named "Factor" have proved that it is not only sterile to its own pollen, but also sterile to all the "Up to Date" type, of which class Factor is probably the best example, for it is a large cropper and an ideal table variety. It will cross with some of the coloured-skinned varieties, which have also flowers of a similar tint, but the seed-vessels mature very slowly and never attain a large size. Where pollen of white-flowered sorts can be obtained, such as the "Admiral," "Provost," "Abundance," and "Cumberland Ideal," a good set can be obtained on "Factor" and the pods soon attain full size; indeed, the growth of the so-called "plum" is remarkable in comparison with that of the others already noted. I have not experimented with the white-flowered varieties, and cannot admit with certainty that the same rule will apply to them, but the "Admiral" and "Provost," both with white blossoms, while sterile to their own pollen, are readily inter-crossable. On the contrary, the pollen of "Factor" has been found to be absolutely sterile to some 30 other varieties of Potatoes, having flowers and tubers of different colours, and none of them of the "Up to Date" class. The scarcity of pollen renders it tedious and difficult to carry out the experiments, for hundreds of flowers have to be examined. It is an easy matter to raise seedling Potatoes, but it is not so easy to secure such crosses as are likely to produce desirable seedlings.

The result of the inter-crossing experiments with "Factor" has confirmed a law already laid down in relation to inter-breeding. That law states that in order to produce a strong and productive hybrid a certain degree of difference is necessary between the parents. When the parent plants are too closely, or too distantly, related, failure is the general rule. Plants which are perfectly sterile to their own pollen, and more or less unproductive when crossed with closely-related individuals, will generally produce good hybrids when crossed with more distantly-related varieties. "Factor" Potato has shown that, while sterile to its own pollen, and also to that of the more nearly-related varieties, and only capable of forming seed vessels with difficulty when crossed with sorts bearing flowers of almost the same shade but with differently-coloured tubers, yet it will readily set full-sized seed pods if crossed with varieties bearing white flowers. I intend to "self" the seedlings when they flower, and to treat the next generation on Mendelian lines. *George M. Taylor, Midlothian.*

THE ALPINE GARDEN.

LEPTARRHENA AMPLEXIFOLIA.

THIS handsome creeping plant is a new introduction from the Rocky Mountains of N.W. America. It is found on mountain slopes, margins of rivulets and in wet places on the Cascade Mountains, Washington, at 4,000 feet to 5,000 feet elevation, near the region of perpetual snow. It forms compact tufts of rooting stems interlaced and matted together. The stems are thick and fleshy, while the thick and leathery leaves are oblong ovate, being 2½ inches long by 1½ inches broad. They are evergreen, glossy green on the upper surface, sessile on the stems, and have slightly dentate margins. The almost leafless flower stems grow 12 inches to 15 inches high, and bear panicles of small, white flowers. The species is perfectly hardy, and forms a tree-growing plant, well worthy a place in the bog garden. The plant may be increased by seeds, but propagation is also easily effected by means of cuttings. The genus *Leptarrhena* belongs to the Natural Order Saxifragaceae, and is monotypic; *L. pyrolifolia* is a synonym of *L. amplexifolia*. *H. L.*

FLORISTS' FLOWERS.

THE SWEET PEA SEASON.

THE atmospheric conditions during September were almost ideal for the culture of Sweet Peas. I visited many gardens during last month, including those at Lochinch Castle, the far-famed residence of the Earl of Stair, and Logan House, and I have never seen the Sweet Peas there finer at this season of the year. In the school gardens of this picturesque, peninsular parish, in one of which the Sweet Peas are exposed to every wind that blows, they have been marvellously fine. In my own garden, I grow them under considerable difficulties, as they do not get adequate sunlight, owing to the presence of a number of lofty and wide-spreading trees. For this reason, they require a good deal of attention, chiefly in the form of fresh, fibrous soil, and manurial applications in liquid form. But I have this consolation, that, though the flowers are somewhat smaller than in other and sunnier regions, they are not scorched by the strong summer sunshine, and last longer when in bloom.

In the matter of popularity, "crenulated" hybrids have for some years predominated; but I think that too much importance has been of late attached to the waved varieties, and that such superbly decorative kinds as Dorothy Eckford, Helen Pierce, Frank Dolby, and Queen Alexandra are in danger of being undeservedly ignored. These, wherever Sweet Peas are adequately cultivated, are still among the greatest ornaments of our gardens. We cannot afford to part with such splendid flowers as these, produced, as they are, in the grandest profusion, especially if, as experts affirm, we are parting with fragrance for the sake of crenulation. It is sufficiently manifest that Sweet Pea hybridisation, while creating larger and perhaps, on the whole, more fascinating flowers, has its own peculiar dangers and limitations. One of the finest attributes of this glorious annual is its incomparable perfume; and we cannot sacrifice this supreme attraction merely for the sake of picturesqueness of form and more commanding dimensions. For this reason, I sincerely trust that the varieties I have enumerated, not to speak of many others which are not "waved," but conserve their splendid fragrance, will not be neglected.

At the same time, I do not depreciate the size and effectiveness of such Spencerian hybrids as Marie Corelli (an unquestionable acquisition of luminous hue), Senator Spencer, W. T. Hutchins, Mrs. Rontzahn, and Anrora Spencer, which have come to us from California, where, at the Santa Clara Nurseries, a cross has been made by Mr. Henry Ohm between my Eckfordian namesake and Countess Spencer: with what result I have yet to learn.

Two very notable waved varieties have recently been introduced by Messrs. Dobbie & Co., viz., Masterpiece and Mrs. Hugh Dickson, of which the former, a flower of most exquisite lavender colour, was raised by Mr. Malcolm, of Duns, in Berwickshire. It is a precious addition to the waved varieties, and its blooms are very large. Mrs. Hugh Dickson is also an important acquisition. It may be characterised as a greatly-improved version of Mrs. Henry Bell, for while it has already proved itself much more reliable than its predecessor, and more conservative of its colours, it is much less susceptible to adverse atmospheric influences. Evelyn Hemus is another very beautiful variety.

Of pure white, crenulated varieties, which are of supreme value for garden decoration, three of the most attractive are Etta Dyke, White Spencer, and Nora Unwin; but I greatly question if any one of these is more effective than Dorothy Eckford. *David R. Williamson, Wigtownshire.*

The Week's Work.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Begonia Gloire de Lorraine.—The removal of the flower-buds should be discontinued if the plants are required to flower their best during November and December. A light and well-ventilated house is the most suitable structure for this Begonia during its flowering period. They may be grouped in their various colours with a few graceful Bamboos or Cocos Palms as relief, and a groundwork of *Panicum variegatum* or *Pittonia Verschaffeltii argyoneura*, with a few plants of *Begonia Rex* and small *Adiantum Ferns*. During last season, I observed a novel method of training these plants: the shoots were trained on either side of a wire screen, painted green, about 2 feet high and 18 inches wide at the top and tapering downwards. The atmosphere of the house should be kept somewhat drier than before, and ventilation should be carefully given, leaving the top ventilators open a little during the night with the temperature ranging from 50° to 55°, and an advance of a few degrees during the day time. Afford a light shade during bright weather, and regularly apply liquid manure at intervals of a week or ten days, with an occasional application of clear soot water. Some approved artificial manure will be beneficial to the plants when they are developing their blooms.

Roman Hyacinths.—Bulbs that were potted or placed in boxes early in August should now be removed from the beds in which they are plunged. If the leaves are blanched the plants may be placed under a north wall until the green colour develops. Any attempt at forcing before the plants have made plenty of roots will result in failure. They should be brought at first into a greenhouse or a structure where a similar temperature is maintained, and when they have made a good progress remove them to warmer quarters. Where the bulbs have been forced into flower under the influence of high temperature, it is advisable to accustom the plants to cooler conditions by placing them in a greenhouse.

Luculia gratissima.—This is a splendid subject for autumn blooming, and succeeds well in the stove. Treated as a climber, it produces a beautiful autumn display, its sweetly-perfumed blooms being very attractive. As the plants complete their season of flowering, they may be subjected to a short period of rest.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Vines on walls.—It will be advisable to cut any bunches remaining on the vines, with a little wood attached, so that the ends may be placed in bottles containing water. Stand them in a moderately warm room, where the air circulates freely, and the Grape will continue to ripen and improve in flavour. The leading shoots of the vines may now be considerably shortened, and the laterals cut back to three or four leaves. This will enable the sun to reach all parts of the vine and favour the maturing of the wood before bad weather sets in. The borders should be examined, and if the soil is found to be dry, a copious watering should be afforded; an application of liquid manure will cause the buds to become plump and hasten the ripening of the shoots.

Raspberries.—October is a suitable time for making new plantations of Raspberries. If the soil is naturally wet and cold, it will need careful preparation. It may be necessary to drain the land, afterwards digging it deeply, incorporating, at the same time, a liberal dressing of light manure and leaf-mould, and also such materials as road scrapings and ashes from the bonfires. The Raspberry is a shallow-rooting plant, therefore the manure should not be buried too deeply. If the soil is light and naturally well drained, it will only be necessary to trench it and work in a liberal amount of well-decayed manure. The planting of the canes may be carried out in a similar manner to that advised in the calendar for January 15.

Walnuts.—The crop of Walnuts is a very light one in most places. The nuts have commenced to drop, showing that it is time for them to be knocked off the trees for storing. The husks

should be removed; but if it is not convenient to do this for a day or two, the nuts should be spread out thinly in a dry, airy shed, for when they are placed thickly together they soon become heated, and the husks decay, causing the shells to become discoloured, and thus detracting from their appearance on the dessert table.

The Blackberry and Loganberry.—If not already done, these plants should be pruned without delay. Cut out all the old fruiting canes and weakly growths, leaving only a few of the best shoots for next season's fruiting. When the pruning is finished, let the new canes be tied loosely to their supports, in order that they may receive the full benefit of the sunshine. All Brambles are gross feeders, and require a deep rooting medium. They are much benefited by frequent applications of liquid manure.

General work.—Continue to gather the late varieties of Apples and Pears as they become ripe, but do not be in too great a hurry to harvest them, as most varieties are later this year than usual in maturing, and if they are gathered too soon they will probably shrivel. Where grease bands are applied on Apple trees for trapping the winter moth, they should be placed in position at once. The females usually emerge from the soil early in October, and ascend the trees to lay their eggs. They are later than usual in doing this this year, not one having been noticed up to the present in these gardens.

THE FLOWER GARDEN.

By E. BUCKETT, Gardener to the Hon. VICARY GIBBS, Abdenham House, Hertfordshire.

Preparation for planting.—Any transplanting of shrubs intended to be done this season may be commenced shortly, and now that the ground is in a good condition the holes may be prepared in advance. The holes, when in not too prominent positions, form excellent receptacles for depositing leaves and other vegetable rubbish, which will quickly decay, and the humus will benefit the tree or shrub that is to be planted. Where much planting is to be undertaken, it may be proceeded with at once, as most deciduous subjects have lost their leaves, and often during mid-winter the work has to be suspended for a considerable time, owing to unfavourable weather conditions. In cases where it is necessary to remove any plants, trees, or shrubs before their new positions can be got ready, the roots should be temporarily covered with soil, or old mats, to keep them moist. Labels attached to plants that are heeled in temporarily often get covered with soil, and rot, and this should be guarded against. The preparation of the beds for the reception of the spring bedding must shortly be undertaken. Notwithstanding the fact that the present occupants are so fine just now, and that they will probably remain presentable for some time, it is necessary to get their successors planted and established before inclement weather comes. The ground must be well cleaned of rubbish, dug thoroughly, and receive a liberal addition of well-decayed manure. Endeavour to do this work when the weather is fine, as it can then be carried out more expeditiously and cleanly. Avoid damaging the walks or turf in the neighbourhood of the beds. The plants of the various spring-flowering subjects have grown well, and their removal should be carried out with as little check to them as possible. Such plants as Wallflower in variety, *Myosotis*, *Arabis*, *Polyanthus*, *Silene*, and *Anemone* should be lifted with a small handfork, and carefully transferred to the beds. In very cold localities, it is customary, and of advantage, to mulch the beds with cocoanut fibre. Where Tulips and other bulbs are employed in conjunction with the plants already named, they should be planted at once, by means of a dibber. In places where game is preserved, hares and pheasants do a great amount of harm in the garden in severe weather, pheasants being very fond of *Crocus* and other bulbs, and scratching a good depth to find them.

General remarks.—Violas are now producing plenty of cuttings, and, if thought necessary, a further supply may be rooted in a shallow layer of fine soil in a cold frame. Fallen leaves must be swept up continuously: it is much easier to remove them when freshly fallen, and the constant brushing of the lawns stimulates the growth of the grass. The fallen leaves provide excellent material, when rotted, for many purposes.

FRUITS UNDER GLASS.

By B. GOODACKER, Gardener to Sir ERNEST CASSEL,
G.C.B., Moulton Paddocks, Newmarket.

Strawberries.—The plants in pots intended for forcing next spring may now be stood in cold frames until required. A sprinkling of soot on the floor of the frame acts as a check to worms. Place the pots closely together, packing them up to their rims with leaves. The lights may be left off until heavy rains prevail or frosts threaten. Ventilate the frames freely except during frosty weather. See that the glass is clean and sound, so that the plants may obtain the maximum amount of light, and not be injured by "drip."

Cucumbers.—The later batches of plants will, with proper treatment, continue to produce a few fruits for a time, and will spare the young plants grown for a winter supply from fruiting before it is absolutely necessary. Cucumbers require skilful treatment in order to yield a regular supply throughout the winter. Overcropping must be avoided, and the growths thinned and stopped regularly, distributing the shoots thinly and evenly over the trellis. Cut the fruits whenever they attain to a fair size, so as not to overtax the plants. Pay strict attention to the temperature of the house and such routine work as watering, ventilating, and damping. A night temperature of 70 degrees, with a proportionate increase by day is suitable. Admit fresh air, whenever possible, for an hour or two in the early part of the day, closing the ventilators about 1 p.m., at the same time giving a gentle syringing with tepid water. See that the plants do not suffer from lack of moisture at the roots. Such stimulants as liquid manure are best discontinued for the present, as they promote a rank growth. Nourishment is best supplied by light top-dressings of fibrous loam, to which has been added a little peat, some fertilizer, and a small proportion of well-sweetened horse-droppings. Keep a sharp look-out for red spider, which is sure to appear sooner or later, and take prompt measures for its destruction. Sponging with a solution of soft soap is the safest measure to adopt.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Preparations for trenching.—Advantage should be taken of dry weather to convey manure to vacant plots in readiness for trenching, which should be commenced as early in the season as circumstances will permit. The heaviest and worst land should be trenched first, in order that it may be exposed to the influence of the weather for as long a period as possible. As land is only trenched occasionally, liberal supplies of farmyard manure should be incorporated whenever it is done. It may be considered an expensive operation, compared with digging, but it will repay any cultivator to trench as much of his land each season as possible.

Cabbage.—Cabbages planted a month ago should have the soil stirred, and any plants that have failed replaced. Another planting may yet be made for late spring supplies; the roots should be placed tightly in the ground, and a liberal watering given. Dust the foliage frequently with soot to keep slugs and other pests in check. If any plants remain in the seed-bed they should be transplanted into beds 4 feet wide, allowing 4 inches between the plants. Treated in this manner, they will provide a stock of plants for putting out in March.

Cauliflower.—Plants raised from seeds sown a month ago for spring planting should now be ready for potting into large "60" pots. They should be potted tightly, using turfy loam. Place them afterwards in cold pits on beds of ashes which should not be more than 18 inches from the glass. The lights may be kept in position and the plants shaded for a few days after potting, but when growth commences they should be removed, and the plants exposed fully to sun and air until the approach of frost, when the glass covering should be replaced at night. The lights should be removed on mild days throughout the winter to keep the plants from becoming drawn. Care should be taken that the plants do not suffer from want of water at the roots during the winter or disappointment is almost sure to follow. Cauliflower plants may also be pricked and transplanted into beds in cold pits for the winter. Allow a distance of 6 inches between the plants each way. The soil should not be too rich

or the plants will be liable to grow too freely, and, when planting time arrives, suffer a severe check in consequence. We grow 7,000 plants of these Cauliflowers at Frogmore, and nearly all are in large "60" pots; they are planted in the first week of April, and cutting commences at about the first of June.

Endive.—This salad may be planted in cold pits to afford supplies through the spring months. If plenty of light and air are afforded very little difficulty should be experienced in keeping these plants in good condition through the winter. The greatest danger is from damping, and may be guarded against by giving an abundance of air whenever the weather is favourable. Endive plants which have attained to their full size in the open garden should be tied up for blanching when they are perfectly dry. If slugs are troublesome amongst salad plants they may be destroyed by dusting the whole surface of the bed with hot lime in the early morning.

Parsley.—Plants growing in pits for winter supplies should have the leaves picked closely now in order to encourage fresh growth before the season is too far advanced. It is a mistake to allow the leaves to become crowded at this season, even if not required for use. The same remark applies to Parsley in the open garden which may have become overgrown, although leaves were gathered a few weeks ago.

Leeks and Onions.—Late plantations of Leeks should be watered freely with liquid manure to keep them growing freely as late in the autumn as possible. Hoe deeply between the rows as soon as the soil becomes workable after watering. Small sowings of Onions may be made in boxes every 10 days and placed in a cold pit for use as green salad during winter. Chives may also be grown in slightly heated pits for the same purpose.

Rhubarb.—Roots may be lifted as soon as the foliage has died down, and placed under a wall, simply covering them with mats to prevent the wind from drying them unduly. This will give the roots a check, which is necessary, as Rhubarb is not forced easily at this season.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE,
Bart., Burtford, Surrey.

East Indian House.—Much of the time will now be taken up in repotting many of the cool Orchids, but there are other plants which should not be neglected. On looking through the warmth-loving Cypripediums, it will probably be found that some of these plants which flowered during the summer months are making considerable growth. Some may be in a pot-bound condition, and, if this is the case with any of the stronger-growing varieties, they will soon lose their older foliage if more root-room is not allowed them. Such plants should be repotted as soon as possible. Cypripediums grow quickly, therefore it is advisable to put them into pots at least two sizes larger than those they now occupy. Particulars as to a suitable compost for Cypripediums and directions as to repotting were given in a former Calendar (see p. —). Arrange the plants on that side of the house where there is the least sunshine, but where they will be exposed to the light, and maintain a moist atmosphere around them. Plenty of water at the root is necessary when the plants are growing freely. Such plants as *C. Stonei*, *C. Rothschildianum*, and other species of similar habit do not like repotting, especially when their roots have to be disturbed, therefore, if such plants have sufficient root space, and the soil is still in good condition, they may be top-dressed. Remove any portion of the compost which has become sour and replace this with fresh material. The *Dendrobium*s should be examined several times each week and any plants which have finished growing should be removed to a drier and more freely-ventilated atmosphere.

Cattleya House.—In this house such plants as *Vanda Kimballiana* and the rare *V. Watsonii* are developing their flower-spikes. Until the flowers open, the Sphagnum-moss on the surface of the compost should be kept moist and in a growing condition, but after the flower-spikes are cut very little water is needed to keep the terete leaves plump. *V. tricolor*, *V. suavis*, and others of that section which have lost some of their lower leaves, and will need repotting a few weeks hence, should have the water supply lessened gradually until that time, the plants

being more easily managed when the moss is somewhat dry.

Intermediate House.—Strong, healthy plants of *Cymbidium Tracyanum*, *C. Lowianum*, *C. eburneo-Lowianum*, and the reverse cross *C. Lowie eburneum* now showing their flower-spikes should be afforded plenty of water at the root, and the others should be kept rather dry at the root for several weeks longer, otherwise growth will commence and the plants fail to bloom. Many of the cooler-growing Cypripediums, as *C. Spicerianum*, *C. Charlesworthii*, *C. Faircannum*, *C. Leeannum*, *C. insigne*, and its varieties, are showing their flower-spikes. Those of *C. Leeannum* and *C. insigne* should be guided carefully through the foliage and tied to small, neat sticks. *Cologyne cristata* and its varieties should be encouraged to finish up strong-flowering bulbs by affording the plants abundance of root moisture till the flower-spikes show, and occasional applications of weak cow-manure water. Keep the plants near to the roof glass, so that they may dry quickly and need frequent waterings. Examine closely the undersides of the leaves for small, brown scale insects, as it is much more easy to do such work now than when the spikes are developing or when the blooms open. The rare *C. Veitchii* has just passed out of flower. For several years this plant has been difficult to manage, but after potting it firmly in well-drained *Osunda* fibre and Sphagnum-moss, and keeping it well supplied with water, no further trouble has been experienced. After various trials, the plant has grown best when placed in a moderately-shaded position in the *Cattleya* house.

Cool House.—In this house the plants preparing to bloom include several species of *Oncidium*, as *O. crispum*, *O. Forbesii*, *O. varicosum*, and *Odontoglossum Edwardii*. It is very easy for these plants to over flower themselves, and afterwards to gradually dwindle away. To prevent this, the spikes should be removed as soon as all the flowers are open, but weakly plants should not be allowed to bloom at all. Plants of *Oncidium concolor* will now require less water at the root, while such *Odontoglossum*s as *O. Rossii*, *O. Cervantesii*, *O. Humeannum*, *O. aspersum*, and *O. Galeottianum*, which are now growing freely, should be plentifully supplied with moisture. These remarks apply also to *Sophranitis grandiflora*. It is advisable to elevate plants of this species well up to the roof glass at the warmest end of the house.

THE APIARY.

By CHLORIS.

Seasonable hints.—No further feeding is necessary after this date. Most beekeepers will have succeeded in bringing up the stores to nearly 50 lbs. This will cause much economy in bee life next spring, because with plenty of food, there will be no need for the bees to search for nectar on cold and stormy days. The hives should be thoroughly overhauled, and the brood chamber reduced to six or eight frames by means of the division board. Good and dry quilts should be used which will exactly cover the brood chambers, so as to leave no gaping corners. Between the quilts, the heat of the hive may be increased by using a sheet of brown paper. It should be unnecessary to remark that the hives cannot be made too cosy. The entrances should be closed, so that only one bee may enter at a time, and if the entrance thus secured be zigzag, forming a "V," it will help to shut out the sunshine, and thus reduce the great temptation to the bees to take a cleansing flight on bright sunny, but otherwise cold days. When the bright light is reflected from the snow bees often venture out and suffer from the cold.

Painting.—Knowing that dysentery is caused by dampness, the beekeeper should see that the hives are painted without delay, if this important work has not already been done. The summer heat causes the wood to split, and all the openings should be stopped. This is best done with putty after the first coat of this paint has been applied. In all cases before painting is begun the surface should be scraped well, all loose putty removed, and then the whole well sandpapered. By this means a good and lasting paint surface will be secured. The amateur painter makes one great mistake when performing what he imagines to be a simple operation, he puts on the paint too thickly, but does not work it sufficiently into the wood.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

THURSDAY, OCTOBER 20—
Fruit Congress at Hexham (3 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—49.5°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, October 12 (6 P.M.): Max. 55°; Min. 50°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, October 13, (10 A.M.): Bar. 30.2; Temp. 56°; Weather—Dull.

PROVINCES.—Wednesday, October 12: Max 53° Ireland E. coast; Min. 47° Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, by Protheroe & Morris, at 67 & 68, Cheapside, E.C., at 10.30.

TUESDAY—
250,000 Rhododendrons and other Stock, at Matlock Moor Nursery, Matlock, by order of Mr. E. W. Richards, by Protheroe & Morris, at 12.

TUESDAY AND WEDNESDAY—
Sale of well-grown Nursery Stock, at the Shortlands Nurseries, Ash, Surrey, by order of Mr. H. Sleet, by Protheroe & Morris, at 12.

WEDNESDAY—
Palms and Plants, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.
Rare Cypripediums from the "West Point" collection of Orchids, by order of S. Gratrix, Esq., at the Coa Exchange, Manchester, by Protheroe & Morris, at 1.30.

THURSDAY AND FRIDAY—
Clearance Sale of Nursery Stock, at Woking Nurseries, Woking, by order of Messrs. Jackman & Son, by Protheroe & Morris, at 12.

FRIDAY—
Choice Established Orchids, at 67 & 68, Cheapside, E.C. by Protheroe & Morris, at 1.

Prices of Nicotine Preparations.

The value of nicotine preparations in destroying insect pests is universally recognised. The importance of keeping down insect pests is both realised by horticulturists and insisted on by the Board of Agriculture. Hence it would seem to be a natural conclusion that no accidental circumstance would be allowed to force up the price of a commodity of so much value as the Tobacco from which nicotine preparations are made; or that as soon as it was discovered that the price of the raw material had advanced to an almost prohibitive figure, our agricultural authorities would have taken effective steps to secure a reduction in the price.

The present position of affairs, however, with respect to nicotine and Tobacco preparations does not appear to warrant us assuming that such steps have been taken. In spite of the agitation carried on by the National Fruit Growers' Federation, nothing appears to have been done towards remedying the present grievous and unnecessary state of affairs. The problem to be solved by our authorities is a simple one. They have to safeguard the revenue derived from the heavy import duty on Tobacco, and, at the same time, to remit the duty on denatured Tobacco—that is, Tobacco rendered unsmokeable even by the most inveterate smoker.

The present position is too ridiculous to continue and leads to the same result as

would be produced were the Revenue officers to enter into a conspiracy with noxious insects to frustrate the efforts of horticulturists to exterminate the pests.

The problem is no new one. After many years, the commonsense advocacy by Mr. Haldane in the House of Commons put an end to a similar state of affairs with respect to alcohol. Till that time, the Revenue officials had exacted the uttermost farthing in the way of duty from all alcohol, whether it was to serve as a beverage or as a chemical reagent. Hence it was that those industries requiring the use of large quantities of alcohol began to go to Germany, where administrative ignorance of the kind tolerated in this country is not allowed. The difficulty of facilitating the use of such commodities of alcohol, whilst safeguarding the Revenue, is got over in the case of that substance by admitting the denatured article free of duty. In the case of alcohol, for example, France allows the addition of material which gives a bright green colour to the spirit and warns the user as well as protects the Revenue. What is wanted in order to remove anomalies such as the present price of nicotine preparations is some joint committee of officials of Board of Trade, Treasury and other departments, in order to watch that laws made with one object may not incidentally do damage in unsuspected directions. The remedy in the case of nicotine compounds is to admit denatured Tobacco free of duty, and if no system of denaturing Tobacco satisfies the requirements of the Revenue officers, it should be made worth some chemist's while to find one. A tax on Tobacco was not designed to serve as a bounty to noxious insects and must not longer be allowed to do so.

Monument to Mendel.

As was announced in our last issue, a monument to Gregor Mendel was unveiled on the 2nd inst. at Brünn, in Moravia, the great manufacturing town in which he lived and worked for so many years. For the following interesting account of the inaugural ceremony we are indebted to Professor Bateson, who was invited to attend as a representative of the Science of Genetics in this country.

The proposal to erect the memorial was made five years ago, the initiative being taken by Dr. N. von Ilis and various residents in Brünn, with the co-operation of Professor von Tschermak, one of the original re-discoverers of Mendel's work. The fund was chiefly subscribed in Austria, but contributions were also received from naturalists in most of the countries of the world, including a handsome donation from Mr. Andrew Carnegie. Formal invitations to attend the function had been sent to only a few of the foreign subscribers, as it was thought unlikely that many of them would be able to undertake the journey. Thus it was that the celebration was primarily local in character. Nevertheless, there was a fair attendance of scientific men of many nationalities including Messrs. Erwin Baur (Berlin), Cuboni (Rome), Hagedoorn (Paris), Lotsy (Haarlem), Nemeš (Prague), Nilsson-Ehle (Svalof), Przišram (Vienna), Rümker (Breslau), von Tschermak (Vienna), de Vilmorin (Paris), and W. Bateson (London). The

University of Vienna was officially represented by the Rector Magnificus, Professors Katschek, Groben and Wettstein, with a large contingent of the junior members of the zoological and botanical staffs. A special welcome was given to Drs. A. and F. Schindler, Mendel's nephews, and to Herr Johann Mendel, a collateral member of the family, and the only one now bearing the name.

An exhibition of relics of Mendel, which was held on the previous evening, included a small herbarium and many interesting objects, especially the, as yet, unpublished replies which he received from Nägeli to the well-known letters in which his discoveries were communicated. This important correspondence is soon to be printed. No hope is now entertained of any further discovery of manuscripts. It is known that Mendel gave a lecture on heredity in bees to the Brünn Society of Agriculturists, but it was not reported in their proceedings, and at Mendel's death the note-books were probably sold as waste-paper. Another remarkable exhibit was the manuscript record of sun-spots and meteorological events, minutely observed every day throughout a long period of years at a time when careful study of the sun's disc was still a novelty.

The celebrations of the following day began with a Mass in the ancient church of the Augustinian Cloister, of which Mendel was abbot. The company went next to view the little garden in which he had grown his plants, and the monastic buildings surrounding it. The monument standing in the square outside the convent was then unveiled. In Moravia, music is indigenous, and odes were superbly sung by two male choirs. Speeches in honour of Mendel and descriptive of his work were delivered by Prof. von Tschermak and others.

The statue is of marble, representing the famous investigator as a young monk standing beside a background of Peas and Beans, as if pausing in his work. Below is a tablet, bearing kneeling figures, male and female, with clasped hands, typifying human marriage and the application of Mendel's discovery to human affairs. The proceedings concluded with a banquet and further speeches, notably one from M. Philippe de Vilmorin, expressing the deep obligation which he, as a practical man, felt to the hero of the day, and emphasising the value of the Mendelian discoveries in their bearing on the practice of agriculture and horticulture.

FLOWERS IN SEASON.—MESSRS. JOHN FORBES, LTD., Hawick, have forwarded varieties of their strain of Pentstemon, a flower which this firm has made a speciality. The spikes were in every case large, with bold, finely-coloured flowers. The varieties, with Messrs. FORBES' description of their colours, were as follow:—Lady Clementine Waring, scarlet with crimson throat; Prosperity, crimson-scarlet, throat veined with chocolate; Mix Michie, white, heavily suffused with rosy-lilac; Mrs. Michie, bright scarlet, throat white; Lady Violet Brassey, pale pink; Mrs. Oliver, rosy-scarlet; Colonel Seely, purple-crimson, with white throat; Alfonso, soft pink, margined with crimson; Orville Wright, carmine, and white throat spotted with crimson; Willmar Wright, cinnamon, suffused with scarlet; Miss Lella Stewart Peter, rosy violet; and Jessie, white, slightly suffused with pink.

WISLEY-STUDENTS' DIPLOMA EXAMINATION, 1910.—The following particulars are sent by the Rev. W. WILKS, M.A., Secretary of the Royal Horticultural Society. The Wisley Diploma Examinations in 1910 were held in March and July for those students whose two-year courses of instruction terminated in these two months respectively. Mr. JOHN FRASER acted as external co-examiner with the Laboratory Director on each occasion in both principles and practice of horticulture. The sets of questions given in March and July, though different, were of equal difficulty. In addition to this examination, the merits of an essay on a horticultural subject and of botanical and entomological collections made, together with the powers of intelligent observations shown, are adjudicated upon in awarding the diploma. The collated results show the following order of merit, those taking the examination in March being distinguished by an asterisk:—1, H. F. CLOUGH; 2, J. W. McCAIG; 3, R. McK. ROBSON; 4, W. CARTWRIGHT; 5, L. C. DYER; 6, R. L. BRAZIER*; 7, A. F. LEVERETT*; 8, E. KRUMBHOLTZ*; 9, H. LANE. Two other students, failing to satisfy the

Some workers escape the rash altogether; others are attacked once only; some individuals are so susceptible that they cannot touch the flowers. The most severe ill effects are felt when the skin of the hands is cut or abraded. Some varieties of the genus *Narcissus* are more powerfully irritant than others. The Daffodil known as *Campanello* is the most irritant, followed by *Narcissus ornatus*, *N. gloriosa*, the Scilly White, and *N. Grand Monarque*; but all other kinds may produce the same effect. Messrs. BULLOCKS, who have examined the plant at the author's instance, have not been able to isolate the irritant substance. The expressed juice of the fresh plants, an alkaloid extracted from them, and the essential oil obtained from the essence and pomade of Jonquil, gave negative results when applied to the unbroken skin. The juice, and the tincture of fresh flowers, however, caused irritation when applied to a surface abraded with a needle, and the former was specially active in this respect. The actual cause of the action is not yet explained; it has been suggested that the raphides which occur plentifully in plants of the N.O. *Amaryllidaceæ* may play some part. The

dark-brown streaks on the stems. On cutting across the stem, the vascular tissues are seen to be of a brownish colour, and microscopic examination reveals the presence in the vessels of vast numbers of the bacterium. The fruit also becomes blotched, and the parts affected by the blotches finally collapse. The symptoms in the Potato are similar, and, in the later stages of the disease, the presence of the bacterium in the tubers is indicated by a brown ring some little distance from the outside of the tuber. Inasmuch as *Bacillus solanacearum* is distributed by insects, the most promising preventive measure would appear to be the use of a spray fluid which contains an insecticide, such as arsenate of lead.

FRUIT AND FLOWERS IN QUEENSLAND.—We have received the following note from the London correspondent of the *North Queensland Herald*:—Half an hour's stroll in the grounds of the Acclimatisation Society at Brisbane will secure an inspection, amongst others, of the following:—Strawberries, imported from England, France, the United States, and New Zealand, grow alongside of Pineapples which have come from Florida,

FIG. 118.—GROUP OF SCENTED-LEAVED PELARGONIUMS AS GROWN AT GUNNFSBURY.

aminers, the diploma has not been awarded to them. The following recognitions have also been given:—The Student Demonstratorship mentioned in the syllabus has been offered to Mr. CLOUGH; the Sutton prize has been awarded to Messrs. J. W. McCAIG, R. McK. ROBSON, and W. CARTWRIGHT; the Nicholson prize of £2 2s. has been awarded to Mr. J. W. McCAIG for observations; the £5 offered by Mrs. G. F. WILSON for collections has been awarded as follows:—1, Mr. H. F. CLOUGH; 2, Mr. R. McK. ROBSON; 3, Mr. L. C. DYER; 4, a special prize for a collection of fungi to Mr. J. W. McCAIG.

"LILY RASH" AMONGST FLOWER PICKERS.—Dr. DAVID WALSH has recently made an interesting communication to the *British Medical Journal* on the subject of the so-called "lily rash" which attacks the flower pickers of the Scilly Isles, who have to handle immense quantities of Daffodils and Narcissus during the season of gathering the blooms. These are more or less subject to an irritating eruption on the hands and arms, and sometimes also on the face.

symptoms seem to be similar to those observed in many other cases of plant rashes; especially in the immunity of some individuals and the extreme susceptibility of others. *Pharmaceutical Journal and Pharmacist*.

BACTERIOSIS OF TOMATOS AND POTATOS.—This disease, of comparatively recent introduction into Great Britain, has been known for some time in America, where its nature and origin have been investigated by Dr. EDWIN F. SMITH. From a note in the *Journal of the Board of Agriculture* (XVII., No. 4, July, 1910), it appears that the disease has now become serious and endemic in at least two localities in England. The parasite (*Bacillus solanacearum*), which is responsible for the Bacteriosis, gains access to the stem at its tip, brought thither by insects, and, penetrating to the internal tissues of the plant through punctures made by insects, spreads downward through the stem. As the result of infection, the uppermost leaves wilt, curl, and turn yellow. Later, many small, scattered, blackish-brown blotches appear on the leaves, and long,

the West Indies, and Singapore; also Bowen Park seedling plants of both Pines and Strawberries. English and Himalayan Blackberries, stand within a stone's throw of Mangoes from Bombay and the Mauritius, and a Custard Apple from Brazil. On the margin of a large patch of tall Sugar canes, consisting mostly of Bowen Park, West Indian, and Demeraran selected seedlings, can be seen Rack and Musk Melons. The filling of one section of the grounds is suggestive of an extensive itinerary, owing to flourishing examples of the following plants coming under review:—Rhubarb from Siberia, English Apples and French Lavender, Spanish Chestnuts and Italian Olives, a Mulberry from Constantinople, Smyrna Figs, Persian and Soudanese Date Palms, Caffea and Ricinus from Arabia, a hedge of Kai Apples from Cape Colony, Jackfruit and Tamarinds, Teak and the Toddy Palms from India, Cinnamon from Ceylon, and many East Indian plants, such as Zingiber and Rice; *Arenga saccharifera* from the Philippines, Tea from China, Central Asian Buckwheat and Japanese Persimmons, California Redwood,

Rondeletia and Monstera from Mexico, Limes from Tahiti, and Flax from New Zealand, with many plants from intervening portions of South America, including Cocaine, Tobacco, Guavas, and Tapioca; Granadillas, Logwood, Gutta-percha, and Mahogany from tropical and Central America, Allspice from the West Indies, and Pecan Nuts from Texas. A flower border in the same grounds contains Daisies and Hibiscus, Ranunculus, Snowflakes and Ipomœa Horsfalliæ, Jonquils and Gardenias, Larkspurs and Poinsettias, Pelargoniums, Fuchsias, Hydrangeas, Wall-flowers, Sweet Peas, Dahlias, Freesias, Chrysanthemums, Hollyhocks and English Ivy, along with Azaleas, various Orchids and Allamandas. Without entering the shelter and glasshouses, in which it is usual to protect plants designed for the tropical north, such as Cocoa and Vanilla—and passing the packing shed, in which may be seen in the winter time such plants as Cherries and other stone fruits, destined for the elevated inland portions of Southern Queensland—one minute's stroll over a sward composed mainly of tropical Buffalo Grass and English Clover, leads to a pond, within which, flanked on one side by Burmese Bamboos, and on the other by a Weeping Willow, can be seen growing from seeds ripened in the open air, the British white Water Lily, culled originally in a tiny Welsh streamlet, and Victoria regia from the Amazon.

PHYLLOXERA.—We have received a communication from the Acting Trades Commissioner of the Union of South Africa, drawing attention to an extract from the South African Union Government *Gazette* of August 19, 1910. This extract refers to regulations for the prevention and spread of *Phylloxera vestatrix* amongst vines in the Province of the Cape of Good Hope. The regulations provide, *inter alia*, that when any trees, plants, tubers, roots, bulbs or other subterranean produce are intended for importation they shall be accompanied by a sworn declaration from the consigner that they contain no vines or portions of vines; that they have been passed as free from insect pests and disease by the Government examining officer at the port of entry; and that they are perfectly free from *Phylloxera vestatrix*. The introduction of Grapes into the division of Graff Reinet is prohibited.

HEXHAM FRUIT SHOW AND CONGRESS.—We may remind readers that the Four Northern Counties Fruit Show and Congress, of which particulars were given in the issue for July 2, p. 8, will open on Thursday next, October 20, and continue for three days. The prizes for fruit include four silver cups and four silver medals, besides gold and silver medals and certificates offered by the Royal Horticultural Society. The Congress proceedings will take place during the afternoon and evening of each day. There will also be demonstrations of spraying machines at work, and lectures on fruit bottling. The exhibition and congress will be visited by delegates appointed by the Royal Horticultural Society, the Royal Caledonian Horticultural Society, and the Scottish Horticultural Association. The general Secretary is Rev. J. BERNARD HALL, Dalston, Cumberland.

L.C.C. CHRYSANTHEMUMS IN THE PARKS.—The annual Chrysanthemum shows at the L.C.C. parks were opened to the public as follows:—Southwark Park, on October 8; Battersea Park, Brockwell Park, Finsbury Park, Victoria Park, Waterlow Park, all on October 15.

ARTIFICIAL MANURES AND MUSHROOM CULTIVATION.—Experiments carried on by Mr. GUFFROY, in France, point to the conclusion that the addition of phosphates to the manure used for Mushroom beds leads to a considerable increase in yield.

BOTANICAL EXPLORATION IN THE MALAY STATES.—The current number of the *Kew Bulletin* contains an interesting account of a journey made recently by Mr. H. W. RIDLEY, Director of the Botanic Gardens, Singapore, to the States of Kedah, Perlis, and Setul, in the North-west of the Malay Peninsula. The narrative, which is in the form of a letter from Mr. RIDLEY to Sir JOSEPH HOOKER, makes it clear that this region is of considerable botanical interest. The land of the north-west of the peninsula is generally flat, and is undoubtedly of modern formation, the limestone hills, which rise out of the flat plain, representing what, not so long ago, were islands in a shallow sea. At one period, the southern part of the States of Malay—all south of Kedah Peak—was cut off from the Siamese States by sea. The flora of the north-west differs markedly from that of the southern part of the Malay Peninsula, the limestone hills particularly having a characteristically homogeneous flora of plants, such as *Cycas Siamensis*, *Impatiens mirabile*, *Dracena cordylinoides*, *Euphorbia trigona*, *Hapaline*, *Amorphophallus hæmatospadix*, and *A. carnea*, *Calanthe rubens*, *Eulophia Keithii*, and *Chirita Viola*. Mr. RIDLEY found *Melaleuca Leucadendron* growing as small forests in the damper places, fringing the outer edge of the tidal flora. Inasmuch as the plant is undoubtedly wild in these situations, the tradition that *Melaleuca Leucadendron* was introduced into the Malay Peninsula by the Dutch seems now to be disposed of finally. Many new plants were obtained, and the majority have, in Mr. RIDLEY's opinion, not Malayan, but Indian affinities. As the result of his exploration, Mr. RIDLEY concludes that the Malayan flora ceases about Gunung Terai, and that north thereof is a Siamese flora. It is to be hoped that Mr. RIDLEY will be able to give us soon a full account of his interesting collections.

PUBLICATIONS RECEIVED.—*Plant Life in Switzerland*, by E. A. Newell Arber. (London: John Murray, Albemarle Street, W.) Price 7s. 6d. net.—*Alpine Flowers and Rock Gardens*, by Walter F. Wright. (London: Headley Brothers.) Price 12s. 6d. net.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

SUMMER FLOWERS IN THE SOUTH-WEST.—Many plants were omitted from my last note (see p. 225), and a few of these may now be considered. The fine *Calceolaria integrifolia*, which is here one of the best of the summer flowering shrubs, and will grow to a height of 6 feet, was a blaze of gold during July and held blossoms in diminished quantity throughout the autumn. Some writers state that the plant is too tender for the open garden, but specimens have survived 23° of frost. *Cimicifuga racemosa* was checked by shifting it from the other garden, and instead of the shoots being 8 feet high as last year, they only reached a height of 3 feet. *Cypella Herbertii* has flowered, but not so freely as in previous years, doubtless owing to the dull season in 1909. *Gladiolus Saundersii* has been superb and has increased greatly; a new variety named *superbus*, grown here for the first time, has larger flowers than the type. *Candollea tetrandra* is a pretty, small shrub, which has been covered with yellow blossoms for some weeks past. *Solanum aviculare*, with its large, deep purple, golden-centred flowers, is a handsome but tender shrub, and two specimens have been lost here from cold in the last six years. This spring, a self-sown seedling appeared; the plant is growing very rapidly, and is now more than 5 feet tall and as much through. The largest example known to me grew in Mr. Howard Fox's garden at Falmouth. The specimen was about 15 feet in height, but the plant was killed by the hard winter of four years ago. *Tricuspidaria lanceolata*, better known as *Crinodendron Hookeri*, bloomed splendidly, and flowers were also borne on the white-

flowered *T. dependens*, which is said to be a very shy bloomer. *Buddleia variabilis superba* is a great improvement on *B. v. Veitchiana* being deeper in colour, and the older variety will now be discarded. *Callistemon salignus* has been covered with its crimson bottle-brush flowers, but a young plant of *L. lanceolatus* has not yet flowered. *Eucomis pallidiflora* produced a flower-spike well over 2 feet in height; this species is a great improvement on *E. punctata*, the blossoms being white with the faintest tinge of green. *Bignonia speciosa* from Uruguay bore its long, trumpet-shaped, wide-mouthed lavender-coloured flowers against a south wall in a neighbouring garden, and a bush of *Crassula coccinea* has been bright with flower. Close to it is growing a specimen of *Celmisia coriacea*. Last year, there was a larger plant near by, which flowered well and then died. This year *C. incana* flowered, but I have been very unfortunate with my *Celmisias*, and have lost quite three-fourths of my stock. *Montbretia Prometheus*, of which two dozen plants were obtained this year, is a glorious plant, being by far the finest variety. A small plant of *Romneya Coulteri* endured the shift and has made good growth, but a fine specimen of the other Californian Tree Poppy, *Dendromecon rigidum*, never recovered from its removal. It has been replaced by a small plant of the same species, and this has already flowered. The Mexican *Inga pulcherrima*, a rare shrub, has produced its scarlet flowers against a south wall in a friend's garden, where the very scarce *Colquhonnia coccinea* has also bloomed. In August, *Cassia corymbosa* commenced its floral display, and is now a sheet of bright yellow. It will retain flowers until close upon Christmas. *Commelina celestis* is a lovely plant in the morning when its bright Gentian-blue flowers are expanded, but these close soon after twelve o'clock, and in the afternoon the plant is unattractive. The white variety is also grown here, but it cannot compare for effect with the blue type. A large plant of *Dianthus Atkinsonii* has been a sheet of deep crimson colour and looks very healthy. Many appear to lose this plant, but here the flower heads are cut off directly they fade, so that the plant is not weakened by seed production. *Malvastrum lateritium* has been charming with its flesh-pink flowers marked within with a carmine bar, whilst *Sphæralcea Munroana*, formerly classed as a *Malvastrum*, has been smothered with its pale red blossoms. The Lion's Tail, *Leonotis Leonurus*, against a south-west wall, promises to be a superb sight in a short time. The first of its flower-shoots are already perfected, and as there are over 60 flower-bearing shoots, it should be a wonderful sight when in full bloom. The blossoms, which are a glowing orange-scarlet in colour, are developed in whorls one above the other, some shoots having six whorls, the largest of which measure 17 inches in circumference. The plant is a native of South Africa, and is tender. *Wyndham Fitzherbert*.

FRUITS AT BELSIZE COURT, HAMPSTEAD.—In the gardens of J. S. Bergheim, Esq., in north-west London (gr. Mr. H. A. Page), the fruit crops have been highly satisfactory for many years, but especially so this season. The crops of Peaches began to ripen on May 16, and the last fruits are still remaining. Fruit trees in pots have cropped heavily, and the vines have borne well. The main crop of Apples in the open ground is obtained from pyramids planted 12 years ago, but some have been planted recently, and the fruits on all can be gathered by a man standing on the ground. The heaviest trees and finest fruits were on Lord Derby, Loddington, Blenheim Pippin, Cox's Orange Pippin, Betty Geeson, Reinette du Canada, Worcester Pearmain, Cox's Pomona, Gascoyne's Scarlet, and The Queen. The trained Pears on the walls have fine fruits on the *Beurré Bachelier*, *Doyenné du Comice*, and other favourite varieties. *B.*

HORTICULTURE IN YORKSHIRE.—In your issue for October 8 a reference was made to an attempt now being made to form a horticultural society in Yorkshire. For the benefit of your readers who may like to attend, I may say that the meeting mentioned by Mr. Donoghue (see p. 266) is fixed for 3 p.m. In addition to the offer of £5 mentioned by your correspondent, I have also guarantees which will carry us over this meeting. *Percy Clapham (sec. pro tem.)*, Brookleigh Gardens, Calverley, Leeds.

SWEET PEAS.—Those who are not members of the National Sweet Pea Society are indebted to the journals which publish the annual lists of Sweet Peas which obtain its recognition; but there are some things in the lists difficult to understand, and to those whose knowledge of varieties is slight I should say that they are sometimes misleading. Thus, in cream, buff, and ivory, the variety Clara Curtis is noted as superior to Paradise Ivory. In another class, Mrs. Hugh Dickson than Constance Oliver; again, Masterpiece than Frank Delby; once again, Elsie Herbert than Mrs. Townsend; Countess Spencer than Zarina; and Etta Dyke than Nora Unwin. Now it is obvious that, in each case, the two varieties are composed of distinct units, so distinct that they are all worth growing, if not by an exhibitor, at least by people who grow Peas for decorative purposes. It is to be remarked, too, that the name of a Sweet Pea does not always afford an indication of what it is. We see, let us say, Clara Curtis growing in many gardens in its own name, or one of its synonyms, and what a variety of form and size there is! What we do want to know about Clara Curtis is, who has the finest strain? Then, what a pity it is that so many inferior varieties are grown which displace others that ought to have a place in every garden. Gardeners ought to be aware that, in many instances, all the flaked flowers are valueless to them, and, generally, the maroons, and, in many instances, the John Ingman and Helen Lewis classes cannot be used with advantage on account of their colour. It is becoming more and more difficult to select colours in flowers to please people with refined tastes. Hence the value of a select list of the best varieties for home use. *R. P. B.*

THE CLASSIFICATION OF SWEET PEAS.—I am pleased to see that the committee of the N.S.P. Society have so far the courage of their convictions as to issue a list of desirable varieties, and to bracket any that are "too much alike." The man in the street has long been crying out about the immense number of names employed to distinguish varieties. This is, in my opinion, the bugbear of the whole business of Sweet Pea growing. Many people are so annoyed with the plethora of names they find when wading through catalogues that without some means of obtaining expert knowledge or information they give up selection, and simply grow a few sorts that they know cannot mislead them. I grew 40 new, or so-called new, varieties this season, and I am so disappointed at the result that I shall fill up the space in the future with some other flower—Roses for example. In the list of "too much alike" varieties published on p. 269, I find no fewer than 144 names—just a gross! How absurd it is for those responsible for the naming of the so-called varieties to think that the public are all so easily enticed to include even a modest few of those names issued! Fancy 10 names of maroon when one sort only is quite sufficient; then we have nine given of yellow and buff waved, with a further addition of six in the same colour section, but of the grandiflora type. For the expert with but limited means and space, the difficulty is to know what to leave out when making an annual selection, but what must the trouble be for the amateur with but a small amount of knowledge of the subject? *An Old Grower.*

POLLINATION OF SPENCER SWEET PEAS.—

The writer on this subject (see p. 257) states that it is probable that, in some of the "Spencer" forms, insect agency in fertilisation has to be reckoned with. I should say that the reason that some of the new type of Sweet Peas are very poor seeders is because the colour factors are unfavourable. I know of no colour of "Spencer" Sweet Pea that will not set seed as freely as any other annual plant in good summer weather, except Nancy Perkin, Earl Spencer, Tortoise-shell, and others of their shade in colour. It is merely because the Sweet Pea is so popular, and that seed is wanted in large quantities, that complaints are made. Bide's Orange King is, perhaps, the most beautiful of all orange shades; it is a small flower, and possesses a very clamped keel, but, like the Spencer forms of a slightly pale colour, its pollen is—or would appear to be—of a sterile character. Yet, like many other flowers in different species that have been a long time

reaching these salmon-orange shades, after a few generations have elapsed, the seeding improves rapidly, and a normal stage is eventually reached. "Stirling Stent" is a case in point. The examination of a "Spencer" flower might easily lead anyone to suppose that the seeding would be poor, but my experience of "Spencer" Peas, grown under normal conditions, is that every colour, except those I have named, when grown in a sandy soil, will set more seed than the plants can ripen properly. During the past six years I have grown more than 18 hundred stocks of Sweet Peas, and made notes on them all several times during their flowering period. I have also grown some stocks that are credited with unfixed characters for four and five years in succession, and they still throw the same rogues as at first. I am no believer in any bee, beetle,

FIG. 119.—DRACÆNA VICTORIA AS GROWN AT KELSEY PARK GARDENS, BECKENHAM.

fly, moth, thrips or other insect agency being the cause of untrue stocks of "Spencer" Sweet Peas, and my chief point against the idea is that the varieties that are unfixed always throw the same colour rogue or rogues year after year, and anyone who grows large numbers of these flowers knows quite well what colour rogues will appear in them. Many "Spencers," when artificially pollinated, produce nothing but perfectly plain flowers in the F₁ generation, and it is, perhaps, to the credit of Sweet Pea raisers that the buyers receive very few plain types from their "Spencer" packets of English-grown Sweet Pea seeds. There are, of course, many "Spencer" Peas that come absolutely true year after year, although they may be grown quite near together; and, apart from that, as the number of the varieties is in-

creasing, so is the impurity of stocks decreasing. There are several English firms who would, I think, guarantee many of their stocks as being perfectly true, although the whole of them would be grown and seeded in the same field within a few feet of each other. Of course, if the Peas for seeding are grown in a closed garden, in quantity, near together, they will not set seed. Planted in a field where the wind can blow through them, the sticks have to be fairly strong to support the crop. I have reason to believe that Sweet Peas seed better when planted across the quarters from which the prevailing winds of the district blow; and if, as in the south, they are mostly south-west, or, in dry times, north-east, the rows should extend east and west. I have saved seed for raisers by request this year from crowded trials, but only in the outer rows was there a good yield. To get seed the flowers must dry quickly. But is it not the same with edible Peas and other garden flowers, or why the cry we all make when the sky is clouded and the flower-heads of choice annuals are daily damping-off for the want of a gentle breeze and golden sunshine? *Charles Foster, The "Times" Experimental Station, Sutton Green, near Guildford.*

DRACÆNA VICTORIA.—Although *D. Victoria* is similar in habit of growth to *D. Lindenii*, it is superior in its variegation. The whole leaf being bright golden yellow, with a central band of light green, ornamented with narrow streaks, varying in colour from greyish to creamy yellow, the golden yellow intensifying with age. This Brazilian plant was awarded a first-class certificate by the Royal Horticultural Society on October 25, 1893, and Messrs. William Bull & Sons distributed the stock in 1899. The plant illustrated in fig. 119 was propagated from a stem-cutting five years ago. The height of this plant, measuring from the top of the pot, is 9 feet, and when the specimen was photographed it bore 170 leaves, which averaged 2 feet long by 4½ inches wide. It has been grown in a compost of yellow loam with sufficient sand to keep it porous. In the early stages of growth it was given a slight bottom heat, subsequently plenty of heat and moisture, with light at all times, which is essential for obtaining the development of colour, avoiding overhead syringing in winter, as the water is apt to lodge in the axils of the leaves. The specimen is in a pot which has a diameter of 11 inches. The Beckenham Horticultural Society awarded the plant a silver-gilt medal on July 14, 1909. The Royal Horticultural Society, on July 19, 1910, gave a similar award to a group of plants, of which this was one. *Mark Webster (gr. to E. J. Preston, Esq.), Kelsey Park Gardens, Beckenham.*

THE MOOR HALL GRAPES.—Cultivators of experience when inspecting the illustration of these Grapes (see p. 258) would know quite well that they must have been given excellent cultivation. Lately, I have been disappointed with the general average of Madresfield Court Grapes to be seen, not at shows entirely, but in private gardens. I do not think this Grape is cultivated so well as it was a few years ago. Let it be understood I do not allude to show specimens that secure leading prizes, but many growers when staging their examples must surely realise how poor have been the result of their exertions. It must be admitted that when properly grown Madresfield Court Grape is unequalled for size of bunch, berry, and flavour. In the last respect seldom has it been beaten where prizes were offered for flavour, even by Muscat Hamburg. I saw the first bunches of this Grape, grown so successfully by the late Mr. J. Meredith, in the Garston Vineyard near Liverpool, and have always had them in my mind's eye as an ideal, but on several occasions I was able to emulate them quite easily. The two most important reasons for non-success with this Grape are over-cropping and a lack of really good foliage. Maturity of wood and leafage is an important factor with it; small, weakly leaves, which result from overcrowding, have an injurious effect upon the ultimate success. My contention is that one good leaf—fully developed by exposure—is of more use to the vine than half a dozen weakly, overcrowded examples. The berries of Black Hamburg are excellent; from their appearance one would say they are perfectly hammered, which in this variety is a sure sign of good culture. *E. Molyneux.*

CELSIA CRETICA AS A BEDDING PLANT.—The illustration of *Celsia cretica* at Sezincot (see p. 267) certainly seems to prove that it is an admirable plant for bedding, as it shows a symmetry and floriferousness desirable in such plants. But this character is not borne out by my experience of the plant. I grew it for several years in a garden in the south of Scotland, on a light soil and in a moist climate. In the first place, I purchased seed, sowed it under glass, and planted out the seedlings in the herbaceous borders. After the first time, I had always sufficient self-sown seedlings in borders that were mulched annually in the winter with a few inches of decayed hotbed materials. With me, the *Celsia* threw up one strong spike, which usually attained the height of 6 feet. As this spike lengthened and the lower flowers dropped, other lateral spikes were formed, and, as is well shown in the illustration, the inflorescence is centripetal, and, by the autumn, the main flower-spike, which had formed seed vessels and had only a few flowers left on the extreme axis, presented rather a grotesque and twisted appearance. *F. Street, Verdley Place Gardens, Sussex.*

—I would like to supplement the note on *Celsia cretica* (p. 267) by remarking that it need not be propagated in autumn, for splendid plants, which bloom right into winter, result from spring-raised seedlings. It should be understood that it is a somewhat coarse-growing plant. *C. Arcturus* is much to be preferred for garden decoration, and this, too, is best raised from spring-sown seeds. I have had it flower from seeds sown in the open; but it is preferable to raise it under glass. At the present time, I have a group of *C. cromandolina* in full flowers, some of the spikes 7 feet high, on plants flowering where sown. This is a handsome plant, and quite hardy, though Grimwood, the nurseryman who first distributed it, sold it as a stove plant. *C. pontica*, white-flowered, is also flowering on plants grown in the open, where sown; but it is less worthy of cultivation than the others. *R. P. Brotherston, Prestonkirk, N.B.*

SEEDLING POTATOS (see pp. 245, 267).—It may be that a variety which does well in Scotland will not succeed on the Wisley sand, just as it seems that a variety may be discarded for years in Scotland, and yet prove to be so good in the South as to merit an award. Potatoes vary wonderfully in diverse soils. Beyond awarding it three marks as a cropper, no further award is made to a Potato grown at Wisley until it has passed the cooking test. That is severe in the sense that some varieties come out very well on the Wisley sand. Some do not cook well; yet these may cook well from other soils. In this respect the cooking test may be too exacting. I have eaten tubers of King Edward VII. from diverse soils this winter, and found the quality to vary remarkably. The National Vegetable Society is content to give three marks only for crop and appearance, apart from the cooking qualities. *A. D.*

REGISTRATION OF FLORAL NOVELTIES.—I was pleased to read the note on page 266 on the registration of novelties by the Perpetual-flowering Carnation Society. As showing how necessary this is, I may instance the variety of Carnation named Queen Mary, described in "Flowers in Season," p. 265. A variety shown under this name by Messrs. W. Cutbush & Son gained an Award of Merit at the Royal Horticultural Society's meeting on June 11 (see p. 391). Messrs. W. Cutbush's flower was a very dark crimson border variety, whilst the other is a yellow-ground with red markings. Cannot the National Carnation Society take up this question of registration in the case of Border Carnations and thus put an end to such confusion of names. *S. J. B.*

ROSE FRAU KARL DRUSCHKI.—Your correspondent (see p. 267) has had trouble with this Rose owing to its making very strong growth. He has also found a remedy, namely, lifting the plants during early spring and pruning the strong roots. The way that I treat Frau Karl Druschki is to peg down the long shoots about April, with the result that they break at every bud, the growths are never more than 15 or 18 inches, and the flowers are fit for exhibition and abundantly fragrant. For a bed of this Rose it is a very good plan to dot in a few plants of *Salvia splendens* or Fireball, which give a very pleasing effect. *W. McIntyre, Eltonmore, Dublin.*

THE LATE MAX LEICHTLIN.—As Mr. Elwes has pointed out in his sympathetic notice of the late Max Leichtlin (see p. 238), a selection from his correspondence would surely be of great interest, for Leichtlin was a generous letter writer, and what he wrote was always to the point; moreover, his quaint way of expressing himself in English added much to the charm and interest of his letters. Answering an enquiry as to how to manage the very beautiful but wayward Lily which bears his name, Leichtlin wrote in 1902:—"Lilium Leichtlinii requires a little more attention than her sisters, and does not bear potting, because it is her nature to strike out underground roots, which can only expand and grow and develop in perfect liberty. As she loves 'coolth' and not much dryness, one must take care that the soil in which she is planted gets only a little sun; on which account one plants her by preference in half-shady Rhododendron beds. With regard to the soil, good English sandy peat should be used, and take care that the water can drain off properly. In her fatherland she is found only in the woods, and even there but rarely; the earth in which you plant her must not be sieved, but torn into little pieces with the hands, and then the coarse and the fine used together." Again, in 1904, he wrote:—"A seed of *L. Phillippense* had fallen aside, and having much space, grew so much as to flower in November, but the flower could not be fairly judged; it seems to want temperate-house treatment. We have very few Lilies which grow to flowering size within one year; now this same bulb I planted out in leaf-mould, and it sends up three stalks now (September) 4 feet high, the strongest being thumb's thick, and showing many hundreds of its elegant leaves and six buds of flowers. I wonder how it goes on when the weather becomes cooler; I judge it is not *Phillippense* after all, but rather a new species." As a matter of fact, the Lily in question subsequently turned out to be *L. myriophyllum*, and Leichtlin raised and distributed a number of plants from this one seed. There seemed to be little in the cultivation of rare plants, and especially of Lilies, that Leichtlin did not know, and was not ready to share with others who were interested in the subject, and one never turned to him in vain for advice or assistance. Although of late years Leichtlin's income and the size of his hillside garden were reduced to such an extent as to preclude the cultivation of more than a few precious things, he remained constant to his love of Lilies, and when one visited him there was sure to be a pan or two of unknown Lily seedlings raised from seed sent to him by French missionaries either in Szechuen or Yunnan, Korea, or elsewhere, which he would insist on sharing with his visitor. *A. Grove.*

CARRION CROWS AND APPLES.—A few days ago I noticed some black carrion crows alight on a large tree of Blenheim Pippin Apple. Watching them for a few minutes, I was surprised to find them carrying away Apples, just as rooks do Walnuts. They repeated this till I had shot four birds, and I have not seen one near since. I have never before known carrion crows take away fruits of any description. *J. G. W., E. Barnet.*

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 11.—The Society's large hall was well filled with exhibits on the occasion of the fortnightly meeting on Tuesday last, the exhibition being one of the largest held this year. The principal subjects were border flowers, these being shown in large masses. There were also quantities of Dahlias, *Chrysanthemums*, Carnations, Roses, Begonias, Ferns, and greenhouse plants. But the two most important exhibits before the FLORAL COMMITTEE were displays of Bamboos and ornamental shrubs, a Gold Medal being awarded in each case. Many novelties were submitted for award, 10 receiving Awards of Merit.

Orchids were fairly numerous, and awards made to these plants included one First-class Certificate and four Awards of Merit.

THE FRUIT AND VEGETABLE COMMITTEE made no award to a novelty, but they recommended a Gold Medal for a magnificent display of Apples.

At the three o'clock meeting in the lecture-room, an address on "Cider and Perry Fruits" was delivered by Mr. B. T. P. Barker, M.A.

Floral Committee.

Present: W. Marshall, Esq. (Chairman); and Messrs. Henry B. May, W. J. Bean, Chas. T. Drury, Jas. Walker, E. A. Bowles, John Green, Geo. Gordon, T. W. Turner, G. Reuthe, Jas. Douglas, W. H. Barr, J. F. McLeod, Walter T. Ware, H. J. Jones, Chas. Dixon, Chas. E. Pearson, Chas. E. Shea, J. T. Bennett-Poë, R. Hooper Pearson, W. P. Thomson, E. H. Jenkins, R. C. Notcutt, John Jennings, W. B. Cranfield, A. Kingsmill, and Herbert J. Cutbush.

MESSRS. JAMES VEITCH & SONS, LTD., Chelsea, showed a group of ornamental shrubs of great magnitude, requiring the whole of one side of the building for its display. Commoner subjects such as Box, *Eunonymus*, Holly, Ivy, Phillyrea, *Eleagnus*, *Aucuba*, and *Ligustrum* were represented by choice forms, several having handsome variegation in the foliage. Especially striking was *Hedera Helix dentata marginata*, with silver foliage. There was also a form of *Griselinia littoralis* labelled *macrophylla*, the leaves being so much larger than the type as to bear no comparison. But the great importance of the display was found in the large number of new Chinese species, introduced by Mr. E. H. Wilson. Species of *Berberis* were especially numerous, most of them being in fruit. The berries of *B. Wilsonae* are like coral, giving the plant a fine appearance at this season. Others of note were *Stranvesia undulata*, *Ligustrum Henryi*, *Berberis polyantha* (with sprays of coral-red berries), *Viburnum Henryi*, *Cotoneaster rugosa Henryi*, *Hex Peryi*, *Berberis brevipaniculata* (with dull-red berries), *Berberis Gagnepainii*, *Viburnum phlebetrichum* (with showy fruits), and *Arbutus proceera* (with handsome leaves). This firm also filled a long table with greenhouse flowering plants, making a pretty exhibit. The beautiful hybrid *Begonias* were remarkably good, especially the carmine-rose-flowered *Elatior*, with semi-double flowers, produced in great bunches and possessing lasting qualities. The variety *Mrs. Heal* has larger flowers of similar shade, but they are single. *Streptocarpus* were good, also the showy, pink-flowered *Crowea saligna* and tall plants of *Plumbago*. *Impatiens Oliveri* flowers the whole year round. (Gold Medal.)

MESSRS. J. CHEAL & SONS, Crawley, Sussex, showed sprays of autumn-tinted foliage, relieved with vases of flowers. The following plants have all deeply-coloured leaves: *Rhus japonicus Osbeckii*, *Prunus persica folius atropurpurens*, *Acer virginicum fulgens*, *A. platanoides Schwedleri*, *Berberis Thumbergii*, *Corylus avellana aurea*, *Taxodium distichum*, *Liquidambar styraciflua*, *Cornus florida* (very effective), *Spiraea prunifolia*, *Acer Ginnala*, *Rhus typhina laciniata*, *Quercus rubra* (the king of Oaks), *Acer japonicum laciniatum*, and *A. dasycarpum tripartitum*. (Silver Flora Medal.)

MESSRS. W. PAUL & SON, Waltham Cross, showed *Crataegus Pyracantha Laelandii*, with pretty orange-red fruits brighter than the type, also baskets of Roses, such as Earl of Warwick, *Corallina*, *Mme. Léon Pain*, *Pharisæer*, and *Margaret*, all, with the exception of *Corallina*, being shades of pink. Interspersed amongst the *Crataegus* were silver-leaved *Ivies*, *Vitis purpurea*, *Prunus Pissardii*, and *Cupressus macrocarpa* *Intea*. (Silver Flora Medal.)

MR. L. R. RUSSELL, Richmond, staged a collection of Bamboos that occupied a space of 75 feet by 9 feet, the group extending the whole width of the hall. There were more than 500 plants in 38 species and varieties. Many of the specimens were very large, some being 15 feet high. All the plants were in the best possible condition, and the arrangement was admirable. The more notable examples were *Arundinaria nitida*, *A. fastuosa*, *Phyllostachys rubicunda*, *P. aurea*, *P. nigra*, *Bambusa Alphonse Karri* with golden stems, *B. quadrangularis*, *Phyllostachys Castellonis*, a golden-leaved form; *Thamnocalamus nana variegata*, the variegation being silver stripes; *Bambusa gracilis*, the most graceful of all and a tall-growing species; *B. palmata*, the broadest-leaved of all Bamboos, but very dwarf; and *Arundinaria auricoma*, a mass of golden leaves that contrasted with the silver-leaved *A. Fortunei variegata*. In *Thamnocalamus Falconeri* the leaves hang in a drooping

manner like plumes. *Arundinaria Hindsii* is one of the darkest-leaved species, with grass-like foliage. The variety *graminea* owes its name to this characteristic. (Gold Medal.)

Messrs. STUART LOW & Co., Bush Hill, Enfield, showed Carnations of remarkably fine quality and attractively staged. We noticed the fine new pink variety named *Lady Alington*; *Colossus*, cerise pink; *Marchioness Lindlithgow*, white, very free in blooming; *Britannia*, one of the best of the scarlet kinds; *Beacon*, also a choice scarlet variety; and *J. Whitcomb Riley*, the best of the yellow shades, but with small flowers. Messrs. Low also showed *Roses*, flowering plants of *Chianthus Dampieri*, a batch of *Chromola exifera*, and a few *Cyclamens*. (Silver Banksian Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, staged varieties of *Begonias* of the *Gloire de Lorraine* type. They were arranged in batches of pink and white-flowered sorts, including *Mrs. Leopold de Rothschild*, with flowers of a deeper tint than the type; also the fine, white *Turnford Hall* variety. With the *Begonias* were standard and dwarf plants of large-flowered *Veronicas* and batches of the handsome *Neprolepis exaltata Marshallii*. (Silver Banksian Medal.)

A batch of *Gesnera Orange King* was shown by *Adeline Duchess of Bedford*, Chemies (gr. Mr. Dickson). The plants were well grown and carried good spikes of blooms. (Silver Banksian Medal.)

Messrs. J. HILL & SON, Lower Edmonton, set up a collection of *Gleichenias* in about 12 varieties and species, there being more than 200 plants. The largest specimen was a plant of *G. dichotoma*, one of the tallest growers, with elegant pectinate fronds; *G. Mendelii* has darker foliage than *G. dichotoma*, and with finer fronds. But the best in the group was *G. flabellata*, with a crown of pinnæ at the end of a stout rachis, the fronds drooping from the centre like a plume of feathers. *G. semivestita* is a creeping species and dwarf-growing. *G. spelunca* is one of the finer-leaved species, with slender growth. *G. dicarpa longipinnata* is most often met with in gardens, being easily grown and of very attractive appearance. *G. rupestris glaucescens* has a bluish-grey under-surface to the leaves, and is very rare. (Silver-gilt Banksian Medal.)

Mr. C. ENGELMANN, Saffron Walden, Essex, filled a small table with varieties of perpetual-blooming Carnations, having good vases of popular sorts. *Rex*, a rather deeper pink shade than *Enchantress*, and very free blooming, and *Harlequin*, a yellow-ground *Fancy* with heavy red markings, are new sorts. (Silver Flora Medal.)

Messrs. B. R. CANT & SONS, Colchester, displayed *Roses*, including a pink seedling raised from *Frau Karl Druschki* named *Elizabeth*. (Silver Banksian Medal.)

HARDY FLOWERS.

Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Ed. Beckett), showed *Michaelmas Daisies* as a flower group, having stands of different heights filled with huge posies of these showy autumn flowers. The method of grouping was a pleasing change from the usual system adopted at these meetings. The table was dispensed with, and the floor carpeted with green cloth, the stands being arranged on this. The outstanding variety was the large, blue-flowered *Climax*; others that were conspicuous for their attractiveness include *Damosel* (blue), *Day Dream*, *Star Shower*, *Sirius* (pink), *Silver Star*, *Desire* (a very effective white variety, the sprays being set with flowers like small *Daisies*), *Comeliness*, *Cinderella*, *Attraction*, *Rapture*, *Arcinus* (pink), and *Stella*. (Silver-gilt Flora Medal.)

Mr. H. J. JONES, Hither Green, Lewisham, also put up an imposing exhibit of border *Asters*, arranging the varieties with great taste. The more notable kinds were *Keston Blue*, *Moonstone* (bluish-grey), *Melpomene* (of the novæ-angliæ section, and having large pink flowers), *Climax* (one of the finest of all *Michaelmas Daisies*, the clear, blue flowers measuring 2 inches across), *Chastity* (white), *Lil Fardell* (one of the choicest of the pink varieties), *Porcelain* (of the shade of blue indicated by the name), and *Mrs. Raynor* (rosy-red). (Silver-gilt Banksian Medal.)

Mr. FRANK BRAZIER, Nurseryman, Caterham, staged a very attractive exhibit of *Michaelmas Daisies*, border *Chrysanthemums* and *Dahlias*. The flowers were displayed in bold bunches in

epergnes with autumn-tinted *Bracken*, *Sycamore*, and other subjects as relief. In the centre was an attractive stand of the fine *Scarlet Dahlia* named *Amos Perry* and, at the foot of this, small plants of *Salvia Horminam*, with deep blue bracts. The group was arranged with commendable skill. (Silver Flora Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, exhibited garden flowers in variety, also many *Chrysanthemums* some of these being large Japanese varieties. The more notable of the *Chrysanthemums* were *Mr. L. Thorn* (yellow), *Master James* (chestnut, with golden reverse), *Splendour* (apricot-buff), *Bryant Beauty* (silver-pink), *White Queen*, *Miss Alice Finch* (plum colour), and a large, white seedling. On another table this firm showed a new white *Carnation* of the perpetual-blooming type, named *White House*. It was raised in America, where it has become very popular. (Silver Flora Medal.)

Mr. JAMES BOX, Lindfield, Sussex, again staged a remarkably attractive display of hardy flowers, the various subjects being of good quality, and shown in large masses. In the centre was a fine mass of *Gladiolus America*, having soft pink flowers with carmine markings. Other interesting plants were *Cimicifuga simplex*, *C. cordifolia*, *C. japonica*, *Romneya Coulteri*, the new pink *Phlox Lindfield Beauty*, a pretty dwarf *Polyantha Rose* named *New Orleans*, spikes of *Delphiniums* and varieties of *Chrysanthemums*. At the back were tall epergnes filled with *Asters* and *Helianthus*, giving a fine effect to the exhibit. (Silver-gilt Flora Medal.)

Messrs. W. CUTBUSH & SON, Highgate, London, set up a large exhibit of perennial *Asters*, *Sunflowers*, *Rudbeckias*, *Pentstemons* and *Scabiosas*, with a dwarfier row in the front of *Perennetya mucronata* in fruit, *Nerine Fothergillii*, *Aster lybosyris* and *Polygonum amplexicaule*. The *Asters* were arranged in great banks, the most effective being the pale blue-flowered *Climax*, one of the best of the race. There was also a good form of *Helianthus argyalis*, and a clump of the soft pink *Newbury Gem Pentstemon*. Messrs. CUTBUSH also showed *Carnations* and greenhouse plants, both flowering and fruiting. *Ericas* provided a touch of colouring, and the bright berries of *Gaultheria procumbens*, *Skimmia japonica*, *Vaccinium Vitis Idæa* and small fruiting trees of *Oranges* appeared in contrast with such elegant-leaved plants as *Dracena Brauntii variegata*, and *Phoenix Roebelinii*, the latter a splendid subject for decorating dwelling rooms. (Silver Banksian Medal.)

Mr. MAURICE PRICHARD, Christchurch, Hampshire, exhibited an assortment of seasonable hardy flowers, varieties of *Asters* predominating. *Pyrethrum Hamlet* has very showy, rose-colored flowers with gold centres.

Messrs. JOHN PEED & SONS, West Norwood, arranged a long table with border flowers, *Alpines*, and succulent species, there being a good assortment of each.

Mr. N. F. ROBSON, Ham, Surrey, staged a large assortment of border *Chrysanthemums*, notable kinds being *Comtesse F. de Cariel* (bronze), *Goacher's Crimson*, *Horace Martin* (yellow), *Mrs. W. A. Hobbs* (pink), *Carrie* (yellow), *Holmes's White*, and *Elstob Yellow*. (Silver Banksian Medal.)

Mr. G. REUTHE, Keston, Kent, displayed an assortment of hardy perennials, *Nerines*, *Lilium sulphureum*, *Magnolia grandiflora*, *Morina longifolia*, *Helianthus argyalis*, a dark form of *Polygonum polystachyum*, and the orange-red *Tropæolum tuberosum*.

Messrs. G. & A. CLARK, LTD., Dover, had some especially choice inflorescences of *Cimicifuga simplex* in a collection of other border flowers, the beautiful *Aster Climax* being equally as good. Plants of *Leonotis Leonurus* were well bloomed. (Bronze Flora Medal.)

The Misses HOPKINS, Shepperton, showed a small exhibit of border flowers, including *Alpines*.

DAHLIAS.

Messrs. T. S. WARE, LTD., Feltham, showed a large exhibit of *Dahlias*, arranged as a bank of flowers. The large *Pæony*-flowered variety *Souvenir de Gustave Douzon* is unsurpassed as a red variety in this section. The *Cactus*-flowered *Electric* has its yellow florets tipped with white. We also noticed a new double-flowered *Aster*, after the style of *Beauty of Colwall*, named *Peggy Ballard*. (Silver Banksian Medal.)

Messrs. BAKERS, LTD., Wolverhampton, showed *Dahlias* of the *Pæony*-flowered type, a

selection of the varieties including *Lady Norman* (salmon pink), *Miss G. Keeling* (apricot-pink), *The Warrior* (crimson), *Lady Muriel Page* (white), *Godsall Gem* (yellow), and *Mrs. W. E. Whineray*, one of the largest-flowered varieties, the florets being pink, suffused with apricot and buff. (Bronze Flora Medal.)

Messrs. CARTER, PAGE & Co., 52 and 53, London Wall, again showed *Dahlias* in great numbers, having varieties of the *Cactus*, *Pæony*-flowered, and single types, prettily arranged with grasses and other light foliage. (Silver Flora Medal.)

A small exhibit of *Dahlias* was made by Mr. J. T. WEST, Tower Hill, Brentwood, the varieties being all of the *Pæony*-flowered type.

Messrs. CHEAL also showed varieties of *Dahlias*, their singles being extra good, *Glencoe* (yellow), *Mikado* (gold, with a crimson centre), *Leander* (red, striped with maroon), *William Parrot* (red, tipped with white), *Lady Bountiful* (carmine and crimson), and *Kitty* (mauve-pink) being a selection. (Silver Banksian Medal.)

Mr. J. B. RUDGE, Chingford, Essex, showed *Dahlias* in variety. *Grand Duke Alexis*, of the giant-flowered decorative type, has bold, white blooms with quilled florets; *La Colosse* is a fine red variety of this section. *Delice* (pink), *Yellow Colosse*, and *Papa Charmer* (crimson) are others of note. The remaining varieties were principally of the *Collarett* type.

AWARDS.

AWARDS OF MERIT were recommended to the following novelties:—

Aster cricoides "Perfection."—This is a charming white variety of this popular type of *Michaelmas Daisy*. Shown by the Hon. VICARY GIBBS (gr. Mr. Edwin Beckett).

Carnation Scarlet Glow.—A perpetual flowering variety of brighter and richer colour than any we have seen. Shown by Mr. G. LANGE, Hanworth Road, Hampton.

Carnation Shasta.—A perpetual flowering variety with white, much fringed petals, very fragrant. Shown by Mr. LANGE.

Carnation White House.—A first-class, white, perpetual-flowering variety. Shown by Messrs. WELLS.

Chrysanthemum Miss P. Collier.—This is a smooth, white flower of the Japanese type, suitable for market supply or general decorative purposes. Shown by Mr. W. T. ROOTS, Holly Cottage, Cranford.

Chrysanthemum "Cranfordia."—A variety of the same type as *Miss Collier*, but in colour very rich yellow. Shown by Mr. ROOTS.

Chrysanthemum Mary Poulton.—This is a very large Japanese flower, suitable for exhibition. The colour is an uncommon shade of silvery-mauve. Shown by Mr. HENRY POULTON, Huntley's Gardens, Tunbridge Wells.

Gesnera "Orange King."—This *Gesnera* was exhibited in numerous examples by *ADELINE Duchess of Bedford*, Chemies (gr. Mr. Dickson). It is a seedling variety raised in these gardens from mixed seed saved from *G. cinnabarina* and *G. exoniensis*. The leaves are mottled with dark green and red, and the flowers are bright orange-red, much richer and more attractive than those of *G. cinnabarina*. The plants exhibited were splendid specimens, and they were certainly calculated to stimulate interest in a class of plants that, in these days, has fallen into neglect. The effect of the group was most gratifying, the colour of the flowers being exceedingly attractive.

Ligustrum Henryi.—This is a very distinct shrub, with erect, wiry growths and small, ovate-leaves having the margins incurved. A Chinese species, exhibited by Messrs. JAS. VEITCH & SONS.

Symphoricarpos mollis.—Under this name, Messrs. JAS. VEITCH & SONS, exhibited a plant with very attractive white berries, similar to *S. occidentalis*, with which it may prove to be synonymous.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, Gurney Wilson, Henry Little, F. Sander, W. Bolton, R. G. Thwaites, Stuart Low, F. J. Hanbury, A. A. McBean, W. Cobb, J. Cypher, J. Charlesworth, C. H. Curtis, W. H.

Hatcher, W. P. Bound, H. G. Alexander, A. Dye, and Sir Jeremiah Colman, Bart.

R. G. THWAITES, Esq., Chessington, (Christchurch Road, Streatham (gr. Mr. J. M. Black)), was awarded a Silver Flora Medal for a group which was composed mainly of hybrids raised at Chessington, including a fine lot of *Cattleya Folia* with several *C. Iris* and *C. Adula*; a selection of scarlet *Odontioda Bradshawiae*, *O. Charlesworthii*, and other *Odontiodas*; three good examples of *Brasso-Cattleya Mrs. J. Lee-mann*, and a plant of the pure white *Laelia pumila alba*.

MESSRS. CHARLESWORTH & CO., Haywards Heath, secured a Silver Flora Medal for an attractive group having in the centre a number of plants of *Epidendrum vitellinum*. Around them were a good selection of hybrid *Cattleyas* and *Laelio-Cattleyas*, those noted being *Cattleya Rhoda*, *C. Venus*, and the handsome new *C. Basil* (see Awards). Others of fine quality were *Laelio-Cattleya Golden Oriole*, *Pilumnia nobilis alba*, various *Odontiodas*, the pure white *Laelia pumila alba*, the new and pretty *Polystachya paniculata* with two branched spikes of reddish-orange flowers, and the handsome *Odontoglossum Dora* of fine shape, white evenly blotched with purple and heavily tinged with purple at the back.

MESSRS. STUART LOW & CO., Bush Hill Park, Enfield, were voted a Silver Flora Medal for a well-arranged group. At the back were some elegant sprays of *Oncidium varicosum*, *O. pulvinatum*, *O. tigrinum*, and other *Oncidiids* and *Odontoglossums*. *Cattleya Maggie Raphael*, *C. Folia*, *C. Iris* and other *Cattleyas* and *Laelio-Cattleyas*; *Oncidium incurvum album*, *O. superbiens*, *Zygopetalum Maxillare*, the pink-tinted *Anguloa uniflora Turnerii*, *Angraecum articulatum*, *Cirrhopetalum Roxburghii*, *C. appendiculatum*, *Bulbophyllum Dearii*, and other interesting species were included.

MESSRS. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for an extensive group containing many rare hybrids and species. Among the hybrids was a very fine plant of *Bulbophyllum virescens*, also of *B. Medusa*, *Anguloa uniflora*, *Brassia brachiata major*, *Dendrobium latifolium*, &c., and of the hybrids noted were *Cattleya Parthenia Princess Clementine*, a white flower with purple veining on the lip; *C. Iris inversa* with richly coloured flowers; *C. Adula*; *Laelio-Cattleya Walter Gott* (*L.C. Bletchleyensis* × *C. bicolor*) with yellowish sepals and petals slightly veined with rose and showy, dark reddish-violet lip; *L.C. Wilsonia*, a large, dark flower on a very dwarf plant; several handsome *Odontoglossums*, *Brasso-Cattleya Thorntonii* and other *Brasso-Cattleyas*.

MESSRS. J. CYPHER & SONS, Cheltenham, were awarded a Silver Flora Medal for a group having in the centre some well flowered *Dendrobium Phalaenopsis*. Beside them were some finely coloured *Cattleya Mantini*, two specimens of *Stanhopea eburnea*, the deep-scarlet *Odontodia Charlesworthii*, *Cypripedium triumphans*, *C. Milo* and other good *Cypripediums*; *Brassia Lawrenceana*, the clear-white *Camaridium ochroleucum*, and several good *Odontoglossums*.

MR. E. V. LOW, Vale Bridge, Haywards Heath, secured a Silver Banksian Medal for a small but select group, which included the new *Cypripedium King George V.* (see Awards). With it were *C. Germaine Opoix*, *C. Niobe Westcumbii* var., *C. Leeanna Corona*, *Cattleya laevata alba*, a pure white flower, and two forms with colour on the lip; *C. Thurgoodii*, *Oncidium incurvum album*, *Odontoglossum crispum Lady Jane*, and *O. grande aureum*.

MESSRS. STANLEY & CO., Southgate, secured a Silver Banksian Medal for a group of *Cattleya Minucia*, *Laelio-Cattleya Walter Gott*, *Brasso-Cattleya Mme. Chas. Maron*, *Cycnoches chlorochilon*, *Eria stellata*, &c.

Mrs. NORMAN COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman), sent *Odontoglossum* × *Clive*, a very handsome hybrid with the greater part of the flowers reddish-claret. Also *Cypripedium Sibyl punctatum* (*Francisae* × *Fairrieanum*), in which the petals are evenly spotted with purple.

MESSRS. JAS. VEITCH & SONS, King's Road, Chelsea, sent their new *Cypripedium* × *Pyrria*, a showy, dark flower of unknown derivation, but the colours of *C. Baron Schroder*, and its fine substance and form are clearly distinguishable, although the flower of *C. Pyrria* is much larger.

Lieut.-Col. SIR GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander), sent *Laelio-Cattleya Arethusa* (*C. Harrisoniana* × *L.C. exoniensis*) with a magnificent spike of ten flowers, and two others (see Awards).

MOIS. FIRMIN LAMBEAU, Brussels, sent *Cypripedium Fairisii* (*Fairrieanum* × *Curtisii*); an interesting cross.

Lady AUDLEY NEED, Grittleton, Chippenham (gr. Mr. J. Pitts), sent a similar hybrid.

EDWARD ROBERTS, Esq., Park Lodge, Eltham (gr. Mr. W. Carr), showed *Cypripedium Venus* Park Lodge variety, a pure-white, wax-like flower with a few black dots on the dorsal sepal.

MR. SIDNEY FLOREY, Tracey's Nursery, Twickenham, sent *Lycaste gigantea* Tracey's variety, imported from Peru. The plant is much more slender than the type. Sepals and petals dark green, lip reddish, fringed.

MR. HARRY DIXON, Spencer Park Nursery, Wandsworth Common, showed *Odontoglossum Dixone* (*Edwardii* × *luteo-purpureum hystrix*), resembling *O. Thompsonii*, but with the larger spiny yellow crest of *O. luteo-purpureum*.

MR. G. W. MILLER, Clarkson Nurseries, Wisbech, sent *Cattleya Lord Nelson* (*Harrisoniana* × *Mossiae* variety), a pretty rose-tinted flower.

Captain J. F. LAYCOCK, Wiseton, Bawtry, Notts., showed *Cattleya Adula* Laycock's variety, with bronzy-orange sepals and petals and mauve-crimson lip.

Sir WILLIAM MARRIOTT, Down House, Blandford (gr. Mr. Denny), sent as *Cattleya Peckavensis* (*Aclandiae* × *Schilleriana*), a dwarf hybrid with rose-pink flowers spotted with purple and, in the opinion of the Committee, too small to be of the parentage named. Probably *Laelia longipes* was one of the parents.

Miss VIOLET FELLOWES, Shotesham Park, near Norwich (gr. Mr. Smith), sent *Cypripedium Charlesworthii* var. *Violet Fellowes*; of fine shape and with a broad, pale rose-tinted dorsal sepal.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cypripedium King George V. (parentage unknown), from Mr. E. V. Low, Vale Bridge, Haywards Heath.—A fine, bold flower, with some of the characters of *C. Gaston Bultet*. The broad dorsal sepal, which is perfectly flat, is green at the base, with dark lines changing to rose in the white upper part, which is also flushed with rose. The broad petals and lip are tinged with brownish purple, and the whole flower quite distinct and florally perfect.

AWARDS OF MERIT.

Laelio-Cattleya Golden Oriole superba (*L.C. Charlesworthii* × *C. Dowiana aurea*), from Lieut. Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander).—A very pretty hybrid, with sepals and petals of a clear canary-yellow colour with a trace of emerald-green. Lip rosy-crimson, with orange disc and golden-yellow veining crossing all but the margin.

Laelio-Cattleya Ortrude magnifica (*L. anceps* × *C. Dowiana aurea*), from Lieut. Col. Sir GEORGE L. HOLFORD, K.C.V.O.—A remarkable hybrid, with cream-white sepals and petals tinged and veined with rose-purple. Lip open, crimped, claret colour, with obscure gold veining.

Cattleya Basil (*Enid* × *Mantini*), from Messrs. CHARLESWORTH & CO.—A complex hybrid, in which *C. Mossiae*, *C. Warszewiczii*, *C. Dowiana aurea*, and *C. Bowringiana* have played a part. Sepals and petals purplish rose, lip deep ruby-crimson. The colours are nearest to those of a good *C. Hardyana*, but the form is more like *C. labiata* in its best varieties.

Catastium fimbriatum aurum, from J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis).—A very distinct form of this pretty aromatic species. The flowers are pale apple-green, slightly marked with rose, the whole of the centre of the fringed lip being deep golden-yellow.

Fruit and Vegetable Committee.

Present: Geo. Binyard, Esq. (in the Chair); and Messrs. Jas. Cheal, John Harrison, Thos. Coomber, J. Willard, H. Parr, A. R. Allan, Chas. Foster, P. C. M. Veitch, Geo. Wythes, G. Reynolds, Owen Thomas, Geo. Kelf, Alex. Dean, C. G. A. Nix, H. Somers Rivers, Edwin Beckett, G. Hobday, W. Crump and P. D. Tackett.

Several seedling Apples were sent for the opinion of the Committee. In the case of one variety, described as a late dessert sort, the sender was asked to submit specimens again later.

Mr. J. CROOK, Camberley, sent clusters of Runner Beans representing a selection from Hackwood Park Success, to show its productiveness.

Mr. W. KNIGHT, Hailsham, showed a seedling autumn-fruiting *Rubus*, said to have been raised from the Raspberry crossed with the Loganberry. The fruits are of deep-red colour, and when fully ripe, fairly sweet. The plant is a heavy cropper. As a trial of autumn-fruiting Raspberries is now being conducted in the Society's gardens with a view to testing them next year, the raiser was asked to send specimens to Wisley.

The chief exhibit before the Committee was a superb collection of 150 dishes of Apples staged by Messrs. JAS. VEITCH & SONS, LTD., Chelsea. The quality and the general finish of the fruits were excellent. Amongst cooking varieties were *Alfriston*, *Tyler's Kernel*, *Mère de Ménage*, *Lord Derby*, *Edward VII.*, *Peasgood's Nonesuch*, *Withington Fillsbasket*, *Golden Spire*, *Warner's King*, *Rev. W. Wilks* (specially fine), *Beauty of Kent*, *Annie Elizabeth*, *Bramley's Seedling*, *Bismarck*, *Sandringham*, *Royal Jubilee*, and *Winter Hawthornden*. Of dessert varieties, the following were specially noticeable: *Blenheim Pippin*, *Scarlet Pearmain*, *Court-pendû-plat*, *Fearn's Pippin*, *Golden Reinette*, *King of Tompkins County*, *Cockle Pippin*, *Rival*, *American Mother*, *Cox's Orange Pippin*, *Melon Apple*, and *Egremont Russet*. (Gold Medal.)

The only exhibit of vegetables was one of Radishes, shown by the "TIMES" EXPERIMENTAL STATION, Sutton Green, Surrey (Mr. C. Foster, superintendent). There were 62 presumably diverse varieties, all in really remarkable condition, and presenting one of the most complete exhibits of these roots we have seen at a meeting. All the seeds were sown simultaneously in the open ground on September 3. (Silver Banksian Medal.)

THE LECTURE.

There was a good audience at the 3 o'clock meeting in the Lecture Room. Sir Albert Rollit presided. Mr. B. T. B. Barker, of the National Fruit and Cider Institute, delivered an address on "Cider and Perry Fruits." Cider making, said Mr. Barker, was a far more important industry one hundred years ago than it is to-day, and the supply of Apples now available for the purpose is appreciably shorter than it was even 10 or 15 years ago. The orchards in the cider-making districts are mostly attached to farms, and very little attention is bestowed on the trees. No attempt has been made until recently to classify the best varieties of Apples for cider making, and in some orchards as many as 50 or even 100 distinct varieties are to be found. Varieties of cider Apples are characterized by their extreme hardness, their prolific cropping, and the small size of the fruits, which are generally very sweet. The trees are trained as standards, the land being grassed and employed for grazing. Generally, the trees have poor stems, which are unable to carry the great weight at the top, so that an orchard presents a very straggling appearance. A trial has been made, under the auspices of the National Fruit and Cider Institute, in growing cider Apples as dwarf trees grafted on the Paradise stock, and the Institute has distributed over six thousand trees, with the result that some 50 trial orchards of this description exist in the West of England.

With a view to discovering those varieties most suited for cider production, analyses have been made of the varieties, to ascertain the specific gravity of the juice, the amount of acidity, the quantity of tannin present, and the rate of fermentation of the juice. Varieties that have proved most satisfactory in these respects are Foxwhelp, No. 182 (a seedling), Kingston Black, Dymock Red, Sweet Alford, Morgan Sweet, Royal Widding, and *Medaille d'Or*. Kingston Black is considered the best, as the quantity of acid and tannin present in this sort is moderate, whilst the amount of sugar is large, and the rate of fermentation low. It has been found that other factors besides these affect the quality of cider, and, in this respect, soil has a large influence. The same variety of Apple grown in one district

may give a good cider, but in another part it is inferior. Another factor in the quality of cider is the season, just as various vintages affect the quality of wine. Then, again, the degree of ripeness in the fruits has to be considered. Highly-coloured fruits, as a rule, make the best cider, and Apples from young, vigorously-growing trees are not so suitable as those from older specimens of the same variety. It is sometimes thought that when many varieties are mixed together a better cider results. This is true in a certain sense, because, when a large number of sorts are employed, the amount of sugar, acid, and tannin is more likely to approximate to an average quantity. But it is much better to use a single sort in which these qualities are known to exist. With regard to the financial side of the industry, Mr. Barker said that £20 per acre was a fair average return. The trees will live to 60 or 70 years, and many will produce 1½ tons of fruit each in a single season, a crop of half-a-ton from a single tree being common.

SCOTTISH HORTICULTURAL.

OCTOBER 4.—The monthly meeting of this association was held at 5, St. Andrew Square, Edinburgh, on this date. Mr. Whytock, the president, occupied the chair, and there was an attendance of 100 members.

Dr. Borthwick, Royal Botanic Gardens, Edinburgh, delivered a lecture on "Plant Diseases." It was only possible, he said, to study the nature of diseases and their causes when the minute structure of the healthy plant was understood, and we must be able to recognise and understand the import of the external or internal morphological and chemical changes which took place in diseased plants before we could adopt preventive or remedial measures. Increased cultivation of various crops, the more rapid transit and increased importation of plants, and the increasing tendency to cultivate the same kind or species of plant on large areas, had all tended to intensify the unhealthy or unfavourable conditions, and thus they were rendered more liable to attack. In 1901 the "Rust" in Wheat on the Continent of Europe involved a loss of £20,000,000, and in Australia the loss due to fungous disease in Cereal crops was about £2,500,000.

The paper for the meeting on November 1 will be on "The Working and Management of Garden Soils," by Mr. Geo. P. Berry, of the Edinburgh and East of Scotland College of Agriculture.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT. (ANNUAL DINNER.)

OCTOBER 6.—The 24th anniversary dinner of the society was held at the Hotel Waldorf, Aldwych, on this date. The chair was taken by Mr. Edward Sherwood, and he was supported by Dr. R. Boxall, Messrs. N. N. Sherwood, W. A. Bilney, Frank Hyams, W. Sherwood, G. Ingram, T. Bevan, J. Hudson, C. H. Curtis, W. P. Thompson, T. Winter, and others. After the loyal toasts had been observed, the chairman proposed "Continued Success to the United Horticultural Benefit and Provident Society." Mr. Sherwood said the society was not so well known by gardeners as it should be. It was distinctly a benefit society, and not a charity. Its funds amounted to nearly £30,000, and they were well invested. Such a society as this encouraged thrift, and was a provision against financial trouble during accident or sickness. The society was managed economically, and its various funds including benefit, management, convalescent, and benevolent, were all conducted in a satisfactory manner. He wished the society every success, and was pleased to submit his name for honorary membership.

Mr. C. H. Curtis, in response, thanked the chairman on behalf of the committee for presiding, and referred to the benevolent fund, which had proved of the greatest possible assistance to members when in adverse circumstances.

In proposing the toast of the "Honorary and Life Members," Mr. E. F. Hawes made special reference to Mr. N. N. Sherwood, who had founded the convalescent fund, and helped it every year with donations. Mr. N. N. Sherwood replied.

The toast of "The Visitors" was proposed by Mr. T. Winter, and Mr. E. Thomas responded.

The toast of "The Chairman" was given by Mr. W. A. Bilney, who referred to the good work which Mr. Sherwood and his family had rendered to this and similar gardening institutions. He also thanked him for providing the musical entertainment. This toast was received with musical honours.

A vote of thanks to the secretary, Mr. W. Collins, and the donors of fruit and flowers terminated a pleasant evening.

Obituary.

THOMAS HAMILTON.—A prominent market grower, Mr. Thos. Hamilton, of Waltham Cross, died on October 1. He settled at Cheshunt some 54 years ago, and began, on a comparatively small scale, the cultivation of Cucumbers, Grapes and Tomatos for the London markets. His business grew, and his several nurseries became of large dimensions, ranking at the time of his death amongst the largest producing these classes of fruit and vegetables. He was one of the pioneers in Cucumber culture for market, exporting produce to France, Germany and Russia. Mr. Hamilton was of Scotch origin, being a native of Edinburgh. He was a clever cultivator and

THE LATE THOMAS HAMILTON.

lover of plants, and never lost his liking for ornamental gardening. For some years he took an active part in local work, and was a member of the Urban District Council, in which capacity he took a great interest in the Cheshunt school gardens of the Herts. County Council, acting as judge. He was one of the founders of "The Hailstorm Insurance Company," being a director until his death. The esteem in which he was held was shown by the unusual signs of mourning that his neighbours at Waltham Cross exhibited on the day of his funeral. He was born on January 3, 1837. *George Paul.*

JOSEPH SPINK GRAY.—The death of Mr. J. S. Gray, for 51 years in the service of Messrs. Jas. Backhouse & Son, Vork, occurred at Richill, Co. Armagh, Ireland. For about two years in his youth he was employed in the office of Mr. Joseph Wilkinson, solicitor, Vork. From there he went to Messrs. J. Backhouse & Son, of the Helgate Nurseries, and from a humble station in the office he rose to the position of manager. It is somewhat singular that Mr. Gray should have passed away so soon after the late Mr. Marshall, who was also with Messrs. Backhouse for about half a century. Mr. Gray will be remembered by

reason of his connection with the Grand Yorkshire Gala, having brought much practical horticultural knowledge to bear upon his duties as a member of the committee. Mrs. Gray predeceased her husband some 15 months ago.

WILLIAM STEWART.—We regret to record the death of Mr. William Stewart, which took place at Carlisle on the 8th inst. He was for many years head gardener to the late Sir Wilfrid Lawson, Bart., Brayton Hall, where he was much respected. He was a familiar figure at the leading horticultural shows, more particularly at the Caledonian Horticultural Society's shows in Edinburgh, where he gained many prizes. As a grower of stove plants he had few equals. About seven years ago Mr. Stewart opened a business in Carlisle as a florist and fruiterer, and his perseverance and tact enabled him to establish a business of good standing and wide connection. He leaves a widow and grown-up family.

DEBATING SOCIETIES.

WARGRAVE AND DISTRICT GARDENERS.—The usual fortnightly meeting was held on Wednesday, September 28, in the Parish Room, Wargrave. A lecture was given by the hon. secretary (Mr. H. Coleby), on "Plant Hairs." The structure of these organs was described and diagrams were shown. The various functions they perform include, said Mr. Coleby, protection from unwelcome insect visitors, from heat, cold, the rain, and too rapid evaporation; assistance in the dispersion of fruit and seeds, and to climbing or clinging, affording "footholds" for insects, and the secretion of various fluids.

SALISBURY GARDENERS.—The annual meeting was held on October 5. The vice-president, Mr. A. C. Jones, occupied the chair. The annual report showed that during the session 1909-10 the members had met 18 times, lectures being delivered on 10 occasions. The younger members were offered prizes for the best essays, and the reading of those formed the programme for one evening, whilst on another occasion a bulb-growing competition was held, the prizes being given by Mr. G. Locker-Lampson, M.P. A botany class was started in November by the Salisbury Education Committee at the request of the society. The financial condition of the society is satisfactory, there being a credit balance of £16 5s. 3d. The secretary, Mr. E. W. Collick, was congratulated and thanked for his efforts in placing the society affairs on a sound basis. The nomination of new members was proceeded with, and no fewer than 15 were enrolled. A letter was read from the president, the Rev. Chancellor Bernard, requesting that his removal from Salisbury rendered it impossible for him to retain the post. On the proposition of the chairman the meeting accepted the resignation with regret. It was decided to ask the Hon. Lewis Greville to fill the vacancy. Mr. Jones was re-elected vice-president; Mr. P. Badling, treasurer; Mr. W. F. Collick, secretary; and Mr. C. Phelps and Mr. A. Warren, assistant secretaries.

CHELMSFORD AND DISTRICT GARDENERS.—The opening meeting of the seventh session of the above society was held at the county Laboratories, Chelmsford, on October 7. About 60 members were present, and eight new members were elected. The subject for the evening was "Soil Sterilisation," by Mr. F. J. Chittenden, of the R.H.S. Wisley Laboratory. Mention was made in the lecture of the valuable work which has been done by Dr. Russell, Dr. Hutchinson, and Mr. Hall, in connection with soil sterilisation. The lecturer quoted the results he had obtained from experiments, and illustrated the effects of sterilisation of the soil as it influenced seedlings, by exhibiting a number of dried specimens. The explanation was given for the increased fertility of the soil after its treatment by heat, and the work of the living organisms in the soil was dealt with. Mr. Chittenden gave suggestions for sterilising soil by heat without the erection of an elaborate apparatus, and gave instances where sterilisation was carried out by market growers. Treating the soil with carbon bisulphide and formalin, for the destruction of soil pests, was also referred to.

GUILDFORD AND DISTRICT GARDENERS.—Mr. H. Lam presided at the meeting held on October 4, there being 47 members present. Mr. G. J. Nichols, of Merrow Grange gardens, read a paper on "Dendrobium noble," and Mr. L. Pike, of Woodbridge House gardens, gave another paper on "Sweet Peas." A good discussion followed the reading of both essays.

CROYDON AND DISTRICT HORTICULTURAL.—There was a big attendance at the meeting held on October 4. The lecturer was Mr. Joseph Cheal, of the Lowfield Nurseries, Crawley, the subject of his lecture being "Old Gardens of Italy." Mr. Cheal's remarks were illustrated by lantern slides made from views obtained whilst touring in Italy a few years ago. Mr. Cheal said that the love of gardening in Italy dates from an early period. The climate being so clear and genial tropical plants and flowers luxuriate in the open, and the lecturer remarked that in walking through some of the gardens the perfumes from the flowers are almost overpowering. Statuary, urns and stone vases abound freely in Italian gardens, and Orange and Lemon trees grow in splendour. Lakes, cascades and fountains are brought into requisition to beautify the scenes and afford cool retreats in the hottest weather. Stone pergolas are largely employed, being clad with Roses, vines and other choicest. Lengthy terraces with parterres form conspicuous objects in the gardens. The Vatican gardens are divided into compartments with straight walls bounded by Box edging and rows of Orange and Lemon trees in pots. Successive fountains have designed their Papal arms in neatly trained lines.

MARKETS.

COVENT GARDEN, October 12.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers such as Asters, Camellias, Carnations, Dahlias, Gardenias, Gladioli, Lapageria, Lily of the Valley, Marguerites, and various orchids with their respective prices.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage plants such as Adiantum, Asparagus, Ferns, Hardy foliage, and Myrtle with their respective prices.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants such as Aralia Sieboldii, Asparagus plumosus, Aucubaria excelsa, Bouvardia, Campanula, Chrysanthemum, Erica, Ficus, Geranium, and Solanum with their respective prices.

Fruit: Average Wholesale Prices.

Table listing various fruits such as Apples, Bananas, Blackberries, Cranberries, Figs, Grapes, Lemons, Melons, and Nuts with their respective prices.

Fruit: Average Wholesale Prices (continued).

Table listing various fruits such as Nuts, Cocoanuts, Walnuts, Peaches, Pears, and various berries with their respective prices.

Vegetables: Average Wholesale Prices.

Table listing various vegetables such as Artichokes, Aubergines, Beans, Broccoli, Cabbages, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Horseradish, Lettuce, Marrows, Mushrooms, Onions, Peas, Potatoes, Radishes, Sprouts, and Turnips with their respective prices.

REMARKS.—The market is now well supplied with English Apples. A consignment of about 4,000 cases of Apples from Wenatchee arrived this week. The fruits were in a good condition and well graded. They were much appreciated by buyers. Good Pears are in demand. Grapes are a plentiful supply, and they are selling slowly, prices showing no advance on those of last week, with the exception of Muscat of Alexandria. Only a few Peaches are to be had. Blackberries show an improvement in colour, and they have advanced in price. Stoers are arriving in limited quantities from the north of Ireland. English Walnuts (Doubles) are a very limited supply. Cob Nuts are dearer. English Tomatoes are arriving in much larger quantities. A few boxes of Tomatoes from the Canary Islands reached the market this week. The vegetable market shows no improvement on last week's trading. E. H. K., Covent Garden, October 12, 1910.

New Potatoes.

Table listing various new potato varieties such as Kents, Bedford, British Queen, and others with their respective prices.

REMARKS.—Prices are about the same as last week: there is a fair amount of trade, and consignments are equal to the demand. Edward J. Newborn, Covent Garden and St. Pancras, October 13, 1910.

COVENT GARDEN FLOWER MARKET.

Trade is very uncertain. I was offered fresh, medium-sized blooms of Chrysanthemums at 4s. per dozen bunches late this morning (Wednesday), and the larger specimen blooms were equally cheap. Dahlias are equally abundant. There has been a fair demand for these for the Harvest Festivals. Asters are past. Lilliums of various sorts are well supplied, good blooms of L. longiflorum being offered at from 1s. 6d. to 2s. 6d. per bunch. Lily of the Valley is fairly well supplied, and may be purchased at moderate prices. Lapageria alba is cheap. Whilst good Chrysanthemums are plentiful, the values of other flowers are much depreciated. Violets are numerous, and the Parma kinds are sold for as low as 1s. per large bunch. Roses are abundant, and prices for these flowers vary considerably. Cut foliage is well supplied. Oak, with bronze-leaved foliage, is now at its best condition, and various subjects have bright autumnal tints.

POT PLANTS.

There is not much variation from last week. Chrysanthemums are the leading feature. Ericas are very good, E. byrnalis being particularly well flowered, but there is not a ready sale for Heaths at present. Ferns of all sizes are seen in large quantities, and may be bought cheaply. Other foliage plants are also well supplied. Palms of good quality, particularly Kentias and Latanias, advance rather than depreciate in value. Cyperus alternifolius is not grown so extensively as formerly, and its value has advanced a little; for some purposes this is a most useful plant. Hardy shrubs are a feature on many stands. Solanums of good quality are well supplied. There is only a moderate demand for plants, and many remain unsold at the close of the market. A. H., Covent Garden, October 12, 1910.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending October 8, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—After heavy rain in the western and north-western districts on Sunday and some more moderate falls elsewhere the weather over the kingdom generally was fair to fine. Slight rain occurred, however, rather frequently in the extreme north of Scotland, and a little was experienced some time during the period in most other localities. Thunder and lightning occurred at some places in the east of England on Sunday, and aurora was observed at Aberdeen on the nights of Thursday and Saturday. The temperature was above the average, the excess amounting to about 4° over a considerable portion of the country, and as much as 6° in England N.E. and Scotland E. The highest of the maxima were recorded on rather variable dates, and ranged from 74° in England E., above 70° over the eastern and central parts of Great Britain generally, and 70° in Ireland S., to 66° in Ireland N. The lowest of the minima, which were registered late in the week at most stations, varied from 32° in Scotland E. to 41° in England N.E. and Ireland S., and to 46° in the English Channel. The nights generally were very mild for the time of year. The lowest grass readings reported were 29° at West Linton, 30° at Crathes and Newton Rigg, 31° at Cockle Park (Morpeth) and Llangammarch Wells, and 32° at Sheffield and Armagh. The rainfall was much less than the average. In England E. and S.E. the fall was less than 0.1 inch, and at some stations in the east of England the week was rainless. Falls of more than an inch were reported over a large area in Ireland and the south-west of Scotland on the 2nd, and also in the Isle of Man. At Douglas the measurement amounted to 1.6 inch. The bright sunshine exceeded the average in Scotland N. and Ireland S. The percentage of the possible duration ranged from 52 in the English Channel and 49 in England N.E. to 31 in Scotland W. and Ireland S., to 28 in Ireland N., and to 24 in Scotland N.

THE WEATHER IN WEST HERTS.

WEEK ENDING OCTOBER 12. The third warm week in succession.—The recent spell of warm weather lasted nearly three weeks, during which there occurred only one unseasonably cold day, and but two cold nights. There has been during the past spring and summer no such long continuance of unseasonably warm weather, the longest being in May when there were 12 consecutive days and nights of unusual warmth for the time of year. The ground is now very warm, being 4° warmer at 2 feet deep, and 5° warmer at 1 foot deep, than is seasonable. Rain fell on two days of the past week, and to the aggregate depth of three-quarters of an inch, making this the wettest week since the end of August, or for six weeks. These rains re-started both percolation gauges. Through the bare-soil gauge there had previously been no measurable percolation since the middle of September, and with one exception none at all since the middle of July though the gauge on which short grass is growing. The sun shone on an average for three hours a day, which is about the average duration for the middle of October. Light airs and calms alone prevailed during the week. The mean amount of moisture in the air at 3 p.m. exceeded a seasonable quantity for that hour by 2 per cent. E. M., Berkhamsted, October 12, 1910.

TRADE NOTICE.

LEAMINGTON NURSERYMEN AND FLORISTS (LIMITED). Notice has been filed of the appointment of J. H. and F. J. Whitlock, 9, Bank Street, Rugby, as receivers, on September 5, 1910, under powers contained in debentures dated December 3, 1909.

GARDENING APPOINTMENTS.

(Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.)

- Mr. JOHN DICK, for the past 3 years Gardener to Colonel NAPIER, Gairth, Stirling, and previously Foreman at Castlemilk, Lockerbie, and Paishanger, Hertford, as Gardener to the Marquis of Breadalbane, K.G., Taymouth Castle Gardens, Kenmore, Perthshire.
- Mr. A. HATHER, previously Foreman in the Gardens at Perry Hall, Birmingham, and Thorpe Lubenham, Market Harborough, as Gardener to Miss BUTLER, The Ashlands, Billesdon, near Leicester.
- Mr. H. BLOXHAM, for 8 years Gardener to the late S. H. WARD, Esq., Nether Edge, Sheffield, as Gardener to W. TOZER, Esq., Tipton Edge, Fulwood, Sheffield.
- Mr. JOHN R. MORGAN, for 3 years General Foreman at Ballywalter Park, Co. Down, as Gardener to E. J. BEAUMONT NESBITT, Esq., Tubberdaly Castle, Edenderry, King's County, Ireland.
- Mr. JAMES MACDONALD, from Messrs. THOS. METHVEN & SONS, Edinburgh, and previously Foreman for 13 years at Aberlour House, Banffshire, and for more than 2 years Foreman at Archerfield, Dirlston, as Gardener to Sir A. H. STON STUART, Bart., of Touch House, Stirlingshire. (Thanks for 2s. for the R.G.O.F. box.—EDS.)
- Mr. JOHN D. AYRISON, for the past 2½ years Gardener to Major ATHERLEY, Hampton Court, Leominster, Herefordshire, and previously 6 years Gardener to the late Viscount ASHROOKE, Castle Durov, Queen's Co., Ireland, as Gardener to Lord BERWICK, Attingham Park, Shrewsbury, Salop.
- Mr. H. T. BARNETT, for the past 2 years Gardener to F. M. GORMAN, Esq., Arnolds, Holmwood, Surrey, as Gardener to the same gentleman at Drove House, Singleton, Sussex.
- Mr. E. ALLAWAY, for the past 3 years Foreman at Wykeham Abbey, Yorkshire, and previously 2 years Foreman at Bessborough Park, Co. Kilkenny, as Gardener to Mrs. E. W. EVERITT, Sherbourne House, Leamington Spa.
- Mr. JAMES DEUCHARS, for the past 6½ years Gardener to the late Mr. ANDERSON ROGER, Glen Park, Port Glasgow, as Gardener to Mrs. JOHN GORDON, Kenmure Castle, New Galloway, N.B.
- Mr. ALEX. BEATON, for the past 3 years Foreman at Belvoir Park, Belfast, and previously at Cullen House, N.B., has been appointed Gardener to Captain REEVE, Leadenhall Hall, Lincoln.
- Mr. ARTHUR OUTLAW, for the past 6 years Inside Foreman at Eglinton Gardens, Kilwinning, as Gardener to Sir JAMES COATS, Auchendrane, Ayr.
- Mr. H. GRIMES, late Gardener to Sir HENRY MEREDITH, Pipewell Hall, Northamptonshire, as Gardener and Bailiff to the Hon. H. BOCKLE, Wootton Hall, near Ashbourne, Derbyshire. (Thanks for 1s. 6d. contributed to the R.G.O.F. box.—EDS.)
- Mr. F. FORWARD, for the past 3 years and 8 months General Foreman in the gardens, Hursley Park, Hampshire, as Gardener to Miss BAKING, Durnisi, Burley, Hampshire. (Thanks for 1s. contributed to the R.G.O.F. box.—EDS.)
- Mr. F. DIBBIN, as Gardener to DOUGLAS CROSSMAN, Esq., Grandsden Hall, Sandy, Bedfordshire.
- Mr. L. JONES, recently Outside Foreman at Waddlesdon Manor, as Gardener to Col. The Hon. W. A. W. LAWSON, D.S.O., Slaveley Lodge, Melton Mowbray.

APPLE SHOOTS DISEASED: *J. Halsey.* The Apple shoots are affected with the twig form of the fungus *Fusicladium dendriticum*, causing the "Black Spot" or Apple scab. Cut out as much as possible of this scabby wood, and spray the tree with bluestone and water (1 lb. dissolved in 25 gallons of water) at the beginning of February. This will also kill any moss or lichen that may be growing on the tree. Afterwards spray with Bordeaux Mixture (4 lbs. copper sulphate, bluestone, 4 lbs. quicklime, 50 gallons water) just before the flower-buds open, and again directly the fruit is set. If the variety is Cox's Orange Pippin, omit the second spraying. A full illustrated account of Apple scab on the leaves, wood, and fruit appeared in the *Journal of the Board of Agriculture* for June, 1908, price 3d.

AVERAGE YEARLY COST OF PAINTING GREENHOUSES: *B. P.* Assuming that the greenhouses described in your note require to be painted with two coats of good white or stone-coloured paint, and that breakages of glass have to be repaired with putty, the cost would approximately amount to £3 15s., made up as follows: ½ cwt. paint (ready mixed), 15s. 11d.; 1½ cwt. putty, 6s. 1d.; glass, 15s.; man, four days' painting, 24s.; one day making good glass and putty breakages, 6s.; one gallon American turpentine, 5s. 6d.; and one gallon linseed oil, 2s. 6d. We interpret the word "painting" as used in your note to apply to the making good of putty breakages (where top putty is used) before painting, but nothing is said about brickwork. If your greenhouses are given two coats of paint now, and they are painted again each year, the average annual expenditure in painting, &c., would be about £1 15s. 6d., if they are only painted one coat thick. But glass-houses are often painted but once in two years, and in this case the annual cost would then be only 18s. 6d.

CARNATIONS UNHEALTHY: *W. J. Facey.* The Carnation leaves are just affected with the Carnation rust (*Puccinia arenariae*). Spray the plants with "liver of sulphur" solution (1 ounce of "liver of sulphur" dissolved in 3 gallons of water). Take care this spray does not fall on any white painted woodwork, as it will blacken it.

CREOSOTING GARDEN FRAMES: *J. E. C. L.* Fumes from creosote are injurious to plant life, and this method of preserving the woodwork should not be adopted. There have been instances where creosoted wood blocks used in road paving have injured plants growing adjacent to the roadway.

GRAPES NOT COLOURING: *Alicante.* The trouble is due to shanking. The most general cause of shanking is an unsatisfactory condition of the roots and border, but it may result from overcropping, excessive defoliation at one time, cold draughts, or any wrong treatment. During the coming winter, overhaul the border, placing the drainage materials afresh, and reconstructing the border. Afterwards, keep the roots under control by giving them occasional top-dressings.

GRAPES WITH BROWN MARKINGS: *C. A. Brinklar.* The brown spots on the Grapes do not appear to be caused by any fungus. Some mites are present.

IVY ON PAINTWORK: *Ivy.* If the paint is thoroughly dry and hard, it will have little effect on the growth of the Ivy. The plant may often be found clinging to the painted work of windows and eaves.

MARKET WEIGHTS AND MEASURES: *T. B. A.* The following weights are recognised in Covent Garden Market:—Apples: "Bushel" = 42 lb.; "pot" = 63 lb.; "case" = 40 lb.; "barrel" = 140 lb. Pears: "Case" = 20 lb. Beet: "Pot" = 70 lb. Brussels Sprouts: "Pot" = 40 lb.; "hamper" = 60 lb. Onions: "Dutch bags" = 110 lb., taken as 1 cwt.; "Valencia case" = 120 lb. Spinach: "Bushel" = 24 lb. Turnips: "Pot" = 60 lb. Potatoes: "Load" = 252 lb.; a "bag" of foreign Potatoes = 1 cwt.; "tally" of green vegetables = 60 heads.

MELON ROOTS WITH "WARTS": *P. J.* The trouble is due to eelworm. See reply to *Geo. West* in the last issue, p. 271.

Names of Flowers, Fruits, and Plants.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time, they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. Correspondents not answered in one issue are requested to be so good as to consult the following numbers.

FRUITS: *S. Symonds.* King of the Pippins.—*Hackness.* 1, Sea Eagle; 2, Madame Trévy.—*O. A. C.* 1, Winter Colman; 2, Bastard Blenheim; 3, Winter Quoining; 4, Dumelow's Seedling (syn. Wellington); 5, Lemon Pippin; 6, 7, King of the Pippins; 8, Reinette de Caux; 9, Catshead.—*O. W. Hunt.* 6, Warner's King; the others are misshaped and small. We cannot undertake to name such poor specimens.—*M. Fritter.* The taller fruit is Smart's Prince Arthur, the other Hanwell Souring.—*S. Bradshaw.* 1, Minchull Crab; 2, Beurre d'Angou; 3, Doyenne Grise; 4, Marie Benoist; 5, Beurre Diel; 6, Beurre Capiaumont; 7, Bergamotte Esperen; 8, Small's Admirable; 9, Marie Louise.—*J. H. Fig Brunswick.* We do not undertake to reply to these communications by post.—*Sweet William, Oron.* Apple Court-pendé plat.

PLANTS: *N. H. P.* *Euonymus europaeus*, Spindle Tree.—*N. H. C.* You have far exceeded the proper number; a small contribution to the R.G.O.F. box would be appropriate. 2, *Aster acris*; 3, *A. ericoides*; 4, *A. multiflorus*; 5, *A. levigatus densus*; 8, *A. ericoides*; 9, *A. acris*; 10, *A. cordifolius elegans*; 15, *A. "Robert Parker"*; 19, *A. punicus pulcherrimus*; 20, *A. novae-angliae roseus*; 23, *A. patens*; 24, *A. novae-belgii niveus*; 28, *A. Amellus*; 29, *A. novae-belgii levigatus*. Those of the intervening numbers are evidently all garden seedlings. The remainder next week.—*R. M.* 1, *Aster "Robert Parker"*; 2, *A. novae-angliae pulchellus*; 3, *A. novae-belgii grandiflorus*; 4, *Chrysanthemum uliginosum*; 5, *Helianthus decapetalus*.—*Constant Reader.* 1, *Cotoneaster microphyllus*; 2, *Thuya occidentalis*; 3, *T. dolabrata variegata*; 4, *Muehlenbeckia varians*; 5, *Smilax sp.*; 6, *Euonymus japonica variegata*; 7, *Santolina Chamaecyparissus*; 8, *Rosmarinus officinalis*; 9, *Escallonia rubra*; 10, *Lychnis dioica var.*; 11, *Elaeagnus pungens variegata*.—*S. B. V.* *Quercus Lucombeana*; *Pyrus Terminalis*; *Tilia dasystyla* (syn. *enchlora*).—*G. G.* *Lucombe Oak*; *Quercus Lucombeana*.—*L. G. P.* *Aralia chinensis*.—*William S. Minty.* *Silene armeria*.—*J. Davis.* *Rose Tillier*.—*A. C. H.* *Cypripedium radiatum* (*Spicerianum* × *Lawrenceanum*). The divided and laterally extended lower sepals may be an occasional feature, or it may be fixed. It merely shows the true character of the lower segments, which are usually joined and arranged behind the lip.—*C. S. C.* *Allamanda Hendersonii grandiflora*; *Lathyrus sativus*, narrow-leaved variety.—*T. A. C.* *Sempervivum ciliatum*.—*T. J.* *Ceanothus thyrsiflorus Gloire de Versailles*, a garden-raised variety.—*Shrubs, Roshill.* 1, *Cotoneaster frigida*; 2, *Viburnum Opulus*. The Begonia leaves have been injured by excessive moisture; keep the plants drier, and afford plenty of ventilation.—*I. Z.* 1, *Oncidium oblongatum*; 2, *Ornithidium sophronitis*; 3, *Stelis Rodriguezii*; 4, *Colia Baueriana*; 5, *Zygotetrum cinctum*; 6, *Cypripedium venustum*.—*P. E. N.* *Stenoglossis longifolia*, a South African terrestrial Orchid. It is near to *Stenoglossis fimbriata*, but in the latter species the basal leaves are blotched with purple. There are no leaves with the small inflorescence you send.—*T. A. N.* *Newcastle*. *Saxifraga Fortunei*.—*W. E.* 1, *Acer polymorphum atropurpureum*; 2, *Acer polymorphum sanguineum*.—*W. J. W.* *Daphne Mezereum*.

PACKING FLOWERS FOR TRANSIT: *T. H. K.* Your plan of packing blooms for a journey in a single layer with damp moss at the bottom is a good one. But do not use too much moisture, as this will cause the flowers to deteriorate. Most flowers are sent to Covent Garden

ENQUIRY

PRESERVING LEAVES ON SHOOTS OF BEECH AND POLYGONUM.—Can any reader inform me when is the best time to cut sprays of Beech and Polygonum, and what process, if any, should be adopted so that the leaves may be retained on the sprays for winter decoration? *Old Reader.*

market in shallow, wooden boxes with layers of soft tissue paper beneath and about the flowers to prevent damage by rubbing. In the case of Roses, Carnations and other big blooms with long stalks, a strip of wool is wedged tightly from side to side, securing the flowers so that they cannot shift.

turf with fine soil. In the spring, dress the grass with some nitrogenous manure, such as sulphate of ammonia. Plantains may be killed by placing common salt in the crowns, or by piercing the centres with a steel spike that has been dipped in a strong acid. Seedlings of this weed may be prevented by mowing the turf

ting, letting the bottom of the wire penetrate the soil several inches deep.

ROSES SUITABLE FOR FORCING: *A. H.* Twelve suitable Tea-scented Roses for pot culture are Niphetos, Sunrise, Mme. Falcot, Peace, Perle des Jardins, Ribens, Catherine Mermet, The Bride, Bridesmaid, White Maman Cochet, Mme. Antome Mari, and Lady Roberts. These are pure Tea-scented varieties, and their flowers give a wide range of colour. Six suitable Hybrid Tea varieties, which favour the Teas much more than the Hybrid Perpetuals, are Mrs. Aaron Ward, Le Progrès, Molly Sharma Crawford, Souvenir de Pierre Notting, Kaiserin Augusta Victoria, and Mrs. W. J. Grant. Of Hybrid Perpetuals, it will be best to confine your selection to dark-coloured varieties. General Jacqueminot, Fisher Holmes, Victor Hugo, Countess of Oxford, Prince C. de Rohan, and Commandant Felix Faure are all suitable; whilst the H. Teas, Richmond and Liberty should be included among the dark reils. Purchase the plants in pots, as these will be more satisfactory than newly-lifted specimens from the open.

SWEET PEAS TO FLOWER IN FEBRUARY AND MARCH: *E. G. F.* Sow the seeds at the end of October in a temperature of from 45° to 50°. Do not use more fire heat than is absolutely necessary, but ventilate the house freely both by day and night, whenever the weather will allow. The seeds are best sown in small pots, and allowed to germinate slowly, either in a cold frame or on shelves near the glass in quite a cool house. Take measures to protect the seeds from mice and rats.

THE WONDERBERRY: *Anxious.* You will find an account of this fruit, accompanied by illustrations, in the issue for October 30, 1909, p. 291.

TOMATOS FOR FRUITING IN MAY: *E. G. T.* Should be sown in the first week of November in a temperature of about 60°. The atmospheric temperature during the winter months should not be less than 55° or more than 65°. Afford the plants all the light possible, avoiding strictly a moist, stagnant atmosphere.

TREE TOMATO (see fig 121): *A. U. S.* This fruit is *Cyphomandra betacea*, the Tomato de la Paz of Mexico and Central America. It is also known as the Tree Tomato and Vegetable Mercury in the West Indies for the real or supposed medicinal qualities of the fruits in relieving liver complaints. The species is distributed widely in tropical and temperate regions.

VINES FAILING TO CROP: *Constant Reader.* The roots of the vines appear to have got into very poor soil. The best thing to do is to renovate the border at once. Dig out a trench about 5 feet wide at the outside of the border, then gradually fork away the soil, working towards the vines, until a good body of roots is reached. Preserve as many of these roots as possible, keeping them damped and shaded until they are planted again in the new soil. After clearing away the old border, place a thin layer of concrete over the bottom to prevent the roots from again entering the subsoil. Make sure the border is perfectly drained by employing plenty of bricks for this purpose. For making the new border, procure some rich loam from an old pasture, and mix with this some old mortar rubble, wood ashes, and crushed bones. Artificial manures can be used to better advantage when the border has become full of roots, applying them in the form of top-dressings just before watering the soil. This will encourage the roots to the surface of the border. Do not commence laying in the roots until half the border is made, then lay them in tiers as the work proceeds. Give the whole a good watering when finished. Syringe the vines two or three times each day in fine weather, and shade them from bright sunshine.

BACTERIA AND AGRICULTURE.*

THE many and important parts played by bacteria in the work of the world are now widely recognised. Certain of these minute forms of life deal out death—these are the pathogenic bacteria, the disease-producing agents of such maladies as tuberculosis, typhoid fever, diphtheria, and so on. Other species of bacteria bring about, in ordered stages, the decomposition of dead organic matter, and in doing so provide the raw material out of which new generations of plants and animals are constructed. To yet other species is confided the all-important task of enhancing the fertility of the soil by the "fixation" of free nitrogen—that is, by causing the nitrogen of the air to combine with other elements to form compounds which serve as sources of nitrogen to the higher plants. Nor does this complete the tale of the activities, beneficent and malign, of bacteria. Besides being the scourges of mankind, the scavengers of the earth, and the fertilisers of the soil, they play essential parts in the chemical operations which underlie all manner of industrial processes, such, for example, as cheese and butter making.

With the recognition of the varied and fundamental parts played by bacteria in the

world's work, it has become one of the definite objects of biological science, not only to complete the discovery of their activities, but also to control them; for this is the first step towards the systematic scientific exploitation of bacteria in the interests of mankind.

As the outcome of the efforts in this direction we have an immense amount of recorded research scattered through the pages of a hundred scientific periodicals, and it is time, as Professor Percival, the author of *Agricultural Bacteriology*, recognises, for scientific agriculturists to gather together the chief results of these investigations, and to present them in intelligent form to the wide public which does not read the technical journals. We may say at once that Professor Percival has carried out this heavy task in an admirable manner, and has produced a book which will prove of great service to the agricultural and horticultural student. Recognising, moreover, that it is not enough for the student to read about bacteria and their manifold forms and activities, Professor Percival has provided in the text a very complete course of instruction for practical work in the laboratory. Aided by these instructions, the student, who has the ordinary resources of a laboratory at his disposal, may isolate the micro-organisms which he wishes to study, cultivate them in appropriate media, and follow the chemical changes which they set up in these media. The practical exercises refer not only to the bacteria of the soil, but also to those concerned in the changes undergone by milk, in the ripening of cheese, and in developing the flavour of butter; hence, the text-book is as valuable to the worker in the dairy as to the purely agricultural student.

Though the method of incorporating the practical laboratory instructions with the text enhances the value of the work to the student, it detracts from its readableness, so far as the general reader is concerned. This is, however, inevitable, and does not imply a criticism of the text, which is written in the direct, simple and yet vivid, style which we are accustomed to expect from Professor Percival.

If the general reader, who has neither the time nor opportunity for practical exercises, skips adroitly the "instructions for experiments" and picks out for perusal the chapters on subjects in which he is specially interested, he will discover a mass of interesting and valuable information on the most varied aspects of agricultural bacteriology. To the horticulturist, the chapters on the bacteriology of the soil, nitrification, denitrification, the fixation of nitrogen and farm-yard manure, will prove of the greatest interest. The worker in the dairy will discover the clue to the significance of the many remarkable changes which he witnesses and seeks to control in the sections dealing with milk—its bacterial flora and the fermentations which it undergoes, the rationale of filtration, cooling, Pasteurisation, and sterilisation, the separation of cream and the making of butter and cheese. The general reader who dips into these pages will learn that there is more of romantic episode in the lives of the bacteria than in those of the heroes and heroines of current fiction, and all will agree that Professor Percival is to be congratulated on the issue of a work of fascinating interest and permanent value.

TEN DAYS IN CO. KERRY.

(See Supplementary Illustration.)

THE following notes on Co. Kerry and its remarkable flora are based upon a visit made in July to Caragh and Killarney, in company with my friend Mr. Arnold Elliott. The district had been so dry for weeks that the rivers were quite low and the salmon had got stale, so that the fishermen had departed. This state of affairs, however, did not affect the lake-fishing for trout, and on two days when there was a nice ripple on Lough Acoose we enjoyed ourselves among the trout, which afford here such excellent sport.

Lough Acoose is beautifully situated at the foot of Carrantual (3,414 feet), the highest mountain in Ireland, and slightly higher than any in England. It was in ascending Carrantual (called Carrantuohill on the Ordnance map and Carr Tual in *Cybele Hibernica*) that the more interesting botanical observations were made.

My companion makes no claim to be a botanist, but he has an innate faculty for finding good plants if they are to be found; and let it be said here that during a skiing holiday in Switzerland last winter he managed to grub up through the snow quite a wonderful collection of interesting Alpines which are succeeding capitally on his rockery. Thus at Whitsuntide he showed me a patch of *Linaria alpina* as floriferous and as brilliant in colour as any to be seen in the Alps.

During our first afternoon in Ireland, Elliott surprised me by bringing a specimen of the rare *Saxifraga angustifolia*, which his keen eyes had seen close to the edge of Lough Caragh, while I had been busy photographing. This North American species was not found in Ireland until 1845, and is unknown elsewhere in Europe, except as an acknowledged introduction. Dr. Scully, who is preparing a book on the flora of Co. Kerry, says: "The more I see of the distribution of this plant in Kerry the more I am inclined to consider it indigenous there." By Lough Caragh it was associated with *Drosera*, *Lobelia Dortmanna*, and *Bog Asphodel* (*Narthecium*).

In *Irish Topographical Botany*, Mr. Lloyd Praeger remarks that "the division of S. Kerry is formed of great folds of Lower Devonian slates and sandstones; the anticlines, including the highest mountains in Ireland, run in massive promontories far into the Atlantic, the synclinal valleys being occupied by carboniferous limestone to a limited extent." One-third of the total surface is unreclaimed mountain, and, of the remainder, two-thirds are under grass; of this area, 24 per cent. is over 1,000 feet in elevation.

We had taken no botanical book with us—not even the useful *Handlist of Irish Flowering Plants and Ferns*, compiled by Miss Knowles, and recently issued for Id. at the National Museum, Dublin. Nor did we have Praeger's excellent little *Tourists' Flora of the West of Ireland*, with its beautiful photographs of typical vegetation and plant associations. So that all our "finds" were accidental and more or less in the nature of surprises. But when we got to Dublin we regretted we had not bought the *Tourists' Flora*, especially as it is quite the cheapest botanical book for 5s. 6d. we ever set eyes upon. It does not comprise Co. Kerry, which region Dr. Scully is doing separately. Though we had not intended doing much botany, the force of circumstances compelled us to be interested in the vegetation. In our first morning ramble, we came across the three *Pinguicula*s growing together—*grandiflora*, (passed flowering), *vulgaris*, and *lusitamica*. Why *Pinguicula grandiflora* should be found on the continent of Europe and re-appear in the West of Ireland without condescending to associate with its mean little brother *lusitamica* on the cliffs near Penzance, or on the boggy heaths of Dorset, is difficult to understand. *Euphorbia hiberna*, whose handsome foliage was rapidly turning a glorious red colour, is not quite so

* *Agricultural Bacteriology*, by John Percival, M.A., Professor of Agricultural Botany, University College, Reading, with illustrations and diagrams. Large crown 8vo., 7s. 6d. net. (Duckworth & Co.)

shy of England, for it does appear in some abundance in the Lyn Valley of North Devon, where the geological formation and, consequently, the scenery are so similar to those of Kerry.

Other rare plants found in Kerry and the south west of England are the Cornish Moneywort (*Sibthorpia europæa*), *Bartsia viscosa*, with its lovely lemon-yellow flowers, and *Inula erithmoides*. The abundance of two commoner plants, *Jasione montana* and *Cotyledon umbilicus*, in the hilly parts of both these large districts may also be noted. The *Arbutus* tree is still in evidence in a few places by the Lake of Killarney, in which situation it grows finer than in the drier climate of the south of France where it is much used for firewood. *Simethis bicolor* is confined in Ireland to southern Kerry; and among other rare or characteristic plants in this division of Ireland are *Thalictrum alpinum*, *Saxifraga Gemm.*, *S. umbrosa*, *S. Sternbergii*, *Carum verticillatum*, *Juncus tenuis*, *Eriocaulon articulatum*, *Carex punctata*, *Deschampsia alpina*, *Asplenium lanceolatum*, *Aspidium Lonchitis*, and *Pilularia*

an interminable and very stony gully. Hooker says of the two British Filmy Ferns in *Brit. Fl.* (1830): "No one, I believe, was aware of their real differences till Mr. W. Wilson found them both growing at the Lake of Killarney, and distinguished them specifically."

We found 15 flowering plants on the summit of Carrantual, viz., *Saxifraga umbrosa*, *S. stellaris*, *Galium saxatile*, *Vaccinium myrtillus*, *Armeria maritima*, *Thymus serpyllum*, *Rumex Acetosa*, *R. Acetosella*, *Luzula maxima*, *Juncus trifidus**, *Carex rigida*, *Agrostis canina*, *Festuca ovina* and *forma vivipara*, *Sieglingia decumbens*, and *Deschampsia flexuosa*. Mr. P. N. Williams, in his interesting compilation on *The High Alpine Flora of Britain*—a list of the flowering plants and Ferns found at 1,000 metres and upwards on the mountains of the British Isles, with authentic references and critical notes (1910)—gives one or two others from the top of Carrantual, 1,041 metres, but he does not record *Juncus trifidus*, except from Scotch summits, while *Sieglingia* (*Tridialia*) *decumbens* is absent alto-

see a good crop of Rushes in these deep trenches; while we took a charming photograph of a Potato field in which Foxgloves and Bracken were the predominating feature of one corner. The Foxglove is remarkably ubiquitous in Kerry, and is to be seen in low-lying turbaries and high up on some of the mountains, where occasionally it can be found on the red rocks, just as it was growing recently on the Malvern Hills.

The first and third photographs reproduced in the Supplementary Illustration were taken on the narrow ridge of Carrantual uniting Caher (3,200 feet) with the summit (3,414 feet) and overlooking to the N.W. the mountain tarns of Coomboughra and Eagher, some 1,500 feet below. *Saxifraga umbrosa* was growing finely in the rock crevices, but, owing to deep shadow and the smallness of the photographs, it is hardly visible. No. 2 shows a steep escarpment of Devonian rock, with the summit of Carrantual across the deep valley. The fourth view indicates the *Arbutus* (and Oak) skirting the Lake of Killarney. H. Stuart Thompson.

ASTILBE SIMPLICIFOLIA.

IN contrast with the many tall-growing species introduced into cultivation from China during the last few years, this dainty little plant from Japan only attains a height of 9 inches to 1 foot. It was first received amongst some imported plants of *Schizocodon soldanelloides* by Messrs. Stansfield Bros., of Southport, in 1908, and also by Messrs. Barr & Sons, with whom it flowered freely and attracted favourable attention on account of its charming habit and free-flowering properties. The plant forms a tuft of radical leaves on petioles 3 inches long. The leaves are ovate in outline, irregularly lobed and incised, 3 inches long, and 1½ inch to 2 inches wide in the broadest part. The inflorescence, produced well above the foliage, is borne on leafless stems, and is about 3 inches wide. The numerous small flowers are starlike, pure white, and feathery in appearance. *A. simplicifolia* commences to flower early in August and continues to produce a long succession of flower till well into October. It is quite hardy, but from present experience, the plant flowers so freely that if it does not die outright, it is so weakened that it fails the following season. Seeds, however, are produced freely and germinate readily. In the first stages, the seedlings are very slow-growing, but afterwards they make rapid progress. The plant requires a moist, shady situation, similar to that suitable for *Shortia* and *Schizocodon*. This is the second interesting and useful plant that has been introduced from Japan in the same way, the pretty *Patrinia palmata* having first come over mixed with *Schizocodons* a year or two ago. They are both charming little plants for the rock garden. W. I.

FIG. 122.—ASTILBE SIMPLICIFOLIA; FLOWERS WHITE.

globulifera, *Eriocaulon articulatum* Morong. = *E. septangulare* With. is a North American species, not found on the Continent of Europe, and confined in Great Britain to a few of the Hebrides.

In climbing Carrantual from Glencar, Elliott discovered the beautiful and extremely rare *Saxifraga Sternbergii* at about 2,500 feet, where the hillside is pink with a dwarf form of *Armeria maritima*, which continues its course to the summit. We also saw the *Saxifraga*, when descending by a different way, growing with the rare *S. decipiens* Ehrh. and *S. stellaris*. But my companion's most startling find was a somewhat dried up mass of *Hymenophyllum peltatum*, at the very unusual height of 3,000 feet. It was growing in an awkward spot, perhaps never visited by any botanist, for, apart from the fact that this mountain is not often climbed, we were trying to make our way down the N.W. arête, and, in seeking a passage over one of the numerous buttresses of this ridge, the Filmy Fern was noticed. A specimen was captured, but the rocky buttress was not, and instead we descended

gether from this list of 1,000-metre plants. Let it be noted that no mountain in England attains to 1,000 metres. Slightly lower, at about 3,000 feet, we found *Viola Riviniana*, *Saxifraga decipiens*, *Sedum Rhodiola*, *Calluna*, a *Euphrasia*, and *Salix herbacea* at 2,700 feet. In one spot above the picturesque valley of Caragh, we saw *Cardamine amara*, which appears to be recorded only from six of the northern divisions of Ireland. Near Killarney the rare *Orobanchae Hederae* was parasitic upon Ivy.

A remarkable feature of the Alpine flora in the west of Ireland is the way in which various species descend to sea-level or near it, and especially in Co. Clare. *Saxifraga Sternbergii* and *Gentiana verna* are examples, while the Alpine-Arctic *Dryas octopetala* and the Mediterranean *Habenaria intacta* grow side by side, as so well illustrated in *The Tourist's Flora*.

Potatoes are generally planted in deep-trenched rows about 4 feet wide in the peat of Co. Kerry, and it is not an infrequent sight to

* Dr. Scully tells me this "is the first modern record for Ireland."

CULTURAL MEMORANDA.

CULTIVATION OF THE MOREL.

OPINIONS differ as to the possibility of making the cultivation of the Morel (*Morchella esculenta*) pay. It has been observed in France that the fungus succeeds in the vicinity of Artichokes, and spreads between the plants when the moisture in the soil is sufficient for its needs, and is regular. But in places where the Morel grows naturally, the esculent can be collected, and put on the market in the fresh or dried state at a cheap price, so that the garden culture, in view of the varied accidents to which it is liable, is not to be recommended. The esculent might be cultivated in hilly districts, in shady places, in parks, and on the borders of Fir plantations, where the soil is suitably moist. To make sure of a crop, the soil should be strewn with the waste from Morels, or the spawn or brood. Success is dependent on the weather. Every fungus collector knows certain spots where the Morel grows, and can usually obtain a supply after rainy weather. P. M.

SAXIFRAGA TRIFURCATA.

THE Saxifrages which await the choice of the cultivator of Alpines are bewildering in numbers. The dactyloides or mossy section alone would form subjects for many years of collecting and study. It is, however, denied to all but a few to cultivate so many of these flowers as to constitute a collection, and in the possession of a few will be found sufficient pleasure for most of us. A comparatively small number of the mossy Saxifrages is sufficient for most gardens, and in *S. trifurcata* (see fig. 123) we have one which ought certainly to have a place. It makes a fine mound of dark green foliage, prettily divided in such a way as to bear with appropriateness the popular name of the Stag's Horn Rock-fool. Where it is happy, it is charming indeed, being a mound of green all the winter, and in spring almost completely covered with snow-white flowers on slender stems, lifted well above the leaves. The plant figured is growing at the base of a rockery facing N.N.W., and is partially screened from sunshine. Here it has flourished for more than five years, without any attention except removing the flower-stems after the blooms have withered, and getting a little restriction when the roots ventured to encroach on neighbouring plants. Other plants of this Saxifrage in more open and sunny places have not thriven so well. It is in sandy loam, and requires no other compost. Propagation is effected by division, seeds or cuttings. The species is a native of Spain. *S. Arnott, Dumfriesshire.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT GLEBELANDS, SOUTH WOODFORD.

It is generally recognised that one of the greatest hindrances to successful plant culture, and especially choice subjects such as Orchids, is a deleterious atmosphere. But although smoke and fogs have an injurious effect on plant life, it is often found that collections in the neighbourhood of large towns appear far more healthy than others in the open country.

The fact demonstrates that there is more in providing proper accommodation, and giving skilful attention than in the purity of the atmosphere in which the plants are grown. The highest illustration of this assertion is to be found in the collection belonging to J. Gurney Fowler, Esq., at Glebelands, South Woodford (gr. Mr. J. Davis), which, although in the metropolitan area, compares favourably with any other in the country. It is not too much to say that there is not an unsatisfactory plant in any of the houses, and the stout pseudo-bulbs and broad green leaves are pleasant to behold, even when the plants are not in flower.

In the *Cypripedium* houses are great masses of most of the rarer kinds, including the unique *C. Leeanum* "J. Gurney Fowler," the handsome *C. Thalia* "Mrs. Francis Wellesley," *C. Thalia* New Hall Bey var., a fine, dark-flowered form of *C. Wiertzianum*, *C. Ernest Read*, a Glebelands novelty, and one of the largest and best shaped of the light-coloured *Cypripediums*; some fine *C. Troilus*, and a new and large form of *C. Salteri*. There are scores of other handsome hybrids besides those mentioned, while in the range devoted to varieties of *C. Leeanum* and *C. insigne*, a batch of the favourite *C. insigne Sanderei* and plants of the dark and finely-formed *C. insigne Fowlerianum* attract attention. In the same house, suspended overhead, are a number of fine tufts of the scarlet *Sophranitis grandiflora* and its hybrids *Sophran-Cattleya Doris*, which are especially fine specimens. With them also are choice varieties of *Lælia pumila alba* with flowers about to expand. *Lycastes* and *Anguloas*, which many persons fail to grow successfully, are in especially good form, a few of the plants being in flower. We noticed a fine plant of the lemon-

yellow and purple-bloomed *Anguloa Cliftonii*; a sturdy batch of *Miltonia Roezlii*, part of a house filled with *Miltonia vexillaria*; and an almost complete collection of *Cymbidiums*, including some very promising hybrids from *C. insigne* (Sanderi); one between that species and *C. Schroderianum* having very large pseudo-bulbs, intermediate in form between the parents and furnished with two very strong inflorescences, which will shortly be in flower. The smaller, lean-to range of glasshouse, the back of which is covered with *Epidendrum O'Brienianum* and *E. radicans* has, suspended from the roof, plants of the best varieties of *Lælia anceps* well set with flower-spikes; in the adjoining division a number of *Phalænopsis*, with large, fleshy leaves, are thriving well, whilst a batch of *Calanthe Veitchii* and other deciduous *Calanthes* occupy the stage and promise well for winter flowering.

the sepals and petals of which are Indian yellow, tinged and spotted with dark red, the lip being carmine-crimson; *C. Elvina* (Trianae × Schilleriana), *Lælio-Cattleya Clonia superba* (L.C. elegans Turneri × C. Warscewiczii), an early Veitchian hybrid of fine colour, and various other handsome hybrids.

The *Odontoglossum* house is the crowning feature in the Glebelands collection, as both the house and its appointments, as well as the plants contained in it, are of the highest order of merit. The extensive tanks and moisture-holding surfaces ensure a healthy, moist, atmosphere, and the heating system admits of careful regulation, so that the house can always be kept comfortably cool. The plants are in fine health, and it is a pleasure to see them. The spotted forms of *O. crispum* receive special attention. A few *Odontoglossums* are in flower, chiefly rare

FIG. 123.—SAXIFRAGA TRIFURCATA.

In the *Cattleya* and *Lælia* house is a choice collection, including rare albinos, the white *Cattleya Warscewiczii* "Frau Melame Beyrodt," and some others being represented by from 6 to 12 specimens each. *Brasso-Cattleya* Mme. Chas. Maron has bright rose flowers with light centres. *Cattleya Mantinii nobilior* and other showy varieties were in flower, and others noted as specially good were *Lælia tenebrosa* Walton Grange variety, *Brasso-Cattleya The Baron* and *Brasso-Lælio-Cattleya Fowleri*, the flowers of these being of exquisite shades of orange, Indian red and crimson. In the large hybrid house devoted to seedlings, are many hybrids approaching flowering size raised at Glebelands. Here the fine forms of *Cattleya Iris* and *C. Adula* were well in bloom, together with the handsome but little known *C. Rosa Leemann* (*amethystoglossa* × *Dowiana aurea*) with a fine spike of flowers.

hybrids; one, the result of crossing *O. ardentissimum* with the pollen of *O. Pescatorei Veitchii*, is flowering for the first time; it has perfectly-shaped, pure-white flowers with the light violet markings suggestive of the rare *O. Pescatorei Veitchii*; another hybrid has large flowers with a rosy-ground colour heavily blotched with claret-purple, the large and curiously-formed lip having dark markings at the base and several rows of small rose-coloured spots inside the margin. At Glebelands is the entire stock of the very handsome *O. Smithii*, figured in the *Gardener's Chronicle*, December 16th, 1905, p. 427; *O. Aliceæ* (Edwardii × *crispoharryanum*), and many other rare hybrids, together with some interesting crosses raised by Mr. Fowler. In the collection of *Odontodas*, the first *O. Charlesworthii*, the brilliant red *O. Keighleyensis* Fowler's variety, *O. Vuylstekeæ*, and most of the

other varieties have very large pseudo-bulbs, scarcely recognisable from those of *Odontoglossum*. At the end of the house Masdevallia Bocking hybrid, *M. Schlimii*, *M. Lindenii*, *M. Carderi*, *M. Veitchiana*, and others are finely flowered, and *Oncidium varicosum* Rogersii, *O. lamelligerum* and other cool-house species are also well in bloom. In two of the stove houses are collections of Selaginellas, pretty plants that were formerly cultivated extensively.

CATTLEYA MADAME PAQUIN (MANTINI NOBILIOR × HARDYANA).

A FLOWER of this charming new hybrid is sent by Messrs. Stuart Low & Co., Bush Hill Park, the raisers. The novelty is well worthy of the parents from which it is derived, these being both favourite flowers. The blooms of *C. Mme. Paquin* are over 4 inches across, and the petals are 2 inches wide, all the segments being proportionate, and constituting it a good florist's flower. The sepals and petals are of a bright rosy-mauve colour, the white ground colour showing slightly between the veining. The broad and well-formed lip is claret-crimson in the centre and mauve on the margin, the central area having gold lines, as in *Cattleya Dowiana*. It is said that the flowers are borne four or five on each inflorescence; but when the plant is fully developed, more may be expected.

PLANT NOTES.

CISTUS RECOGNITUS.

AT Kew the other day, under this name, I found a beautiful spotted kind of *Cistus* still in flower. I did not know of this plant, and in the issue of August 15, p. 118, I drew attention, as I then supposed, to all the spotted *Cistuses* that were known. This *C. recognitus* at Kew is quite distinct from all the others, and I missed it, no doubt, because Grosser, in Engler's *Monograph*, does not describe his plant under this name as spotted. He states that the plant under this name is a cross between *C. laurifolius* and *C. monspeliensis*. But how then, it may be asked, has it got spotted flowers, since neither of these reputed parents has spotted flowers? The plant at Kew has rather the character that might be expected in *C. laurifolius* × *monspeliensis*, but, if it had that origin, it would be the *C. Loretii* which I mentioned in my article. Whatever it is, it is not, I should think, the *C. recognitus* of Engler's *Monograph*. That plant has lanceolate or linear lanceolate leaves, while this I noted as having ovate-obtuse leaves. The plant, however, is quite charming; it has much the habit of *C. monspeliensis*, being dwarf and shrubby. The young stems are reddish, the lower leaves are ovate, obtuse, flowers 3 or 5 together, not very large, being only about 2 inches across, but pure white with deep maroon-coloured blotches. The plant is as clammy and strongly fragrant as of *C. laurifolius*. According to Grosser, *C. recognitus* is found wild in the South of France. My object in writing is to supplement my article above referred to, and to draw attention to a good plant, but not to determine, with the means I have, what its name should be. *R. Irwin Lynch.*

CLERODENDRON TRICHOTOMUM.

THIS *Clerodendron* is a shrub or small tree well worth growing in the southern part of England, as it is ornamental both in leafage and in flower. The blossoms are produced towards the end of the summer and in early autumn, when most other hardy shrubs are over. It is tree-like in habit, and is seen to the best advantage when the main stem is kept free from suckers. The spreading branches are fairly stout and are clothed with broadly ovate leaves, 6 inches to 8 inches long, and deep green in colour. The flowers, which are borne in large,

terminal, freely-branched panicles, are white, and have the form of a five-pointed star. As in many other *Clerodendrons*, the calyx forms a showy feature of the inflorescence. In this species, the calyx is of a reddish-purple tint. *Clerodendron trichotomum* is a native of Japan and was introduced to gardens as long ago as 1800, but it is only within the last 20 years or so that it has become generally known. Propagation can be readily effected by means of root cuttings taken during the winter and inserted in a bed of sandy soil.

Another hardy species is *Clerodendron frutidum*, which dies down to the ground in winter and in summer develops shoots 3 to 4 feet high, which are at this season terminated by closely-packed heads of reddish flowers. These are fragrant, but the leaves, when roughly handled, give off an unpleasant smell. This same character is very pronounced in *C. fragrans*, a stove species. *W.*

FLORISTS' FLOWERS.

SWEET PEAS UNDER GLASS.

OCTOBER is the best time to sow seeds for raising Sweet Peas to flower early under glass. They should be sown in shallow boxes or pots, which should be placed in cold frames and kept fairly close until germination takes place. After germination, all the air possible should be given during open weather. When the plants are about 2 inches high, they should be potted up singly in 3-inch pots, and put back into cold frames, plunging the pots to the rims in ashes, in order to preserve the roots from frost. In the first week in February they should be transferred to their permanent quarters. Sweet Peas require very little heat. A house employed for perpetual-flowering Carnations suits them well, because the Carnations, like the Sweet Peas, require plenty of air, very little fire heat, and not too much moisture in the air. If there is plenty of room in the centre of the house, it is best to grow the Sweet Peas in a trench, and plant a double row at an angle, each plant about 1 foot apart. Trenches should be dug to a depth of 18 inches, and good rotten farmyard manure well mixed with the soil, leaving the trench several inches below the level of the walk to allow for watering. A neat way of staking Sweet Peas under glass is to use thin tapering canes, 9 feet or 10 feet in length, inserting them in the ground by the side of the plants, and tying them to the top wire in the ridge. After staking each plant singly, another cane should be put lengthways, about 4 feet from the ground, and each upright tied to it. Rafia or thin string can be strung from cane to cane to tie in the lateral growths when they appear. If grown in these conditions, the plants should be showing buds when about 5 feet to 4 feet high, and may be expected to bloom at about the end of April. When the flower-buds appear, the roots should be watered about twice weekly with dilute liquid manure, and an occasional application of a fertiliser will greatly assist in developing the colours of some varieties and also the length of stem.

Certain varieties are better adapted for glass culture than others. Some of the best are *Clara Curtis* (primrose), *Elsie Herbert* (white, with Picotee edge), *Frank Dolly* (lavender), *Etta Dyke* (white), *King Alfonso* or *Suproof Crimson*, *Earl Spencer* (salmon), *Mrs. H. Sykes* (pink), *Mrs. Townshend* (lilac, with Picotee edge), *Mrs. C. W. Breadmore* (buff, with Picotee edge), *Nubian* (amaroon), *Senator Spencer*, and *John Ingman*.

Any cool house is suitable for growing Sweet Peas, provided they can be given plenty of air and the necessary height for their growth. If well grown, they generally attain a height of 11 or 12 feet. *George Herbert, Winchester.*

HARDY PLANT BORDER.

POTENTILLA LANUGINOSA.

THERE are a considerable number of the shrubby *Potentillas*, or *Cinquefoils*; but it is strange that, with the exception of *P. fruticosa*, varieties of *Potentillas* are rarely met with in gardens. Nevertheless, several of the more recently-introduced species and hybrids are more useful and beautiful than the older *P. fruticosa*. One of the least known is also one of the prettiest, this being *P. lanuginosa*. Owing to its small stature, it is more suited for the Alpine garden than for the shrubbery or the flower border, but it might be employed with other choice, low-growing plants in the front of the shrubbery.

Young plants are dwarf, only growing a few inches high; but I have a specimen which is about 2 feet high, the plant having been in my possession for many years. Its rate of increase in height is very slow. The species forms a mass of tangled, curving, brownish, wiry branches, which are plentifully covered with beautifully-formed, toothed leaves of a delightful silvery-grey colouring. The texture of these is more silky than woolly, a fact which the specific name does not convey. Amongst this mass of leaves there are borne in late summer, and far into autumn (indeed, into early winter), bright, clear, yellow flowers, about 1 inch across. There is no other small shrub which has precisely the same effect at this season. I have amply tested its hardiness, and have no hesitation in saying that *P. lanuginosa* can withstand the most severe winters of this country. Nor is the plant difficult to accommodate in the matter of soil. Loam, sand, and grit, with a few stones, will suffice for its needs, and a little leaf-soil or peat is no disadvantage. A sunny position is the best, and in such it will give its most pleasing appearance. I have propagated it from cuttings taken off with a heel of old wood and inserted in a pot of sandy soil in a cold greenhouse; but they root more readily if a little bottom heat is afforded. *S. Arnott.*

PENTSTEMON TRIFLORUS.

PENTSTEMON TRIFLORUS is a recent addition to the members of this genus in cultivation. It forms a bushy plant, about 3 feet high, covered with dark green foliage, and bears loose panicles of long, coral red flowers. The species is a native of Mexico, and was introduced to gardens by Messrs. Bees, Ltd., in 1908, under the name of *P. isophyllus*. This *Pentstemon* is quite hardy in dry, sheltered positions, and has survived the last two winters unprotected in the rock garden at Kew. The flowers measure 1½ inches to 1¾ inches in length, and are produced freely during the whole of the summer and well into the autumn. Like all *Pentstemons*, it is easily increased by means of cuttings, and it also ripens seed freely. Several other members of this family are also in flower at the present time, including the distinct and small-growing *P. antirrhinoides*, an erect, bushy plant, with lemon yellow flowers and small leaves. This species is a native of California, and is sometimes known as *P. Lobblii*. *P. cordifolius* is another Californian plant of shrubby, scandent habit, more suited for a sunny wall than the border. At Kew it grows several feet high, and produces its scarlet flowers in late summer and autumn. *P. grandiflorus*, from the open prairies of the United States, grows from 2 feet to 4 feet high, with broad, glaucous foliage—the stem leaves being perfoliate—and large lavender-blue flowers. One of the smallest species is *P. Jamesii*, which grows only a few inches high. The leaves are linear, and the flowers pale slaty-blue. This plant is a native of the Southern United States. *W. I.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

DR. J. NEVILLE KEYNES.—The election of this eminent scholar to the office of Registrar of the University of Cambridge, which has just taken place, recalls to memory one of the same surname, our scholar's most esteemed father, John Keynes, the famous florist of Salisbury. John Keynes and his contemporaries—Charles Turner, W. Bragg, A. Dodwell, Samuel Barlow, E. D. Horner, James Douglas, Richard Dean, and others, not forgetting old George Glenny, constituted a remarkable group of distinguished florists. Wonderfully good work in relation to floriculture did these men do, or still seek to do. There is not now that same devotion to form or to outlines in flowers which characterised the ideals of these earnest men. John Keynes, founder of a famous Salisbury firm, left his impress on horticulture in a remarkable degree. His talented son prefers to devote his abilities to the university world. Those who have followed his career have the pleasure of knowing that the same earnestness, acute intelligence, and devotion to work which distinguished the father in one walk of life characterise the son and have brought him distinction in another. D.

ENDEMIC PLANTS IN THE MARITIME ALPS.—

In connection with Mr. Reginald Farrer's interesting articles on the Götian and Maritime Alps and the extremely confined habitats on the primary rocks of *Viola valderia*, *Saxifraga valdensis*, and *S. florulenta* in particular, the following paragraph from Dr. Briquet's *Le Développement des Flores dans les Alpes Occidentales* (1906) (extracted from the *Résultats scientifiques* of the Botanical Congress at Vienna, 1905, pp. 130-175) may be worth translating here, for it confirms what Mr. Farrer has noticed. Mons. Briquet says in this learned work on the origin of the Alpine flora: "A salient point in the phytogeography of the Maritime Alps is the large proportion of localised crystalline (silicicole) endemic plants. Elsewhere in the Western Alps, the crystalline endemics are widely spread. The superb *Saxifraga florulenta*, *Potentilla Valderia*, *Sempervivum Allionii*, *Galium Tenda*, *Viola valderia*, *Oreochloa pedemontana*, &c., are pronounced 'silicicoles.' Several of these species have been able to exist during glacial times without going out of the central crystalline axis; all have been able to find on the grits of the outer chains excellent conditions of existence." H. S. Thompson.

NICOTINE PREPARATIONS. On the subject of nicotine preparations, referred to on page 282, let me suggest that fruit-growers should be allowed to grow Tobacco under proper regulations for denaturing the crop when it has been cut, and heavy penalties for infringing such regulations. They would probably cure the whole plants in a rough-and-ready manner, and simply cut them up to a small extent for boiling to obtain extract.—There was a misprint on p. 273, which makes me describe Currant-leaf spot as a "beautiful" disease instead of a "harmful" one. A *Southern Grower*.

ABUTILON THOMSONII.—By the kindness of the Editors, a paragraph of enquiry for pollen of *Abutilon Thomsonii* was inserted in a recent issue of this paper. The result is of great interest, for it appears that the old *A. Thomsonii* has practically disappeared, its place being taken by a very similar but quite different plant. The original *A. Thomsonii*, I believe, I know well. I have had it here in the Cambridge Botanic Garden for many years, and in a local garden there is a fine specimen which the gardener informs me was purchased from Messrs. James Veitch & Sons, under the name *Thomsonii*, 35 years ago. It is identical with the plant I have always regarded as *A. Thomsonii*. It is, in point of fact, I believe, only a yellow, variegated form of *A. striatum*, having flowers of precisely the same shape and with the same deep-crimson veins. The plant I have now received from several sources, however, has a much softer leaf, pubescent beneath; the flowers are of different shape and colour, and have not the deep-coloured veins that are so ornamental a feature, while the

hairiness of the bud is quite different. I believe, however, that it may be a better plant horticulturally for golden effect; but this does not justify the name *A. Thomsonii*, and I should be very glad if any reader can give me its history, or the history of *A. Thomsonii*, which would also be of interest, as it is not in Nicholson's *Dictionary of Gardening*, nor do I find it in several books to which I have referred. It may be worth remark, perhaps, that the present interest in *A. Thomsonii* is on account of its complete self-sterility, so far as yet known. *Abutilon Beule de Neige*, however, does set seed with its own pollen, I understand. This genus, therefore, is like the genus *Passiflora*, in which some species appear to be perfectly self-sterile, and others equally self-fertile. R. Irwin Lynch.

WHY NEED THERE BE "EQUAL" PRIZES?—

In these days, when point-judging is so general, I cannot see the necessity of awarding equal prizes. I do not agree with any judges who award equal prizes in a collection of even a few dishes of fruit or vegetables, but rather with the critics who say that the giving of equal prizes is merely an easy way out of a difficulty. The critics contend that there is always a difference in two exhibits, and it is the duty of judges to find it. At the recent fruit show held in Vincent Hall, equal third prizes were awarded in the class for a collection of fruit. From the freely-expressed criticisms of visitors, one was forced to the conclusion that no one but the judges agreed with the verdict given. I do not know who were the judges, but from what I saw of the two collections I do not think there should have been any difficulty in arriving at a different decision. The Grapes, Melon and Apples in one collection were decidedly superior to similar fruit in the other exhibit, whilst the Peaches in the latter were of poor quality. An *Onlooker*.

SCENTED-LEAVED PELARGONIUMS.—I was exceedingly pleased to read the remarks by Mr. Jas. Hudson on p. 278 on the varieties grown at Gammersbury. May I point out that Rollinson's *L'unique* was not included in the list? It is a very slow grower in some places, but it makes a charming basket plant, the beautiful, rich, crimson blossoms being very effective. Most of the larger flowering varieties are useful for furnishing hanging baskets for the conservatory. While one may not have the space or the ability to grow such fine specimens as those shown in the illustrations in the last issue, a selection of sorts is very useful, the leaves and shoots blending well with unscented flowers in the making of sprays and buttonholes. The foliage of the very small-leaved forms are also used for placing in finger bowls. W. Warner, *Road Manor Gardens, Bath*.

—On reading Mr. Hudson's notes on *Pelargoniums* (p. 278), I am reminded of an idea bearing upon the subject, which has been in my mind for some time past. Some years ago I had charge of a large terrace garden, in which were a number of Standard H.P. Roses placed regularly in lines. During hot summers one or more of them were apt to die or become weakly in growth, thus breaking up the uniformity of the whole. We decided to grow about a dozen scarlet *Pelargoniums*, as specimens about 3 feet in height, then stopping them so as to form good heads. They were in 10-inch pots, and were used as reserve plants to plunge in the place of the dead or decaying Roses. With care in wintering, they lasted in good condition for several years. The idea alluded to is to have similar Standards grown, and then inched or grafted with some of the choicest Ivy-leaved varieties. If a light iron rod or stake with a triangular, three-pronged base and a circular top, say 18 inches to 2 feet in diameter, was affixed to each plant, there would be no risk of injury from breakage. Of course, stems up to 4 feet might be used. Is it not possible for some of our clever cultivarists to work up a batch in time for the forthcoming "International" in 1912? I venture to think that if a prize were offered for a group of varying heights arising out of a suitable groundwork, there would be competition for it. If well-grown, they would attract attention from visitors. I may as well add, the idea came into my mind on seeing some well-flowered Standards of Dorothy Perkins Rose. On looking over Mr. Hudson's notes again, it occurred to me that the variety "*Clorinda*" would make

a good stock to put Ivy-leaved varieties upon, and I have asked a county gardening friend, who has some big plants, to try and graft some. *Yorkshire Gardener*.

MAGGOTS ON PRIVET.—The destruction referred to by your correspondent J. (p. 267) is very widespread. A resident in the south-west of London, I have a tall hedge or screen of the Oval leaved Privet, which is almost defoliated by the pest, and some Golden leaved Privets, a considerable distance therefrom, are also badly affected. Last year a few leaves of the Golden variety showed some signs of damage. During a recent visit to Westcliff I noticed that nearly all the Privets in that seaside resort were more or less attacked by the pest, and if it increases next year to the same extent as it has done in my own suburban garden much future trouble may be anticipated. Everywhere around London the Privets seem to have suffered to a certain extent. The advice of your correspondent to closely shear all Privets and burn every scrap is very good, but it seems to me that the majority of the pests has already hibernated in many cases, possibly in the soil. W.

ERIOGONUM RACEMOSUM.—This little plant is of fairy-like beauty, as far superior to the commoner *E. umbellatum* as Aster "*Rycroft Purple*" is to the common Aster *Triplium* of our estuaries; yet it is seldom to be seen. I have not noticed it in any collection except my own. Belonging to the Polygenaceae or knotweeds, *E. racemosum* is very different in appearance from the rest of that Order. From a tuft of spoon-shaped radical leaves, clothed with dense silvery tomentum on the backs, and set on 3 or 4 inch petioles, rise in June slender racemes 12 or 14 inches high, closely set with tufts of rosy pink blossoms. These delicate, plume-like spikes are produced continuously during the summer; many of them are in beauty at the present time (October 17). The plant is too choice an ornament of the rock-garden to be neglected. It ripens seed freely, and appears content with ordinary loam mixed with peat. The clumps show no tendency to spread, so they cannot compete with such rampant growers as *E. umbellatum*. *Herbert Maxwell, Monrovia*.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Fort St. Suresy.

General treatment.—With the advance of the season, the management of the houses will require some modification. Although the weather has been favourable to the occupants of the cool, intermediate houses, and to the *Odontoglossums*, *Masdevallias*, and other cool Orchids, the lack of sufficient sun-heat and light has hindered the growth of *Phalenopsis*, *Aerides*, *Saccolabiums*, the terete-leaved *Vandas*, *Catasetums*, and *Cycnoches*, whilst the maturation of growth in *Cattleyas*, *Laelias*, *Dendrobiums*, *Thunias*, *Brassavolas*, some of the *Epidendrums*, and many of the Mexican and Brazilian species, is not so perfect as usual. It is desirable to remove all permanent shadings from the roof-glass, so as to expose the plants to all the light possible. The atmosphere of the houses should be kept rather drier than usual, and a free circulation of air will be beneficial during the day if it can be managed without causing any great fluctuation in the temperatures. A moderate amount of syringing on the paths, under the stages near the hot-water pipes, and between the pots, morning and afternoon, will suffice in any division, but should the weather prove to be cold and dry, with bright intervals of sunshine, a little extra damping may be necessary. After the permanent shadings have been removed, the sun may prove just a little too much for such species as *Phalenopsis*, *Aerides*, *Angreecums*, *Vanda*, *Rhomboidia* *Lowii*, *Cypripediums*, *Zygopetalums*. These, and any unhealthy plants which have been reported recently should be placed by themselves in one part of the house, where they may be more conveniently attended to in this respect. In some cases, where there are only a few of such plants, a piece of tissue paper laid over them will answer the purpose. The cool house plants must be shaded from warm, bright sunshine, and,

where open lattice wood blinds are used, the extra light through these, as compared with the permanent shading, will tend to strengthen the foliage. These remarks apply to houses fully exposed to the sun's rays, while houses having a northern aspect will require very little, if any, shading after this date.

Watering and temperatures.—As regards watering, the plants do not now dry up so quickly, therefore the water-pot must be used with increased care, and the grower will have to be guided by the state of each plant, whether in active growth, at rest, or approaching the flowering stage. The temperatures of the houses at night must not be subjected to sudden changes; the grower should be on the alert for sudden falls in the outside temperature, so that, by carefully regulating the heating apparatus, they may not be allowed to injure the plants. It is a common occurrence towards the end of October and the beginning of November for moderate sharp frosts to occur before daylight, and often without the slightest warning. When such frosts come, the temperatures of the various departments are almost sure to be several degrees below what is considered their proper standard, unless forethought was exercised over-night. On these mornings, when the temperature is low, no watering or damping-down should be proceeded with until the proper temperatures have been obtained. In the East Indian house there are many plants which are easily injured by low temperatures of but short duration. For the next few weeks it is advisable when finishing up for the night to err a trifle on the high side with the temperature, and the dampers should then be so used as to allow a drop of several degrees by morning. For the next month or five weeks the night temperatures may be as follow:—**East Indian House**, 65° to 70°; **Cattleya and Mexican House**, 60° to 65°; **Intermediate House**, 55° to 60°. The greater heat should be maintained when the external air is mild; but when the exterior atmosphere is near the freezing point, the lower figures are preferable. The cool houses should be kept at about 55°; but, in the event of cold weather, the temperature may fall to 50°.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Freesias refracta alba.—Where it is desired to have Freesias in bloom by Christmas, they may, if the pots are filled with roots, be removed from the cold frames and placed on a shelf near the glass in a house where the temperature does not fall below 45°. It is not advisable to unduly force Freesias into bloom, as they are of much better value for decorative purposes when brought into flower steadily.

Schizanthus.—Plants growing in 4-inch pots have filled their receptacles with roots, and must be afforded a shift into the pots in which they will flower, those of 6 or 7 inches in diameter being large enough. The compost should consist of coarse materials, with small quantities of manure from a spent Mushroom bed. This should be first rubbed through a fine-meshed sieve; a few pieces of charcoal added will assist in keeping the soil sweet and porous. When the plants are potted, stand them in a heated pit, as near to the glass as possible, allowing sufficient warmth from the hot-water pipes to just exclude frost. Afford ventilation on all favourable occasions, and fumigate the pits whenever aphids makes its appearance. Pinch out the top of each growth in any specimen that has a tendency to grow tall, in order to induce a bushy habit. The plants may also be stopped again during the early part of the new year. In the case of *Schizanthus retusus* and *S. Grahamii*, it is advisable to place four or six plants in each pot. Both these species are of great value for furnishing cut blooms, also for table decorations as pot plants. The *Schizanthus* is essentially a sun-loving plant, and must never be shaded, not even when in flower.

Mignonette.—Plants intended to produce a display of bloom in spring should be transferred to their flowering pots, using those of 5 or 6 inches diameter, according to the vigour of the plants. Stand them on a greenhouse shelf as near to the glass as possible. Keep the roots dry, but do not allow the plants to suffer from drought. The flower-shoots should be supported by neat stakes, twigs of Privet being suitable for the purpose.

Nicotiana Sandera.—The plants are growing freely, and must be examined to ascertain if repotting is necessary. If it is intended to retain the plants in small pots for decorative purposes in the greenhouse or conservatory, they will need stimulants, liquid manure from the farmyard, given alternately with clear water, being suitable. They may remain for the present in frost-proof pits; but when the flower-spikes appear they should be placed in a cool greenhouse.

Liliums.—The plants of *L. Harrisii* have made considerable growth, and should be top-dressed with lumpy loam and peat. If they are required to bloom at Christmas, or early in January, they should be removed from the pits into the intermediate plant stove. Aphids must be kept down by fumigations or syringing with insecticides. Retarded bulbs of *Lilium auratum* and the variety *L. Melpomene* may be started into growth, under the influence of gentle warmth, to furnish a successional display of blooms.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Quinces and Medlars.—The fruits of the Quince should not be gathered until they are quite ripe: they are usually ready for gathering about the last week in October, or early in November, according to the season. Quinces should be quite dry before being stored in the fruit-room, and they will become fit for use in the course of a few weeks. This fruit makes a splen-

sey. Seeckle, Emile d'Heyst, Beurré Hardy, Beurré Superfin, Doyenné du Comice, Princess, Charles Ernest, St. Luke, Glou Morceau, Oliver de Serres, Marie Benoist, Easter Beurré, Doyenné d'Alençon, and Bergamot d'Esperen; (culinary) Catillac, Bellissime d'Hiver, and St. Verulam. **Plums:** (dessert) Oullin's Golden Gage, Angelina Gage, Kirke's, Coe's Golden Drop, Reine Claude de Bayay, Late Orange, and Late Transparent; (culinary) Early Prolific, Czar, Victoria, Pond's Seedling, White Magnum Bonum, Monarch, and Primate. **Peaches:** Early Alexander, Hale's Early, Dymond, Royal George, Early Alfred, Grosse Mignonne, Sea Eagle, Goshawk, and Princess of Wales. (Two varieties recently introduced and worthy of a trial are Duke of York and Peregrine.) **Nectarines:** Early Rivers, Lord Napier, Dryden, Stanwick Elruge, Milton, and Humboldt. **Apricots:** Early Moor Park, Shipley's, Hemskerk, Moor Park, Royal, and Powell's Late. **Cherries:** Bigarreau de Schrecken, Early Rivers, Black Tartarian, Bigarreau Napoleon, Governor Wood, Noble, St. Margaret's, Late Duke, and Late Black Bigarreau; (culinary) May Duke, Kentish, and Morello.

Remarks.—Examine carefully the early-gathered fruits of Apples and Pears, and remove any that are found the least decayed. Continue to keep the leaves tied back, or removed entirely from the late-ripening fruits of Peaches and Nectarines. The fine weather of the past few weeks has been all that could be desired for the proper finishing of these fruits.

R.H.S. FRUIT SHOW.

(Photograph by H. J. Vasey.)

FIG. 124.—FIRST PRIZE COLLECTION OF SIX DISHES OF FRUIT SHOWN BY LORD BELPER.

did jelly; it is also used for mixing with other fruits in tarts, etc., to which it imparts a pleasant flavour. Medlars are generally ready for gathering about the same time as the Quince, and a dry day should be chosen, as the broad, rough, open eye holds the moisture. Medlars should be gathered carefully, and stored thinly, with the stalk upwards, as decay usually commences at that part. Medlars, also, are used for making jelly, and are sometimes appreciated raw. They are best for consumption when quite soft, and will remain eatable for a few weeks in this condition. Examine the fruits at frequent intervals.

Planting fruit trees.—As a guide in planting, I append a list of varieties of fruits that are found to do well generally. **Apples:** (culinary) Frogmore Prolific, Keswick Codlin, Lord Suffield, Stirling Castle, Golden Spire, Cox's Pomona, Peasgood's Nonesuch, Loddington Seedling, Warner's King, Lane's Prince Albert, Gascoyne's Scarlet Seedling, Ecklinville, Lady Henniker, Tower of Glamis, Alfriston, Bismarck, Bramley's Seedling, Newton Wonder, Schoolmaster, Annie Elizabeth, Dunclelow's Seedling, and Northern Greening; (dessert) Beauty of Bath, Irish Peach, Mr. Gladstone, Langley Pippin, Lord Bughley, Chas. Ross, Adam's Pearmain, Rival, Scarlet Nonpareil, Ribston Pippin, Worcester Pearmain, Fearn's Pippin, and Blenheim Pippin. **Pears:** (dessert) Doyenné d'Été, Beurré Giffard, Dr. Jules Guyot, Fondante d'Automne, Williams' Bon Chrétien, Beurré d'Amanlis, Marie Louise, Louise Bonne of Jer-

Syringing of the foliage may be discontinued after this date. It is pleasing to see the foliage so free from red spider; I have never seen the trees present a cleaner or more healthy appearance generally.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSEL, G.C.B., Moulton Paddocks, Newmarket.

Pot Vines.—Preparations may now be made for starting the young Vines to fruit early next season. The house should first be thoroughly cleansed and, if necessary, the walls should be limewashed and everything made sweet and clean. Prepare a small bed of fermenting material in the proportion of three parts leaves to one part horse manure, in which to plunge the pots. Prune the young rods to a length of about 6 feet and dress the wounds with styptic to prevent bleeding. Wash them with some good insecticide and use a sponge, handling it carefully to avoid injuring the buds. Remove a little of the surface soil, and replace this with fresh compost in which is incorporated a good sprinkling of bonemeal. Before moving them indoors apply a thorough soaking of clear lime water to eradicate any worms present in the pots. As soon as the Vines have been placed in their proper positions in the house, the young canes may be tied down so that the tips of the rods will be level with the pots. Syringe them once or twice daily according to the weather, and otherwise maintain a moist atmosphere. Little fire heat should be necessary for some time, as

in the absence of severe weather the gentle warmth arising from the hotbed will be sufficient to prevent the thermometer falling below 45°. As there is always a percentage of young rods which fail to "break" satisfactorily so early in the season, it is advisable to start a few more than are actually required to cover the trellis in order that a few of the worst may be discarded when it is seen which have started well.

Early permanent Vines.—The Vines to be forced in succession to those in pots ought to be pruned at once. After pruning cleanse the rods thoroughly with soap and warm water and dress them with an insecticide, working it well into the older parts of the stem with a soft brush. Wash the woodwork, glass, trellis, &c., with soap and warm water, limewash the walls, and after attending to the border, give the hot-water pipes a coating of linseed oil and lamp black. If the border has not been top dressed this may now be done. Remove all the loose and inert soil on the surface, and apply a top dressing of artificial manure, pricking it lightly in with a fork, after which a few inches of fresh compost may be put on and tramped or beaten quite firm. When all the cleaning is complete, open the door and ventilators wide for a few weeks, or until it is

transplanted with ease. A supply of plants for this purpose should be raised annually from cuttings or layers, and grown through the summer months in an open position by themselves.

Evergreens.—The value of planting evergreens in the pleasure grounds and borders is now widely recognised. A free use should be made of them, in addition to deciduous shrubs, when forming shrubberies of any description. But unless they are planted as screens, I do not advocate a too free use of them, as too many give a sombre appearance at all seasons; when, however, they are planted in moderation, they associate and harmonise well with flowering shrubs and others of a deciduous character; whilst, as isolated specimens on lawns, they are very effective, especially the pendulous forms. A particularly useful and conspicuous evergreen in flower now is *Arbutus Unedo*, the Strawberry tree. There are several varieties of this species worthy of cultivation, including *coccinea*, *Croomii* magnifica, *Rollisonii*, and *rubra*. *Azara microphylla* is a beautiful evergreen, with deep, lustrous, shining leaves; when in flower, its small, deliciously fragrant flowers are very attractive. The many varieties of *Berberis* are both interesting and attractive, especially when grown as isolated specimens.

gathered will, in many instances, have germinated freely. The seedlings require pricking-out into boxes filled with finely-sifted, sandy soil, and should be afforded the protection of a cold frame. The frame ground will need attention. Thoroughly wash the glass of all frames. Plants in frames should be plunged or placed together as thickly as possible, now that growth has finished, so that full use may be made of the space. Give an abundance of air to Violets in frames, remove yellow leaves, and stir the surface of the soil. Overhaul the herbaceous borders, removing as many as possible of the untidy growths.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Lettuce.—Lettuce sown early in September should be ready for planting in some sheltered situation, to remain throughout the winter. If the plants can be grown successfully through the winter, they will be valuable at a time when good salads are scarce. Well-prepared land, on a south or west border, should be chosen for them, and a distance of 12 inches each way allowed the plants. The soil should be of a rather sandy nature, and the border well raised at the back. It is important that the plants should be put out without delay, so that fresh roots may be made before very cold weather sets in. Sparrows are so troublesome to this crop in spring that we are forced to employ nets as a protection. If any cold frames are available, they should be filled with Lettuces from the open border before the plants are damaged by frost. They should be taken up with a good ball of soil attached to the roots, and well watered after planting, so that they experience very little check in transplanting. Lettuces treated in this manner will be less likely to suffer from damping than if left in the open until they are fully developed, and then lifted. Decayed foliage should be carefully removed, and the lights kept off the frames until frost is imminent.

French Beans.—French Beans in pits should be given frequent waterings of liquid manure and an abundance of fresh air both night and day while mild weather lasts. Pick the pods as soon as they are large enough, whether they are required for immediate use or not, or the plants may become exhausted before their season is over. Surplus pods may be kept fresh for a few days if placed on a clean slate in a cool cellar. Another sowing may be made now to produce a few dishes of Beans through December. Pots of a diameter of 7 inches are large enough for this sowing. An atmospheric temperature of 60° at night-time will be suitable. As soon as the plants are a few inches high, syringe them freely with clear water in order to promote a clean, healthy growth. Plants in pots raised from seeds sown a month ago should be given liquid manure. The plants should be kept as near to the glass as possible so that they may not become spindly.

Late Cauliflower.—The heads should not be allowed to remain uncovered and exposed to the weather, or their value may be considerably lessened. The usual method of protection by placing a few of the plants' own leaves carefully over each head will be sufficient to keep off a few degrees of frost, and will also suffice to protect the curds from strong light.

Autumn Broccoli.—Owing to the mildness of the season, the plants are "turning in" earlier than usual, and, in order to keep up a supply as long as possible, some of them may be lifted with a good ball of soil and replanted at half their usual distance apart, taking care that a covering of some kind is at hand to be applied in case of frost. By lifting some of the plants carefully when the heads are about the size of a hen's egg, the supply of Broccoli may be kept up for some time after the ordinary crop is over. At Frogmore, we lift a great many plants in this manner each autumn. Be careful to lift the plants with a good ball of soil. Clean mats will provide a suitable protection against frost.

Herbs in pits.—Give an abundance of fresh air to Marjoram and other herbs growing in pits, as a stagnant atmosphere must be avoided as far as possible, to prevent injury from damping.

Mustard and Cress.—Seeds may be sown weekly in heated pits. If a small supply is only necessary, Mustard and Cress may be grown in boxes; but the seed boxes should be placed in a heated pit or house.

R.H.S. FRUIT SHOW.

(Photograph by W. J. Vasey.)

FIG. 125.—PEAR "DOYENNÉ BOUSSOCH," AWARDED THE FIRST PRIZE IN THE SINGLE-DISH CLASS "FOR ANY OTHER EARLY VARIETY."

necessary to close the house for starting. A short time before this takes place a heap of leaves and manure should be collected, and turned once or twice to sweeten in readiness to place inside.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. Vicary Gibbs,
Aldenham House, Hertfordshire.

Shrubs for bedding.—There are many species and varieties of shrubs that are well suited for use as small specimens for bedding purposes during the winter months. Some are specially fitted for planting in borders in shady and damp positions, presenting, when arranged judiciously, a pleasing and bright effect. Evergreens may be largely used for this purpose, including varieties of Holly, Aucuba, *Berberis*, Ivy, Box, *Choisya ternata*, *Cotoneaster*, *Daphne laureola*, *D. purpurea*, *Cassinia fulvida*, *Euonymus*, Lavender, *Phillyrea*, Rosemary, *Ruscus*, *Skimmia*, *Veronica*, Gorse, and *Vinca*. Small plants of deciduous subjects might be interspersed, and, of these, varieties of Willow and Cornus, *Forsythia suspensa*, *Populus alba* var. *Bolleana*, and *Spiraea Douglasii* are suitable; whilst all of those named may be

Bupleurum fruticosum forms a compact, rotund bush, and produces umbels of yellow flowers. *Castanopsis chrysophylla*, commonly known as the golden-leaved Chestnut, is a beautiful, hardy shrub, with deep, glossy, green leaves that are golden on the reverse side. There are many interesting varieties of *Prunus Laurocerasus*, such as *camellia-foolia*, *latifolia*, and *schupkensis*. *P. lusitanica azorica* is also a fine-foliaged evergreen. *Colletia cruciata*, with its curious spiny growth, makes a fine evergreen in a sheltered position. Others that are suitable include *Cotoneasters* in variety, *Desfontainea spinosa*, with its Holly-like foliage; *Cassinia fulvida*, with pretty golden reverse to the leaves; *Hymen-anthera crassifolia*, Hollies in great variety, *Olearia*, *Phillyrea*, *Osmanthus*, *Raphiolepis japonica*, *Photinias*, *Pittosporum*, *Rosmarinus officinalis* and its variety *alba*, *Ruscus aculeatus* (a fine subject for planting under trees), *Skimmias*, and *Veronica Traversii* and *V. ligno-trifolia*. The foregoing list includes those only that would be found both useful and hardy, and is by no means comprehensive.

General remarks. Seeds of *Delphiniums* and other subjects that were sown as soon as

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unneeded communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations.—The Editors will be glad to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, OCTOBER 24—
Nat. Chrys. Soc. Floral Com. meet.

TUESDAY, OCTOBER 25—
Roy. Hort. Soc. Com. meet. (Lecture at 3 p.m. by Professor Henslow, on "Life, a Director of Forces in Development and Evolution.")

WEDNESDAY, OCTOBER 26—
Hertfordshire Fruit, Root, Grain, and Chrys. Soc. Sh. (2 days). Croydon Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich 47.6°.

ACTUAL TEMPERATURES.—
LONDON.—Wednesday, October 19 (6 p.m.): Max. 57°; Min. 50°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, October 20, (10 a.m.) Bar. 29.7; Temp. 50°; Weather—Slight rain.

PROVINCES.—(Wednesday, October 19): Max. 53° Cornwall; Min. 46° Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
At 67 & 68, Cheapside, E.C., Dutch Bulbs by Protheroe & Morris, at 10.30.

MONDAY, TUESDAY, AND WEDNESDAY—
Sale of Nursery Stock, at Womersley Nurseries, Sharnley Green, near Guildford, by Protheroe & Morris, at 12.

WEDNESDAY—
Azaleas, Rhododendrons, Palms, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

Nursery Stock in variety at Putney Nursery, Hazelwood Road, Putney, by Protheroe and Morris, at 12.

THURSDAY AND FRIDAY—
36th Great Annual Sale of Nursery Stock at Hollinby's Nurseries, Groombridge, near Tunbridge Wells, by Protheroe & Morris, at 11.30.

FRIDAY—
Imported Cattleya, Dowiana, also Choice Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.15.

The International Exhibition.

There is a fairly general consensus of opinion that the International Exhibition of 1912 should not only be distinguished by the finest horticultural display that this country has ever seen, but also that the Exhibition should mark a stage in the progress of horticulture by serving as the occasion for a congress of horticulture at which subjects of importance should be discussed. On the general question of such a congress we hope to have something to say later on; but for the present we wish to confine ourselves to a subject which, as we think, ought to be considered exhaustively and dispassionately by the body of experts who may be expected to assemble on the occasion of the Exhibition.

The subject in question is the practice which

is being adopted all the world over of prohibiting the importation of this or that kind of plant for fear of the simultaneous introduction of pests which afflict the vetoed plant. Of the prevalence of prohibitive legislation all horticulturists have large experience. Only last week we published the terms of the embargo placed on the importation of vines into South Africa. In order to keep out Phylloxera the Government of South Africa, acting, no doubt, on the advice of the Department of Agriculture, bans the introduction of Vines, and, incidentally, closes by a stroke of the pen a market for one kind of horticultural produce. We cite this example, not because of its intrinsic importance, but because it happens to be the most recent. Instances of a similar nature could, of course, be multiplied almost indefinitely. Moreover, it is certain that the fashion of which we have given an example is likely to continue. Once accustomed people to the idea that a pest is likely to prove seriously detrimental to a given crop and they will acquiesce readily in the exclusion of plants of the kind attacked by the pest. Thus the man of foresight sees on all sides barriers rising up to protect this or that country and to exclude foreign horticultural produce. Free exchange of horticultural commodities will in consequence be more and more impeded as each country surrounds itself with a rising wall of prohibition. The time is ripe for a consideration by horticultural experts of the question whether this fashion of prohibition is wise or not. By this we mean whether the growing practice of exclusion of plants in order to secure immunity from pests is, after all, sound from a scientific standpoint. Should the consensus of informed opinion declare itself in favour of the practice, then, no matter how strongly prohibitive measures may be deprecated on general grounds, they must be accepted and horticulturists must shape their courses with reference to this trend of custom. Should, however, a full and free discussion on the subject disclose grave reasons why these legislative prohibitions are unscientific as well as undesirable, we may be confident that it will not be without due and important effect on this custom. Inasmuch as our present object is to propose to the executive committee of the International Exhibition that a congressional consideration should be given to the growing custom of legislative prohibitions with respect to horticultural objects, it would be manifestly unfair at this juncture to express an opinion as to the probable outcome of such deliberations. Nor would it be discreet to endeavour now to anticipate the arguments which are likely to be used for and against this practice of modern Governments. For the time being, therefore, we do not wish to promote a discussion of this question, but if our proposal commends itself to those of our readers who are interested in the subject, we shall be pleased to be informed of the fact.

We endeavour—with what success our world-wide circle of readers must judge—to hold the balance even between the practical and scientific aspects of horticulture. This is the sole means by which the true interests of horticulture may be advanced. But a practice is not necessarily good, even though it is followed by a man utterly ignorant of science. Nor is a practice necessarily good even though it is advocated by the contemporary representatives of science. Science, like practice, ad-

vances over the dead bodies of its previous errors. What is all-important is to examine from time to time current practice and current scientific doctrine in order to let in the fresh air of criticism and to eradicate the weeds of error which are bound to be found growing side by side with the true plants—of science and practice—which we all desire to cultivate. Our proposal is, therefore, that there should take place in connection with the International Exhibition a congressional consideration of the question whether legislative enactments prohibiting the importation of plants are calculated to serve the permanent interests of horticulture. We suggest, further, that, in the event of our proposal being adopted, a full report of the conference should be published.

ROYAL HORTICULTURAL SOCIETY.—The Royal Horticultural Society has arranged for the following trials to be made at Wisley in 1911-1912:—FRUIT: Strawberries and Raspberries, autumn fruiting (these trials will be continued). FLOWERS: Fuchsias for bedding and for the conservatory (two plants of each to be sent early in March); Begonias (fibrous), including summer and winter-flowering, and bedding varieties (two plants of each to be sent in March); Delphiniums (two plants of each in February); Dahlias (decorative), introduced into commerce since January 1, 1908 (two plants of each in May); Primulas (hardy), for borders and rock-work (three plants of each in February). VEGETABLES: Carrots ($\frac{1}{2}$ ounce of each early in February); Cucumbers (six seeds of each in February); Peas ($\frac{1}{2}$ pint of each early in February); Cabbages, Savoy (one packet of seed of each in March); Potatoes ("mid-season" and "late") (each variety must be labelled as being "mid-season" or "late"; 20 tubers of each to be sent by February). Everything sent for trial *must be named*, and the name and address of the sender attached. If sent by post the address should be, The Superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey; if sent by rail, The Superintendent, R.H.S. Gardens, Wisley, Horsley Station, L. & S.W.R., with advice by post to the Superintendent, W. WILKS, Secretary, R.H.S.

—The next meeting will be held in the Society's Hall, Vincent Square, Westminster, on Tuesday, October 25. At the 3 o'clock meeting in the lecture room the Rev. Professor G. HENSLOW, V.M.H., will give an address on "Life—a Director of Forces in Development and Evolution."

THE R.H.S. VEGETABLE SHOW.—This exhibition will be held on October 25, in conjunction with the usual fortnightly meeting in the Society's Hall, Westminster. The show is restricted to amateurs. The principal class is for a collection of 12 kinds, distinct, to be selected from a published list. The 1st prize embraces the Sutton Challenge Cup (value £21), and £10 in money. There are other smaller classes for collections, also for Potatoes, Onions, Salads, and 30 single-dish classes.

FLOWERS IN SEASON.—Mr. FREDERICK ROEMER sends us from Quedlinburg, Germany, inflorescences of a variety of *Statice sinuata* with blooms of a rose tint, rather deeper than we have observed before. The variety is named *rosea*.

THE SURVEYORS' INSTITUTION.—The first ordinary general meeting of the session 1910-1911, will be held on Monday, November 14, 1910, when the president, Mr. LESLIE ROBERT VIGERS, will deliver the opening address. The chair will be taken at 3 o'clock.

CHRYSANTHEMUMS AT WISLEY.—A sub-committee of the Royal Horticultural Society visited the Wisley Gardens on September 15, and recommended Awards of Merit, which have been confirmed by the Council, for the following Chrysanthemums: To Messrs. WELLS, of Merstham, for Elaine, and to Messrs. DOBBIE, of Rothsay, for Abercorn Beauty, Flora, Miss Balfour Melville, Mr. Selby, Nina Blick, and Leslie. A sub-committee also visited the Wisley Gardens on September 29 last, and recommended Awards of Merit, which were confirmed by the Council on October 12, for the following Chrysanthemums:—Diana, Market White, Mrs. A. Thompson, Polly, Tapis de Neige, Fée Japonaise, Perle Chatillonnaise, and Provence. These were sent by Messrs. DOBBIE & Co., Edinburgh. Also Diana, Cecil Wells, and Gatton, sent by Messrs. WELLS, of Merstham.

TRIALS OF DAHLIAS AT WISLEY.—Awards of Merit have been recommended by a sub-committee, and confirmed by the Council of the Royal Horticultural Society to Dahlia Grenadier, sent to Wisley by Messrs. HOBBS, LTD., Dereham; Hohenstaufen, sent by Mr. PFITZER, Stuttgart, Germany; and S. T. Wright, sent by Messrs. BAKERS, Godsal and Wolverhampton.

NATIONAL HARDY PLANT SOCIETY.—We are informed that a meeting of the provisional committee of the National Hardy Plant Society was held at the Royal Horticultural Society's Hall, Vincent Square, on Thursday, October 13; Mr. MACSELF in the chair. Rules and by-laws were adopted, subject to approval by a general meeting of the Society, which will be held on Thursday, November 3, at 3 p.m., at the Hotel Windsor, for this purpose, and for the election of officers and council for the ensuing year.

NATIONAL FRUIT AND CIDER INSTITUTE.—The report of Messrs. B. T. P. BARKER and J. ETTLE on the work of this institution during 1909 is interesting, chiefly by reason of the account given of the testing of various ciders and perry with the object of classifying them and determining their qualities and values for blending, &c. Other subjects dealt with in the report include the much-discussed question of the effect of grass on the growth of orchard trees. From trials made at Leng Ashton, and summarised in the report, the average growth of young Apple trees planted in grass as compared with that of similar varieties in land cultivated within 9 feet of the trees was, in the course of four years, as 198:218. The conclusion drawn by Messrs. BARKER and ETTLE is that the deleterious effect of grass manifests itself during the early stage of the life of the tree, and they recommend, therefore, that the land should be cultivated for the first two years after planting.

"THE BOTANICAL MAGAZINE."—The issue of this publication for October contains illustrations and descriptions of the following species:—

BETULA MAXIMOWICZII, tab. 8357.—This fine Birch was discovered by the late Mr. MAXIMOWICZ in the Island of Yezo, in Japan. Seeds were sent to England by the late Mr. J. H. VEITCH, and seedlings raised from this consignment were distributed. The leaves are especially large for a Birch, and resemble those of certain of the Limes.

ROSA MOYESII, tab. 8358.—The species as presented in the *Botanical Magazine* plate appears very striking, a small spray having six bright-red single flowers and several unopened buds. The fruits also are a brilliant red. *R. Moyesii* was collected on the mountains of Szechuan, China, by E. H. WILSON, and the illustration in the

Botanical Magazine has been prepared from a plant in Messrs. JAMES VEITCH & SON'S nursery at Coombe Wood. The flowers appear to be variable in colour, for Mr. HEMSLEY remarks that another form exists with paler flowers. The plants at Coombe Wood are about 6 feet to 8 feet high, so that in gardens this species would, no doubt, be classed with the Ramblers.

STYRAX HEMSLEYANUS, tab. 8359.—This also is a Chinese species, first discovered by Dr. A. HENRY and subsequently by Mr. WILSON, who sent home seeds, from which plants were raised in the Coombe Wood Nursery. These flowered in June, 1909. The flowers are produced in long racemes; the petals are white, and the stamens form rich, yellow clusters. The leaves are of a pale, bright-green colour. *Styrax Hemsleyanus* forms a tree of about 20 feet to 30 feet high, and has a peculiar white bark.

IRIS WILSONII, tab. 8340.—As the specific name indicates, this is another of Mr. WILSON'S introductions whilst collecting for Messrs. JAMES VEITCH & SONS. The perianth tube is green, with the outer segments veined with purple on a pale yellow ground; the inner segments are pale yellow. There appear to be several forms of *I. Wilsonii*, and one has been distinguished as the variety major. Mr. GEORGE FORREST has collected on the Tali Range an Iris with bright purplish-blue flowers, which in other respects greatly resembles *I. Wilsonii*.

PRIMULA LITTONIANA, tab. 8341.—*P. Littoniana* is one of Mr. GEORGE FORREST'S introductions from China whilst collecting for Messrs. BEES LTD. The species was figured and described in *Gardeners' Chronicle*, July 10, 1909. The colours in the *Botanical Magazine* plate do not happily illustrate this most remarkable species.

ERRATA.—In the paragraph in last issue on the "Average Cost of Painting Greenhouses," for "½ cwt. putty" read "½ cwt.," and on line 15, for "painting" read "pointing."

FLOWER GARDENING AT BATTERSEA.—With a view to encouraging the cultivation of flowers and plants by the tenants of the houses and tenements numbering 351 on the Latchmere and Town Hall Estates, the Battersea Borough Council arranged for the seventh consecutive year competitions for the best displays of outdoor and indoor flowers. The prizes and certificates obtained by the exhibitors in the several classes will be presented by the Mayoress (Mrs. P. P. HAYTHORNTWHAITE) at a public meeting to be held in the Small Hall, Latchmere Road Baths (Burns Road entrance), on Friday, the 23rd inst.

BRITISH FERN SOCIETY.—This society may be said to have had its origin in 1891, when a society was formed at Kendal with the object of bringing together the local lovers of our native Ferns, and particularly those who devoted themselves to the search for varietal forms and their improvement by selective culture. The society was named at the outset the Northern British Pteridological Society, but it speedily became important, and the name was altered to the British Pteridological Society. For various reasons, however, the membership afterwards declined, and attempts to hold meetings in the south fell through, and two meetings fixed in Ireland were almost failures. But the establishment of a quarterly journal, under the Editorship of Mr. CHAS. T. DRURY, has resulted in a largely-increased membership, which amounts at the present time to 150. The subscription, as hitherto, is 5s. per annum, entitling to membership and four issues of the *Gazette*. The secretary is Mr. C. T. DRURY, 11, Shaa Road, Acton.

APPLE SOLD FOR FOURTEEN GUINEAS.—The remarkable price of 14 guineas was obtained for a single fruit of Apple Gloria Mundi in Covent Garden Market by Messrs. GARCIA JACOBS & SON, salesmen. The weight was declared to be 27 oz., and the fruit had a circumference of 16 inches and a height of 5 inches. The purchasers were Messrs. ADAMS & Co., of Bond Street, who secured the fruit after spirited bidding at public auction, which opened with a bid of £1. We may observe, however, that this fruit does not constitute a "record" for weight; for in our record book we find the following:—"1838 (Apples) a fruit of Warner's King, shown by Mr. ROBT. SMITH at the Ledbury Show, weighed just over 2 lb."

TROPICAL FRUITS RIPENING AT NICE.—According to a note in *Le Jardin* (October 5, 1910), Mr. ROBERTSON-PROSCHOWSKY has succeeded in obtaining from plants grown in the open ripe fruits of *Passiflora edulis* (Passion fruit), *Psidium Cattleianum* (Guava) and *Opuntia gymnocarpa*, all three of which are of tropical or sub-tropical origin. Since these fruits are much esteemed delicacies, and since they grow readily and without any particular attention at Nice, it is probable that their cultivation will be undertaken in favoured localities in the Riviera. The case of *Passiflora edulis* is particularly promising, inasmuch as its fruits suffer considerably during the long passage to Europe. It is stated that the fruits of the Argentine species *Opuntia gymnocarpa*, produced at Nice, are much superior to those of *Opuntia ficus indica*. Inasmuch as, on the comparatively rare occasions when these several fruits appear on the market in London or Paris, they meet with a ready sale, it is certain that if they can be grown in the Riviera, the fruits are assured of a market.

PEAR LEAF BLISTER MITE.—Leaflet No. 239 of the Board of Agriculture deals with *Eriophyes pyri*, the Pear-leaf blister mite, which pest appears to have increased considerably during the past few years. The mite attacks the foliage chiefly, though occasionally the young fruits are also damaged, and though the Pear is the chief sufferer from this pest, the Apple, White Beam, Wild Service tree and Mountain Ash are also liable to receive attention from it. The symptoms by which the work of the mite may be recognised are raised patches or blisters on the leaves, each with a minute opening on the under side. The patches or blisters are red, green-red or green, becoming later brown or brown-black. The mite itself is extremely small, some 1-125th of an inch in length. It passes the winter under the outer scales of the buds on the shoots of the current year, and commences its galling operations in the spring. In addition to collecting and burning affected leaves, the leaflet recommends spraying with paraffin emulsion, e.g. the Woburn Paraffin Emulsion (see leaflet 70) in January or February. American experience points to the efficacy of lime-sulphur-caustic soda wash, applied when the trees are dormant. The formula for this wash, recommended by THORVALD, is as follows: Lime 30 lbs., flowers of sulphur 30 lbs., caustic soda 10 lbs., soft soap 10 lbs., water 100 gallons. To prepare it, make the flowers of sulphur into a paste with water, and pour it over the lime. Boil the mixture for quarter of an hour, and add the caustic soda. Boil for a short time, add the dissolved soap and make up to 100 gallons. Nurserymen are recommended to disinfect their young stock whilst in a dormant condition with hydrocyanic acid gas. The method of use of this insecticide may be found in our pages (see *Gardeners' Chronicle*, April 7, 1906, p. 220), and also in Leaflet No. 188 of the Board of Agriculture.

Exhibition of British Crown Fruits.

OCTOBER 13, 14.

THE earlier of the autumn fruit shows of the Royal Horticultural Society were undoubtedly the finest of the series. We refer to those that took place at the Crystal Palace, Sydenham; since they have been held in the Society's Hall at Westminster, interest has appeared to wane, and last season the exhibition was allowed to drop. This year it was held again, and resulted in an average display.

Although several classes are provided for Grapes, these fruits are seldom very remarkable at these shows, and on this occasion they were scarcely up to the average. The schedule also makes provision for Plums, Nectarines, Cherries, and other soft fruits, but the season is too late for these, and they might well be eliminated. The show of Apples and Pears is always a fine one, and this year, notwithstanding the general scarcity of these fruits, they were as good or even better than ever. We were impressed with the high colour generally of the Apples, and they appeared to be remarkably free from fungous pests, which fact points to a more general use of washes and sprays. The large exhibits made by nursery firms were as good as we have ever seen them, and some little attempt was made to render the exhibits attractive from a spectacular standpoint. But when the most has been done in this direction, the results fall far short of an ordinary flower show, so that the general public vouchsafes only a scanty patronage. Even on the first day, visitors, apart from exhibitors and others professionally interested, were very few. Two displays of fruit trees in pots were staged, and served to break the monotony of the numerous flat dishes and baskets. The Fruit and Vegetable Committee met on the morning of the first day and recommended two Awards of Merit, one to the well-known Peach *Salwey*, the other to a variety of culinary Apple. The arrangements were admirable, all the classes being placed in proper sequence, so that it was an easy matter to find an individual exhibit. For the courtesy and help rendered by the superintendent, Mr. Wright, and also by the secretaries and the other members of the staff at Westminster, the thanks of all concerned are due.

AWARDS OF MERIT.

Apple Hounslow Wonder (fig. 127).—This is a culinary variety said to have been raised from Dunelov's Seedling, which is often known as Wellington. The skin is mellowish-yellow, heavily flushed with red next to the sun. There is a certain resemblance to the variety *The Queen*, especially in the "eye," but it is not so flat a fruit as that variety. The flesh is crisp, juicy, and very solid. The tree is said to be a good cropper, and not liable to canker. The fruits keep in good condition until March. Shown by Messrs. SPOONER & SONS, Hounslow.

Peach Salwey.—This old variety is well known, and was shown in splendid condition by the Duke of RICHMOND from his garden at Goodwood. The skin is of a deep, rich yellow colour. In the *Fruit Manual* the flesh is described as of a deep orange colour, very melting, juicy, and vinous. It was raised by Col. Salwey from a Peach stone brought from Italy, and was introduced by Mr. Charles Turner, of Slough.

DIVISION I.

COLLECTION OF HOTHOUSE AND HARDY FRUITS. (OPEN TO GARDENERS AND AMATEURS ONLY.)

Two classes are provided in this section for displays of ripe dessert fruits, either from hot-houses or the open garden. The largest is for a collection of nine kinds, only one Melon or Pine, or one dish of a Black or White Grape being allowed, and not more than two varieties of any other kind. The 1st prize consists of a silver cup and £5 in money.

There were only two exhibits, and neither was remarkable for high quality. The exhibitors were C. A. CAIN, Esq., The Node, Welwyn, Hertfordshire (gr. Mr. T. Pateman), and J. A. NIX,

Esq., Tilgate, Crawley, Sussex (gr. Mr. E. Neal); the 1st prize falling to the former and the 2nd to the latter exhibitor. The best Grapes were Muscat of Alexandria in the 1st prize group. The berries were finely finished and of deep amber colour, but the bunches were not remarkable for either size or shape. Mr. CAIN showed Black Alicante as his other variety of Grape; he had in addition a moderately good Melon of the Hero of Lockinge variety; Peach, Lady Palmerston; Plum, Coe's Golden Drop, of small size; Pears, Pitmaston Duchess and Beurre d'Amanlis, the former showing some rubbing of the exterior; and Apples, Duchess's Favourite and Cox's Orange Pippin, the latter being one of the finest dishes in the collection. Mr. NIX lost heavily for Grapes, his bunches being much below best exhibition size; but Nectarine Peach was splendid, also Pear (Doyenné du Comice) and Apple (James Grieve).

In both cases Ampelopsis sprays and leaves were employed for decoration.

Collection of six dishes.—In the smaller class for a collection of six dishes, to include at least four kinds, only one Melon and one variety of white and black Grapes each being allowed, the quality was infinitely superior. Competition also was keener, there being four exhibitors. The 1st prize was awarded to Lord BELPER, Kingston Hall, Derby (gr. Mr. W. H. Cooke). The Grapes were Gros Colman and Muscat of Alexandria. The two bunches of the former were amongst the finest in the show for size of berry and finish. The Muscats were well matched, being long, tapering bunches without shoulders, and the berries were well finished. The other dishes were Cox's Orange Pippin Apple, of superb quality and highly coloured; Melon Eminence, Pear Doyenné du Comice; and Peach Gladstone, the last of excellent quality.

The 2nd prize exhibit, shown by the Duke of NEWCASTLE, Clumber, Worksop (gr. Mr. S. Barker), was also a remarkably fine display. The two bunches of Madresfield Court Grapes lacked nothing but size. Though a trifle under weight, they were otherwise perfect specimens. Pears (Pitmaston Duchess) were very large, and the Melon Sutton's Scarlet was a superb fruit.

The two other exhibitors were Sir C. E. HAMILTON, Bart., Hatley Park, Sandy (gr. Mr. T. W. Birkinshaw), and H. ST. MAUR, Esq., Newton Abbot (gr. Mr. G. Richardson), the exhibits being adjudged equal in merit and awarded equal 3rd prizes. Sir C. E. HAMILTON had large bunches of Grapes, those of Alwick Seedling being of fine colour, but uneven in berry. Mr. ST. MAUR had a fine Melon, of the variety Superlative.

GRAPE CLASSES.

Taking the Grape classes as a whole the exhibits were distinctly below the average for these shows, and this notwithstanding the fact that these exhibitions have never been strong in Grapes. There were no competitors in the largest class for a collection of five varieties, two bunches of each sort, whilst in that for four varieties there was only one collection. It was shown by A. BENSON, Esq., Upper Gattin Park, Mersham (gr. Mr. H. Cornish), and received the 2nd prize. The varieties were Madresfield Court, Muscat of Alexandria, Mrs. Pearson and Mrs. Pince.

Black Hamburg.—There were two exhibits of this popular kind, and well-coloured but small berried bunches shown by Lord HILLINGDON, Sevenoaks (gr. Mr. J. Shelton), gained the 1st prize; 2nd, J. A. NIX, Esq., Tilgate (gr. Mr. E. Neal).

Mrs. Pince.—Three stands of this variety were forthcoming, much the best examples being shown by Lord HILLINGDON, who was awarded the 1st prize; 2nd, H. ST. MAUR, Esq.; 3rd, G. MILLER, Esq., Newberries, Radlett, Hertfordshire (gr. Mr. J. Kidd). Mr. MAUR's bunches were the largest, but they were not nearly so well coloured as those from Lord HILLINGDON's garden.

Black Alicante.—This class was one of the best in the Grape section. There was good competi-

tion, and the quality ran fairly uniform throughout. The 1st prize was awarded to the Duke of NEWCASTLE (gr. Mr. S. Barker), the berries being the largest and finest coloured; the 2nd prize was won by W. G. RAPHAEL, Esq., Castle Hill, Englefield Green (gr. Mr. H. H. Brown), the bunches being well matched, large, and only deficient in size of berries; 3rd, Sir WALPOLE GREENWELL, Bart., Marden Park, Surrey (gr. Mr. W. Lintott).

Madresfield Court.—There were four exhibits, one being so much superior to the others as to bear no comparison. The exhibitor was the Duke of NEWCASTLE (gr. Mr. Barker). The bunches were not of extra large size, but they were well matched and perfectly finished; 2nd, Lord BELPER (gr. Mr. W. H. Cooke); 3rd, G. MILLER, Esq. (gr. Mr. J. Kidd).

Prince of Wales.—The only exhibit of this variety was shown by the Duke of PORTLAND, Welbeck Abbey, Worksop (gr. Mr. J. Gibson), and was awarded the 1st prize.

Any other black Grape.—There were four exhibits in this class, the 1st prize being awarded to Gros Guillaume, shown by the Duke of NEWCASTLE; 2nd, Appley Towers, shown by C. A. CAIN, Esq. (gr. Mr. T. Pateman). The two bunches of Gros Guillaume were large, even for this big-growing sort, and the berries were as well finished as it is usual to find in this variety.

Muscat of Alexandria.—The Grapes in this class all showed rich amber colouring, pointing to good quality, and although no individual exhibit was outstanding, the quality generally was good. The 1st prize was won by L. G. PIKE, Esq., Wareham, Dorset (gr. Mr. W. D. Pope); 2nd, G. MILLER, Esq. (gr. Mr. J. Kidd); 3rd, A. BENSON, Esq. (gr. Mr. H. Cornish).

Any other white Grape.—This proved a poor class. Foster's Seedling, shown by Sir CHAS. E. HAMILTON, Bart. (gr. Mr. T. W. Birkinshaw), being awarded the 2nd, and Mrs. Pearson, shown by A. BENSON, Esq. (gr. Mr. H. Cornish), the 3rd prize, these being the only exhibitors.

COLLECTION OF HARDY FRUITS.

This class was for 30 dishes, distinct, arranged in a space of 12 feet by 3 feet. Three exhibitors competed, their displays including a selection of hardy fruits of nearly all kinds, as well as nuts, the intention being to make the collections as varied as possible. The 1st prize was won by Lieut.-Col. A. C. BORTON, Cheveney, Hunton, Kent (gr. Mr. J. Whittle). His Apples and Pears were splendid, and he had also fine Quinces, Peaches, Blackberries, Nuts, and Damsons. Of the Apples, Allington Pippin, Wealthy, Bramley's Seedling, Bismarck, and Cox's Orange Pippin were especially good; Walburton Admirable and Princess of Wales Peaches were also choice samples. 2nd, Major POWELL-COTTON, Quez Park, Thanet (gr. Mr. T. Cornford). Here again Apples and Pears were very good, Withington Fillbasket Apple being remarkably large and good in colour. Golden Noble is a grand culinary Apple and was finely shown by Major POWELL-COTTON. Prince of Wales and Late Admirable Peaches, Victoria Nectarines, Mulberries, Brown Turkey Figs, and Nuts formed other dishes in this admirable collection. 3rd, Sir MARCOS SAMUEL, Maidstone (gr. Mr. W. H. Bacon), with a meritorious exhibit.

DIVISION II.

NURSERYMEN'S CLASSES.

FRUITS GROWN ENTIRELY OUT-OF-DOORS.

There are no traders' exhibits at this fruit show, except such as are seen in competitive classes. These are divided into four, the largest class being for a display of hardy fruits occupying a space of 30 feet run, and the smallest for 6 feet, thus making provision for the small as well as the large growers.

In the largest class there were four collections, Gold Medals being awarded to two exhibits and Silver-gilt Medals to the others.

Messrs. GEO. BUNYARD & CO., LTD., Maidstone, showed fruits of fine quality arranged on dishes, stands of varying heights and metal displays, a few plants of *Crataegus Pyracantha* being interspersed for relief. The fruits showed rich

colours, were well graded as to size, and had generally unblemished skins, denoting choice quality. Amongst Apples, especially good were Baumann's Red Reinette, Bountiful, Bramley's Seedling, Royal Jubilee, Lord Castlereagh, Queen Caroline, Mère de Menage, Golden Spire, Lady Sudeley, Ben's Red, Warner's King, Wealthy, Withington Fillbasket, King of the Pippins, Allington Pippin, and Golden Noble. (Gold Medal.)

The KING'S ACRE NURSERIES, Hereford, had a very imposing display, well set up, the coloured varieties being exceptionally richly coloured. Very fine were Apples Chas. Ross, Rival, Warner's King, Stirling Castle, Golden Noble, Cox's Pomona, Beauty of Stoke, Bismarck, Hambling's Seedling, King's Acre Bountiful, Wealthy, and Lord Grosvenor. Along the front were Medlars, Strawberries of the St. Joseph variety, Peaches, Coe's Golden Drop Plums, Nuts, and Pears. (Gold Medal.)

The exhibit shown by Messrs. H. CANNELL & SONS, Swanley, Kent, was very bright, and the arrangement pleasing, whilst the fruits were free from blemish. Notable dishes of Apples were King of the Pippins (extra fine), Cox's Orange Pippin, Wealthy, Golden Spire, Gascoigne's Scarlet Seedling, Emperor, Lord

of Cox's Orange Pippin Apple, and huge fruits of Warner's King. 3rd, Messrs. LAYTON BROS., Bedford, who had fruits of high quality but small; the arrangement was remarkably attractive, sprays of Berberis Thunbergii forming a border. Notable dishes in this group were Allington Pippin, Gascoigne's Scarlet Seedling, Sandringham, Lord Derby, Wealthy, Bismarck, and Dartmouth Crab. 4th, Messrs. S. SPOONER & SONS, Hounslow.

Collection on a space of 12 feet by 6 feet.—For a display of hardy fruits, measuring 12 feet by 6 feet, there were six exhibitors, the 1st prize being awarded to remarkably highly coloured specimens shown by Mr. W. TAYLOR, Hampton, Apples Chas. Ross, Emperor Alexander, Lady Sudeley, Barnack Beauty, Gascoigne's Scarlet Seedling, Edward VII., Allington Pippin, Annie Elizabeth, Bismarck, Newton Wonder, Cox's Orange Pippin, Blenheim Pippin, Mère de Menage, Allington Pippin, King of the Pippins, and others were splendid samples. There were also good Pears and some Quinces. This exhibit was a most notable one, the fruits equalling any in the show for size and good quality. 2nd, the BARNHAM NURSERIES, LTD., Barnham, Sussex. They had very fine samples of such varieties of Apples

Conference, Beurré Bose, Durondeau, Beurré Diel, Uvedale St. Germain, and Duchesse d'Angoulême Cherry; Guigne de Winkler; and Plum; President. The gathered fruits included:—Apples: The Queen, Chas. Ross, Cox's Pomona, Peasgood's Nonesuch, and Duchesse's Favourite. Plums were represented by Grand Duke, Late Orange, Coe's Golden Drop, President, Late Transparent, and others. Pears: Doyenné Boussoch, Marguerite Marillat, and Beurre Hardy.

MESSRS. BUNYARD had fine trees of Gascoigne's Scarlet Seedling and Farmer's Seedling Apples; Pears Marie Benoist and Beurré Alex. Lucas; and a choice tree of Golden Eagle Peach. The gathered fruits were splendid, and embraced such fine Apples as King of Tompkin's County, Gascoigne's Scarlet Seedling, Ribston Pippin, Golden Noble, Chas. Ross, and Byford Wonder; and Pitmaston Duchess and Belle du Bois Pears.

DIVISION III.

(OPEN TO MARKET GROWERS ONLY.)

In the class for a display of hardy fruits occupying a table space of 18 feet run by 6 feet, the 1st prize included a Silver-gilt Medal, offered by the Fruiterers' Company. Mr. A. POUPART, Marsh Farm, Twickenham, was placed 1st for a collection of Apples and Pears, which, as a whole, was above the average quality and free from all blemishes. Of Apples, extra-fine specimens were observed of Stone, Peasgood's Nonesuch, Norfolk Beauty, Lane's Prince Albert, Bismarck, Warner's King, Twenty Ounce, Allington Pippin, Sandringham, Chas. Ross, Bramley's Seedling, Gascoigne's Scarlet Seedling, Chelmsford Wonder, Coronation, Barnack Beauty, Mabbott's Pearmain, The Queen, Striped Beefing, The Houblon (a handsome reddish Russet of the middle size), Egremont Russet, and Rosemary Russet. These formed a collection of the best modern varieties, not excelled by any others for size, or shape, or general excellence. Of Pears, we may mention Calebasse, Beurré Baltet, Conference, Beurre superfin, Durondeau, Beurré Hardy, Beurré d'Arenberg, Beurré Bachelier, Louise Bonne of Jersey, Fondante d'Autonne, Pitmaston Duchess, and Emile d'Heyst, all good varieties for the market, large in size and of good appearance, just the fruits to suit the fancy of the ordinary purchaser. The 2nd prize was awarded to the KENTISH FRUIT GROWERS' UNION, 6 and 7, Market Buildings, Maidstone (manager, Mr. T. W. Startup). In a few instances the fruits had been closely sorted, and evidently the cultivators had employed fungicides in order to prevent skin blemishes.

The next class was for an exhibit arranged on a table space of 12 feet by 6 feet, the highest award for which was a Silver Medal presented by the Fruiterers' Company. The 1st prize was won by Mr. G. H. DEAN, Sittingbourne, with a representative collection of fine fruits, Mr. H. T. MASON, Hampton Hill, being placed 2nd. This exhibitor arranged his group in a novel but attractive manner, and quite simply. The fruits were piled up in round and oblong market baskets, some of the baskets being elevated in the centre to form a star, and from this radiated rows of baby baskets, the whole being brightened with autumn-tinted leaves. The Council affixed on the exhibitor's card an appreciation of his method of staging.

In this Market Grower's Division there was a class for 12 dishes of Apples, distinct, six culinary and six dessert, exhibitors in the two previous classes not being admissible. The 1st prize was taken by Mr. R. A. WHITING, Dargate, Faversham, with fine, well-selected fruits, of which we noted the Pippins, Allington, Cox's Orange, Ribston, and King; also Chas. Ross and Rival as dessert varieties, the culinary kinds being Peasgood's Nonesuch, Lord Derby, Emperor Alexander, Cox's Pomona, Warner's King, and Loddlington. The fruits were large and clear in the skin. 2nd, Mr. A. E. MASON, Hampton Hill, with capital fruits of Ribston Pippin, Cox's Orange Pippin, and King of the Pippins, Jefferson, and Worcester Pearmain. The exhibitor's fine culinary varieties were Prince Albert, Peasgood's Nonesuch, The Queen, Allington Pippin, and Bismarck. Equal 3rd prizes were awarded to Miss K. M. COURTLAND, Knight's Farm, Colne Engrave, Essex, and Mr. A. J. CARTER, Billingshurst.

R.H.S. FRUIT SHOW.

[Photograph by W. J. Vasey.]

FIG. 126.—COLLECTIONS OF HARDY FRUITS IN THE NURSERYMEN'S CLASSES.

Derby, Peasgood's Nonesuch, Lady Henniker, Queen Caroline, Bramley's Seedling, Yorkshire Beauty, and Cellini Pippin. Pears were represented by good fruits of Pitmaston Duchess, Winter Windsor, Conference, Emile d'Heyst, and Souvenir de Congres. (Silver-gilt Knightian Medal.)

MESSRS. J. CHEAL & SONS, Crawley, also showed well in this class, having good fruits of well-known varieties of Apples and Pears, such as have been already enumerated. (Silver-gilt Knightian Medal.)

Collection of hardy fruit on a space of 20 feet by 6 feet.—There were four exhibits in this class, the 1st prize being given to Messrs. W. SEABROOK & SONS, Chelmsford, who showed large, clean fruits of the best culinary and dessert Apples, with a few Pears. Especially good were Apples Royal Jubilee, Newton Wonder, Emperor Alexander, Cox's Orange Pippin, Mother, Lane's Prince Albert, Peasgood's Nonesuch, The Queen, and Stirling Castle. Pear Marie Louise d'Uccle was excellent. The staging was decorated with fruiting sprays of Medlar. 2nd, Mr. R. C. NORCUTT, The Nursery, Woodbridge, Suffolk. This exhibitor had a splendid basket

as Gascoigne's Seedling, Bismarck, Coronation (a dessert Apple of fine appearance), Lord Derby, Worcester Pearmain, Chas. Ross, Warner's King, King's Acre Pippin, Lord Hindlip, Egremont Russet, and Invincible. 3rd, Messrs. JOHN PEED & SON, West Norwood.

ORCHARD HOUSE FRUIT AND TREES.

There were two exhibits in the class for a display of Orchard house fruit trees and fruits, the competitors being Messrs. T. RIVERS & SON, Sawbridgeworth, and Messrs. GEO. BUNYARD, LTD., Maidstone. Much the better trees were shown by Messrs. RIVERS, who were awarded the 1st prize. Besides the trees, each exhibitor arranged baskets of orchard-house fruits along the front, and these were in both cases very choice.

Of fruit trees in the premier display, notable examples were:—Apples: Belle de Pontoise, Cox's Pomona, Gascoigne's Scarlet Seedling, Buckingham (a very free cropper), King of Tompkins County (a magnificent tree that occupied the centre of the exhibit), and St. Martin's. Pears: Doyenné du Comice, Winkler, Beurré Bachelier,

DIVISION IV.

FRUITS GROWN ENTIRELY IN THE OPEN AIR.

(OPEN TO GARDENERS AND AMATEURS ONLY.)

Twenty-four dishes of Apples, distinct, sixteen cooking and eight dessert.—1st, Lieut. Col. A. C. BORTON, Cheveny, Hinton, Kent (gr. Mr. J. Whittle), for very superior culinary fruits, large, clear, and well chosen, of Emperor Alexander, The Queen, Lord Derby, Mère de Ménage, Belle Dubois, Peasgood's Nonesuch, Bramley's Seedling, Newton Wonder, Warner's King, Lane's Prince Albert, Honblon's Seedling, Belle Pontoise, Annie Elizabeth, and Stone's Seedling. The finer dessert varieties were Melon, Ribston Pippin, Cox's Orange Pippin, King of the Pippins, The Rival, Chas. Ross, Wealthy, and Allington Pippin. 2nd, C. GURNEY, Esq., Biggleswade (gr. Mr. A. Carlisle). The culinary varieties in this display were splendid, being of large size and clear in the skin; the finer were Bramley's Seedling, Blenheim Pippin, Newton Wonder, and Emperor Alexander. Dessert varieties of special merit were Chas. Ross, Cox's Orange Pippin, James Grieve, and Allington Pippin. 3rd, Sir EDMUND LODER, Leonardlee, Horsham (gr. Mr. W. A. Cook), with fruits of culinary kinds of rather small size. The best were Peasgood's Nonesuch, Loddington, Lane's Prince Albert, Gascoigne's Scarlet Seedling, and The Queen. His finer dessert Apples were St. Edmund's Russet, Blenheim Pippin, Adams's Pearmain, and Calville Rouge Précoce.

Eighteen dishes of Apples, distinct, twelve culinary, six dessert.—The 1st prize was won by J. G. WILLIAMS, Esq., Pendley Manor, Tring (gr. Mr. F. G. Gerrish), with excellent fruits of both kinds; the finer of the cookers were Warner's King, Harvey's Wiltshire Defiance, Lane's Prince Albert, Hambling's Seedling, Lord Derby, Peasgood's Nonesuch, Bramley's Seedling, and Withington Fillbasket. The finer specimens of dessert varieties were Ribston Pippin, Red Blenheim Pippin, Chas. Ross, Crimson Quoining, and Rival. 2nd, Sir MARCUS SAMUEL, Bart., Mote Park, Maidstone (gr. Mr. G. H. Bacon). Well developed fruits were Bismarck, Peasgood's Nonesuch, Lord Derby, Lane's Prince Albert, The Queen, Harvey's Wiltshire Defiance, and Stirling Castle. The best varieties of dessert Apples were Cox's Orange Pippin, St. Edmund's Pippin, Wealthy, Chas. Ross, and Allington Pippin. 3rd, Major POWELL-COTTON, Quex Park, Birchington (gr. Mr. F. Cornford), who showed fine fruits of Mère de Ménage, Withington Fillbasket, Afriston, Peasgood's Nonesuch, Tyler's Kernel, Cox's Orange Pippin, and American Mother.

Twelve dishes of Apples, distinct, eight culinary and four dessert.—MR. A. BASILE, Woburn Park, Weybridge, was awarded the 1st prize for extra fine fruits of Peasgood's Nonesuch, Lord Derby, Warner's King, Emperor Alexander, Gloria Mundi, Cox's Orange and Ribston Pippins, Rival, and Cornish Aromatic. 2nd, J. A. NIX, Esq., Tilgate, Crawley (gr. Mr. E. Neal), who showed choice fruits of Royal Jubilee, Lord Derby, and Lane's Prince Albert, and dessert fruits, James Grieve, Scarlet Nonpareil, and Ribston Pippin.

Six culinary Apples of distinct varieties.—1st, Lieut. Col. BORTON, with large fruits of Peasgood's Nonesuch, Warner's King, Mère de Ménage, Bismarck, and others. 2nd, C. GURNEY, Esq., with extra-large fruits of Peasgood's Nonesuch, Gascoigne's Scarlet, and Emperor Alexander.

Six dishes, distinct, of dessert Apples.—Lieut. Col. BORTON was placed 1st for King of the Pippins, Wealthy, Allington Pippin, Christmas Pearmain, Cox's Orange Pippin, and Calville Rouge Précoce. 2nd, C. GURNEY, Esq. There were many competitors in this small class, and but little variation was seen in the exhibits.

Eighteen dishes of dessert Pears, distinct.—The 1st prize in this contest fell to Sir MARCUS SAMUEL, Maidstone, for astonishingly large fruits of Marguerite Marillat, Pitmaston Duchess, Beurré Baltét Père, Beurré Bose, Beurré Hardy, Beurré Superfin, Beurré Fonqueray, Doyenné du Comice, Marie Benoist, Durondeau, Triomphe de Vienne, Fondante Thiriot, Directeur Hardy, and Princess; 2nd, F. A. WHITE, Esq., East Grinstead (gr. Mr. W. T. Finch), with fine fruits,

among others of Nouveau Poiteau, Doyenné Boussoch, Beurre Bachelier, Maguete, Glon Moreau, very large Doyenné du Comice, and Jersey Gratiot; Lieut. Col. BORTON was awarded the 3rd prize, showing immensely large fruits of Pitmaston Duchess, Marie Benoist, and Doyenné du Comice.

Twelve dishes of dessert Pears, distinct.—The 1st prize was won by Mr. A. BASILE, with Charles Ernest, Marie Benoist, Beurre Baltét Père, Triomphe de Vienne, Beurré Alexandre Lucas, and others; 2nd, Major POWELL-COTTON, with very fine examples of Marguerite Marillat, Chaumontelle, and Josephine de Malines.

Nine dishes of dessert Pears, distinct.—J. A. NIX, Esq., Tilgate, showed alone in this class. He staged clear-skinned fruits quite large enough for ordinary use. Very fine examples of Brockwell Park, Beurré Alexandre Lucas, and Beurré d'Amanlis were noticed. The 1st prize was awarded.

Six dishes of dessert Pears, distinct.—The 1st prize was made in favour of JOHN BRENNARD, Esq., Baldersby Park, Thirsk (gr. Mr. J. E. Hathaway), who showed fruits of medium size of Louise Bonne of Jersey, Charles Fine t, Doyenné de Boussoch, and Beurre Bachelier; the 2nd prize was awarded to Mr. B. CRAYDON, 72a, East Street, Sittingbourne. The fruits of Pitmaston Duchess in this exhibit were amongst the largest shown on this occasion, and others of fine proportion were Princess, Maréchal de la Cour, and Beurré Bachelier.

Three dishes of stewing Pears, distinct.—1st, Mr. B. CRAYDON, with Catillac, General Tolleben, and Beurré Châteauneuf; 2nd, Major POWELL-COTTON, with Uvedale's St. Germain, Gilgil, and Catillac.

Peaches.—There was a class for a dish of Peaches grown out of doors, the 1st prize being awarded to the Duke of Richmond for a splendid dish of Salvey, the fruits being large and of high colour; 2nd, Viscount ENFIELD, Wrotham Park, Barnet (gr. Mr. H. Markham), for the variety Princess of Wales, of large size.

Nectarines.—In a similar class for a dish of Nectarines, the 1st prize was awarded to the AMERICAN AMBASSADOR, Wrest Park, Ampthill (gr. Mr. G. Mackinley), for the variety Victoria, of medium size and pale in colour; 2nd, Major POWELL-COTTON.

Plums.—There were five classes for these fruits, one for three dishes, distinct, grown under glass, and another for the same number of varieties grown out of doors. Lord HOWARD DE WALDEN, Suffolk Walden (gr. Mr. J. Vert), showed the finest fruits grown indoors, having Decaisne, Cox's Golden Drop, and Cox's Violet; 2nd, Mrs. BANKS, Kingston Lacy, Wimborne (gr. Mr. J. Hill), with President, Pond's Seedling and Grand Duke. C. H. BERNERS, Esq., Woodverstone Park, Ipswich (gr. Mr. W. Messenger), excelled in the other class, with Reine Claude de Bravay, President, and Cox's Golden Drop; 2nd, Lord HOWARD DE WALDEN, with the same varieties. C. H. BERNERS, Esq., had the best dish of Cox's Golden Drop; 2nd, Lord HOWARD DE WALDEN. The Marquis of NORTHAMPTON, Castle Ashby (gr. Mr. A. R. Searle), won the 1st prize in the class for one dish of any other dessert variety of Plum with Transparent Gage, whilst C. H. BERNERS, Esq., showed the best dish of a culinary Plum, having late Transparent Gage.

AFFILIATED SOCIETIES CLASS.

There was a class for societies in affiliation with the R.H.S., the schedule requiring six dishes of culinary, the same number of dessert Apples, and six dessert Pears. There were only four entries, the EAST ANGLIAN HORTICULTURAL SOCIETY winning the 1st prize, which included a Silver Challenge Cup and the Society's Silver Gilt Knightian Medal, with a magnificent collection, that included splendid fruits of (culinary Apples) Mère de Ménage, Bramley's Seedling, and Lane's Prince Albert; (dessert Apples) Allington Pippin, Ribston Pippin, Worcester Pearmain, Tyler's Kernel; (Pears) Conference, Pitmaston Duchess, Durondeau and Doyenné du Comice; 2nd, COLCHESTER GARDENERS' ASSOCIATION (Silver Gilt Knightian Medal). The other societies that exhibited were the Croydon and Addlestone Associations.

DIVISION V.

SPECIAL COUNTY CLASSES.

Classes to the number of 11 were provided for groups of counties or areas having similar climatic conditions, and including one each for Scotland, Ireland and the Channel Islands. In each case there was a section for six dishes of culinary and two dishes of dessert Apples, and another for six dishes of dessert Pears.

KENT.—*Apples:* This important fruit-growing centre was the first on the schedule, constituting a class in itself. There were three exhibits of Apples, all of superior quality, but much the finest was displayed by W. E. S. ERLE DRAX, Esq., Wye (gr. Mr. J. Bond). His fruits of Chas. Ross were magnificent; there was also a good sample of James Grieve, whilst fine culinary Apples were observed in Warner's King, Hambling's Seedling, Peasgood's Nonesuch (very large), and Lord Derby. 2nd, Rev. H. A. BULL, Westgate (gr. Mr. F. King), with choice Cox's Orange Pippin, Lady Sadley, Striped Beefing, Gascoigne's Scarlet Seedling and Warner's King.

—*Pears.*—The same number of exhibitors contested in the class for Pears, and again Mr. DRAX excelled with a meritorious collection, and was easily 1st. He showed Beurré Superfin (extra choice), Beurré Bachelier, Beurré Diel, Beurré Alexandre Lucas, Pitmaston Duchess, and Doyenné du Comice. 2nd, Lord HILLINGDON, Sevenoaks (gr. Mr. J. Shelton), with large but green fruits, Beurré Superfin excepted. Those of Pitmaston Duchess and Doyenné du Comice were very big.

SURREY, SUSSEX, HAMPSHIRE, DORSET, SOMERSET, DEVON AND CORNWALL.—*Apples:* The competitors numbered only four, a poor response for such fine Apple-growing counties as Hampshire, Somerset and Devon. The 1st prize collection was a grand one, the exhibitor being the Duke of RICHMOND, Goodwood (gr. Mr. F. Bruck). Both the dessert sorts, Rival and Cox's Orange Pippin, were remarkably good; the culinary sorts were Lord Derby, Lane's Prince Albert (a fine sample), Peasgood's Nonesuch (large, well-matched, and finely coloured fruits), and Warner's King. 2nd, F. J. B. WINGFIELD DIGBY, Esq., Sherborne Castle (gr. Mr. T. Turton), whose best dish was Warner's King. We also noticed the fine Apple Hollandbury, of conical shape, ribbed and with fine red colouring. The fruits of Cox's Orange Pippin were rather small and deficient in colour.

—*Pears.*—Mr. DIGBY showed finely in the Pear section, and received the 1st prize, the only fault being a lack of colour. There were extra large fruits of Beurré Baltét Père, Durondeau, Doyenné du Comice, Marie Benoist, St. Luke, and Beurré Bachelier. 2nd, C. H. COMBE, Esq., Colham Park, Surrey (gr. Mr. A. Tidy). This collection included an excellent dish of Louise Bonne de Jersey; the others were very green.

WILTS, GLOUCESTER, OXFORD, BUCKS, BERKS, BEDS, HERTS AND MIDDLESEX.—*Apples:* There were only four exhibits from these eight counties. Lord HILLINGDON (gr. Mr. A. R. Allan) had very fine fruits and won handsomely. He showed splendid samples of Cox's Orange Pippin, Ribston Pippin, Emperor Alexander (very good), Warner's King, Lord Derby, and Peasgood's Nonesuch. 2nd, J. B. FORTESCUE, Esq., Dropmore (gr. Mr. C. Page), whose finest specimens were Chas. Ross, Cox's Orange Pippin, Tyler's Kernel, and Loddington.

—*Pears.*—Lord HILLINGDON was also 1st for Pears, Durondeau was his best dish. Thompson's were rather small, but of excellent quality; there was also a good dish of Marie Louise; Triomphe de Vienne, and big Pitmaston Duchess completed the varieties. 2nd, Viscount ENFIELD, Wrotham Park (gr. Mr. H. Markham), with fruits showing fine finish all round, highly coloured, not over large, but most suitable for the dessert table. The best dish was of Marie Louise (with mellow skins), Durondeau, Beurré Bose, and Beurré Superfin were also good; Pitmaston Duchess was a little rougher on the skin.

ESSEX, SUFFOLK, NORFOLK, CAMBRIDGE, HUNTS AND RUTLAND.—*Apples:* The better of two exhibits was put up by Col. PETER, Westwick, Norwich (gr. Mr. G. D. Davison). The fruits exhibited remarkably high colouring, especially Mère de Ménage, Ribston Pippin, and Gascoigne's Scarlet Seedling. There was a nice

plate of Cox's Orange Pippin and extra big fruits of Bramley's Seedling. The remaining variety was Stone's Apple, 2nd, W. A. VOSS, Esq., Eastwood Road, Rayleigh. In this collection was seen delicate-looking fruits of The Queen. The old Scarlet Pearmain formed one of the dessert kinds, the other being Duke of Devonshire, like a green Cox's Orange Pippin.

—*Pears*.—Col. PETRE had the best of three collections, the fruits being of large size, Triomphe de Vienne was of fine size and good finish, Marie Louise, Doyenné du Comice (extra big), Durondeau (with deep red flush on the skin), and Pitmaston Duchess. They were a choice lot, and probably the best yet noticed in the county classes. 2nd, C. H. BERNERS, Esq., Woolverstone, Ipswich (gr. Mr. W. Messenger). The fruits of Durondeau were ripe and good,

Orange Pippin, and Ribston Pippin. They were a good even lot, but the skins were green. 2nd, Mr. JOHN LEE, Higher Beblington, Cheshire, with large Warner's King, Hawthornden (small but finely coloured), Cox's Orange Pippin, and a showy dish of Chas. Ross.

—*Pears*.—1st, Duke of PORTLAND, Welbeck (gr. Mr. J. Gibson), with extra fine fruits of Chas. Ernest (splendid), Emile d'Heyst, Beurre Diel, Pitmaston Duchess, Marie Benoist, and big specimens of Doyenné du Comice, not red anywhere, but a delicate greenish yellow. The 2nd prize was awarded to a good exhibit shown by F. BIBBY, Esq., Hardwick Grange, Shrewsbury (gr. J. Taylor).

WORCESTER, HEREFORD, MONMOUTH, GLAMORGAN, CARMARTHEN AND PEMBROKE.—*Apples*:

hibits, and neither very good. P. YORKE, Esq., Erdly Park, Wrexham (gr. Mr. G. Atkens), was awarded the 1st prize. Fruits of the variety Golden Noble, in the 2nd prize group, were not bigger than Cox's Orange Pippin, and quite green instead of golden. Peasgood's Nonesuch was not much larger.

—*Pears*.—Mr. YORKE was again placed 1st. He showed small but rather good fruits of Marie Louise, Louise Bonne de Jersey, Beurre Hardy, and Beurre Sterckmans. 2nd, Col. CORNWALLIS WEST, Ruthin Castle (gr. Mr. H. Forder).

THE SIX NORTHERN COUNTIES OF ENGLAND AND THE ISLE OF MAN.—*Apples*: JOHN BRENNAND, Esq., Baldersby Park, Thirsk (gr. Mr. J. E. Hathaway), showed the better of two exhibitors. The influence of a northern climate was noticeable in the specimens which included Rival, Lord Derby, Royal Jubilee (a good dish), Worcester Pearmain (highly coloured) and Bismarck. 2nd, W. E. HYDE, Esq., Northwood Hall, Sheffield. The dessert kinds were fair samples, of Cox's Orange Pippin and Allington Pippin, but the culinary sorts were under size for the varieties.

—*Pears*.—Mr. BRENNAND again won with fruits of average quality; 2nd, W. E. HYDE, Esq., with green fruits below average exhibition size.

SCOTTISH COUNTIES.—There was only one exhibit of Apples and none of Pears from the whole of Scotland. The small exhibit of Col. Gordon, however, was a fine one. The fruits showed excellent finish and high colour, but were not of extra large size. They embraced King of the Pippins, Worcester Pearmain, Gascoigne's Scarlet Seedling (very highly coloured), The Queen, Hawthornden, and Peasgood's Nonesuch.

IRISH COUNTIES.—The Earl of Bessborough, C. B., Piltown, Kilkenny (gr. Mr. T. E. Tomlin), showed that Ireland can grow fine Apples, equal to some of the best from English gardens. Fruits of Cox's Orange Pippin were small but finely coloured. King of the Pippins (good), Warner's King (splendid), Hambling's Seedling, Peasgood's Nonesuch and Loddington were also fine examples. 2nd, Mr. C. B. BROW, Achern Court, Co. Cork. Chas. Ross was shown well in this exhibit, also Allington Pippin and Emperor Alexander.

DIVISION VI.
SINGLE DISH CLASSES.
DESSERT APPLES

Twenty eight classes were provided for varieties of dessert Apples, 26 being for specified varieties. Several kinds were poorly represented, these being such as find little favour with growers, and some in the list may be regarded as worthless. *Adams's Pearmain*. This fine old variety was represented by six dishes. Lord HILLINGDON, Uxbridge (gr. Mr. A. R. Allan), showed the finest sample, and Mr. W. STARTUP, West Farleigh, was 2nd. The fruits generally were of moderate quality only.—*Allington Pippin*: This is evidently a popular variety, as there were 14 dishes, some of the fruits being too large for dessert purposes. E. MOCATTA, Esq., (gr. Mr. T. Stevenson), was placed 1st, the Duke of RICHMOND, Goodwood (gr. Mr. F. Brock), taking 2nd place with rather brighter coloured fruits.—*American Mother*: There were 16 dishes of this variety, the fruits generally showing bright colour. Lord HILLINGDON was a good 1st, having handsome fruits. C. A. MORRIS FIELD, Esq., Sevenoaks (gr. Mr. R. Edwards), was placed 2nd.—*Ballinora Pippin*: An Irish Apple, of which only one dish was staged. The exhibitor was Lord HILLINGDON. Sevenoaks (gr. Mr. J. S. Shelton).—*Belle de Boskoop*: Four dishes of this Dutch Apple were exhibited, the various fruits exhibiting remarkable differences in appearance. J. WALTER, Esq., Beatwood, Berks (gr. Mr. W. Barnes), had the best sample; 2nd, Mr. W. STARTUP.—*Christina's Pearmain*: A small but pretty Apple, shown by four exhibitors, the best dish being staged by the Duke of RICHMOND; 2nd, W. E. S. ERLE DRAX, Esq. (gr. Mr. J. Bond).—*Ben's Red*: This variety was represented by three dishes only, all the fruits being

R.H.S. FRUIT SHOW.

FIG. 127.—APPLE "HOUNSLOW WONDER"; RECEIVED R.H.S. AWARD OF MERIT ON OCTOBER 13.

Directeur Hardy showed high red colour, Pitmaston Duchess with mellow yellow skin, Durondeau also finely coloured, and Doyenné du Comice small, but good. Col. Hon. C. HARBORD (gr. Mr. W. Allan) showed a fruit of Pitmaston Duchess weighing in this class 2 lb. 1 oz.

LINCOLN, NORTHAMPTON, WARWICK, LEICESTER, NOTTS, DERBY, STAFFS., SHROPSHIRE AND CHESHIRE.—*Apples*: Two exhibits only were forthcoming from these counties, the Duke of RUTLAND, Belvoir Castle, Grantham (gr. Mr. W. H. Divers), being placed 1st with Peasgood's Nonesuch, Belle de Pontoise, The Queen, Gascoigne's Scarlet Seedling (extra good), Cox's

There were two exhibits from these western counties. W. DENNIS BEST, Esq., Worcester, won the 1st prize with Lord Derby (extra big and good), Lane's Prince Albert (splendid), Stirling Castle, a nice dish of Cox's Orange Pippin, and big and highly coloured fruits of Worcester Pearmain. 2nd, G. H. HAYFIELD, Esq., Morastou House, Ross (gr. Mr. J. Dick), Bramley's Seedling being his best dish.

—*Pears*.—This was a poor class, the only exhibitor being Mr. HAYFIELD, who had fruits of good average quality.

OTHER COUNTIES OF WALES.—*Apples*: This also provided a poor class, there being two ex-

rather small. Mr. J. BOND won the 1st prize, the Rev. H. A. BULL, Westgate-on-Sea (gr. Mr. F. King), coming 2nd.—*Blenheim Pippin*: This famous variety was only represented by 10 dishes, which is sufficient to show that the trees have fruited but poorly this year. Here, too the variations in the fruits were remarkable. The Rev. H. A. BULL was 1st with pretty, well-coloured samples. 2nd, H. ST. MAUR, Esq., Newton Abbot (gr. Mr. E. Richardson).—*Charles Ross*: A comparatively new variety. Some of the samples were rather too large, but all were of great beauty. Mr. G. CROYDEN, Sittingbourne, was placed 1st, and Mr. R. EDWARDS 2nd amongst eight exhibitors.—*Claygate Pearmain*: The best of three exhibits was staged by Mr. R. EDWARDS, Mr. GARDENER, Ruxley Lodge, Esher, being 2nd.—*Coronation*: This Apple was seen in four dishes, Mr. BROCK having the best sample; the 2nd prize fell to an Irish grower, the exhibitor being Mr. C. B. BROAD, Co. Cork, for samples that were richly coloured.—*Cox's Orange Pippin*: As might be expected, this class brought a keen competition, there being 15 dishes, generally excellent samples, the best coming from Mr. DENIS BEST's garden at Worcester; 2nd, Mr. H. B. DAVIES, Ashford, Middlesex.—*Duke of Devonshire*: A variety not widely grown, the best of four dishes coming from Mr. W. A. VOSS, Rayleigh, Essex; 2nd, Col. PETRE, Norwich (gr. Mr. G. D. Davison).—*Egremont Russet*: Mr. J. BOND, Wye, showed beautifully golden fruits and won the 1st prize. J. SPEER, Esq., Swanley Junction, being placed 2nd. There were seven exhibits.—*Fearn's Pippin*: Although one of the oldest varieties of Apple, it was scarce on this occasion, there being only three dishes. Mr. W. BARNES won the 1st prize with brightly-coloured fruits; 2nd, Mr. H. G. KLEINWORT, Maidstone.—*The Houbton*: Only one dish of this new variety was staged, and it received the 1st prize. It was a very handsome sample, however, and was shown by Mr. RICHARDSON.—*James Griere*: No fewer than nine dishes of this popular sort were presented. Lord HOWARD DE WALDEN, Saffron Walden (gr. Mr. J. Vert), was 1st with singularly beautiful fruits; 2nd, Mr. RICHARDSON.—*King of Tompkin's County*: This class brought three dishes only, Lord HOWARD DE WALDEN being again placed 1st; 2nd, Mr. A. SMITH, Roehampton Lane.—*Lord Hindlip* was poorly represented in a single dish, the fruits being very green and speckled, the 2nd prize only being awarded. The exhibitor was Mr. T. JACKSON, Thornton Heath.—*Margil*: Four dishes of this variety were presented, Lord HILLINGDON taking the 1st prize with fruits from his Sevenoaks garden, and the 2nd prize with others from his Middlesex garden.—*Ribston Pippin*: This well-known sort was seen in 13 dishes, forming a capital lot of fruits, much superior to some of the newer and much-boomed varieties. Lord HILLINGDON was easily 1st; 2nd, Lord HOWARD DE WALDEN.—*Rival*: This class brought six dishes, the best coming from the garden of the Duke of RICHMOND; 2nd, C. B. BROAD, Esq., Clark.—*Scarlet Pearmain*: Oddly enough, this old variety was seen in one dish only, and the exhibit only received 2nd prize. Shown by J. T. CHARLESWORTH, Esq., Nutfield (gr. Mr. F. W. Herbert).—*St. Edmund's Pippin*: Of the five dishes staged the best was shown by Mr. F. LANDSELL, Leicester; 2nd, J. B. FORTESCUE, Esq., Droghda (gr. Mr. C. Page).—*Walthy*: A superb sample, the best of eight dishes, was shown by Mr. C. O. WALTER, Wantage; 2nd, Sir CHARLES HAMILTON, Bart., Sandy, Beds. (gr. Mr. T. W. Birkinshaw). *Any other variety*: In the class for any other variety of Apple fit for present consumption, 15 dishes were presented. It was interesting to see the old variety King of the Pippins placed 1st. They were splendid fruits, the exhibitor being Lord HILLINGDON; 2nd, Worcester Pearmain, shown by a Worcester grower, Mr. BEST; 3rd, King of the Pippins, the exhibitor being W. W. MANNDY, Esq., Bexley; 4th, Jefferson, shown by Mr. A. SMITH. In a corresponding class for any other variety ripening later, there were 10 dishes. The

old Cornish Gilliflower was placed 1st: the sample was by no means a pretty one. The exhibitor was Mr. W. BARNES; 2nd, McIndoe's Russet, a fine late Apple, shown by Lord HILLINGDON; 3rd, Scarlet Pearmain, shown by Mr. W. A. VOSS.

CULINARY APPLES.

In some of these classes the fruits were of extraordinary size; still, many showed the cold, uncongential nature of the season.—*Annie Elizabeth*: This first class late cooking Apple was seen in 11 dishes. A new competitor, B. HENDERSON, Esq., Berkhamsted (gr. Mr. H. Smith), was awarded the 1st prize for grand fruits; 2nd, Mr. DRAX.—*Beauty of Kent*: There were four dishes of this variety, the best coming from J. LUBROCK, Esq., Byfleet, Surrey (gr. Mr. J. B. Lowe); 2nd, Hon. Col. HARBORD.—*Bismarck*: This class brought six dishes, all very good fruits, Mr. BEST taking the 1st place and Mr. G. RICHARDSON the 2nd.—*Branley's Seedling*: There were 13 dishes of this grand variety, and all were of singularly good quality. Earl STANHOPE, Sevenoaks (gr. Mr. J. C. Sutton), was easily 1st, Mr. BEST being placed 2nd.—*Byford Wonder*: Of two dishes staged, Mr. R. EDWARDS had the better one, Mr. J. LEE BEVINGTON, Cheshire, being 2nd.—*Dumelow's Seedling (syn. Wellington)*: This variety was shown by six competitors, the 1st prize being awarded to Mr. A. SMITH for fine fruits; 2nd, Mr. J. B. LOWE.—*Edward VII.*: This Apple was seen in one dish only; the fruits were very clean, but green, being evidently a late keeper. Shown by Mr. F. LANDSELL, Leicester.—*Emperor Alexander*: Only two dishes of this once-popular variety were seen, Mr. CHARLESWORTH and Mr. HENDERSON taking the 1st and 2nd prizes respectively.—*Encore*: This new variety was represented by one dish only, a fine sample, shown by Mr. R. M. WHITING, Hereford.—*Gascogne's Scarlet Seedling*: The best fruits were shown by Mr. DRAX, Mr. E. MOCATTA taking the 2nd prize.—*Golden Noble*: The best of five dishes was shown by Mr. JACKSON, Thornton Heath; 2nd, T. J. B. WINGFIELD DIGBY, Esq., with fruits of smaller size, but richly coloured.—*Grenadier*: This variety was represented by five dishes, Mr. FORTESCUE winning the 1st prize with extra large fruits; 2nd, Mr. BROAD, with good samples from Ireland.—*Hambling's Seedling*: Mr. RICHARDSON had the finest of seven dishes, being followed closely by Mr. J. C. SUTTON.—*Lady Henniker*: Three rather indifferent samples were staged, 1st, Duke of RICHMOND; 2nd, Mr. FORTESCUE.—*Lane's Prince Albert*: This variety was seen in 12 dishes, the 1st prize fruits, shown by Mr. BEST, being unusually large and broad; 2nd, Mr. BROCK. All the dishes in this class contained fine samples.—*Lord Derby*: This class brought 12 dishes, Mr. BEST's 1st prize fruits being extraordinarily fine specimens.—*Mère de Ménage*: The best of five exhibits was shown by Mr. C. D. DAVISON.—*Newton Wonder*: There were 10 dishes, all fairly representative of this fine Apple. Mr. W. BARNES took the 1st prize with beautiful specimens; 2nd, Mr. LANDSELL.—*Norfolk Beauty*: The 1st prize dish contained superb fruits, being shown by Mr. W. ALLAN, Gunton Park; but Mr. BROAD, an Irish grower, followed closely.—*Pearspood's Nonpareil*: Mr. H. B. DAVIES had the best sample of this huge variety; 2nd, Mr. D. BEST.—*Potts's Seedling*: Only three dishes were represented, the fruits being of medium size. It is an Apple which has had its day. Mr. TURTON was placed 1st; Mr. F. W. PLATT, Highgate, being 2nd.—*Royal Jubilee*: This fine variety was seen in eight dishes. The Duke of RICHMOND showed the best specimens, the 2nd prize being awarded to Mr. JOHN LEE, Bellington.—*Stirling Castle*: It was surprising to find only four dishes representing this excellent Apple, Mr. BEST and Mr. FORTESCUE taking the prizes in this order.—*The Queen*: There were eight dishes, some of the fruits being well coloured. The best came from Mr. W. A. VOSS; 2nd, Mr. DRAX.—*Power of Glamis*: This is still a good culinary Apple. Of seven dishes, the finest was shown by the Earl of BESSBOROUGH, Co. Kilkenny (gr. Mr. F. E. Tomalin); 2nd, Lord STANHOPE (gr. Mr. C. Smith).—*Farmer's King*: This, one of the first market Apples of to-day, brought 13 dishes, including some wonderfully fine fruits. 1st, Mr. BEST; 2nd, Mr. MOCATTA.—The final class for cooking Apples was for any other variety than those enumerated. No fewer than 16 dishes were staged. Magnificent fruits of Tyler's Kernel,

shown by Mr. A. SMITH, Roehampton, were placed 1st; 2nd, Mrs. Barron, shown by Mr. BROCK; 3rd, Gloria Mundi; 4th, Withington Fillbasket.

PEARS.

There were 40 classes for these fruits in single dishes, not all of which were filled, and, in many cases, the entries were few. This served to show that, indifferent as the season has been for Apples, Pears have been affected far worse. *Beurré Alexandre Lucas*: There were but two dishes, Mr. DIGBY coming 1st and Mr. FORTESCUE 2nd.—*Beurré d'Amant*: The only exhibitors were the Rev. H. A. BULL and G. MILLER, Esq., Radlett, the prizes being awarded in this order.—*Beurré d'Anjou*: Again there were only two exhibits; 1st, Mr. TURTON, 2nd, Mr. FORTESCUE.—*Beurré Bose*: Lord HOWARD DE WALDEN was placed 1st for this variety, and Mr. DIGBY 2nd.—*Beurré Dumont*: Mr. SKETTON and Lord HILLINGDON were the only exhibitors in this class, receiving the 1st and 2nd prizes respectively.—*Beurré Hardy*: Lord HILLINGDON had the best of three dishes, the Rev. H. A. BULL taking the 2nd prize.—*Beurré Superfin*: This Pear was seen in five dishes, of which the best came from C. H. BERNERS, Esq., Ipswich (gr. Mr. Messenger); 2nd, Mr. DIGBY.—*Blickling*: Only one dish of this variety was staged, and it was not surprising to find the exhibitor was Mr. W. ALLAN.—*Charles Ernest*: The Duke of PORTLAND, Welbeck Abbey (gr. Mr. J. Gibson), was placed 1st out of four exhibitors with superb fruits; 2nd, Mr. MESSENGER.—*Comte de Lamy*: Four dishes, all with small fruits, were shown, Mr. FORTESCUE and Mr. SKETTON taking the 1st and 2nd prizes respectively.—*Conference*: Col. PETRE showed best of seven exhibitors, having extra large fruits; 2nd, R. F. BRISTOWE, Esq., Mildenhall (gr. Mr. J. Reynolds).—*Directeur Hardy*: This variety was represented by three dishes, Col. PETRE having the best exhibit in large fruits; 2nd, F. BIBBY, Esq., Shrewsbury (gr. Mr. J. Taylor).—*Doyenné du Comice*: Col. PETRE excelled with this choice variety, Mr. TURTON being 2nd.—*Durondeau*: Brightly-coloured fruits were seen in six dishes. Col. PETRE won with superb samples; 2nd, Mr. DIGBY.—*Emile d'Hayst*: Mr. W. ALLAN and Mr. J. REYNOLDS were the only exhibitors, and were awarded the prizes.—*Fondante d'Automne*: Mr. W. ALLAN showed the better of two exhibitors; 2nd, Mr. SKETTON.—*Fondante de Thiriat*: Mr. MESSENGER had the best of four dishes; 2nd, Mr. BROCK.—*Glou Morceau*: Col. PETRE had much the better of the two dishes staged.—*Joséphine de Malines*: Mr. DIGBY's fruits were the finest of six exhibits; 2nd, DUKE OF PORTLAND.—*Le Lectier*: Lord HOWARD DE WALDEN (gr. Mr. J. Vert) was placed 1st, and Mrs. BANKES, Wimborne, 2nd.—*Louise Bonne of Jersey*: This class brought but three dishes of moderate excellence. Mr. TAYLOR, Shrewsbury, was awarded the 1st prize, and A. BENSON, Esq., Merstham, Surrey (gr. Mr. Cornish), the 2nd.—*Marquérîte Marillat*: Col. PETRE alone staged this variety, having splendid fruits, and Mr. DIGBY was the only exhibitor of *Marie Benoist*, which he showed in fine form.—*Marie Louise* brought but three dishes, but those from Col. PETRE and Mr. W. ALLAN were specially fine, and took the prizes in this order.—There were five dishes of *Nouvelle Fulvie*, Mrs. BANKES having the best fruits.—*Olivier de Serres*: Six dishes made but a poor show, the fruits being of indifferent appearance. Mr. DIGBY and Lord HILLINGDON were awarded the prizes.—*Pitmaston Duchess*: Nine dishes were staged, Mr. H. C. KLEINWORT, Maidstone, showing best, having fine fruits. 2nd, Lord HILLINGDON.—*President Barabe*: Only two dishes were staged, the 1st prize going to Mr. W. ALLAN, Gunton Park Gardens.—*Thompson*: This Pear does not attract attention by its beauty, although it is of good eating quality. There were four dishes, Mr. DIGBY being placed 1st, Lord HILLINGDON following closely.—*Triomphe de France*: The soundest fruits were shown by Lord HILLINGDON.—*Winter Noble*: This Pear was seen in six dishes, Mr. J. REYNOLDS having the best; 2nd, Mr. GARDENER, Ruxley Lodge. In the class for eight fruits of any other variety of early Pear only four dishes were staged, Mr. W. A. VOSS having the best in Doyenné Boussoch (see fig. 125). *Fondante de Cuerne* being 2nd. The class for any other variety of late Pear brought ten exhibits, Mr. DIGBY having the best in Easter Beurré; 2nd, Beurré Diel; 3rd, Beurré Rance.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

OCTOBER 11.—*Present*: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the Chair); Dr. A. B. Rendle, F.R.S.; Messrs. R. H. Curtis, J. Fraser, W. E. Ledger, A. Worsley, J. W. Odell, W. Hales, R. H. Pearson, G. Gordon, J. Douglas, W. C. Worsdell, W. Fawcett, and F. J. Chittenden (hon. sec.).

Buds on leaves.—Mr. W. C. WORSDELL showed leaves of *Verbascum nigrum* affected by some disease, now under investigation, which causes the production of numerous adventitious buds around the margins of the leaves. Masses of small buds are also produced around the base of the stem.

Lycoris aurea, &c.—Mr. A. WORSLEY showed a flowering spike of the Chinese *Lycoris aurea*, which he found succeeded and flowered well when planted out in a house. He also showed flowers of the South African Composite, *Cryptostemma calendulaceum*, which is very sensitive to frost, but which ripens seed early, and so succeeds in maintaining itself.

Modified flowers of Erica cinerea.—Mr. BOWLES showed, on behalf of Mr. L. R. Russell, of Richmond, a form of *Erica cinerea* in which the flowers were replaced by deep-red groups of closed, packed leaves arranged in fours, as in the flowers of normal plants, not in threes, as the foliage leaves are usually. The case was similar to that described and figured in the *Journal of Botany*, 1909, pp. 437-9, by Dr. Rendle, from wild plants collected near Axminster, except that in that instance ordinary flowers were also produced. Although no stamens were produced, carpels and apparently good ovules were borne in the centre of the groups of leaves.

Fasciation in Pyrethrum aliginosum.—Dr. D. H. SCOTT sent specimens of this plant with fasciated stems, in some cases separating before producing flower heads, and in others remaining fasciated until the flowering stage was reached, so that the head appeared as though two or three were joined.

Double-flowered Tropaeolums.—Mr. J. L. ARKWRIGHT, of Lyonshall, Herefordshire, sent flowers of some double *Tropaeolums* which he had raised. One or two of the plants were climbers, and there were among the plants more than a dozen distinct variations in colours. The flowers were regular and had no stamens or carpels.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

OCTOBER 6.—*Committee present*: Messrs. E. Ashworth, Arthur, Ashton, Chapman, Cowan, Crombleholme, Cypher, Holmes, Holden, Keeling, Parker, Shill, Thorp, Ward and P. Weathers.

There was a fairly good display of plants at this meeting.

Messrs. CYPHER & SONS, Cheltenham, were awarded a silver medal for an attractive display of well-grown plants, which included bright *Cattleya* and *Laelio Cattleya* hybrids, some well-grown examples of *Dendrobium*, *Phalenopsis v. Schröderiana* and several good *Cypripediums*.

Mr. J. ROBSON, Altrincham, exhibited a small collection of *Cypripediums*.

THE LIVERPOOL ORCHID AND NURSERY CO., Gateacre, were awarded a silver medal for a group consisting of *Odontoglossums*, *Cattleyas*, &c.

CLIVE COOKSON, Esq., Wylam-on-Tyne (gr. Mr. Chapman), staged an interesting group, which included a few new plants, *Cypripedium Sibyl*, a hybrid between *C. Fairieanum* × *C. Franciscæ* was shown in four distinct and named varieties, one of which *C. Sibyl* var. *punctatissimum* was voted a First-class Certificate, *C. Sibyl* var. *purpureum* received an Award of Merit. This latter distinction was also conferred on *Cattleya* × *Angela* (*C. intermedia* var. *nivalis* × *C. Schröderæ* (alba), a pretty and distinct albino; *Cattleya* × *Hardyano-Warneri*, the parents of which are indicated by the name. (Silver Medal.)

J. J. HOLDEN, Esq., Southport (gr. Mr. Johnson), exhibited a small group of good things, including *Cypripedium* × *Bleriot*, *C. Dora Crawshaw*, *Cattleya* × *Hera* var. *superba*, and *Cattleya* × *Iris* var. *illuminesa*, each of the plants named receiving an Award of Merit.

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), usually displays at these meetings a contribution of choice plants. On this occasion he received First-class Certificates for *Odontoglossum crispum* var. "La Dame Charmante," a beautifully-formed flower of the white type, the lip being richly marked with deep red, and *Cattleya* × "Colleen Bawn," closely resembling the white forms of *C. Hardyana* var. *alba*. Awards of Merit were voted to *Odontoglossum crispum xanthos* var. *Snow Queen*, *Cattleya aurea* var. *Mercia*, and *Cypripedium* × *Antonius Lees* var.

Col. J. RUTHERFORD, Blackburn (gr. Mr. Loft-house), was awarded points in the "R. Ashworth" competition for a nicely-arranged group of *Odontoglossums*, *Cattleyas*, and other popular Orchids.

F. A. HINDLEY, Esq., Great Horton, Bradford, was awarded a Bronze Medal for a small display, consisting mainly of *Cypripediums*.

S. GRATRIN, Esq., Whalley Range, Manchester (gr. Mr. Shill), staged a group of choice *Cypripediums*, all notable for their fine forms. *C. Ellis Markendale* is new, and was voted a First-class Certificate. *Brasso-Cattleya* × *Leemannæ* in the same group also received a First-class Certificate.

Mr. H. ARTHUR, Blackburn, received an Award of Merit for *Oncidium* × *Larkinium*, a natural hybrid.

Messrs. STUART, LOW & CO., Bush Hill Park, Mr. W. SHACKLETON, Gt. Horton, Bradford, Mr.

FIG. 128.—A TURF CUTTING MACHINE.

J. BIRCHENALL, Alderley Edge, Mr. E. V. Low, Hayward's Heath, J. H. CRAVEN, Esq., Keighley, were exhibitors of small groups. P. W.

HORTICULTURAL CLUB.

IMPRESSIONS OF CARNAC (BRITANNY) AND ITS MENHIRS, &c.

OCTOBER 11.—On this date, at the Hotel Windsor, the Horticultural Club commenced its winter series of monthly dinners. The chair was occupied by Mr. Peter Veitch, of Exeter. In accordance with the long-established custom of the club, the dinner was followed by the reading of a paper for discussion, and on this occasion Mr. Geo. Bunyard, V.M.H., gave an account of his visit to Carnac, in Brittany, under the title of "Impressions of Carnac (Brittany) and its Menhirs, Dolmens and Alignments," illustrated by numerous lantern slides showing the remarkable number and arrangement of the large granite monoliths, for which Carnac is famous. In opening the subject, Mr. Bunyard, referring to the evolutionary side of human handiwork in the way of tools and architecture, of both of which Carnac has supplied much material for study, he referred to the investigations of his near neighbour in Kent, Mr. Benjamin Harrison, of Igham, who was the pioneer in establishing the existence of far more primitive and more ancient tools than the so-called Paleoliths which had been previously assumed to be the oldest of all. Of these older and ruder implements Mr. Bunyard exhibited several specimens, a careful examination of which showed indubitably that they had been artificially clipped into certain forms.

An interesting discussion followed the lecture, and a hearty vote of thanks was given in conclusion to Mr. Bunyard for his interesting address.

UNION OF HORTICULTURAL MUTUAL IMPROVEMENT SOCIETIES.

OCTOBER 14.—The annual conference of Affiliated Societies and Societies in Union with the Royal Horticultural Society, took place on this date, the second day of the fruit show, in the R.H.S. Hall, Westminster. Sir Albert Rolitt occupied the chair.

In opening the conference, the Chairman conveyed the assurances of the Council of the great interest it takes in the work of the debating societies and its readiness to do whatever lies in its power to promote the interests of all such societies. The Council has recently framed a certificate of "Recognition of Diligent Interests in Plants," to be awarded to children by Affiliated Societies in their juvenile show competitions. Sir Albert Rolitt said the advantages offered by the R.H.S. to the mutual societies are very great. The exhibitions, gardens, trials, experiments and publications of the parent society are of the utmost value in promoting the advance of horticulture, but in the localisation of effort the mutuals are of the greater value. The official list of lecturers compiled by the R.H.S. is specially drawn up for the use of the gardening societies, and prepared lectures, illustrated by lantern slides, may also be obtained.

The Journals of the R.H.S. are issued to the libraries of the mutuals for the benefit of the members, and medals and cards of commendation are also obtainable from headquarters.

The Chairman then spoke on the first subject on the agenda, viz., the international horticultural exhibition to be held in the grounds of Chelsea Hospital in 1912. It had been hoped that the exhibition secretary, Mr. Edward White, would be present to speak on this subject, but illness prevented his attendance.

It was proposed by Mr. Boshier, of Croydon, seconded by Mr. Basket, of Egham, and carried with enthusiasm by the meeting, that "this meeting heartily endorses the proposal to hold an international exhibition in 1912, and will do its utmost to give it publicity and support."

It was desired that the exhibition secretary should furnish the secretaries of the affiliated societies with a programme and full particulars of the exhibition as soon as possible.

A resolution was carried that "the meeting recommended to the Council of the Society the consideration of the following subject, introduced by the Croydon and District Horticultural Society:—

"Would the Council of the R.H.S. admit the sons of members of affiliated societies to vacancies occurring at Wisley for periods of two years at a premium less than that paid by ordinary students? Appointments to be according to merit shown by an entrance examination. A nominal wage to be given, and also a certificate of efficiency on the termination of service if the latter has been satisfactory. Three years apprenticeship in an approved garden to have been spent prior to admission."

The definition of an amateur gardener came under reconsideration. The R.H.S. rule was read, and the Rev. W. Wilks said this indicated the broad principle of differentiation between the amateur and professional gardener, but it is open to each society to further amplify the definitions in such a way as would satisfactorily meet any local difficulty or condition.

NEW INVENTION.

A TURF CUTTING PLOUGH

Messrs. Boulton & Paul, Ltd., Norwich, have recently placed on the market a new machine (see fig. 128) for stripping the turves off grass land or lawns. The great advantage claimed by the makers for their machine over the old system of turf cutting is that a perfectly uniform thickness of the sod is assured, with the result that a considerable saving of labour is effected in relaying the turves. It is stated that with the aid of this plough an acre of turf may be stripped in the short space of two hours. Where turf laying forms an important item, this little implement, which is the invention of Mr. H. I. Muntz, of Hungerford, should prove of great service.

Obituary.

MR. P. HILL NORMAND.—We regret to record the death of Mr. Patrick Hill Normand, of Whitehall, Aberdour, Fifeshire, which took place at his residence on October 15. Mr. Normand was a keen lover of hardy herbaceous and Alpine flowers, and his garden at Whitehall contained an exceptional collection of choice plants. Several novelties were distributed from his gardens for the first time in Great Britain, including the two double-flowered Helianthemums, Jubilee and Old Gold, which sported from the crimson variety, Mrs. Earle. The deceased gentleman had not been in good health for some time past. The funeral took place at Dysart Cemetery on the 13th inst.

ENQUIRIES AND REPLIES.

TO DESTROY ANTS.—In answer to H. S. (see p. 271), I have found paraffin very suitable for destroying Ants. The petroleum should be poured into their holes or haunts, from which they will very soon disappear, as those that are not killed by contact with the liquid will find their usual haunts untenable. I have entirely cleared my glasshouses of these pests by this method, after everything else had failed. W. C. C. Babington.

—One of your correspondents is asking for a cure for ants. I have tried several things, but the best is "Apterte," especially where it is possible to get at the ants. During the warmer weather, where I could find their runs (from one house to another) I gave them a good dusting with Apterte, and most of them were killed in a few minutes. Fred. Treseder.

••• The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

CHRYSANTHEMUM RUST: *Beard.* To preserve the plants from attacks of this fungus, they should be sprayed at intervals, during the time they are making their growth, with a solution of potassium sulphide (liver of sulphur), 1 ounce in a quart of hot water, afterwards making this up, by adding clear water, to 2½ gallons. Pick off all leaves showing rust, and burn them. Good results may also be obtained from applications of water containing a little paraffin.

CUTTINGS OF ICELAND POPPY: *Cornflower.* Although a perennial, it is not usual to propagate this plant from cuttings. Save the seeds from the special plant you wish to grow, and endeavour to fix the variety by selection.

ELM ROOTS: *J. P.* After you have made the trench and destroyed the roots therein, make a thin wall of concrete, otherwise the roots will grow into the border again.

EMPLOYMENT AT KEW: *G. W. B.* If you write to the Director of the Royal Botanic Gardens, he will send you a memorandum of conditions of employment as gardener, together with a form of application. This must be returned to the Director, accompanied by a letter in the applicant's own handwriting, with testimonials in English from employers or head gardeners. Applicants must be unmarried, between 19 and 24 years of age, and must have been employed not less than four years in good gardens or nurseries. They must be healthy, free from physical defect, and not below average height. Gardeners whilst at Kew receive an allowance of 21s. per week to meet the cost of subsistence. Those who are selected to serve as sub foreman receive 27s. per week. Extra allowances are granted for Sunday duty, a certain amount of which is compulsory.

HOME READING: *F. B., Surrey.* The book you refer to is entitled *The Faculty of Reading*, by George Redford, M.A. (Cambridge: University Press), price 1s.

LICENCE FOR GARDEN EMPLOYEES: *H. L.* If the person is employed as a garden labourer, no licence will be necessary. The courts have recently decided that, in the case of persons employed as professional gardeners, a licence is necessary.

MIGNONETTE DISEASED: *R. G. P.* The injury is caused by *Cercospora roseae*, a fungus very prone to attack Mignonette. Spray the plants thoroughly, at intervals of four days, with a solution of liver of sulphur, one ounce to three gallons of water. Bordeaux mixture will also answer, but should be used at half the ordinary strength.

NAMES OF FRUITS: *C. W. T.* Mère de Moinage, —*E. Sanders.* 1, Ribston Pippin; 2, Lane's Prince Albert; 3, Welford Park Nonesuch; 4, not recognised.—*M. Sahl.* 1, The Queen; 2, Alfriston; 3, King of the Pippins; 4 and 5, Cox's Orange Pippin. E.* 1, *Corydalis lutea*; 2, *Tropeolum canariensis*. Some mistake was evidently made in the naming of the plant before.—*J. W.* The specimen was too small for identification.

NERINE FOTHERGILLII: *Bulb.* The flowers are those of *Nerine Fothergillii*. With regard to the cultural requirements of the plants, the following particulars are given by Mr. Banks in the issue for November 17, 1906, p. 356. "Unlike a good many bulbous plants, they make their growth during the dark days of winter, and should therefore be afforded all the light possible at that time. After the flowering period, which is during September and October, the plants should be grown on shelves near the glass, in a cool, well-ventilated house, facing due south, having an atmospheric temperature at night of 45° to 50°. Watering should be judiciously done during the last two months of the year, one or two applications each week being quite sufficient for their requirements; but with the turn of the year and brighter days, they require looking over every other day. When they commence to show

signs of decay, water should be gradually withheld. While at rest, the plants should be cleared of all dead foliage, and placed in frames in the full sun, baking them all through the summer months, keeping them entirely without water until the flower scapes appear, which will be at about the middle of August. Any potting that is necessary should now be taken in hand, shaking the roots free from all the old soil and replacing it with good fibrous loam and sand. Use comparatively small pots, a pot-bound condition being favourable for the production of flowers. This operation provides an excellent opportunity to clear the bulbs of any pests that may infest them, mealy bug being the most troublesome. Stand the plants, whether repotted or not, in pans containing water, allowing them to become thoroughly soaked, afterwards placing them in the glass-house to flower."

PELARGONIUMS UNHEALTHY: *E. W. D.* No disease due to fungi is present, nor is the trouble caused by insects. The plants have received some wrong cultural treatment.

PLANTING A VINERY: *W. H. M.* Varieties of vines most suitable for your purpose are Black Hambro and Black Alicante. The former is a most reliable cropper, the bunches being very early in ripening. Black Alicante ripens much later, and the bunches will keep sound for several months when well finished. You need not plant any other sorts unless you need a white variety, in which case Foster's Seedling would succeed well with those mentioned; it ripens a week or so later than Black Hambro. Good planting canes would cost from 5s. to 7s. 6d. each. Fruiting canes from 10s. 6d. upwards. We do not advise the planting of Peach trees on the back wall of a vinery. The better plan is to purchase a few trees in pots. The prices of Peach trees in pots range from 5s. upwards, according to the size of the specimens. Hale's Early and Bellegarde are two suitable varieties for the purpose. Cardinal and Pine Apple Nectarines are excellent sorts of this fruit for pot culture.

PROPAGATING THE CHRYSANTHEMUM FROM STEM CUTTINGS: *F. D.* You would not be likely to be very successful in propagating Chrysanthemums from the hard stems. In the case of plants, after the flowers are cut, side shoots may develop from the stems, and these, taken off close to the main stem, will root under the ordinary treatment afforded to cuttings. In the case of some varieties, the stem cuttings do not prove satisfactory, and plants so raised are liable to vary in the colour of their flowers. If stems only are procurable, they may be cut into short lengths and a cut made below each joint. If these cut stems are covered partly with a sandy compost, they will start to grow from each node, and shoots thus formed may be taken off and treated as cuttings.

PUBLIC PARKS AND OPEN SPACES: *G. H. O.* The following works may be suitable for your purpose: *The Municipal Parks and Gardens of London*, by Lieut.-Col. J. J. Sexby, V.D. (London: Elliot Stock, Paternoster Row, E.C.); *The Royal Parks and Gardens of London*, by Nathan Cole (London: *Journal of Horticulture*, Fleet Street), price 2s. 6d.; *The Parks and Gardens of Paris*, by W. Robinson, F.L.S. (London: Macmillan & Co.)

SEEDLING VIOLA: *H. B.* The flower is of good form and fair substance, but, in our opinion, the colour being run in the centre spoils it. Had the centre been pure white, it would have been a most effective variety.

VACUUMING: *P. L.* Directions for employing this preparation for destroying ground insects are given by the makers with each package. Wireworm may be caught by placing traps of some vegetable, such as Potato or Turnip, on the borders.

EFFECTS OF POLLINATION ON ORCHID FLOWERS.

ALL who are interested in Orchids, either from a botanical or cultural point of view, are aware that the deposition of the pollen masses (pollinia) on the stigmatic surface of a tropical Orchid is often the signal for a striking sequence of events. The order of these events is as follows:—First the flower fades, though if the flower had not been pollinated it would have remained fresh for a considerable time, in some cases for days, in others for weeks, and in others again, such as *Phalenopsis violacea*, *P. amabilis* and *Rhynchostylis retusa* Bl., for a month or more. This premature withering, which resembles the natural withering, is ushered in by a closing movement of the perianth. Next, the gynostemium or column swells and the edges of the stigma may curve inward so as to enclose the surface of the column are yet other changes. The ovary increases in size, its ovules, which curiously enough are not formed so long as the flower remains unpollinated, begin to develop and the perianth may become green and persist in this condition till the seeds are ripe. Needless to say, the full sequence of events is not exhibited by all tropical Orchids; nevertheless, it is fairly general. The occurrence of this remarkable series of post-floration changes, called forth by the deposition of the pollen-masses on the stigma of an Orchid flower, suggests a number of problems, the solution of which would prove certainly of great scientific interest and perhaps of some practical value. Chief among these problems is that which asks by what agency or agencies the pollinia produces their effects?

It might be supposed that the premature withering of the flower and the swelling of

the column are due to disturbances set up in the tissues of the column by the pollen tubes of the germinating pollen grains. The observations and experiments which have been made recently by Hans Fitting (*Zeitsch. F. Bot.* II, 1909) not only demonstrate that this is not the correct explanation, but throw an entirely new light on the origin of post-floration changes in Orchids.

Fitting's investigations, which were conducted in the laboratory and garden at Buitenzorg (Java) were made on many species of Orchids belonging to widely separated genera, and show that the changes which we have enumerated are not all due to the same cause. The rapidity of the premature withering of the flower induced by pollination would seem to preclude the explanation that it is an effect of the growth of the pollen tubes through the column. Moreover, this explanation is put out of court completely by the fact that grains of sand deposited on the stigma of *Rhynchostylis retusa* induce the same premature withering as that brought about by the pollen masses. This observation led Fitting to suspect that the withering is a consequence of mechanical injury of the stigmatic surface, a suspicion the truth of which he was able to verify by proving that scratching or scraping the stigmatic surface also produces the premature withering. To give rise to the result the damage need be but slight and must be local. Cutting through the column itself may be without effect, whereas a single scratch on the stigmatic surface of *Phalenopsis amabilis* suffices to induce withering of the flower in the course of a day or two, and this in the case of a flower which, if left intact, remains fresh for upwards of a month.

Further, it is only when certain parts of the stigma are touched and damaged slightly that the withering of the flower takes place, the susceptible parts being those neighbouring on the rostellum.

We are, therefore, driven to the conclusion that the withering of the flower is not brought about by a grave damage to essential parts, but by a slight and local irritation. That it is in no way connected with the germination of the pollen is proved by the fact that dead pollinia cause premature withering almost as readily as living pollen masses. In the course of his experiments, Fitting observed that, whereas "sanding" the stigma induces withering and that only, dead pollinia deposited on the stigma bring about not only this effect, but also the second of the series of post-floration changes enumerated above, namely, the enclosing of the stigmatic surface by its edges and the swelling of the column.

Further experiments indicate that the active agent which brings about this swelling is of a chemical nature and is located not in the pollen grains, but on their surfaces or between them. For example, when the slime was removed from the stigma of *Phalenopsis amabilis* and pollinia placed on it, though the pollen grains did not germinate and became only slightly swollen, nevertheless they caused the column to swell. Acting on the assumption that the active agent in causing the swelling of the column is located on the pollen grains, Fitting tried the experiment of dipping the pollinia in hot water and examining the influence of the extract. When imbibed in a little cotton wool and placed on the stigma, the hot-water extract was found to induce the

swelling of the column. So also when the pollinia were soaked in cold water and the extract applied to the stigma, the swelling of the column was brought about. The conclusion, therefore, is that, whereas premature withering is due to the effects of slightly wounding certain areas of the stigma, swelling of the column is independently produced by a different agent, namely, by a chemical substance, soluble in water, which occurs on the pollen grains.

Both effects may be produced either by "own" pollen or by that of other species of Orchids, and, indeed, by the pollen of plants belonging to other natural orders, *Hibiscus*, for example.

Unlike the preceding post-floration changes, the swelling of the ovary only takes place—as far as is known at present—when the pollen tubes reach the ovary.

It seems fairly clear that the series of changes have all a more or less definite utility to the plant. The closing and withering of the flower render it secure from further visits of pollinating or marauding insects; the swelling of the column and incurving of the edges of the stigma protect the latter and provide, it may be, a supply of water for the germinating pollen grains; the swelling of the ovary is obviously related to the need for accommodating the growing ovules; and the greening of the perianth is probably an indication that food material, available for the seeds, is in course of preparation in that structure.

What is admirable is to see the detailed devices whereby these useful changes are brought about in ordered sequence.

The Orchid raiser who has followed the above account with attention will not have failed to take the hint that crosses which fail may in some cases be due not to sterility, but to a withering of the flower before the pollen tubes have grown down the column into the ovary. He may, therefore, be inclined to try the effect of soaking the pollinia in water for an hour or two before applying them to the stigma. By this procedure he will remove the chemical agent which contributes to the post-floration changes of the flower. Keeping the road to the ovary open for a longer time may make the difference between success and failure of cross-fertilization. The experiment is worth trying, though no good result can be guaranteed.

NOTES FROM A "FRENCH" GARDEN.

THE pricking out of all the Lettuces is now completed; those first planted are already growing freely and will require moderate ventilation.

It is customary to look over the Lettuces and replace those that have failed 8 or 10 days after the transplanting. The dry weather experienced early this month has been responsible for many losses amongst the plants, especially where care has not been taken to make the soil firm at the roots.

Slugs attack Cos Lettuces more than any other kind, and the grower must be careful to replace at the earliest opportunity any that have been destroyed. It is, however, remarkable that, for some reason or other, the Lettuce "Passion" is largely immune from the attacks of this pest. Slugs also cause very little damage among the "Little Black Gott" Lettuce when the plants are well established.

Should mildew make an appearance in some of the cloches careful ventilation must be given, as this will prevent, to a certain extent, the spreading of the fungus.

The ground intended for the second planting of the Cos Lettuces must be prepared at the earliest opportunity, and it is advisable to put under shelter a certain amount of sifted, decayed manure necessary for this planting, as the weather may turn wet and prevent this being done later.

The bell glasses used for this purpose will be at liberty in good time this year, as, owing to

spring, in case the weather would not permit of an early planting in their final quarters. Cauliflowers sown early in October will not be pricked out for another three or four weeks, as it is preferable to plant only strong seedlings at this time of the year.

When ever possible, the ground occupied by the Onions pricked out early in October, and by Winter Spinach, must be stirred and kept

beds in the open; (2) as soil for planting the Melons in their final quarters; (3) to put in the frames intended for cold work in the spring.

The grower having decided where the various crops will be set next spring, carries this decayed manure where it will be wanted, as he has now time available for this work. *P. Aquatics.*

FLORISTS' FLOWERS.

SWEET PEAS IN TUBS.

SWEET PEAS cultivated in tubs are very useful for some gardens. If large clumps are wanted, the best receptacles are obtained from old paraffin barrels, cut in halves. These can be painted any colour required, and, with the iron bands painted black, are no disfigurement in the garden; but even if the tubs are considered unsightly this can easily be remedied by growing a few trailing plants and letting them hang over the sides. Four or five large holes should be drilled in the bottom for drainage; over these put a good layer of broken pots, and a layer of broken turf and rotted manure, and fill the tub to within a few inches of the top with a good compost of loam, rotted manure, and a small quantity of bonemeal. The compost should be made thoroughly firm as the filling proceeds, as nothing is more detrimental to the plants than loose soil with occasional hollows. If small clumps are preferred, lard buckets can be used instead of paraffin barrels. Two plants may be put in a lard bucket and five in a paraffin barrel. Some varieties are better adapted for tub-culture than others. The 12 I would recommend for a town garden are as follows:—Moneymaker (white, partially waved), Clara Butt (cream), Countess of Northbrook (pale pink), Dusky Monarch (maroon), Mrs. Unwin (scarlet), A. N. Dickson (violet and purple), Paradise Ivory, Masterpiece (lavender), Dazzler (flame-coloured), Countess Spencer (pink), Elsie Herbert (white, with Pico-tee edge), and John Ingman (rose and carmine).

The chief point to ensure success in tub-culture is strict attention to watering, for as the tubs get full of roots the plants absorb a great deal of moisture. An occasional application of weak manure-water will greatly benefit them during the period of growth. If this is not available, a little Clay's fertiliser, sprinkled on the top of the soil and watered in, will be beneficial. Sweet Peas growing in tubs can be used for covering trellis-work or fences round the garden, or even the yard, provided the plants are exposed to the sunshine. They can also be used for training on pillars of a verandah. Seed-pods should never be allowed to form, or the plants will quickly stop blooming, and all their energies go to the ripening of the seed. By keeping the blooms constantly cut and applying a stimulant now and again it is possible to have bloom from early in June until late in October, and the plants will be capable of growing to a height of 8 feet or even 10 feet. If they should get too tall, cut them back to a lateral growth, and they will grow again and flower profusely. *George Herbert.*

CLEMATIS NUTANS.

THE photograph from which the illustration in fig. 129 was prepared was taken at the latter end of September in Aldenham House Gardens, Elstree. It shows a portion of a plant of the new Clematis nutans introduced from China by Wilson, and it well illustrates the free-flowering habit of this plant. The specimen is growing on a shed, which position it has only occupied since the spring of the present year, thus proving it to be a plant of extremely rapid growth. The pendant clusters of creamy-white flowers are produced from the axils of the leaves of the current season's growth. The blooms have a delicious scent, and for autumn flowering the species will be found extremely useful. *E. Beckett, Aldenham House Gardens, Elstree.*

FIG. 129.—CLEMATIS NUTANS, A NEW CHINESE SPECIES: FLOWERS CREAMY-WHITE.

the favourable weather recently the Lettuces "Little Gott" now under the cloches are forming nice heads.

The Cauliflowers sown in September are well established in their winter quarters, and, when ever possible, ample ventilation must be given the plants. During frosty nights, the shelter afforded by the closed lights will be sufficient, at least until Christmas.

This crop must be grown very hardy to avoid the need of a second transplanting and to prevent the plants from being too strong in the

thoroughly clean. The cultivator reaps the benefit of these hoeings by obtaining earlier and better crops.

All the old manure beds have now been well broken up. This decayed manure, which will form the soil for the frames next spring, will be put in ridges 3 feet wide, 3 feet high and 15 feet apart (from centre to centre) any time during November.

About two-thirds of this decayed manure has been utilised for these ridges. The remainder will be employed: (1) for the top dressing of the

THE ALPINE GARDEN.

SAXIFRAGA LINGULATA AND SAXIFRAGA LANTOSCANA.

It is curious that such confusion should still exist in gardens over the great Saxifrages of the Maritime Alps. Even the *Kew Hand List* gives *S. florulenta* as a variety of *S. lingulata*. (It only remains now to make *S. longifolia* a variety of *S. Bursieriana*.) In cultivation, there are innumerable plants and forms called *S. lingulata*, *lingulata lantoscana*, *lingulata Alberti*, *lingulata albida*, and so forth. Not one of these plants has anything to do with *S. lingulata*; every one of them is a form of *S. lantoscana*, which, so far from being a variety of *lingulata*, is a priceless and definite species, from which the true *lingulata* stands entirely distinct. Under many names, the polymorphic *S. lantoscana* is the glory of our rock-gardens; but *S. lingulata* (though I found it "unbekannt" in a Midland garden once) has not been recognised in cultivation till this year, and yet, so magnificent is *S. lingulata*, that it makes me wonder if our allegiance may not have to be transferred from *S. lantoscana*.

It is, indeed, under the name of "*lingulata*" that I myself, too blindly confident in gardeners, have long been celebrating *S. lantoscana*; it is fitting now that I should make the due amends to *S. lingulata*. *S. lantoscana* (following the curious local tendencies of the special species belonging to the Maritime Alps) is really restricted to the distinct round St. Martin Lantosque (which has now, by some bureaucratic caprice, been turned into St. Martin Vésubie), where it occurs abundantly, if sporadically, on rocks and shelves of white limestone, always in unsummed northerly or westerly exposures. It is especially notable in the great deep gorge of the Vésubie, making cushions and masses along all the ledges. It varies in size and quality of flower; but Burnat distinguishes as a separate plant (*S. Bellardii*) the Saxifrage which occurs in the eastern valleys towards the Col de Tenda, with *lingulata* and *cochlearis*; and thus restricts the range of true *lantoscana* to its name-district. In cultivation, *S. lantoscana* is honourably distinguished, not only by its startling beauties, but by its willingness to thrive, increase, and multiply. On my westerly-facing cliff it seeded freely in its first year, and now, in its third, is well on the way to reproducing the picture it presents in the gorge of the Vésubie.

S. lingulata has its focus in the upper valley of the Roja, far to the east of St. Martin, round the Col de Tenda. Here, with apparent indifference to aspect, it grows with equal luxuriance in sun or shade, forming wide, plummy masses, and seeding as freely as *S. lantoscana*. (Young plants are, to me, quite indistinguishable from *S. lantoscana*.) It shares its home with the lantoscausch *S. Bellardii* (with which, however, there is no confusion possible), with *Aizoon*, *cæsia*, *diapensioides*, and *cochlearis*. M. Correvon demes any intermediate forms, but Burnat quotes localities for them, and no one who has ranged the Alps of Tenda and seen these species at home can retain much doubt that there are connecting links between at least *lingulata* and *lantoscana*. I, myself, collected one singularly ugly form, whose shape and colour strongly suggested to me that *Aizoon* had spoiled *lingulata*, though the general mass of *Aizoons* are, as a rule, only just opening when *lingulata* is passing over.

S. lingulata is about twice the size of *lantoscana*. The leaves which, in *lantoscana*, tend to recurve and splay out, stand in *lingulata* much more erect, producing a wild and towzled effect. In *lantoscana* they broaden very markedly and abruptly towards the tip, are of no great length, and, in colouring, are of a characteristic light grey-green, edged with a line of silver. In *lingulata* they are very long and narrow, stiff and wiry, with only the smallest and most gradual expansion at their ends; their ground colour is much greener, with a harsh and very vivid dentation of silver jags at their edge.

Imagine *S. Aizoon paradoxa* multiplied by three and electrified till its leaves all stand on end, and you have a faint picture of *S. lingulata*. The resemblance, indeed, made me fear—for the flower was over—lest *lingulata* might have the stodgy greenish-yellow tone of blossom of *paradoxa* rather than the clean and snowy splendours of *lantoscana*. However, I succeeded in discovering belated spikes, and found to my joy that *lingulata* has flowers as large and round and white as anyone could desire. The spikes are much more freely produced in nature than those of *cochlearis* or *lantoscana*. They are very graceful and plummy in outline, much longer, better proportioned, and more feathery than those of *lantoscana*, arching up and out in a wide sweep, and, so far as I could judge, forming the most beautiful spike in the whole range of the great Silver Saxifrages. The flowers, as I saw them, are big, solid, and snow-white, though there are probably as many variations in *lingulata* as in *cochlearis* and *lantoscana*; or nearly as many, perhaps, for in foliage, at least, *lingulata* is less variable than *lantoscana*, and infinitely less so than the multiform *cochlearis*. I, myself, was only able to note one outstanding variation, which merely took the satisfactory form of unusual size and floriferousness. As to its cultivation, *S. lingulata* is, of course, not yet tested, but I see, from watching the plant at home, no shadow of a reason to doubt that it is fully as amenable and prolific as *S. lantoscana*, with the added advantage of having no objection to hot and sun-baked aspects; though I fancy that it attains its happiest development in cooler clifts. I hardly need suppose that it is faithful, like so many of its kin, to the mountain limestone. In the Maritime Alps, so far as I have seen, *S. pedemontana* and *S. florulenta* are the only species that are as rigidly granitic in their tastes as all the others are calcareous. The ubiquitous *Aizoon*, however, has no rigid habit, and occurs on limestone quite happily, though its marked preference is for primary *Dumetous*. *Rogunda Ferrer*.

ORCHID NOTES AND GLEANINGS.

LELIO-CATTLEYA GARNET

(L. C. LA FRANCE × C. BOWRINGIANA).

This new hybrid was raised in the gardens of W. H. St. Quinton, Esq., Scampston Hall, Rillington, Yorks., and a flower of it has been sent for description by the gardener, Mr. F. C. Puddle. The flower adheres closely to *C. Bowringiana* in colour; it is slightly larger, and, strangely enough, the narrow, elongated labellum of *L. C. La France* (*C. bicolor* × *L. tenebrosa*) is not shown in the least degree. The flower is 3 inches across, and has bright mauve-purple sepals and petals. The lip, which is rather more open than in *C. Bowringiana*, has a whitish tube, slightly streaked with purple, and a rose-purple front with a light yellow disc. The petals and sepals have small white bases, and the whole flower is so attractive as to make it a welcome addition to the late-flowering *C. Bowringiana* hybrids.

LELIO-CATTLEYA YVONNE

(L. C. BADEN POWELL × C. FORBESII).

This is an interesting hybrid, though not showy, with rather narrow, cream-white sepals and petals, both slightly tinged with green, the latter having a trace of pink on the veining. The narrow lip has an elongated whitish tube, the front being only slightly expanded. The disc, which shows the influence of the coloured lines seen in *C. Forbesii*, is yellow; the rather flat front lobe and the margins of the side lobes are lilac, prettily veined with rose-purple. *Lelio-Cattleya Baden Powell* is derived from *Cattleya Lawrenceana* × *Laelia tenebrosa*, and both these species may be traced in the hybrid.

The plant flowered in the gardens at Scampston Hall.

NOTICES OF BOOKS.

THE RAINFALL.

SINCE the appearance of the volume of *British Rainfall* for 1908, the British Rainfall organisation has been for the first time placed on something like a permanent footing, the nucleus of an endowment fund having been raised and placed under the charge of trustees, with Dr. R. H. Mill as director. The history of the British Rainfall organization, which is given in the present volume, is most interesting, being a record of one of the finest examples of voluntary work ever undertaken in this country. Mr. G. J. Symons, F.R.S., the founder, carried on the investigation of the rainfall of the British Isles from 1860 until his untimely death in 1900, the results being published by him annually. Since 1900, save for a short interregnum, Dr. R. H. Mill has continued the same work, and on virtually the same lines. Some idea of the extent of this investigation may be gathered from the fact that nearly 5,000 records, mostly of daily rainfall, have to be examined. They are discussed as exhaustively as the income of the organization will allow, this work occupying Dr. Mill and his staff of five assistants from the beginning of each year until nearly the end of August, when the results obtained make their appearance in an annual volume of over 300 pages, entitled *British Rainfall*.

The work of the organization is supported almost entirely by contributions received from the observers, but the contributions are, at the present time, insufficient to defray the expenses which have to be incurred by the director, owing to the rapidly-increasing number of rainfall stations in this country and to other causes. The director himself receives no remuneration whatever. If even one-half instead of only about one-third of the observers were subscribers to the general fund, the British Rainfall organisation would be entirely self-supporting.

The present issue is typical of the whole series, with various additions and improvements, which have been inserted from year to year in order to make the examination of the numerous records more complete and of greater value.

The following particulars may serve to illustrate the comprehensive and thorough manner in which the question of rainfall is treated in these annual volumes. For instance, suppose we require to know the wettest and driest localities in 1909, we have only to turn to the chapter on "Extremes of Rainfall" in order to learn that the heaviest rain in the British Isles was 176 inches at the Styx (C) in Cumberland, whereas only 19½ inches of rain fell at Fortrose, Hollyside, East Ross. The rainfall maps for the different months in the year are very helpful, as they show at a glance where the fall of rain was unusually heavy and where it was below the average. For instance, in the maps for February, which proved the driest month in the British Isles in the year under review, there is only one small area where the rainfall in any way exceeded the average. Whereas in the next month, March, the wettest of the year, the only parts of the country with less than an average fall were situated in the West of Scotland, the West of Ireland, and in the English Lake District, which are usually among the wettest districts in these islands. Then as regards percolation, at the experimental station at Rothamsted, Herts., which is under the direction of Mr. A. D. Hall, F.R.S., the total rainfall of the year was 28½ inches, of which amount only about 16 inches came through the soil in the percolation gauges, which are respectively 20, 40 and 60 inches deep. In the winter half of the year, nearly the whole of the rainfall passed through these gauges, whereas in the summer half, when the total fall of rain was, as it happened, practically the same as in the winter half, only about 4 of the 14 inches of rainfall came through either of those gauges. Taking the country as a whole the dry

periods were fewer and less protracted than usual. In fact, the number of absolute droughts are stated to have been 7 below, and the partial droughts 15 below the average. Sufficient has, however, we think, been said as to the valuable and interesting character of the information provided in this, the latest, volume of *British Rainfall* to make readers wish for a closer acquaintance with its contents, for we all know how greatly our gardens are affected at any time by either the excess or lack of rain, and more particularly during the growing period of the year. *Edwd. Mawley.*

FRUIT BOTTLING.*

THIS little book seems to be exactly what is wanted in the home. It describes a method of bottling fruit which is practicable in a home of limited means, where, during a glut of fruit, much is often wasted, owing to an erroneous belief that an expensive apparatus is required to preserve it. By Mr. Stoney's method it may be done in any cottage at small cost and with very little trouble. The recipes of home-made jams, wines and pickles, written by Mrs. Stoney, should contribute to the success of this useful little book. *A. A. P.*

NURSERY NOTES.

TULLY NURSERY, Co. KILDARE.

(See figs. 131 and 132, also Supplementary Illustration.)

TULLY is only an hour's journey by train from Dublin, but is situated in open country, with a delightful atmosphere and ideal climatic conditions and soil for gardening. With such conditions, it is not surprising to find in the Tully Nurseries, belonging to Col. Hall Walker, M.P., luxuriant vegetation, but before describing in detail the more interesting of the plants met with, it may be well to give an account of the garden and the ideal which it represents. The true Japanese garden has a story to relate, a plot to unfold, and, as a painting reveals the ideals of the artist, so also should the mind of the garden artist be revealed to those who walk therein. The prevailing theme in such gardens is the one selected in the Tully garden, viz., the walk or journey of life.

Emerging, as it were, from the dark unknown, the garden is entered by a plain, simple gate, and the first scene is the brightness and freshness of "birth," portrayed by the brightest of coloured foliage in profusion. Then is seen the playground of "infancy," where there are plenty of placed stones, "fimicky" gardening, and a lantern. Certainly there are no difficult problems here to solve. Following on, "school life" is represented by a cave and the old Japanese idea of one teacher, one child. This cave is beautifully overhung and surrounded by *Cotoneaster horizontalis*.

"Youth" and its uncertainty is depicted by another cave, with more than one exit, the right path therefrom ascending by rockwork steps, through pretty scenery, provided by Saxifrages and other plants, to a spot which commands a bright prospect.

Proceeding, a "danger spot" is found, for a "pitfall" has to be avoided, and a valley, that of "Doubt," is entered. The serious aspect of life appears, the hard, monotonous plodding has to be encountered, with a swamp to negotiate, in which, however, there are safe stepping-stones. A choice has to be made between a sharp deviation to a rugged height with a blank end, a second path and an easy one which ends in a morass, and a third which leads by a gradually-inclined path into a pleasant high ground, with luxuriant vegetation such as Bamboos, giving the ideas of comfort and reality. Beyond is seen a tempting prospect: golden *Ligustrum* with relief of *Berberis vulgaris purpurea*, a fairly even

path, winding amidst rocks, and, on one side, overhanging a ravine depicting the business life leading to the bright goal.

The pleasures, by the way, may be said to be represented by such beautiful subjects as Saxifraga "Guildford Beauty"—a mass about 7 feet through—and other lovely gems of the Alpine flora. The culmination point is the mound or "Hill of Ambition," to the summit of which only one of the numerous paths lead. Having gained this, a retrospective view of the journey is obtained, the various deliverances and escapes surveyed, the pleasant episodes recalled, with the pleasing reflection that comes from having trodden the path of honourable dealing. By the pathway of "Integrity," this scene is left behind, the wayfarer now leaves "activity," and enters by running waters into the repose of the

[Photograph by G. W. Leak.]

FIG. 130.—GLADIOLUS "SAFRANO": COLOUR YELLOW, SHADED WITH BUFF.

"House of Comfort," whence he surveys in the distance the calm and restful "Garden of Peace," leading to which there are almost invisible stepping-stones in the even sward.

Such then is the legend very inadequately described, which is carefully and faithfully treated, in its many details in this really artistic garden. Lanterns in stones, cascades and bridges have their places, and a huge landscape is reproduced in miniature. Many large Scotch Firs have been imported into the garden from a considerable distance, some of the trees weighing as much as 8 tons; all, with one exception, are thriving, the one exception being very fittingly in the "Garden of Peace" or cemetery. The more gnarled these trees, the better for their purpose, and I noticed that the manager, Mr. Paine, has

so far caught the Japanese "dwarfing fever," that he is successfully operating upon many of the trees. At the entrance to the garden there is a recently-planted Scotch Fir, 25 feet high, of a dwarfed and grotesque form, sheltering one of the orthodox stone lanterns. The characteristic dotting of plants in the grass entails much extra labour in mowing and clipping the sward, and, to our Western ideas, is very fussy. The Japanese gardener is, however, dealing with a dainty picture, every detail of which demands constant supervision. Near the garden tea-house is a model garden, a perfect piece of work, showing the usual mounds, water, bridge, paths, and forest. If my memory serves me aright, this was made by Col. Hall Walker himself. On either side of a cascade stand two grotesque figures, water guardians, and leading from the waterfall is a Heather walk which is very interesting, as is also a Water Lily pond. *Acena Buchananii* forms a very appropriate ground or setting to one of the lanterns. The native Saxifrage, *S. hibernica alba*, is very effective, and a form of *S. Camposii* named The Pearl, raised by Mr. Paine, is also good, among a host of other fine varieties. The Wistaria roof-garden is an indispensable feature in a Japanese garden, and one to be copied in other styles with advantage, especially in the south and west of England. I am tempted to mention other of the good plants I observed in this interesting section, but will only name *Lithospermum Gastonii*, the specimen being 4½ feet across. Before leaving this garden, I must refer to an Elm tree, formerly growing upright, but now undermined on one side so that it leans half over a water-way; the tree seems perfectly reconciled to its new conditions. *Dicksonia antarctica* survives the winters safely, whilst a fine batch of *Lilium giganteum* greeted my exit through a long pergola leading from the Japanese garden. Masses of *Gunnera* flourish near a pond which is being surrounded by garden effects.

So far, my note has mentioned nothing to indicate a nursery. But Col. Walker is so convinced of the possibilities of the soil and climate for plant-growing, that, in addition to the ornamental and pleasure gardens, about 50 acres have been devoted to raising stocks of choice, rare, and new plants. Already, I was informed, there are a million seedlings handled, or about to be, including thousands of *Morisia hypogea*, for instance, *Aquilegia alpina* (true), double-flowered *Celandine*, *Pyrola rotundifolia*, from seed collected in Ireland; Saxifrages in great numbers and varieties, *Agrostemma The Pearl*, *Androsace primuloides*, *Shortia uniflora*, seedling *Gerberas* and seedling forms of *Campanula barbata*. Some wonderfully fine hybrids of *Gladioli* arrested my attention, and St. Bridgid's *Anemones* were observed in all stages and in all colours. Several plants not in commerce were noticed, of which more will be heard in due course. A new *Astilbe* seen in flower is a cross between *A. Davidiana* and *A. (Spiraea) Queen Alexandra*, carrying a bold spike with flowers intermediate in colour between the parents.

Convenient structures, in the way of green-houses, frames, offices, commodious bothies, sheds, &c., speak of design, method, and enthusiasm. Under the intelligent management of Mr. W. H. Paine, this hobby of Col. Hall Walker cannot fail to be a successful one. *Visitor.*

GLADIOLUS "SAFRANO."

THIS variety of *Gladiolus* (see fig. 130) was exhibited at a meeting of the Royal Horticultural Society on August 30 last by MM. Vilmorin et fils, Paris. It will be seen that the flower-spike is unusually regular, being closely set with fine, yellow blossoms shaded with buff, and stained with crimson near the base. Moreover, the petals are pleasingly frilled, making the variety one of great beauty. The variety received an Award of Merit from the Floral Committee.

* A Simple Method of Bottling Fruit at Home, by Mr. J. Stoney, Inspector of Horticulture to the Staffordshire County Council. Price 6d.

Garvichrou.

FIG. 131.—VILWS IN THE JAPANESE GARDENS AT THE TULLY NURSERIES.

ELECTRICITY IN HORTICULTURE.

During the past summer a small installation belonging to Miss E. C. Dudgeon has yielded interesting results. The apparatus consists of a $\frac{1}{4}$ h.p. gas engine, a 60 volt dynamo, a suitable transformer, and five of Sir Oliver Lodge's patent valves. The current leaves the engine-house at a potential of some 80,000 volts, and is taken along a wire fixed round specially-made insulators, supported by ordinary telegraph poles, about 15 feet above the ground. Generally speaking, the discharging apparatus was at work whenever the weather was suitable. On very bright days it was only turned on for about two hours at sunset; on fine but dull days, the discharge was kept on for four or five hours, and in showery weather as often as the wires were sufficiently dry. It was used regularly after May 30, except for two weeks, the last weeks in June, and from July 7 to 14, when repairs had to be made.

The experimental plot is on ground belonging to Miss Young, Lincluden House, near Dumfries, and amounts to about $\frac{1}{4}$ acre. It had been previously used for Potatoes and other root crops for four successive years, and had, during that time, received very little manure. Unfortunately, no ground was available for satisfactory control experiments, but an attempt has been made to compare the results with other crops grown without electricity in the neighbourhood.

Oats.—Variety, Potato. A plot, 60 feet by 20 feet, received electrical discharge for 177 hours during the summer. The soil in this place is shallow, and the only manure employed was a light dressing of kainit. The seed was sown on March 28, and the leaves were visible above ground on April 18; the crop was fully ripe and harvested on August 11. It was an unusually luxuriant one; some of the plants had tillered abundantly, 27 shoots being counted to a single seed. The length of straw varied from 5 feet 10 inches to 6 feet 5 inches. No conclusions could be drawn as to the yield of grain. The attacks of sparrows and the necessity of moving the sheaves to get them dried made it impossible to weigh the seeds in a satisfactory manner. The quality of the grain was excellent.

A field about 150 yards away, and 25 feet higher, had been sown with the same variety on the same day. It was considered that the soil was richer in manure in this field than in the electrified plot, and also that there was less shelter from trees. The Oats in this field did not ripen until about eight to ten days after those under the discharge. The length of straw varied from 4 feet 6 inches to 4 feet 10 inches, and was obviously very much smaller in amount. The quality of the grain was not so good.

Potatoes.—A small quantity of Early Midlothian was grown under electricity, and yielded a good crop of quite satisfactory tubers. No difference was, however, perceptible in quality between these electrified Potatoes and others grown without electricity. Two rows, amounting to 120 feet in all, of the variety Factor were grown in the plot, and received electric discharge for altogether 224 hours. Former crops of Potatoes had been badly diseased; the place is almost surrounded by trees, and appears to be very favourable to the development of blight. The foliage of the plants was, however, remarkably luxuriant, and, up to August 24, there was no sign of disease. Although injured, the crop was an excellent one. Miss Dudgeon found that those plants which were directly under the discharge wires were very slightly affected. The tubers were firm to the touch, and were excellent when cooked.

As Mr. Matthew Wallace had some of the same variety at Terreglestown, about $\frac{1}{2}$ miles distant, a comparison was made between a measured length in his field and the electrified plot. His field had been manured abundantly, and the plants grown under more favourable conditions. The results were as follow:—

Potatoes "Factor,"	Landruden Electrified.	Terreglestown Non-electrified.
Length of row	120 feet	128 feet
Ware over 12 inch	137 lbs.	184 lbs.
.. .. 14 to 12 inch	126 lbs.	17 lbs.
.. average 1 lb. each	10 lbs.	-
.. small	40 lbs.	-
.. diseased	59 lbs.	54 lbs.
Tuber Total weight,	370 lbs.	255 lbs.

So that, excluding all under $1\frac{1}{4}$ inches and diseased tubers, a shorter length of row yielded 265 lbs. under the electric discharge, as compared with 201 lbs. without electricity. The yield of the plot under electricity works out at about 23 tons per acre.

Beetroot.—A row 60 feet yielded: Electrified, 93 lbs.; non-electrified, 84 lbs.

Peas.—A row 60 feet in length, sown with the variety "Quite Content," yielded a splendid crop. The stems were 7 feet high, most of the pods had nine Peas, and the flavour was excellent. Those grown in the adjoining garden, from the same seed, were in every way inferior. The roots of the electrified plants were specially well developed, and had a much larger number of tubercles.

Strawberries.—Those grown under the electric discharge were of a better quality, and lasted three weeks longer than those grown in the garden. The foliage was also more luxuriant. Certain plants which had produced fruit under glass in April gave a second crop in the electrified plot.

Onions.—This crop was badly attacked by insects, but, on the whole, those plants grown under the discharge were much better, both in bulb and foliage, than those grown outside.

Next year it is intended to extend the experiment over 6 acres, and to include a satisfactory control plot. The results certainly warrant further experiment. *G. F. Scott Elliot*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Kirt- rd, Surrey.

Vanda.—The end of October or the beginning of November is the best time of the year to thoroughly overhaul all plants of the section embraced by *V. tricolor* and *V. suavis*, especially if any disturbance at the roots is necessary, as there will be far less loss of foliage than when the operation is performed at any other season. These plants do not appreciate sunlight at any time, and now that the sun is daily decreasing in strength, and the external air is cool and moist, a suitable atmosphere can easily be maintained for them at the coolest end of the Cattleya or intermediate house. A cool, shaded position is of the greatest assistance towards the re-establishment of the plants without loss of foliage, whereas, when the operation is performed in the spring or early summer, the increasing strength of the sun is unfavourable to them in every particular. Repotting at this season is also favourable to the production of fresh roots, and the retention of the lower leaves. It is principally "leggy" specimens that will need repotting, and in the case of such plants, it will be necessary to remove the old potting material and drainage. If the base of the stem can be cut off, so as to bring the lowermost leaves down to almost the rim of the pot, without disturbing the old roots that are clinging to the sides of the receptacle, so much the better. When it becomes necessary to take a plant out of its pot, these old roots should be detached with the least possible injury. In repotting, keep the stem of each plant in the centre of the pot, and carefully work the lowermost roots around the bottom, intermixing with them clean crocks to about half the depth of the pot. Over these place a layer of Sphagnum-moss, spread the other roots over the surface and work among them and the remaining roots some clean, picked Sphagnum-moss and small broken crocks. Press the materials down moderately firmly and fill the pots to the rims, surfacing the whole with fresh, healthy Sphagnum-moss placed in a conical manner. The taller plants should be secured to a strong stick to hold them firmly, and to keep them in an upright position. It is very important to fix them firmly, as the least swaying will cause the lower leaves to turn yellow and fall off. In tying the plants, use broad, flat pieces of bast or matting, so as to prevent any injury to the base of the leaves. Plants that are furnished with leaves to the rims of the pots, should not be disturbed, but if the rooting materials have become spongy or decomposed, they should be removed carefully down to the drainings and fresh moss substituted. Any of the large, fleshy roots that are pliable may be pegged to the surface of the moss into which they will enter. The more

roots that can be induced to grow thus, the better it will be for the welfare of the plant. Throughout the year it is good practice to tie in the aerial roots gradually, and to guide as many as possible down to the compost. The repotted plants must be shaded from sunshine, and their immediate surroundings should be kept thoroughly moist at all times. For several days, or perhaps a week after potting, afford them no water at the roots, as the moisture from the moss will be sufficient for them, but after that time a thorough watering will be necessary. The moss on the surface will soon become fairly dry again, and it should be sprayed as often as is necessary to keep it in a healthy-growing condition. Vandas of this section should be placed on a cool, moist stage; open woodwork stages should be covered with thin slates, over which is placed a layer, about 4 inches in depth, of finely-broken coal, which always looks clean, and retains just sufficient moisture. There are several distinct varieties of *V. tricolor*, all of which are well worthy of cultivation, viz., *V. t. planilabris*, *V. t. Pattersonii*, *V. t. Dalkeith* variety, *V. t. Veitchii* variety, *V. t. suavis*, *V. t. tenebrosa*, and *V. t. pallida*. These Vandas, when well grown, form very handsome plants, with their symmetrically-arranged leaves, and when several are in bloom, the perfume from the deliciously-scented flowers pervades the whole house. A group of Vandas furnished with leaves as low as the rim of the pot, whether in or out of bloom, is an imposing feature in the Orchid house, and for this reason alone the plants are deserving of more general cultivation.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Beet.—The latest batch of this vegetable should be dug up without delay and stored. Take care that the plants are not rubbed or scratched, as this may cause bleeding, the roots thereby losing some of their quality. Do not cut off the leaves, but remove them with a twist. Beetroots should be stored in a frost-proof shed or cellar, as they soon deteriorate through frost.

Turnips.—Roots which are large enough for pulling should be removed from the ground, as they would be of little value as a vegetable when hard through being old. Place them in pits in the open, covering them with straw or Fern in sufficient quantity to keep them dry. The plants of the latest sowings may be allowed to remain in the ground until very cold weather sets in, when all the roots that are of sufficient size should be pulled and stored in some frost-proof place. Those that remain may be allowed to grow until the spring, when they will be found useful, either for their roots or their tops, which will furnish Turnip-greens.

Celery.—The final earthing-up of this crop should be done immediately. Let the soil be broken as finely as possible, placing it carefully around each plant with the hand, at the same time taking care to keep the centre of the plants free from soil and open to the air. It is a mistake to place the soil too high about Celery at any time.

Green vegetables.—Decaying foliage should be removed from Brussels Sprouts and other green vegetables, and the ground raked and generally made tidy before the season is far advanced. A free circulation of air is necessary about the stems and lower parts of the plants to harden them before the winter sets in, therefore the removal of dead leaves and weeds is necessary. Spinach, in particular, should be examined for the purpose of removing all spotted and overgrown leaves. In this case also hoe the ground between the rows frequently, and, if slugs are troublesome, apply a dressing of soot.

Tomatos.—Plants raised from seeds sown in the latter part of September are ready for potting into small 60's pots. A suitable soil consists of loam and leaf-mould in equal quantities. After the plants are potted, stand them near to the glass in a pit, keeping the ventilators closed for a few days until root-action has commenced, when plenty of fresh air may be admitted to induce a sturdy growth. This is probably the most important batch of Tomatos grown throughout the whole year, as the plants will furnish a supply of ripe fruits before Easter, provided they are grown in a house with a southern aspect.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Strawberry beds.—The plants should be looked over once more, and any runners found upon them should be cut off. Let the surface soil between the plants be lightly hoed, and all weeds and rubbish removed, then apply a good mulch of decayed manure. It is essential that this work be done early, in order that the autumn rains may wash the manurial properties from the mulch down to the roots, and so assist the plants to complete the maturing of their crowns before cold weather sets in.

Morello Cherries.—The trees may now be pruned at the first opportunity, and an effort should be made to get this work well in hand before there are hard frosts. Cut out all shoots which have borne fruits this season, and cut back to two or three eyes the new growths not required to be trained in. When the pruning is completed the trees should be detached from the walls, and all shoots and branches thoroughly washed with some approved insecticide. The main branches may then be temporarily secured to a few stout stakes to hold them away from the wall whilst the latter is thoroughly cleansed. Soluble paraffin is useful for this purpose with a little flowers of sulphur well mixed in with the solution; it should be applied with force by means of a garden engine to make sure of it reaching every crevice. When the cleansing is completed, the branches may be again placed in position. Tie or nail in the main branches first, placing them evenly, so that the trees present a well-balanced appearance when the training is finished. After the main branches are secured, the young growths should be laid in at distances of not less than 4 inches apart; always use clean shreds and nails, and should any of the old nails be used again, steep them for a few minutes in boiling water in order to destroy red spider or any other insect pests that may be upon them. When the training is finished, gather up the prunings and place them on the rubbish heap to be burnt. Should any of the trees show signs of weakness, they may be improved by removing the surface soil down to the roots, and replacing it with a loamy compost containing mortar rubble and wood ashes, with a sprinkling of bonemeal. This compost should be made quite firm about the roots.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

The herbaceous border.—The work of replanting hardy herbaceous borders may now be proceeded with. Planting at this season has many advantages, for, whether new borders are to be formed, or the plants in those already existing merely divided and rearranged, it is best done when the weather is open and the nature of the various subjects may be still identified. Where it is intended to renovate entirely borders already existing, or to plant fresh ones, the ground should be thoroughly well trenched and enriched. In many instances existing borders might be considerably improved if the plants were lifted and the ground treated in this manner. Herbaceous plants are often allowed to remain undisturbed for a number of years, and yet other parts of the garden are cultivated annually. But, before trenching is attempted, care must be taken to dig up and lay by in a convenient place near at hand the whole of the plants, taking every precaution to preserve the labels of the various kinds. The plants should be laid in the soil temporarily, or well covered with mats or some other material that will protect the roots. If possible, trenching should always be done in preference to ordinary digging, and the ground treated liberally with manure, moving the soil to a depth of at least 2 feet 6 inches. The nature of the soil should govern, to a great extent, the material used for incorporating with it; much may be done to improve a heavy or a light soil by the addition of suitable materials. When the ground has sufficiently settled again, planting may be commenced. This should be done when the weather is open, and not when the ground is wet. Knock the ground down well with the fork to ensure a suitable surface for planting. Before commencing this, the border should be marked out, and the positions for the larger and more important subjects indicated, for, unless

this is done, much confusion will arise. The heights of the various plants, their habit of growth, colour of the flowers, and the season of blooming are important points to remember when establishing a mixed border. Avoid planting large portions of any particular subject—a common mistake. I prefer placing three small clumps in a triangular manner, if a mass is required. It is surprising how quickly the various subjects grow when planted properly, and division of the clumps increases the vigour of the plants in a marked degree. The best method of dividing the crowns is by placing two forks back to back and levering them apart. This is much to be preferred to chopping them apart with a spade. Plant firmly, and mark with a stick the positions of those plants that are entirely covered with soil. Proper labelling is an important part of the work, and, when neatly and legibly carried out, is not only necessary and educative, but adds a pleasing finish to the work. When completed, the ground should be levelled in the neatest manner possible, and the whole surface top-dressed with spent manure from a Mushroom bed, or other material of a suitable nature. Surplus plants of a robust character may be planted in spare places, and will prove useful for furnishing a supply of cut blooms. Where ample ground is available, these surplus plants may be placed in rows.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSELL, G.C.B., Moulton Paddocks, Newmarket.

Pineapples.—Where manure has to be relied upon for supplying the necessary bottom heat, it will be advisable to renew parts of the hot-bed to keep up the required temperatures, which should not be lower than 75° to 80°. The best plan is to remove the plants, throw out the old material on to the path, and then mix the new dung with it in the proportion that is considered suitable. A few fresh leaves added at the same time will have the effect of preventing a too rapid fermentation, thus causing the bed to be longer of service. When forming the bed, arrange it so that the plants may be set close up to the glass without allowing the leaves to actually touch it. As frost may appear at any moment, it will be advisable to prepare a quantity of long litter, stored near at hand, so that it may be thrown over the roof when severe cold is imminent. By doing this, a proper temperature can be maintained without employing excessive fire heat, as this has many disadvantages; amongst others, it encourages the increase of insect pests. Those plants that are fruiting should be treated as advised in a previous Calendar. Manure water must be given them regularly until the fruits show signs of ripening, when stimulants must be withheld, and the amount of water given to the roots gradually reduced. A dry, buoyant atmosphere is needful to produce the best flavour in the fruits, therefore it will be necessary to circulate a little heat in the hot-water pipes, so that the ventilators may be opened a little to keep the air moving.

Successional Pines.—The night temperature should be reduced to 65° or 60°, as high temperatures would have the effect of causing too rapid a growth. Besides, a slight rest now will be of great assistance to the plants, its effect being seen later in the season.

Fig trees in pots.—The plants will continue to supply a few fruits for some time yet, provided they are managed carefully, although the flavour of the Figs will be poor compared to those that ripened during the summer. Syringe well the bare spaces between the pots on fine bright days, but not overhead. Pay careful attention to the watering of the plants, and continue to apply liquid manure at intervals. Maintain a night temperature of 65°, allowing a rise of about 10° during the day.

Perpetual-fruited Strawberries.—Plants which are carrying ripe fruits must be kept on the dry side, affording water just sufficient to prevent the foliage from flagging. The best place for the plants is a shelf near to the glass, in a cool, airy house. In such a position they will enjoy a free current of air on all sides, and be safe from the attacks of vermin. Runners of perpetual-fruited varieties that were placed in thumb pots some time since may now be stood in their winter quarters. If they are plunged in ashes in a cold frame they will be secure against

frost. The lights may be removed entirely during mild weather, and at all times, except during very severe weather, the frame should be freely ventilated.

Alpine Strawberries.—Both the red and the white-fruited varieties have been providing a useful supply of berries for some time past, and will continue to do so for a few weeks longer. Strawberries require fine weather to produce their best flavour; during dull, damp days, they ripen very slowly. It is best to maintain a dry, warm atmosphere in the house, using fire-heat freely whenever it is damp and cold. Watering should be done in the early part of the day, so that most of the moisture is dissipated before night arrives. The plants are very susceptible to attack of red spider, but as they will be of no further use when the fruits are gathered, it is not necessary to employ insecticides, as this might affect the flavour of the berries.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Roses in pots.—It is a suitable time to make a selection of new Roses for pot culture, and it will be advisable to give the order to the nurseryman early, as the best plants are usually sent out first. The stock of Roses in pots that have been standing out-of-doors all the summer should now be made ready for placing in the houses. Prune the shoots well back to sound, ripened wood, overhaul the drainage material, give the pots a thorough cleansing, and then syringe the plants with a specific for mildew. Forcing should commence steadily; the atmospheric temperature of the house must not be allowed to exceed 45° at night time for a start, with a few degrees increase during the day time. As the plants make their growth higher temperatures may be afforded. The Rambler Roses are almost indispensable for pot culture, and, for general purposes nothing is better than either Dorothy Perkins or Lady Gay. But these Roses can only be brought into bloom early when they are thoroughly established in pots, for although specimens that are lifted carefully and potted may be brought into bloom several weeks earlier than the outdoor plants, the best success is obtained with those that have been established in pots for at least one season. The dwarf sorts of Polyantha Roses such as Baby Dorothy and Mrs. W. Cutbush are very serviceable as pot plants. The latter variety is almost a perpetual bloomer, provided it is kept steadily growing and supplied with liquid manure occasionally.

Morantia.—These ornamental leaved plants should not be encouraged to grow throughout the winter months, as they need a season of rest. They should, therefore, receive a reduced amount of moisture, and be staged in the intermediate plant stove.

Enphorbia (Poinsettia) pulcherrima.—Batches of this useful winter-flowering plant should be placed in a structure having an intermediate stove temperature. The roots may be fed with clear soot water and liquid manure given alternately with ordinary waterings; an occasional sprinkling of some chemical fertiliser will also be of benefit. But it must be remembered that Poinsettias may be injured by over-feeding, as well as too much moisture applied to the roots. Give the plants plenty of space, so that they may retain their foliage, crowding often causing the bottom leaves to drop.

Caladium.—The corns may be stored when thoroughly ripened in a dry place and clear of dripping moisture, in a temperature of about 55°. It is best to allow the corns to remain undisturbed in their pots, but if this is inconvenient they may be placed on a layer of cocoanut fibre. When they are in the pots, they are not so liable to become shrivelled, and shrivelled corns do not start freely into growth.

Begonia Gloire de Soreaux.—The beautiful metallic-tinted foliage of this Begonia renders it a delightful subject for arranging in collections of other plants, whilst its rose-pink blossoms are an additional charm. The plant is a gross feeder, but as it is necessary to restrict the roots in small pots, in order to induce a free flowering, stimulants must be given occasionally, and great care afforded in watering. In a general respect the culture adopted for Begonia Gloire de Lorraine will suit the variety under notice.

EDITORIAL NOTICE

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matter which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR NOVEMBER.

TUESDAY, NOVEMBER 1—
Brighton Chrys. Sh. (2 days). Bournemouth Fl. Sh. (2 days). Scottish Hort. Assoc. meet.

WEDNESDAY, NOVEMBER 2—
Kent County Chrys. Exh. at Blackheath (2 days). National Chrys. Soc. Exh. (3 days).

THURSDAY, NOVEMBER 3—Torquay Autumn Fl. Sh.

FRIDAY, NOVEMBER 4—Derby Gard. Assoc. Chrys. Sh.

SATURDAY, NOVEMBER 5—
Soc. Franç. d'Hort. de Londres meet.

TUESDAY, NOVEMBER 8—
Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Cecil H. Hooper, on "Observations on the Blossoming of Hardy Fruits.") Birmingham & Midland Counties Chrys. Sh. at Bingley Hall (3 days). British Gard. Assoc. Ex. Council meet. Ulster Hort. Soc. Sh. at Belfast (2 days). Oxford Chrys. & Fruit Sh. Southampton Chrys. and Fruit Sh. (2 days). Worthing Chrys. Sh. (3 days). Finchley Chrys. Sh. (2 days).

WEDNESDAY, NOVEMBER 9—
Northampton Chrys. Sh. (2 days). Bath Gard. Soc. Chrys. Sh. at Assembly Rooms, Bath (2 days). Liverpool Hort. Assoc. Autumn Sh. (2 days). Highgate & Dist. Chrys. Sh. (2 days). Doncaster Chrys. Sh. (2 days).

THURSDAY, NOVEMBER 10—
Wandsworth & Dist. Chrys. Sh. (2 days). London Branch of B.G.A. meet. Weston-super-Mare Chrys. Sh.

FRIDAY, NOVEMBER 11—
Sheffield Chrys. Sh. (2 days). Altrincham Chrys. Sh. (2 days). Chrys. and Fruit Sh. at Corn Exchange, Mark Lane. Huddersfield Chrys. Sh. (2 days).

MONDAY, NOVEMBER 14—
United Hort. Ben. & Prov. Soc. Com. meet.

TUESDAY, NOVEMBER 15—York Chrys. Sh. (3 days).

WEDNESDAY, NOVEMBER 16—
Scottish Hort. Assoc. Chrys. Sh. (4 days).

THURSDAY, NOVEMBER 17—
Barnsley Chrys. Sh. (2 days).

FRIDAY, NOVEMBER 18—
Leeds Paxton Soc. Chrys. Ex. (2 days).

TUESDAY, NOVEMBER 22—
Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Jas. Hudson, on "Plants in Congenial Positions.")

FRIDAY, NOVEMBER 25—Aberdeen Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—46° 6'.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, October 26 (6 P.M.): Max. 58°; Min. 53°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, October 27, (10 A.M.): Bar. 30.0; Temp. 55°, 11 o'clock—Overcast.

PROVINCES.—Wednesday, October 26: Max 59° Ireland S.W.; Min. 49° Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris at 10.30.

MONDAY—
Roses, Special Sale at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.30.
Clearance Sale of Market Garden Crops, Glass, Piping, Implements, &c., at Crab Tree Farm, Fulham, by Protheroe & Morris, at 12.

MONDAY, TUESDAY, WEDNESDAY, AND THURSDAY—
Seventeenth Annual Sale of Nursery Stock at the Milford Nurseries, near Goldingham, by order of Messrs. M. Young & Son, by Protheroe and Morris, in conjunction with Messrs. Mellish, at 12.

TUESDAY—
Sale of Fruit Trees and other Stock, at the Nurseries, Farningdon, Berks, by order of Messrs. R. Tucker & Son, by Protheroe & Morris, at 12.0.

WEDNESDAY—
Twelfth Annual Sale of Nursery Stock, at Shortlands Nursery, Shortlands, Kent, by order of Mr. J. B. Bryant, by Protheroe & Morris, at 11.
Sale of Duplicate *Cypripediums* at The Coal Exchange, Manchester, by Protheroe & Morris, at 1.30.
Azaleas, Rhododendrons, Palms, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY—
Sale of Nursery Stock, at The Nurseries, Richmond Road, Twickenham, by order of Mr. H. E. Fordham, by Protheroe & Morris, at 1.30.

FRIDAY—
Choice Established Orchids, by order of Sir J. Colman, Bart., and others, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.15.

A recommendation has been made by the Fruit and Vegetable Committee to the Council of the Royal Horticultural Society that a trial of varieties of Sugar-beets should be conducted at Wisley next year. Without doubt, Beet culture for Sugar production is just now once more in the public mind, as indeed, having regard to the importance of Beet-sugar, it is right that it should be. Of ordinary garden Beets grown for domestic use or market sale, there seem to be myriads, all sweet, all giving colour and flavour, and in most cases of very handsome form; still, none of these give such a percentage of Sugar as would render their cultivation for Beet-sugar profitable. In that admirable book, *The Vegetable Garden*, there are descriptions of some 12 Sugar-beets. The majority of these are white, and all are long or tapering. Possibly, since the issue of that book, other varieties have been raised. In any case, seedsmen at home and abroad would readily help the Council to obtain stocks, and thus secure, so far as varieties are concerned, a trial of exceeding interest. But in an economic sense, any trial to show practical or commercial values must include average weight of root-crop per acre, and also percentage of sugar obtained from the roots of the diverse varieties. In order to secure satisfactory results, at least one rod of each variety should be sown, and the Sugar-content of the produce estimated by the polarimeter, according to the method in use in the Beet-sugar factories of the Continent. Certain varieties, such as the French white red top and the white green top are said to give some 20 tons per acre with about 12 per cent. Sugar. This, it may be assumed, represents a fair average during a favourable season. But with Beets, as with so many other plants, sunshine plays so important a part that, when there is an absence of that element, such as has marked the present and preceding summers, the weight of the crop and hence its total amount of Sugar may be materially reduced. It is stated by British agricultural authorities that to grow Sugar-beet successfully, that is, to obtain the maximum of Sugar, the soil should be rather poor than rich, but it has to be remembered that in Continental practice deep cultivation is found to be essential. Still farther it is asserted that Beet culture is profitable only where land is cheap and labour is very cheap, indeed, much cheaper than either in this country. These are factors which, in any commercial undertaking, have to be taken into serious account. To the ordinary farmer the production of a big crop of Mangolds of the globular form offers great attractions, because these produce at least twice the bulk of flesh yielded by the finest of Sugar-beets. Moreover, in lifting such a crop from the ground, the cost is trifling as compared with the lifting of one of long Sugar-beets. These latter have all to be lifted with forks or by special Beet-lifting machinery, and the labour necessitated is expensive, whilst the oval or globe Mangold can be pulled with comparative ease. That fact, again, is an important one in relation to Sugar-beet culture. It is hoped that, should the suggested Wisley trial take place, it will be as complete as possible.

As was pointed out by Mr. Hall, in the course of a discussion on the subject at the

recent meeting of the British Association, the chief ground for urging the general cultivation of the Sugar-beet in this country—assuming that its cultivation can be made a commercial success—is that thereby an additional crop is introduced to agriculture.

But it has to be remembered that unless high Sugar-yielding varieties are grown, that unless the machinery used in Continental cultivation is employed, and unless a similar system of close co-operation between farmers and Sugar factory are adopted, the cultivation of the Sugar-beet, as an agricultural crop, is foredoomed to failure.

To give some idea of the fine art to which Sugar-beet culture has been brought elsewhere, we may describe briefly the method adopted by the co-operating farmers in the north of France. The factory is placed in the region of production. The officials of the factory distribute pedigree seed the Sugar-producing capacity of which is known approximately. A definite system of cultivation is insisted upon. Whilst the crop is standing, officials of the factory sample the roots—bringing out pieces of a number of individual Beets. The samples are taken to the factory, where their Sugar-content is determined accurately by the polarimeter method, and the farmer is paid on the basis of weight of crop and Sugar percentage. Special machinery is employed for lifting the roots and for crushing them in the factory. Oxen are used for ploughing and drawing the Beet-lifting machinery, and women do the work of chopping away the tops of the roots. In short, Beet cultivation has in these regions been reduced to a fine agricultural-commercial art.

It may be mentioned that, according to the only accurate experiments which have been made, when sunlight has been below normal, though the roots give a smaller yield per acre, the percentage of sugar is the same as that yielded by roots raised from similar seed, but grown under more sunny conditions. More experiments on this head are wanted, and it is to be hoped that if trials are made at Wisley, meteorological records of sunshine and soil temperatures will accompany the trial.

LINNEAN SOCIETY.—The first general meeting of the society for the forthcoming session will be held here on Thursday, November 3, at 8 p.m., when the following papers will be read:—1. Mr. H. B. BIGELOW, M.Sc.—"Biscayan Plankton," part xiii. "The Siphonophora." 2. Prof. W. A. HERDMAN, F.R.S.—"Plankton Fishing in Hebridean Seas." Mr. J. C. F. FRYER will exhibit lantern slides illustrating coral reefs and the natural history of the Aldabra group of islands.

THE DEVELOPMENT GRANT AND HORTICULTURE.—The Board of Agriculture is taking active steps to secure a considerable annual allocation from the "Development Grant" for the purposes of agricultural research. It is believed that the sum which the Board would like to see devoted to this purpose is £50,000. If, as is bound to be the case, a substantial grant is forthcoming, it is to be hoped that the claims of horticulture will not be overlooked. It is probable that grants will be made only to those societies and institutions which submit definite proposals and make out a good case for assistance. Therefore it behoves all such bodies, if they have not yet formulated their proposals, to do so without delay.

THE LATE MR. JOHN KNIGHTON NOCK.—In his annual report (1909) on the Royal Botanic Gardens, Peradeniya, Ceylon, the acting director, Mr. R. H. Lock, pays a well-deserved tribute to the memory and services of Mr. JOHN KNIGHTON NOCK, Curator of the Hakgala Gardens, who died in November last at the early age of 29. "His loss, universally regretted in Ceylon, deprives the department of a most able and conscientious officer, and one whom it will be difficult to replace."

ary members one guinea, and for amateurs and professional gardeners 5s. A provisional committee was elected to make the requisite arrangements and draw up a scheme and rules.

CHRYSANTHEMUMS IN THE LONDON PARKS.—The annual displays of Chrysanthemums in Southwark Park are always good, but this year the flowers are finer than ever. Mr. F. WRIGHT, the superintendent, has adopted a different method of arranging the plants, by curving the central

parts of the glass room. The Japanese varieties standing on the floor form the bulk of the plants. There were observed Master James (a glowing chestnut, slightly shaded with rose and the reverse of the florets golden yellow), Amarantha (a large flower of rich amaranth colour, with broad, reflexing florets), Mrs. D. W. James (chestnut red), Vivian Morel, Merstham Gem, and Descartes, besides some of the better-known old favourite varieties.

WISLEY TRIALS.—The list of Trials to be held in the R.H.S. Wisley Gardens in 1911 should be amended as follows:—Peas—1 pint of each early in February, instead of "½ pint" of each early in February. W. WILKS, Secretary.

MR. R. F. FELTON.—Much sympathy will be felt for Mr. FELTON, the well-known florist of Hanover Square, in the loss he has sustained in the death of his wife from tuberculosis. Mrs. FELTON, who died at Bognor on the 20th inst., had suffered for a very long time. She had been taken to Bognor six weeks previously, in the hope that she might gather strength to enable her to withstand the winter.

EXHIBITION OF COLONIAL FRUIT AND VEGETABLES.—The Royal Horticultural Society is again holding a show of Colonial-grown fruit and vegetables, the dates being fixed for December 1, 2 and 3. The show will open at 12.30 on December 1, and at 10 a.m. on the two following days, closing each day at 6 p.m. Fellows of the Society will be admitted free on presenting their tickets. There are ten competitive classes, four being for preserved fruit and vegetables grown and preserved in the Colonies. In the largest class, for an exhibit of 50 boxes of Apples, the 1st prize is the Society's Gold Medal.

SENSATIONAL NEW SWEET PEA.—Under this title the *Weekly Florists' Review* (America) publishes an illustrated account of a new white variety of Sweet Pea raised by Mr. BLAND, secretary of the Horticultural Society at Vancouver. It has been named Jimmie Bland. Etta Dyke was the seed-parent, crossed with an unknown variety. According to our contemporary, the measurements of the flowers on an average spike are as follow:—The lower flower was 2½ inches across; second from the bottom, 2½ inches; second from the top, 2¼ inches. The petals were thick and heavy. The stem was 13 inches long to the base of the bottom flower and as big and rigid as an average Carnation stem. Single seeds were planted from pots on March 1. The plants in September were 10 feet high, 3 feet in diameter and vigorous almost past belief. As seeds are being sent for trial by the National Sweet Pea Society, there will be opportunity of testing the new variety in this country.

PUBLICATIONS RECEIVED.—*Present Day Gardening*: A series with coloured plates from photographs, edited by R. Hooper Pearson. Vol. III.: Root and Stem Vegetables, by Alexander Dean. Vol. IV.: Daffodils, by Rev. Joseph Jacob. (London and Edinburgh: Messrs T. C. and E. C. Jack.) Price 1s. 6d. each volume.—*Department of Agriculture and Technical Instruction for Ireland*. Agriculture Statistics, Ireland. General Abstracts, showing the Acreage under Crops, and the Numbers and Descriptions of Live Stock in each County and Province, 1909-10. (Dublin: Cahill & Co.) Price 1½d.—*Quarterly Journal of Forestry*. (October, 1910.) (London: Langhorne & Co., Ltd.) Price 2s.—*South Australia: Government Resident's Report on the Northern Territory, 1909.* (From the Agent-General.)—*United States Department of Agriculture. Bureau of Plant Industry*. Circular No. 70: Additional Notes on the Number and Distribution of Native Legumes in Nebraska and Kansas, by Joseph Allen Warren; Bulletin No. 185: Cold Resistance of Alfalfa and Some Factors Influencing It, by Charles J. Brand, and L. R. Waldron.

(See p. 312.)

HORTICULTURAL SOCIETY FOR YORKSHIRE.

—A well-attended meeting convened by the Lord Mayor of Leeds for the purpose of forming a horticultural society for Yorkshire was held on Wednesday, October 26. The Lord Mayor presided. The following resolutions were adopted:—(1) That a horticultural society, to be affiliated, if possible, with the Royal Horticultural Society, be formed with its headquarters in Leeds. (2) That the society be called the Yorkshire Horticultural Society. (3) That the minimum annual subscriptions be: for honor-

path, thus enabling bolder groups to be staged. The plants are rather closely packed, a matter not easy to avoid where thousands are displayed in a limited space. The park is within easy access of London Bridge. There is also a fine display of Chrysanthemums at Battersea Park. The plants are exhibited in a long, hip-roofed glass-house too narrow for the purpose, but apparently the only one available at this season. A serpentine walk winds between the groups on either hand, and single and semi-double-flowered varieties in contrasted tints cover the lower

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

MONTBRETIA ROSEA.—This plant is quite distinct both in habit of growth and in the colour of its flowers, which are of a soft shade of rose. I saw a fine patch of it in flower a short time ago at Underley Hall, Westmoreland, where it was growing in the beautiful flower garden which is situated on a steep bank, near the River Lune. Mr. Miller, the gardener, had placed it in an ideal position, where it could be seen from a path lower down the bank; being of a drooping habit, as compared with others of this family, it showed to much better effect than if it had been planted on a level piece of ground. I have always given this plant a little protection in winter here since 1895, when my specimens were killed, but that was a very severe winter, and I was told it survives at Underley without protection. Like other Montbretias, it requires transplanting every second or third year, or it becomes weak and refuses to flower. I have called it by the name generally used in catalogues, but in Nicholson's *Dictionary of Gardening* it is called *Tritonia rosea*. The so-called "wild garden" at Underley was very gay at the time of my visit, a large collection of the best herbaceous plants occupies a steep bank above the river, where each kind is placed in very large groups; these are intersected by winding paths, but nothing is "wild" now except the surrounding woodland; an abundant supply of rain contributes largely to the success of many of these plants, especially when it is accompanied by a mild temperature. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

ERIOGONUM RACEMOSUM.—In my note on this plant last week, by a slip of the pen I described the flowers as "rosy-pink." I ought to have written "rosy-white." *Herbert Maxwell.*

WHY NEED THERE BE EQUAL PRIZES?—The question is very properly asked by *An Outlooker* (p. 297), why need there be equal prizes? There can be no doubt whatever in the minds of practical men who grow and exhibit first-rate produce as to there always being a dividing line in point of merit in the various exhibits. Competent and painstaking judges can detect the differences if they only take the time and trouble to do so. That a difference in quality of only a half, or even a quarter, of a point may be noticeable in two exhibits is no reason why such exhibits should be placed "equal." Though in such circumstances, I have heard judges say in all sincerity and honesty of purpose "let us place them equal." In judging the numerous high-class exhibits staged at an exhibition such as the Shrewsbury show, the 50 or more experts engaged in awarding the prizes in the horticultural section of the show have to closely scrutinise the majority of the exhibits in pointing them, in order to determine the right and proper position of the individual exhibits; sometimes only half a point divides the 1st and 2nd prize exhibits in important collections. During the many years I have assisted in making the awards at the Shropshire Horticultural Society's Autumn Shows I have no recollection of "equal prizes" being awarded. *H. W. Ward.*

ASTER LUSTRE.—This semi-double-flowered variety of Michaelmas Daisy is a distinct gain to the autumn flower border. The colour of the florets is a deep rose, the flowers being produced in compact heads on stalks about 4 feet high. This variety is suitable for supplying cut blooms as the semi-double flowers last a long time fresh. Like many other fine new Asters, it was raised by Mr. Ed. Beckett, at Aldenham House Gardens. *M.*

TWO NEW PURE WHITE-FLOWERED DELPHINIUMS. In the issue of *Country Life* for October 1, on p. 475, is figured and described by its owner a most beautiful perennial Larkspur under the name of Lady Isabel, which originated some six years ago in the gardens at Ribstone Hall in Yorkshire. It came from seed saved from a blue-flowered variety named Captain Lambton, but its flowers are pure ivory-white, with a black centre. It must be a most strik-

ingly beautiful and uncommon variety, as nearly all perennial Larkspurs, save *D. nudicaule*, are blue of a darker or lighter shade. In the *Revue Horticole*, for October 16, on p. 465, is also described by M. G. T. Griguan another variety of Delphinium with pure white flowers named *D. Moerheimii*, now being sent out by its raiser, a Dutch nurseryman named Ruys, of Dedemsvaart, in Holland. This is a case of pure dimorphism of a most curious and unexpected nature. A strong seedling plant from blue-flowered parents sent up five flower stems, three of which produced pure white flowers, while those of the other two were pale blue, like the variety Persimmon, the plant was divided, and the blue-flowered portion given the name of *Capri*. *W. E. Gumbleton.*

IVY-LEAVED PELARGONIUMS AS STANDARDS. An easy way to obtain tall stems on which to graft heads of scented, Ivy-leaf or hybrid Pelargoniums, to make standards, is to sow next February in warmth seed of some good strong-growing zonal variety. Such a variety as Paul Crampel would do well. In that way it is possible to raise tall-stemmed seedlings from 3 feet to 4 feet high. When once the stems of these become firm, they may be grafted easily. Even without the assistance of warmth and with but crude conditions I succeeded in working Ivy-leaf varieties on to such stocks 30 years ago, and they soon formed large heads. It may be possible even now to get standards by May, 1912, as has been suggested. Many of the sweet-scented section, whilst pretty, do not give much colour. The new *Clorinda* is a good one, but Ivy-leaf varieties are better. A group of some 20 good standards of these rising out of a ground or carpet of the Snowdrift Zonal Pelargonium would have a striking effect and make a most attractive picture. *A. D.*

INTERNATIONAL EXHIBITION, 1912.—I hope that your proposal for a discussion on the subject alluded to in your leading article (see p. 300) may be carried out at the suggested congress of horticulture. In regard to Phylloxera, I may say that more than once I have found in Switzerland the stringent regulations in France and Germany a nuisance when I have wanted to send through those countries to England parcels of Alpine plants; for even if the roots come from situations 6,000 feet above the sea and miles from any vines one has to go through the formalities. When in a hurry to despatch a box of plants one sometimes has difficulty in finding the burgomaster to sign the form, and on one occasion I found him some distance from the village making hay. This may be a small matter, but the postal authorities in Switzerland refuse to send to England flowers with any roots or soil, e.g., a few *Gentians*, unless accompanied by the signed declaration. I refer to the ordinary tourists' boxes of flowers, which are now allowed to be sent, when small, by "sample post." I think such arbitrary regulations are a hindrance to botany as well as horticulture. *H. Stuart Thompson.*

LARGE APPLES.—With reference to the announcement on p. 301, respecting the "Apple which sold for 14 guineas," I may say that in these gardens this summer I gathered a fruit of Peasgood's Nonesuch which weighed 28 ounces; the dimensions were 16½ inches in circumference and 6 inches high. Unfortunately, there was a hole in this Apple, picked out by birds, about the size of a penny piece, the hole being approximately ¼ inch deep. Therefore, the original weight of the fruit would have been more than 28 ounces. *John H. Gooding, Terrisome Gardens, Flushing, near Falmouth.*

VARIATION OF POTATOS ON DIFFERENT SOILS.—I was interested in *A. D.*'s note on p. 286. A variety of Potato was given an Award of Merit by the R.H.S. this autumn, and I examined the tubers carefully before I knew the name it was sent under for trial. It was a great surprise to me when I saw the name. I thought the soil at Wisley must be different from any other. Here was a Potato altered in both type and colour from the original stock. It would be only fair to the raisers of new Potatos that they should be asked to send some of their original stock when their varieties are sent for trial by other persons. *A. I.*

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 25.—The meeting on Tuesday last provided a splendid and varied display of garden produce, adding one more to the long sequence of successful exhibitions, only broken by the miserable failure that attended the one held after the August Bank Holiday. A special competitive exhibition of vegetables added additional interest. In most cases, the vegetables were all that could be desired, representing the full-grown produce of a successful season.

Orchids were as attractive as ever, several fine groups being seen, as well as choice individual plants and novelties. The ORCHID COMMITTEE recommended two First-class Certificates and four Awards of Merit.

The displays before the FLORAL COMMITTEE were mainly groups of garden flowers, which have been especially favoured this year with a prolonged season. But the outstanding group in this section was a magnificent exhibit of choice stove and greenhouse plants staged by Messrs. JAS. VEITCH & SONS. The Society's Gold Medal was awarded for this group, and the medal card was specially marked by the Council as being, so far, the most worthy exhibit for receiving the Lawrence Memorial Medal, offered for the premier display at any of the Society's fortnightly exhibitions during the year. The table in the room where the Committee sat was crowded with new and choice plants presented for award, and no fewer than 12 were granted Awards of Merit, the majority being given to varieties of *Chrysanthemums*.

At the three o'clock meeting in the lecture-room, the Rev. Prof. George Henslow delivered an address on "Life—a Director of Forces in Development and Evolution."

Floral Committee.

Present: W. Marshall, Esq. (in the Chair); and Messrs. H. B. May, Chas. T. Druery, W. J. James, Chas. E. Pearson, Chas. E. Shea, Wm. Cuthbertson, H. J. Jones, Arthur Turner, Chas. Dixon, J. F. McLeod, G. Reuthe, T. W. Turner, Wm. Howe, C. Blick, J. Jennings, W. J. Bean, James Walker, E. H. Jenkins, W. P. Thomson, W. G. Baker, Herbert J. Cuthbush, Edward Mawley, W. B. Cranfield, C. R. Fielder, and R. Reginald Nevill.

The collection of choice stove and greenhouse plants referred to above, staged by Messrs. JAS. VEITCH & SONS, Chelsea, occupied the whole width of the hall, having a frontage of 72 feet, with a depth of 8 feet. Conspicuous in the exhibit were plants of *Nepenthes*, arranged on tall stands. These plants were in splendid condition, and included 20 grand specimens, representing 15 sorts. *N. ventricosa* was especially good, and the new *N. nobilis* was afforded a conspicuous position. The curious *N. ampullaria* develops a batch of pitchers at the base of a stem, almost in the soil. The group was brightened by large batches of showy Orchids such as *Oncidium varicosum*, *Odontoglossum crispum*, *O. grande*, *Cattleya labiata*, and *Cypripediums*. The back of the group was comprised of tall *Codieums*, *Dracenas*, *Alpinias*, *Dieffenbachias*, and *Aralias*, with tall *Coccos flexuosa* overhanging all. Then in the body of the exhibit were choice examples of *Heliconia illustris*, *Alocasia* in sorts, *Anthuriums*, *Marantas*, *Tillandsias*, and similar fine foliage plants with dwarf specimens along the front, all arranged in a setting of choice Ferns. The disposition of the plants was excellent, and the imposing display evoked much admiration. (Gold Medal.)

Messrs. VEITCH also filled the table usually allotted to them with *Chrysanthemums* in pots, and varieties of their winter-blooming *Begonias*, these being splendid. The variety *Mrs. Heal* is a fine shade of rose, the flowers being larger than *Elatior*, but it is difficult to choose which is the handsomer. The variety *Julius* has semi-double, salmon-pink blossoms. This exhibit received a Silver Flora Medal.

Messrs. H. B. MAY & SONS, Edmonton, showed varieties of large-flowered *Veronicas*, batches of *Begonias* of the *Gloire de Lorraine* type, and choice Ferns, including *Gold and Silver Gymnogrammas*, and a magnificent specimen of *Todea superba*, the most elegant of the filmy Ferns. (Silver Banksian Medal.)

Mr. FRANK LILLY, Guernsey, showed three dozen bunches of blooms of Nerines. The more notable varieties were Herm, Purple King, Pink Star, Garibaldi (derived from *N. coruscans* and possessing a charming bright colour), delicatissima, and Bowdenii. (Silver Banksian Medal.)

Mr. L. R. RUSSELL, Richmond Nursery, Richmond, Surrey, showed Veronicas in bloom, a few Clematis in bloom, *Viburnum Tinus argentea variegatus* (with distinct variegated foliage), *Eleagnus glabra*, *Pernettya mucronata* in variety loaded with their fruits, bush Ivies, *Aucuba japonica vera*, the minutely-leafed *Hedera Russelliana*, some capitally-grown *Anaechthochilus* in variety, *Gesnera Golden King* (a very striking plant, bearing large spikes of flowers and bronzy-velvety leaves). (Silver Banksian Medal.)

Lady TATE, Streatham Common (gr. Mr. Howe), showed Ferns of exotic species, occupying a considerable amount of floor space, exhibiting admirable cultivation. (Silver-gilt Flora Medal.)

Messrs. CRISP & SONS, West Bergholt, Colchester, showed a small group of cut Roses.

Mr. C. ENGELMANN, Saffron Walden, showed abundantly perpetual-flowering Carnations, as cut blooms, with, amongst others, Carola, May Day, Harlequin, Fiancee, Scarlet Glow, Regina, Mrs. Thomas Lawson, Victory, Pink Delight, besides a number of seedlings of promise, but which are unnamed at present. (Silver Banksian Medal.)

Messrs. STUART LOW & Co., Bush Hill Park, Enfield, had an exhibit of perpetual-flowering Carnations, consisting of the cream of the older varieties of this section, and some few of the newer ones. We may name T. M. Cook (of a red granite colour), Marchioness of Linlithgow, Beacon, Helen M. Gould, Bay State, Regal Mauve, Royal Purple, May Day, and Black Chief as desirable sorts.

Messrs. Low likewise exhibited a quantity of the pretty decorative *Asparagus myriocladus*, and some plants in good bloom of *Begonia Gloire de Lorraine*. (Bronze Flora Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, arranged a large bank of Chrysanthemums in one corner. In addition to single and border sorts, there were many large exhibition varieties, the more noteworthy of these being Mrs. R. Luxford (golden chestnut), Mrs. L. Thorne (yellow), Mrs. C. H. Totty (pink), and Miss E. King (sulphur-yellow). (Silver-gilt Banksian Medal.)

DAHLIAS AND HARDY FLOWERS.

Messrs. BAKER, LTD., Wolverhampton, were exhibitors on a large scale of varieties of Peony-flowered Dahlias. The following sorts were extra good of their kind—Mrs. G. Drummond, Joseph Chamberlain, Baroness Turckheim, Mrs. R. Copeland, Lady Savile, Mrs. W. Kerr, The Tatler, Lady Norman, Germania, Countess of Lonsdale, Hyde Park Gem, Red Indian, and Mrs. J. Nettlefold. (Silver Banksian Medal.)

Messrs. J. CARTER & Co., High Holborn, showed a dwarf Cactus Dahlia named Rayne's Park Gem, 1½ foot in height, with bright scarlet flowers.

Messrs. J. CHEAL & SONS, Crawley, again staged varieties of Dahlias, having a selection of good sorts of the single, Peony-flowered Cactus and Pompon types. (Silver Banksian Medal.)

Messrs. W. CUTBUSH & SON, Highgate, London, again made a bold display with Asters and other border flowers. *Senecio glastifolia* was shown well; the flowers are rosy-mauve, with pretty yellow centres, like some of the border Pyrethrus. *Aster novi-belgii* Gloire de Cronstadt is a choice purple-flowered variety, enhanced by dark orange-coloured stamens. As a separate group, this firm showed Carnations and an assortment of greenhouse plants, including many in berry, and a fine batch of Oranges in Pots. (Silver-gilt Flora Medal.)

Mr. G. REUTHE, Keston, Kent, showed a small, but choice collection of Alpines. The beautiful blue-flowered *Parochetus communis* was observed, also the curious flowered *Treyrtis hirta*, Nerines in variety and *Crocus caspius*.

Messrs. BARR & SONS, King Street, Covent Garden, showed hardy flowers. *Lilium nepalensis* was well bloomed; *Schizostylis coccinea* attracted notice in its beautiful bright red flower spikes; *Colchicum autumnale* and its double-flowered white variety were pretty; there were also Nerines, border Asters, Kniphofias, and other seasonable subjects. (Bronze Banksian Medal.)

Mr. FRANK BRAZIER, Caterham, showed Asters, Phloxes and Chrysanthemums. A beautiful

Golden Chrysanthemum was seen in the variety Mrs. A. Thompson, while Ethel Blades is a fine red sort. *Aster Amellus Fraumfeldii* is a good dwarf-growing Michaelmas Daisy. (Silver Banksian Medal.)

AWARDS OF MERIT.

Carnation Regina (perpetual-flowering).—A large, salmon-pink-coloured bloom, with serrated petals, developed on long, stout stalks. The calyx does not split, so that the flower retains a good form. Shown by Mr. C. ENGELMANN, Saffron Walden.

Codiaeum (Croton) Golden Ring "Lynwood variety."—A form with narrower and rather more drooping leaves than the well-known Golden Ring variety, and also rather more compact in habit. The foliage is twisted spirally and has pleasing colour variation. This and the type are excellent as small plants for table or conservatory decoration, but are not suitable for cultivating as large specimens. Shown by A. E. BAINBRIDGE, Esq., Lynwood, Jesmond Park West, Newcastle-on-Tyne (gr. Mr. Thos. Bell).

Nepenthes nobilis (sanguinea × Curtisii superba).—A large-pitched variety, the biggest pitcher measuring 14 inches in length. The variety favours sanguinea, but is not so dark in colour. The rim is exceedingly handsome, and there are dark-red mottlings on the upper part of the pitcher on a ground of lighter red, which is gradually lost, until, at the bottom, the colour is a shade of green. The plant was a splendid specimen, with 10 finely-developed pitchers. Shown by Messrs. JAS. VEITCH & SONS, LTD.

Nerine elegantissima Mansell Seedling.—A variety with a large spike of flowers as fine as those of *N. Fothergillii* major, but coloured a cerise-rose. Shown by Mr. FRANK LILLY.

Aster "Novelty."—A pretty Michaelmas Daisy, belonging to the *Ericoides* section of *Aster*, the stem bearing long, shower-like sprays of tiny bluish-tinted flowers. Shown by Mr. F. BRAZIER, Caterham.

Chrysanthemum Mrs. G. C. Kelly.—A large Japanese variety of the exhibition type, with incurving florets, the upper surfaces being old rose and the reverse a silvery-grey, which the incurved tips largely display. The largest bloom measured 9 inches in depth and 8 inches across.

Chrysanthemum J. H. Greswold Williams.—A decorative or large-flowered single variety of bright yellow colour.

Chrysanthemum Mrs. Sam Nash.—Also a single variety, the colour being a pretty bluish-pink. The flower is of fine form, and may be likened to a glorified Moss Rose.

These three Chrysanthemums were shown by Messrs. W. WELLS & Co., Merstham.

Chrysanthemum Miss Mary Pope.—This also is a bluish-pink single variety, the florets drooping pleasingly at the tips, and are set off by the fine yellow disc. Shown by Mr. FRANK BRAZIER.

Chrysanthemum Joan Edwards.—A single variety, with rose-coloured petals and a prominent golden centre. Shown by Mr. P. LADDS, Swanley.

Chrysanthemum Mrs. Tresham Gilby.—Of the large-flowered, decorative, single type, being a yellow sport from the well-known Mrs. Pagram variety. The blooms have three or four rows of extra-large florets, these being of good substance and very clear yellow. Shown by Mr. T. WARD, Bishop's Stortford, Hertfordshire.

Chrysanthemum Hilda Blick.—A white decorative variety of great purity; the florets tubular almost to their tips. A very refined flower. The variety is suitable for vases and other decorative purposes. Shown by Mr. C. BLICK, Hayes.

Orchid Committee.

Present: Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Stuart Low, F. Sander, R. G. Thwaites, F. Menteith Ogilvie, A. A. McBean, Walter Cobb, J. Charlesworth, J. Cypher, C. H. Curtis, W. H. Hatcher, H. G. Alexander, A. Dye, W. H. White, H. Ballantine, Gurney Wilson, C. J. Lucas, C. Cookson, F. J. Hanbury, and Sir Jeremiah Colman, Bart.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a fine group, in which were many interesting plants, the best of them being the handsome new *Cypripedium Britannia* and *C. Princess Mary* (see Awards). The setting of the group was of good Cattleyas, *Laelio-Cattleyas* and blotched *Odontoglossums*,

chiefly hybrids. Among specially fine things noted were the new *Oncidium Sanderae* of the *O. Papilio* section, but having a very extraordinary beard-like development on each side of the column, the curious little *Lanum Berkeleyi*, the yellow *Dendrobium Bullenianum*, *Govenia Gardneri*, and some as yet unidentified species; *Bulbophyllum Dearei*, the wax-like, white *Houlletia Sanderi*, and a good batch of the favourite *Cypripedium insigne Sanderae*.

Messrs. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for a fine group in which spotted *Odontoglossums*, both varieties of *O. crispum* and home-raised seedlings were prominent. A batch of *Vanda corulea* was in the centre, around which were several forms of *Cattleya Folia*, *C. Lord Rothschild* var. *alba*, good *C. aurea*, a selection of fine varieties of *Laelia pumila*, good *Oncidium tigrinum*, various *Laelio-Cattleyas*, including some very finely-coloured *L. C. luminosa*; and *Odontoglossum ardentissimum album*, a white form, with a few yellow spots.

Messrs. STUART LOW & Co., Bush Hill Park, received a Silver Flora Medal for an extensive group, in which the late autumn-flowering *Oncidium varicosum*, *O. oblongatum*, *O. splendidum*, *O. undulatum*, &c., formed the background. *Cattleya Gaskelliana alba*, *C. labiata alba* in several forms, one very white-petalled variety having a pink veining on the lip, as in *C. l. R. I.* Messrs. the pretty rose-red *Sophras-Cattleya eximia*, the bright-yellow *Laelio-Cattleya Ophir*, and various *Bulbophyllums*, *Cyrtopetalums*, &c.

Messrs. MANSELL & HATCHER, Rawdon, Yorks., were awarded a Silver Banksian Medal for a group containing very good examples of *Odontoglossum grande*, *O. crispum* and hybrids, varieties of *Cattleya Folia*, *C. Mantiuii*, *C. Davisii*, *C. Armstrongiae*, *Brasso-Cattleya Digbyana Mendelii*, *Brassavola cordata*, *Epidendrum atropurpureum album*, and other showy Orchids were also included.

Messrs. J. & A. A. McBEAN, Cocksbridge, were awarded a Silver Banksian Medal for a small but select group in which was an example of *Cattleya Dowiana aurea* var. *alba*, the first of its kind to be shown. The sepals and petals were cream-white, the lip ruby-crimson, rather lighter than typical *C. D. aurea*, but with the same fragrance and gold veining. Others noted were *Miltomia vexillaria Leopoldii* of fine colour, and some *Cypripediums* and *Odontoglossums*.

Messrs. ARMSTRONG & BROWN, Tumbidge Wells, were accorded a Silver Banksian Medal for a group containing several of their pretty *Cattleya Armstrongiae*, several fine *C. Folia*, *Cypripedium Gaston Bultel*, *C. Germaine Opoix*, several *C. insigne Sanderae*, &c.

Mr. E. V. Low, Vale Bridge, Haywards Heath, was awarded a Silver Banksian Medal for a select group containing some fine white varieties of *Cattleya labiata*, including *Amesiana*, *Cooksoniae*, *Daphne*, and *Vale Bridge variety*, which had a slight bluish tint on the lip; *Laelia pumila* Queen Alexandra, white with slate-blue lip; *C. labiata eximia*, a fine dark variety; *Cypripedium Olympicum* (*Lecanum Clinkberryanum* × *Sollieri Hycanum*), and *C. Wivelsfieldense* (*Fascinator* × *Lecanum Clinkberryanum*) were also shown.

Messrs. JAS. VEITCH & SONS, Chelsea, at intervals in their magnificent group of pitcher plants and decorative *Crotons*, *Dracanas*, *Marantas*, &c., placed groups of very fine forms of *Cattleya labiata*, *Odontoglossum crispum* varieties, *O. grande*, *Oncidium varicosum*, and *O. tigrinum*.

Sir JEREMIAH COLMAN, Bart., V.M.H., Gatton Park (gr. Mr. Collier), staged an interesting group in which were a good example of *Odontioda Bradshawiae*, a pretty claret-coloured hybrid between *Odontoglossum Edwardii* and *O. sceptrum*, the pretty *Calogyne sulphurea*, a very large form of *Cirrhopetalum refractum*, several examples of an interesting hybrid *Spathoglottis* raised at Gatton between *S. Fortunei* and *S. plicata*, and named *S. Zebolina*. In form and colour it is nearest to *S. plicata*, the cream-white flowers being more or less tinged and spotted with rose, the apex of the lip in some forms being rose colour and in others yellowish.

Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander), sent *Laelio-Cattleya Barbarossa* Westnomb variety (*L. C. callistoglossa* × *C. Trianae Imperator*), a grand flower with large, rose-tinted sepals and petals and intense ruby-claret lip, and his new and fine *Odontioda Bradshawiae Westnomb* variety (see Awards).

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), sent *Cyripedium* *Troilus* J. Gurney Fowler's variety, a very handsome form with several flowers; and *C. Priscilla* (exul. \times *insigne* Harefield Hall), a noble-looking flower with the upper half of the distinctly-blotched dorsal sepal clear white.

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham (gr. Mr. Black), showed one of the finest pure-white forms of *Laelia pumila* alba yet exhibited, and his new *Odontioda Seymourii* (*O. Uro-Skinneri* \times *C. vulcaniae*), which increases in beauty as it gains strength.

FRANCIS WEILLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), sent *Sophro-Laelio-Cattleya Veitchii* var. *Eros* of a bright-red colour, and *Cyripedium Germaine Opois* var. *imperiale*, an excellent variety both in form and colour.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), showed a fine form of *Sophro-Laelio-Cattleya Veitchii* var. *Eros*, *Cattleya Fabia* alba, and *Laelio-Cattleya Felicia* Goodson's variety, a handsome flower with a primrose-yellow tinge on its pink sepals and petals and deep mauve-purple lip.

From the late H. A. TRACY'S Orchid Nursery, Twickenham, was sent as *Vanda Floridae*, provisionally named, what appeared to be a small form of *V. Charlesworthii*, white with violet lip.

AWARDS.

FIRST-CLASS CERTIFICATES.

Odontioda Bradshawia Winstombirt variety (*O. crispum Britannia* \times *C. Noezliana*), from Lieut.-Col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—A superb hybrid with flowers equal in size to those of an ordinary *O. crispum*, all the segments being broad and finely displayed. The sepals are orange-red with a cream-white margin tinged with rose; petals broadly ovate, cream-white, tinged with mauve, and bearing a large reniform blotch in the centre and some red lines at the base. Lip with a chestnut-red blotch in the centre and on the side lobes.

Cyripedium Princess Mary (*nircum* \times *Helen II.*), from Messrs. SANDER & SONS, St. Albans.—The general appearance of this fine *Cyripedium* approaches that of *C. bellatulum* album (derived through *Helen II.*), with a much-enlarged lip and beautiful and uniformly-distributed purple spotting on the dorsal sepal and petals. The ground colour of the flower is pure white, and its form and substance excellent.

AWARDS OF MERIT.

Cyripedium Britannia (*parentage unknown*), from Messrs. SANDER & SONS.—A large and finely-formed flower of the *C. Eson giganteum* section. The broad upper sepal is pale emerald green in the lower half and white above the basal area, having some purplish-spotted lines. Petals and lip large, honey-yellow, veined and tinged with pale purple.

Cyripedium Reginald Young (*Elmireanum Hitchinsii*) \times *insigne* Harefield Hall), from H. J. BROMLOW, Esq., Rann Lea, Rainhill (gr. Mr. Morgan).—A very fine hybrid with some resemblance to *C. Earl of Tankerville* in the large blotches on its Indian-yellow dorsal sepal, which has a white upper half. The petals and lip are yellow tinged with purple.

Calanthe densiflora, from Sir JEREMIAH COLMAN, Bart., V.M.H. (gr. Mr. Collier).—An old but rare species, native of Sylhet and Assam. Scape erect and bearing a dense head of yellow flowers furnished with prominent bracts.

Odontoglossum Circe (*Cervantesii* \times *Prescottii*), from Messrs. CHARLESWORTH & CO.—A pretty, dwarf hybrid nearest to *O. Cervantesii*. Flowers white, spotted with red on the inner halves of the segments, which are broader than in *O. Cervantesii*.

PARENTAGE OF CYRIPIDIUM GEORGE V.

Mr. E. V. Low, Vale Bridge, Haywards Heath, forwarded his record of parentage of his *Cyripedium* King George V., omitted when the plant was entered. It is stated to be *C. giganteum* (*Harrisianum* \times *nitens*) \times *C. Charlesworthii*.

Fruit and Vegetable Committee.

Present: W. Ponpart, Esq. (in the Chair); and Messrs. Jas. Cheal, J. Jacques, Thos. Cumber, W. Crump, H. Somers Rivers, Alex. Dean, Geo.

Wythes, James Vert, G. Reynolds, John Lyne, Chas. O. Walter, C. Hobday, H. Parr, A. R. Allan, W. Fyfe, W. Pope, James Gibson, John Harrison, Edwin Beckett, W. Bates, Owen Thomas, and J. Davis.

Messrs. SUTTON & SONS, Reading, showed a general collection of vegetables, embracing 160 dishes, representative of almost all kinds in cultivation. They displayed varieties of Onions from a trial of these bulbs at Reading, notable sorts being *AI*, Improved Reading, Imperial White Globe, a splendid solid Onion, and Ailsa Craig. Brassicas of all types were shown grandly, especially good being Drumhead Cabbage, Dwarf Blood-red Cabbage, a heating form of Couve Tronchuda, Rosette Colewort, and variegated Kales. Good Beets were seen in Blood Red, Scarlet, and Sutton's Black; choice Parsnips in Tender and True; solid, well-hearted Celery in Superb Pink and Solid White; beautiful specimens of Kohl Rabi in Sutton's Earliest Purple and Earliest White; also Best of All Runner Beans, *Stachys tuberosa*, New Red Intermediate Carrot, Prizetaker Leek, Satisfaction Lettuce, and varieties of Capsicum, Shallot, Tomato, Maize Heads, Chilies, Cress, Gourd, Turnip, Celeriac, Marrow, Dandelion, Artichoke, Brussels Sprouts, Mushroom and Cucumber. Messrs. SUTTON also showed as a separate exhibit a collection of Tomatos from a trial of these fruits in the open. The best were Abundance, Sutton's Early Market, Winter Beauty, of fine quality; Princess of Wales, and Earliest of All. (Gold Medal.)

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, also contributed a large exhibit of vegetables, showing fine produce from their seeds. We observed Peas Gladstone and Autoerat; Endive, Hollow Crown Parsnips of extra-large size; Autumn Giant Cauliflower with large, white curds; Drumhead Colewort, Maincrop Onion; Sulham Prize, Superb White and Early Rose Celeries; Lyon Leek; Tomato Solidity and many other things such as Beet, Spinach, Brussels Sprouts, Shallots, Salsafy, Mushrooms, Radishes and many more. (Silver-gilt Knightian Medal.)

A collection of Apples in 24 varieties was staged by C. B. BROAD, Esq., Aghern, Conna, Co. Cork. The fruits were well developed and finely coloured, notable varieties being Coronation, Peasgood's Nonesuch, Bramley's Seedling, Baron Wolseley, Hambling's Seedling, Chas. Ross, a superb dish of this showy variety; Baumann's Red Winter Reinette, of deep red colour; Belle de Boskoop and King's Acre Pippin, a fine Christmas dessert Apple. (Silver Banksian Medal.)

A collection of preserves shown by Mrs. G. BANKS, was awarded a Silver-gilt Banksian Medal.

A Silver Knightian Medal was awarded to Mr. R. W. GREEN, Wisbech, for a collection of 80 sorts of Potatos.

COMPETITIVE CLASSES FOR VEGETABLES.

These numbered 41, three being for collections of distinct kinds, six for collections of Potatos, Onions, Salads and a collection of six uncommon kinds, and the remainder—numbering 32—for single dishes of specified vegetables. Generally, the competition was restricted to three or four exhibitors. The Duke of PORTLAND (gr. Mr. J. Gibson) met with remarkable success, winning 19 1st and five 2nd prizes. He secured the Champion Challenge Cup offered to the winner of the greatest number of 1st prizes, receiving 41 points, the winner in Class I being excluded. The Hon. VICARY GIBBS (gr. Mr. Edwin Beckett) also figured prominently in the list of prize winners.

Collection of 12 distinct kinds.—A list of varieties was enumerated in the schedule from which exhibitors could make a selection. The 1st prize included the Sutton Challenge Cup, valued at 20 guineas, which the exhibitor may only hold once in four years. Besides this, a sum of £10 in money was offered to the most successful exhibitor. It was won by one of those magnificent displays we are accustomed to see from the gardens of the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Edwin Beckett). The produce all round was of superb quality, and staged by a master hand in exhibiting. The dishes were Dwarf Gem Brussels Sprouts, Tender and True Parsnips, Superb Pink Celery, Ailsa Craig

Onion, Prizetaker Leek, Autumn Mammoth Cauliflower, New Red Intermediate Carrot (extra choice), Potato Superlative, Early Snowball Turnip, Perfection Tomato, Black Beet, and a brace of Matchless Cucumber. 2nd, H. T. TATHAM, Esq., Kendall Hall, Elstree, Herts. (gr. Mr. W. Gaiger), whose best dishes were Ailsa Craig Onion, Student Parsnip, Superb Pink Celery, Cheltenham Green-top Beet, Prizetaker Leek, and Dwarf Gem Brussels Sprouts. There were no other exhibits beyond these two.

Collection of nine kinds.—These were also to be selected from the same list as in the case of the preceding class. There were three fine exhibits, the premier one being shown by the Duke of PORTLAND, Welbeck Abbey, Worksop (gr. Mr. Jas. Gibson). The exhibit was a most meritorious one, the quality of the produce being superb, and staged most effectively. It comprised New Red Intermediate Carrot (a remarkable dish), Ailsa Craig Onion, Superlative Potato, Superb Pink Celery, Prizetaker Leek, Black Beet, Superlative Pea (the finest dish of Peas in the exhibition), Autumn Mammoth Cauliflower, and Princess of Wales Tomato; 2nd, W. H. MYERS, Esq., Swannmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), with excellent vegetables, especially good being Ailsa Craig Onion, Prizetaker Leek, Autumn Giant Cauliflower, and Superb Pink Celery; 3rd, Earl SPENCER, Althorp Park, Northampton (gr. Mr. S. Cole), with choice Parsnips of the Marrowfat variety, very big Webb's Perfection Celery, and Prizewinner Carrot.

Collection of six distinct kinds.—The Marquis of NORTHAMPTON, Castle Ashby, Northampton (gr. Mr. A. R. Searle), was the only exhibitor, but he showed well, and was worthily awarded the 1st prize. Especially good were Giant Celery, Prizewinner Carrot, Autumn Mammoth Cauliflower, Ailsa Craig Onion, and Emperor Tomato.

Collection of 12 varieties of Potatos.—There were two exhibitors in this class, the 1st prize being awarded to the Duke of PORTLAND for as fine a display of tubers as we have observed at an exhibition. The skins were without blemish; moreover, the tubers were well matched and had shallow eyes. A selection of the choicer examples includes Radiator, Supreme, Mr. Breese (a coloured Potato), Sutton's Seedling, Ideal, and Abundance; 2nd, Countess COWPER, Panshanger, Herts. (gr. Mr. R. Staward).

Mrs. DENISON, Little Gaddesden, Berkhamsted (gr. Mr. A. G. Gentle), was the only exhibitor in the class for a collection of six varieties of Potatos, winning the 1st prize with good specimens.

Collection of six varieties of Onions.—The Duke of PORTLAND had the best of three exhibits, all remarkably good. He showed large, sound bulbs of Improved Reading, Crimson Globe (finely coloured), The Sutton Globe, *AI*, Perfection, and Ailsa Craig; 2nd, W. H. MYERS, Esq., Swannmore Park, Bishop's Waltham (gr. Mr. Ellwood).

Salads.—For a collection of 12 kinds of salads the Hon. VICARY GIBBS won the premier prize easily with extraordinarily good Celery of the Solid White variety, Lettuce Matchless, Chicory Christmas Salad, Cucumber Delicacy, Tomato *AI*, Batavian Endive, and Mustard and Cress; 2nd, H. T. TATHAM, Esq., Kendall Hall, Elstree (gr. Mr. W. Gaiger).

For a collection of six kinds there were two good displays, the better of the two being staged by the Duke of PORTLAND (gr. Mr. Jas. Gibson), his kinds being Blood Red Beet, Epicure Cucumber, Superb Pink Celery, Golden Ball Lettuce, Curled Endive, and Eclipse Tomato; 2nd, W. H. MYERS, Esq., with good produce, Batavian Endive and Perfection Tomato especially.

Other vegetables.—A list of uncommon vegetables was enumerated in the schedule, from which six kinds were to be selected. The only exhibitor was the Hon. VICARY GIBBS, who had models of uncommon vegetables in Celeriac, Scorzonera, Long Red Capsicums, *Stachys tuberosa*, Giant Salsafy, Earliest Purple Kohl Rabi.

There were numerous classes for single dishes of vegetables, and the competition in most cases was satisfactory, whilst the produce in all cases was equal to the best exhibition standard.

Four Northern Counties Fruit Show and Congress.

OCTOBER 20, 21, and 22.

A joint fruit exhibition and congress for the North of England took place on October 20-22, in the Town Hall and Wesleyan Schools at Hexham. It may be said, at once, that the event was attended by a measure of success that should be most gratifying to those who have worked hard to promote an increased interest in the culture of hardy fruits in the four northern counties, Durham, Northumberland, Westmorland, and Cumberland.

The idea originated with the Rev. J. Bernard Hall, R.N., of Dalston (Cumberland), whose enthusiasm for Apple and Pear growing is of such a character as to infect most people with whom he comes into contact. Firmly convinced himself of the desirability of increasing the area of fruit-growing in these counties and of bettering the cultivation already practised, he set himself to obtain the sympathy and support of the local gardening societies, the county councils, the Royal Horticultural Society, and the Boards of Agriculture and Education in a scheme for holding an exhibition of hardy fruits and an educational congress for the discussion of matters relating to fruit cultivation. There could be no better testimony to the zeal and energy he has displayed than that borne by the double events. Although the competitive exhibits were exclusively from the four counties, the exhibition included nearly 700 dishes of Apples and Pears, besides Grapes, boxes of fruit packed for market, and bottled fruits and vegetables. The high quality of many of the Apples caused considerable surprise.

The visitors included a deputation from the Royal Horticultural Society, consisting of Messrs George Bunyard (chairman of the Fruit and Vegetable Committee), James Hudson, and A. H. Pearson; a deputation from the Scottish Horticultural Association, consisting of Messrs. James Whytock (president), and W. H. Massie (vice-president), and a delegate from the Royal Caledonian Horticultural Association—Mr. G. P. Berry. The proceedings were also inspected by representatives of the Boards of Education and Agriculture, and it is generally understood that a Government grant will be forthcoming towards the expenses incurred by the congress. If this is the case, the help thus afforded will be much appreciated by horticulturists in the North, who have not been slow to recognise the great educational value of the Hexham events. A guide to the congress, on sale during the proceedings, contained a large amount of information for cultivators, and the Executive Committee hopes to publish a second volume, which will include all the papers read at the conference and a report of the discussions. The wider this volume can be distributed over the four counties, the greater will be the result of the work that has been so successfully carried out. Many matters of prime importance to northern fruit-growers have been treated of, including such subjects as the best stocks for the trees and the most suitable varieties for cropping in a cold climate. The general opinion appeared to condemn the Paradise stock for the northern counties, on account of its comparative tenderness, and in the matter of varieties it was held that in most cases where failure has attended the attempts to grow good Apples in the North of England, the lack of success can be traced to the preference given to first-class exhibition varieties that succeed in the South to the exclusion of hardier sorts that are alone capable of yielding good returns.

The show was formally opened on Thursday by the joint presidents, Mrs. J. C. Straker and Capt. J. H. Cuthbert, the chair being occupied by Dr. Stewart. Conferences were held each day, and were all well attended. There were exhaustive trials of spray apparatuses, for gold and silver medals. During the exhibition, meetings were held by the British Gardeners' Association and the National Fruit Growers' Federation.

HARDY FRUITS GROWN ENTIRELY IN THE OPEN.

Mrs. N. G. CLAYTON, Chesters Hall, Humsbaugh (gr. Mr. J. Cocker), won a cup offered by Mrs. Bainbridge, Eshott Hall, for the best collection of 18 dishes of hardy fruits. The exhibit contained the following varieties:—*Apples*: Warner's King, Blenheim Pippin, James Grieve, Cellini Pippin, Stirling Castle, King of the Pippins, Lord Sutfield, Peasgood's Nonesuch, Ribston Pippin, Ecklinville Seedling, Bismarck, and Worcester Pearmain. *Pears*: Beurré Bosc, Doyenné du Comice, Pitmaston Duchess, and Beurré Diel. All the Pears were from wall trees.

The best collection of nine dishes came from Mr. J. M. ROBSON, Beacon Grange, Hexham. He had of *Apples*: Lord Grosvenor, Lord Sutfield, and Worcester Pearmain; *Pears*: Beurre d'Anjou, Belle de Bruxelles, and the very curiously-formed Bishop's Thumb; *Plum*: Magnum Bonum; and Blackberries.

REV. J. BERNARD HALL, R.N.

Hon. Secretary to the Northern Fruit Show and Congress.

Twelve dishes of hardy fruits.—This class was open for horticultural Societies. The HEXHAM GARDENERS' SOCIETY won the 1st prize. The fruits shown in this class were:—*Apples*: Allington Pippin, Lane's Prince Albert, Warner's King, King of the Pippins, and Lord Derby. *Pears*: Belle de Bruxelles, Beurre d'Amanlis, and Marie Louise. *Plums*: Cox's Golden Drop and Magnum Bonum; and *Peach*: Royal George. The CORBRIDGE GARDENERS' SOCIETY gained the 2nd prize with an exhibit of Apples and Pears, and a dish each of Monarch Plum and Blackberries.

Six boxes of hardy fruits, graded and packed for market.—Mr. ALEXANDER, Hexham, had the best exhibit in this class. His boxes contained magnificent fruits of Ecklinville Seedling, Warner's King, Lord Derby, Bramley's Seedling, Worcester Pearmain, and Newton Wonder. They were shown in paper-lined boxes, and each fruit was separately wrapped in paper. 2nd, Mr. J. MILLICAN, Scotby Lane, Carlisle; 3rd, Messrs. H. BRITTON & SONS, Langworthy.

APPLES.

Twelve dishes, in six or more distinct varieties (restricted to market growers).—In this class were seen some of the finest fruits exhibited at the show. Mr. J. MILLICAN, Scotby Lane, Car-

lisle, obtained the 1st prize for a collection which included the following varieties:—Bramley's Seedling, Royal George (a favourite Apple in these counties), Golden Noble (excellent specimens of this first-rate variety, highly-coloured, clean-skinned, but not very large), King of the Pippins (good in quality, but rather small), Annie Elizabeth (very good), Peasgood's Nonesuch, Bismarck, Cambusneath Pippin (a rather flat-looking fruit, with irregularities about the eye), Lady Sudeley, Warner's King, Charles Ross, and Lord Derby. The 2nd prize in this class was won by Mr. ALEXANDER, Hexham. His specimens of Warner's King were much above the average size, and those of Ecklinville Seedling were very fine specimens. 3rd, Messrs. H. BRITTON & SONS, Langworthy. There were five exhibits in this class.

Six dishes, distinct varieties, suitable for commercial culture.—Mr. ALEXANDER, Hexham, won the 1st prize and a medal offered by the Worshipful Company of Fruiterers. The varieties were Ecklinville Seedling, Lord Derby, Warner's King, Newton Wonder, Worcester Pearmain, and Bramley's Seedling. 2nd, Mr. J. MILLICAN, Carlisle. His varieties were Early Victoria, Lord Derby, Annie Elizabeth, Lane's Prince Albert, Charles Ross, and Bramley's Seedling.

Twelve fruits of Worcester Pearmain, as packed for market, in a wooden box.—Mr. JOS. HENDERSON, Falldon Hall, Chester Bank, won the 1st prize; Mr. ALEXANDER, Hexham, was 2nd; whilst Mr. JAS. WAUGH, Stocksfield, was awarded the 3rd prize.

Six dishes of cooking varieties, distinct.—Mr. J. H. STEWART, Holm Hill, Dalston, won the 1st prize with Blenheim Pippin, Annie Elizabeth, Gloria Mundi, Potts's Seedling, Peasgood's Nonesuch, and a seedling which resembled Annie Elizabeth. These fruits were very fine specimens, and gained, in addition to the 1st prize, the Bronze Banksian Medal of the R.H.S., and the Medal of the Royal Caledonian Horticultural Society. A 2nd prize in this class was awarded to Mr. J. FARQUHARSON, Hoyton Gardens, Carlisle; 3rd, Mr. JAMES WAUGH, Stocksfield.

Six dishes of dessert Apples, distinct varieties.—Mr. F. FISCHER, Brackenburgh, had the best collection in this class, showing the varieties Cox's Orange Pippin, Allington Pippin, Blenheim Pippin, Charles Ross, Ribston Pippin and Rival. This exhibit gained the 1st prize and the Bronze Banksian Medal of the R.H.S.; 2nd, Mr. G. DUNN, Whitfield Hall Gardens, R.S.O. The varieties displayed by this exhibitor were Allington Pippin, Pontoise, Kerry Pippin, Worcester Pearmain, Lady Sudeley, and another. 3rd, Mr. J. P. BENLEY, Causa Grange. There were 10 exhibits in this class.

SINGLE DISH CLASSES.

In the class for one dish of James Grieve, the 1st prize was awarded for large-sized, rather conical-shaped fruits shown by Mr. F. FISCHER. In the class for Allington Pippin, the prizes were offered by Messrs. Geo. Bunyard & Co. Mr. J. WAUGH, Stocksfield, won the 1st prize with exceedingly large fruits; there were seven exhibits. In a class for any other kind of dessert Apples, the 1st prize was gained by Tyler's Kernel.

In the classes for single dishes of cooking Apples, the 1st prize for Stirling Castle was gained by Mr. G. SHOTTON, Prudhoe Hall Gardens, Prudhoe.

In the class for Warner's King the 1st prize was given for medium-sized, firm-looking fruits still very green, but some of the specimens shown in this class were quite yellow, and the skins were badly spotted, therefore incapable of keeping good for any considerable time. Bismarck was very well shown, the fruits being good in size and bright in colour; Lane's Prince Albert was equally satisfactory, as were the fruits of Newton Wonder, for which prizes were offered by Messrs. J. R. Pearson & Sons. Bramley's Seedling was represented by large, firm-looking fruits, whilst King of Tompkins' County was worthy commendation in a class for any

other cooking variety than those enumerated in the schedule.

LOCAL APPLES.—Messrs. J. Robson & Sons offered prizes for the best dishes of local varieties originating in the four northern counties. The 1st prize was won by Mr. J. T. STEWART, Holm Hill, Dalston, who showed some fine fruits of an unnamed variety, whilst the local variety Mary Barnes gained the 2nd prize.

ORCHARD HOUSE FRUIT.

(Nurserymen and Market Gardeners excluded.)

Mr. DAVID MARIE, Eshott Hall, Felton, won the premier prize in a class for three dishes of dessert Apples, showing Ribston Pippin, Allington Pippin and Cox's Orange Pippin. 2nd, Mr. JAMES WAUGH, who showed Cox's Orange Pippin, Ribston Pippin and Worcester Pearmain. 3rd, Mr. G. SHOTTON.

Mr. JAMES WAUGH was awarded the 1st prize in a similar class for cooking Apples with an exhibit composed of the varieties Cox's Pomona, Lord Derby, and Peasgood's Nonesuch.

For three dishes of Pears.—Mr. JAMES WAUGH showed Doyenné du Conice, Magnate and Princess; 2nd, Mr. G. SHOTTON.

Six dishes of dessert fruit.—Mrs. N. G. CLAYTON, The Chosters, Humshaugh (gr. Mr. J. Cocker), won the 1st prize with a collection which included Pitmaston Duchess and Beurré Diel Pears, Lady Sudeley Apple, Golden Drop Plum, Sutton's Scarlet Melon, and Black Hamburg Grapes. 2nd, Mr. G. SHOTTON, Prudhoe Hall Gardens, Prudhoe.

Mr. G. SHOTTON had the best four bunches of Grapes, showing excellent bunches of Black Alicante and two indifferent bunches of Muscat of Alexandria.

PEARS.

Hon. C. A. PARSONS, Holeyh Hall, Wylam-on-Tyne (gr. Mr. Matthew Dixon), had the best collection of six dishes in the varieties Beurre Superfin, Marie Louise, Pitmaston Duchess, Doyenné du Conice, and Durondeau.

Mr. W. H. LAMBERT won the 1st prize for three dishes, showing Pitmaston Duchess, Durondeau, and Hacon's Incomparable. Mr. DIXON was 2nd with Durondeau, Marie Louise and Pitmaston Duchess.

In a class for Pitmaston Duchess, some splendid fruits were shown by Mr. J. WAUGH; and in the class for any other variety, both the 1st and 2nd prizes were awarded to the variety Durondeau.

There were also classes for bottled fruits, in which Mr. J. STEVENSON, Newbiggin House, Blanchard, showed the best fruits; and others for fresh fruits of Plums, Crab Apples, Loganberries, Red Currants, and Blackberries.

HONORARY EXHIBITS.

Messrs. JOS. ROBSON & SON, The Nurseries, Hexham, contributed a collection of coniferous and other evergreen plants in pots. These were bushy little specimens, but the names were not indicated. An exhibit of good Apples was also shown in many varieties, and red cards were affixed to certain sorts to indicate that they succeed best in the Hexham district. Those so marked included the varieties Lord Grosvenor, Lord Suffield, Worcester Pearmain, Northern Spy, Domino, Warner's King, Potts's Seedling, Stirling Castle, Ecklinville Seedling, Lubbe's Seedling, Gascoyne's Scarlet Seedling, and Duchess of Oldenburgh.

From the CUMBERLAND AND WESTMORLAND COUNTY COUNCILS fruit plots, Mr. W. B. Little exhibited excellent Apples (see fig. 135) of such varieties as Worcester Pearmain, King of the Pippins, Duchess of Gloucester, and a local variety without name; also bottled fruits and Rhubarb. Pear shoots and fruits affected with canker, mounted specimens of various insect pests, and artificial and mineral manures. Mr. Little also exhibited a large number of Apples from the Cumberland and Westmorland fruit plots at Newton Rigg and Lyth. The labels were marked with +, ++, or +++, as indications to visitors which varieties are remarkable for vigorous growth and free cropping qualities, and separating them for light and heavy soils.

Mr. JOHN MITCHELL, market gardener, Scotby Lane, Scotby, staged upwards of 70 dishes of Apples of varieties specially recommended for Northern England. We cannot give a list of the varieties, but a few may be men-

tioned. White Paradise appears to be known in the Hexham district as "Ten Shilling." Of the uncommoner sorts, we may enumerate Mary Barnes (a green-looking kitchen Apple), Swan Egg, North Britain Giant, Scotch Bridgett, Over Sea Peggie, Harvest Lemon, and Yorkshire Beauty.

Messrs. GEORGE BUNYARD & CO., Royal Nurseries, Maidstone, Kent, staged a large collection of Apples and Pears, including a splendid lot of fruits from the orchard house. The numerous varieties of Apples from the open orchard were divided into two sections, those specially recommended for culture in North Britain being marked "N.B." Amongst these we noticed Golden Noble, Seaton House, Worcester Pearmain, Galloway Pippin, Bielo Borodawka, Lady Sudeley, Lord Grosvenor, Lane's Prince Albert, Stirling Castle, Bramley's Seedling, Hitchin Pippin, Ross' Nonpareil, Potts's Seedling, Duchess of Gloucester, Ben's Red, Claygate Pearmain, Early Victoria, Golden Noble, Newton Wonder, Worcester Pearmain, and Lord Derby.

Messrs. THOMAS RIVERS & SON, Sawbridge-worth, Hertfordshire, brought an exhibit of about 50 dishes of Apples and Pears. Many of the fruits exhibited were the produce of indoor cultivation, but in these instances this fact was pointed out on the labels, so that visitors were in no wise misled in the matter. Amongst the varieties grown indoors were very fine examples of that excellent

Golden Noble; another, Stanwix King, which had some resemblance to Mère de Ménage, Blackwell Park (a deep green fruit), Carlisle Castle, Over Sea Peggy (after the manner of Housewife), Lowther Castle, Old Nonpareil, and Royal George.

Mr. WILLIAM LAWRENSON, Newcastle-on-Tyne, showed a group of winter-flowering Carnations, Bouvardias, Primula obconica, Ferns, Begonia Gloire de Lorraine, and selected varieties of Apples and Pears.

Messrs. GEO. FAIRBAIRN & SONS, Botcherley, showed Carnations and florists' devices.

The KING'S ACRE NURSERY COMPANY, King's Acre, Hereford, contributed a large number of Apples and Pears in distinct varieties (see fig. 134). Most of the standard sorts were represented by excellent specimens, both in size and colour. In addition to a very fine exhibit of gathered fruits, this nursery company contributed a few fruit trees in pots, with Apples and Pears still hanging upon them.

Messrs. E. F. FAIRBAIRN & SONS, Carlisle, showed border Chrysanthemums and Dahlias.

Messrs. FELL & CO., Hexham, exhibited a group of ornamental plants, including stove and greenhouse species, such as Liliun speciosum, Carnations, Spiræas, and Ericas in flower; also a few carefully-selected Apples and Pears of good quality. These included, of Apples, Beauty of Moray, Scotch Bridgett, Tower of Glamis, Mary Barnes, and, naturally, Keswick Codlin.

Mr. JNO. COULSON, St. Mary's Chase, Hexham,

[Photograph by W. E. Little.]

THE NORTHERN FRUIT SHOW.

FIG. 134.—EXHIBIT OF APPLES AND PEARS FROM THE KING'S ACRE NURSERIES, HEREFORD.

Apple Gascoyne's Scarlet Seedling, of large size, and showing brilliant colouring. Cox's Orange Pippin was scarcely recognisable owing to its large size, being equal in this respect to fruits of Blenheim Pippin. In colour, they were rich yellow, with streaking of deep red, and, as exhibition fruits, they were very prominent, but scarcely the most suitable for the dessert table. The varieties Allington Pippin and Charles Ross sufficiently resembled Cox's Orange Pippin to indicate something of their parentage, whilst Charles Ross was equal in size, at the least, but possessing a form, especially some of the fruits, exactly similar to Peasgood's Nonesuch, one of its parents. James Grieve, a good northern fruit, was represented by fine specimens; and Peasgood's Nonesuch were the largest and most conspicuous fruits in the entire exhibit. The most brilliantly-coloured varieties were King of Tompkin's County and Cox's Pomona. Lady Hemiker, The Queen, and Washington were more delicately coloured, but not the less inviting. To mention a few Pears from the orchard house, there were Conference, St. Luke (Rivers), Red October (Rivers), Pitmaston Duchess, Beurré Fouquieray, and Beurré d'Anjou. Whilst the out-door fruits were commendable specimens, they naturally suffered from their association with those obtained from indoor culture.

Messrs. CLARK, BROS. & CO., Carlisle, showed a collection of local Apples, in which we noticed one named John Peel, which resembled

exhibited tubers of a new, coloured, oval-shape Potato, known as Lord Allendale.

Messrs. MITCHE & CO., Alwicks, showed the following varieties in a very commendable exhibit of Apples:—Beauty of Moray, Cockpit, Kerry Pippin, Galloway Pippin, Cambusneath Pippin, Royal Snow, Ringer, Winter Ruby, Thole Pippin, Seaton House, and Northern Dumpling. These varieties were stated to be capable of bearing satisfactory crops in the district.

Messrs. PORTEOUS & THOMSON, 27, Market Place, Hexham, showed some Apples and Pears; Messrs. SAMUEL FINNEY & CO., 17, Colliery Wood Street, Newcastle-on-Tyne, flowering bulbs, fibre, and utensils for the cultivation of bulbs; and the CHADWICK MEMORIAL SCHOOLS a collection of fruits, vegetables, and flowers; Mr. WALTER A. VOSS, Rayleigh, Essex, a collection of Apples and Pears; and Mr. W. ALEXANDER, Hexham, a collection of Apples.

INSECTICIDES, SPRAYING APPARATUS, &c.

There were excellent exhibits of insecticides, fungicides, spraying apparatuses, and other implements arranged in the Wesleyan Schoolrooms. Amongst the firms thus represented were the following:—The COLORADO ORCHARD HEATER CO., Hounslow, London, W.; M. HERROD, Wisbech; MORRIS, LITTLE & SON, LTD., Doncaster; WALTER VOSS & CO., LTD., Millwall, London, E.; R. BURLAND & SON, Wigan; WILLIAM COOPER & NEPHEWS, Berkhamsted; BELL &

RIDDLE, Hexham; ALPHA EXTINGUISHER, LTD., Ross, Herefordshire, and the FOUR OAKS Co., Sutton Coldfield.

Awards by the Royal Horticultural Society.

SILVER-GILT KNIGHTIAN MEDALS to The King's Acre Nursery Co., Hereford; Messrs. Bunyard & Co., Maidstone.

SILVER HOGG MEDAL to Messrs. T. Rivers & Sons, Sawbridgeworth.

SILVER-GILT BANKSIAN MEDALS to Messrs. J. Robson & Co., Hexham; Messrs. G. Fairbairn & Sons, Carlisle; Mr. J. Millican, Scotby, Carlisle.

SILVER KNIGHTIAN MEDALS to Messrs. W. Fell & Co., Hexham; Messrs. Miche & Co., Alnwick; The Cumberland County Council; Mr. Walter A. Voss, Rayleigh, Essex.

SILVER BANKSIAN MEDALS to Messrs. Lawrenson & Co., Newcastle; Mrs. N. G. Clayton, Chester Hall (gr. Mr. J. Cocker); Mr. W. Alexander, Hexham; Messrs. Clark Bros. & Co., Carlisle; Mr. Dixon, Holey Hall Gardens, Wylam; The Chadwick Memorial Schools.

Cecil H. Hooper, M.R.A.C., F.S.L. (Wye College, Kent); Mr. David Horne (Cowan's, Sheldon & Co.), Carlisle; Mr. W. B. Little, Hort. Lecturer, Armstrong College, Newcastle; Mr. G. L. Murray, M.I. Mun. E., Cert. R.S.L., Town Surveyor, Hexham; Mr. E. J. Chittenden, F.L.S. (R.H.S. Laboratory, Wisley, Surrey).

KNAPSACK SPRAYERS.

Having inspected the various models of knapsack sprayers, submitted by the FOUR OAKS Co., Messrs. BURLAND & SON, and the ALPHA Co., on the lines of power, nozzle tests, lime washing, durability, access to parts, and general construction, the judges gave their awards as follows:—THE ALPHA Co. (Gold Medal), FOUR OAKS Co. (Silver Medal), BURLAND & SON (Bronze Medal).

The judges consider that the knapsack sprayers submitted by the ALPHA Co. (which are of the pneumatic type) are a considerable advance on previous designs. Their construction is simple, reliable, and effective, there being no working parts to get out of order.

The Four Oaks knapsack was found to be a considerable improvement on the older forms of knapsack sprayers, inasmuch as the fittings are

display as a whole (Gold Medal); BURLAND & SONS, horticultural sundries, trade display as a whole (Silver-gilt Medal); VOSS & CO., horticultural sundries, trade display as a whole (Silver-gilt Medal, with special reference to their "Dry Sprayer"); ALPHA Co., horticultural sundries, trade display as a whole (Silver-gilt Medal); COLORADO Co., horticultural sundries, trade display as a whole (Silver Medal); M. HERROD, horticultural sundries, trade display as a whole (Silver Medal); CROZIER, STEPHENS & CO., horticultural sundries, trade display as a whole (Award of Merit); D. WILSON, horticultural sundries, trade display as a whole, frames for intensive culture (Award of Merit); COOPER & NEPHEWS, Award of Merit as an educational exhibit; MORRIS LITTLE & SON (Award of Merit).

THE CONFERENCE.

THE proceedings were opened on Thursday, at 3.15 p.m., Dr. D. Stewart in the chair. The room was crowded, and it was not possible for all to gain admission.

The first paper, which we print below, was by Mr. Geo. P. Berry, Horticultural Instructor to the Edinburgh and East of Scotland College of Agriculture, on "Fruit Storage and the Bottling of Fruit."

THE STORING AND BOTTLING OF FRUIT.

In the practice of horticulture, as in the professions and crafts generally, we have been guided, to a great extent, by conclusions arrived at by eminent men, and have taken little trouble either to verify or to question them. It is not surprising, therefore, that, from time to time, the rules and systems which have hitherto bound us should be shown to be fallacious. At the same time, I trust that any statements in this paper which may appear to be antagonistic to generally-accepted ideas may be well considered.

PICKING THE FRUIT.—In addition to the importance of avoiding the breaking of the cuticle, or outer skin, there is another matter which requires attention. In Apple and Pear growing, thinning should always be carried out on the lines of one fruit to one spur, but too little care is often bestowed on the buds, which should remain on the spur after the removal of the fruit. On a spur bearing a good Apple, no bud, as a rule, develops sufficiently strongly to produce fruit the following season.

During the development of the fruit, two small buds form, one on either side of the fruit stalk, and immediately below its junction with the spur. On rare occasions only do these buds produce blossom the following season; but they do so in the second season after their formation. In picking the fruit, great care must, therefore, be taken not to damage these buds, and it must be done in orthodox fashion by gently raising the fruit and severing the connection at the end of the fruit-stalk by means of the fore-finger and thumb. The buds are very easily damaged, and, in hundreds of cases, they are removed along with the fruit, thus rendering the spur useless for several years.

BRUISING OF THE FRUIT.—Too little importance is often attached to the operation of gathering the fruit. Such methods as shaking the trees, and picking the fruit off the ground as is sometimes practised in orchards, tend to do away altogether with the possibility of keeping the fruit. Apples, Pears, Plums, &c., should be carefully picked in shallow, lined baskets, and should be removed and placed on the fruit-store shelves by hand. Apples should not be placed in large hampers and wheeled to the fruit-store in barrows, as, by so doing, bruising is certain to take place. Whenever the skin of the fruit receives a bruise of any kind, air is admitted, and this at once begins to act on the acid of the fruit, causing oxidation or discoloration, and hastening decay.

STRUCTURES FOR STORING THE FRUIT.—These are often very unsuitable. I have in my mind a most elaborate fruit-room in a fruit growing garden in Banffshire, where almost all the conditions necessary for successful storage are absent. The best fruit-rooms are those below the ground level, and into the construction of which practically no woodwork enters. The shelves should be formed of Welsh slate slabs, fixed into the surrounding walls, and ventilation should be provided for by means of openings at the base of the

THE NORTHERN FRUIT SHOW.

FIG. 135.—EXHIBIT FROM THE CUMBERLAND AND WESTMORLAND COUNTY COUNCILS.

BRONZE BANKSIAN MEDALS to Mr. J. H. Stewart, Dalston; Mr. Thos. Waugh, Stocksfield; Mr. F. Foster, Brackenhurst; Messrs. Porteous & Thomson, Hexham.

SPRAYING DEMONSTRATION.

The following is an official account of the spraying trials.

Judging took place on the following basis:—

- Max. Points.
- 25 For power tests.
- 25 For nozzle tests.
- 20 For lime washing, e.g., clear working, thick coat, strainer, &c.
- 10 For durability and resistance to chemical actions.
- 10 For cost.
- 5 For ease of access to parts, e.g., in case of clogging.
- 5 For general portability and adaptability.

100

The judges were:—Mr. G. B. Berry, Hort. Lecturer, Edinburgh Agricultural College; Mr.

external to the reservoir, and therefore not in contact with the liquid. A great improvement was also noted in the fittings of the extension rods, the inlet having been removed from the bottom to the side. The harness and socket for holding the extension rods were also favourably commented on.

The Burland knapsack was similar in some respects. The working parts are outside and easily accessible, a special feature being its adaptability for working with either hand.

HAND-POWER SPRAYING MACHINES.

The competition between hand-power spraying machines was keen, and after exhaustive tests, and taking into consideration the mechanism, portability and cost, the judges came to the following conclusions, viz., Messrs. BURLAND and FOUR OAKS Co. (Silver Medals), Messrs. W. VOSS (Bronze Medal).

SPRAYING SYRINGES.

The Four Oaks undentable spraying syringe, with adjustable nozzle, was awarded a Gold Medal.

The following medals were also granted:—FOUR OAKS Co. for horticultural sundries, trade

walls, and in the roof, in order to prevent stagnation of the atmosphere.

TEMPERATURE.—For Apples the temperature should be kept as near to 33° F. as possible. In fact, in some stores it falls to 32° without doing any injury. A most important thing, however, is the presence of a considerable amount of moisture in the atmosphere, provided there is a fair circulation of air. Many fruit-rooms have such a dry atmosphere that it is impossible to keep Apples well in them. A dry-and-wet-bulb hygrometer, which will at once indicate the state of the atmosphere as regards moisture, should always be used.

DESSERT PEARS.—These require a considerably drier atmosphere and higher temperature than Apples, from 40° to 45° F. being about the best temperature. The fruit should, as far as possible, be placed one layer deep on the shelves, and it should be examined periodically, and decayed specimens removed. Late-keeping varieties of stewing Pears will require a lower temperature, with moisture in the atmosphere, similar to that required for Apples, otherwise undue evaporation takes place, with corresponding shrinkage of the fruit.

FLAVOUR.—Fruits of all kinds, but more especially Apples, very readily take the flavour of substances with which they may be brought into contact, or which may be in suspension in the atmosphere of the fruit-room. A fruit-room, therefore, should contain no substances likely to contaminate the atmosphere, and it should never be used as a seed-store. I have tasted the flavour in Apples of ordinary Archangel mats (in which seeds had been received) which had been placed for some time on the floor of the fruit room, although no direct contact had ever taken place. Straw is another objectionable substance in a fruit-store, and even woodwork of all kinds should be dispensed with, as already mentioned. The best substance on which to lay Apples and Pears is burnt clay. A layer of this, one-eighth of an inch deep, should be placed on the shelves of the fruit-store, and, by this means, not only will the flavour of the fruit be retained, but it will be considerably improved, by preventing contact with the wooden shelves, more especially in the case of late-keeping varieties.

Light in a fruit room is not objectionable, provided it is not direct sunlight. No windows which are directly exposed to the sun should be left unshuttered, otherwise the uniformity of temperature will be disturbed.

THE SWEATING PERIOD.—Apple fruits exude an oily substance, which is more abundant in some varieties than in others. This sweating commences from 14 to 21 days after storing, and the oily substance exuded from the fruit is, apparently, one of Nature's methods of rendering the skin air and water-proof. The sweating period should never be hurried by drying the atmosphere of the store either by fire heat or by too much ventilation. If a gentle circulation of air is taking place, just sufficient to prevent saturation, that is all that is necessary. The "sweat" should be allowed to dry slowly on the skin of the fruit, and it will repay one, so far as the keeping qualities of the fruit are concerned, to give this matter careful attention.

In the north, late varieties of Apples are sometimes gathered too early. This, of course, causes shrivelling even in the best store and under the best conditions. It often pays to allow a late variety of Apple or stewing Pear to remain on the tree to well on in November, or even later. These varieties seldom suffer from frost, the sugary material in the fruit being less easily affected in this way than it is in the earlier, and, therefore, more mature varieties.

STORING IN JARS.—After the sweating period has been passed, the fruit may be selected and placed in large earthenware jars. This is done in the following way: The fruits are placed in layers in the jars, and the top of the jar covered by a piece of ordinary roofing slate. The jars should then be placed in a cool cellar or store-room, and if a variety has been selected which has got a long keeping season, such as Bramley's Seedling, Newton Wonder, or even Lane's Prince Albert, fruits stored under such conditions will almost keep until the fruit season comes round again. It is always advisable, even in a large establishment, to treat a few of the best of the late-keeping varieties of Apples, and also of the late-keeping varieties of Pears, whether dessert or stewing, in this way.

BOTTLING OF THE FRUIT.—We are all more or less familiar with some of the many devices resorted to by experienced cooks in large establishments for the storing and preserving of fruit and vegetables. In many cases a fair measure of success attends such efforts, but the one great objection to the majority of the methods employed is that the fruit has to be heated to the boiling-point before being considered safe to place in the store-room. This causes the fruit to become discoloured, and ripe fruit is almost certain to burst. Formerly, few private families, and still fewer cottagers, ever attempted the bottling of fruit for their own use, but in the course of the last few years a great change has come about in this matter. Bottles and appliances, with full instructions, can now be had so cheaply that any person possessing even a few fruit bushes in a small cottage garden is in a position to lay by a portion of his fruit, either ripe or unripe, for winter use.

The operation is of such a simple nature that success should attend the first effort. The one essential to success is suitable bottles and appliances for sealing them. The most useful and economical bottle that the writer has yet seen is that sent out by Carrington, Shaw & Co., Glasgow. Almost any size of bottle can be obtained, holding from a pound or two up to a gallon. The most suitable size for all purposes is, perhaps, the quart bottle, costing, along with glass stoppers, washers, &c., 4s. 6d. per dozen. The bottles are of ordinary glass, have a wide neck, and a special screw arrangement, by means of which the stopper is fixed down. Each bottle is provided with a rubber washer and a glass stopper, which fits firmly down on the rubber washer when in position.

THE OPERATION OF BOTTLING.—The fruit should be carefully selected. It should not be bruised, nor should it be damaged by birds or insects. Taking Gooseberries as an example, either green or ripe, proceed as follows:—First remove, by means of small scissors, the fruit-stalk and the withered remains of the calyx at the apex of the fruit. Make sure that the bottles have been scalded, and are scrupulously clean and sufficiently cool. Begin by placing the Gooseberries in the bottles, using fruits of various sizes, and giving the bottle an occasional shake in order to pack them as closely as possible. When the bottle has been filled up to the neck with fruit, pour into it sufficient pure (preferably spring) water to cover the fruit and stand a quarter of an inch up the neck of the bottle. Adjust the rubber washer. Place the stopper on the bottle, and adjust the screw on lid so that the stopper presses equally on the rubber all round. When the fruit has been thus disposed of, the bottles are ready for heating. This may be done in any large cooking utensil which is deep enough to allow of the bottles standing in water up to the neck while being heated. Place the pot containing the bottles over a fire, gas stove, or spirit lamp, and place an ordinary dairy thermometer in the water surrounding the bottles. The thermometer should be examined from time to time as the temperature of the water rises, and when 145° F. is reached the heat should be so regulated as to keep the temperature of the water as near to that point as possible for one and a half hours. The vessel should then be placed in a cool scullery or cellar, and when the water has become quite cold (in the course of 9 or 10 hours) the bottles should be taken out. The stopper will be found to be sealed hard down to the washer. Give the tin lids a rub with an oily or greasy cloth to prevent corrosion, and store the bottles in a cool, dark cellar or cupboard. The same process must be gone through in the bottling of all kinds of fruit, whether ripe or unripe. In bottling ripe Plums, care must be taken in removing the fruit stalk not to rupture the fruit at the base, or at any rate to damage it as little as possible, and in order to avoid this the stalk should be twisted round before being pulled out.

In the case of ripe fruit, a sugar solution consisting of $\frac{1}{2}$ lb. pure cane sugar to 1 quart of water may be used. Heat should be applied till the sugar is dissolved, and, when cold, pour into the bottles. The fruit may then be used directly from the bottles, along with the syrup.

Apples and Pears, after being cored for bottling, should be kept under water till ready for placing in the bottles, and immediately this is done they should again be covered with water, in order to prevent discoloration.

SCIENTIFIC PRINCIPLES UNDERLYING THE OPERATION.—According to a well-known physical law, if the temperature of a given volume of a gas be raised, while the volume is kept constant, the pressure of the gas increases in direct proportion to the rise in temperature. Now, we have in the neck of the bottle a volume of air confined in a given space, and as the temperature rises the pressure increases to such an extent as to raise the lid and allow the expanding air to escape, without allowing the stopper to be blown off. By keeping the water in the bottle at 145° F. for over one hour, a considerable portion of the air contained in the water is also liberated, and when the temperature of the water begins to fall below 145°, the screw-on tin cover presses the stopper down on the washer on all sides, so that no air is admitted from the outside. When the bottles and their contents are cold, the pressure of the air inside will be considerably lower than that outside, and the greater pressure of the air outside will therefore be sufficient to keep the lids down on the washers, and thus the bottles are perfectly air-tight. The washers should never be used more than once. The bottles are opened by unscrewing the outer tin lid and raising the glass stopper.

STORAGE OF FRUIT.

Mr. W. B. Little, Horticultural Instructor to Armstrong College and the Cumberland and Westmorland County Councils, next read a paper upon the "Storage of Fruit." He said that everyone recognized that it was desirable to have means of keeping late-ripening Apples in good condition for as long as possible. But in the first place it was necessary to adopt the best methods of cultivation possible in order to ensure perfect development in the fruits, for it was only the finest fruits that were worth the trouble and expense of keeping over a long period. All but the soundest fruits should be rejected, and, for this reason, the greatest care should be exercised in the gathering and handling. He next explained how amateurs might ascertain when certain kinds of fruits are ready for gathering.

Plums readily part from the twigs when ripe.

Apricots are ripe when the side next the sun appears soft and yields to gentle pressure by the finger; they as a rule adhere firmly to the twigs and would over-ripen on them if allowed to remain.

Peaches and Nectarines will separate if ready by moving the fruits upwards and allowing them to descend with a slight jerk; they should be received into a funnel lined with velvet.

Pears part readily from the tree on being raised to a horizontal position level with their stems on foot-stalks.

In regard to Apples, if it is noticed that some are dropping naturally from the trees, the whole of the crop will be ready for gathering. If doubt still exists, cut open an apple of the average ripeness, and if the seeds are black or brown in appearance it is a sure indication of the readiness of the crop. All fruits should be gathered in the middle of a dry day.

It is necessary to have a suitable fruit room, and advice should always be sought from some one having a knowledge of the necessary conditions. It is desirable to have the building partly underground to ensure evenness of temperature and moisture.

Burnt clay tiles specially made are cheap, and if laid on rafters would make ideal shelves for laying the fruit on.

If an amateur wishes to convert an ordinary shed into a fruit room it should be made frost-proof by thatching or by matchboarding the inside and filling between this and the permanent walls, with sawdust or straw. The roof should be treated in a similar manner. The interior may be fitted with sliding trays in tiers.

SIMPLE STORAGE.—Many kinds of Apples will keep successfully if stored away in bulk. A good many people in the north pit Apples in much the same fashion as Potatoes. It is necessary first of all to cover the fruit with brown paper and then with Wheat straw on thoroughly dried bracken. The whole is then covered with a thick layer of soil. An aperture is left at the top for some weeks to allow for sweating. The drawback, however, is the difficulty experienced in getting to the fruit.

The erection of a simple hut on something like the following lines was suggested for small amateurs. Make an excavation about 18 inches

A JAPANESE GARDEN IN THE TULLY NURSERIES, CO. KILDARE.

deep, then build brick walls, the back wall to be 4 or 5 feet in height and the front wall 3 or 4 feet. All around the walls, with the exception of the entrance end, turves or sods may be stacked in much the same way as in the case of the old sod-pits or frames. The roof should be formed of galvanized zinc, and a thick layer of turves and then another layer of zinc to allow the water to run off.

The door should be made box-like, and packed with sawdust. Inside, the pathway could be excavated to the depth of 18 inches or 1 foot, so as to allow a person to stand erect. There are certain points to remember in the management of a fruit room. For three or four weeks allow a free circulation of air, afterwards keep the air close. Maintain an even temperature during winter from 38° to 42°. Never allow the atmosphere to become dry.

Another means of storage is to pack Apples in barrels and store them where frost will not injure them. If a barrel of Apples is sunk half its depth into the ground and covered over with soil frost is excluded.

FRUIT-TREE STOCKS.

Mr. H. Somers Rivers read the following paper on "Fruit-tree Stocks."

To speak on the subject of fruit-tree stocks necessitates frequent reference to the history of horticulture, and that in turn involves research in many ancient garden books written in quaint language expressive of quaint ideas.

Many worthy writers seem to have taken their predecessors' statements for gospel and copied freely from them with or without acknowledgment. In the early 18th century there was a fashion, which obtained also in medical and other works, of going back to the classics for information. All was accepted as fact, without hesitation. However wild the statements may have been, they were under the aegis of antiquity, and, therefore, credible.

Myths of Roman writers were cited in good faith, and all sorts of impossible graft combinations gravely set forth.

To give an idea of these, Virgil, for instance, relates that Nuts were grafted on the Arbutus; Apples on Nut and Maple bushes, on Planes and Pears; Pears on Ash, &c.

I need not multiply instances, many of the authors were poets and took poetic license.

Most of these fairy tales are to be found in *The Fincyard*. Being the Observations made by a Gentleman in his Travels (2nd edition, 1732), which may be consulted by anyone wishing an excellent resumé of them. The gentleman need not have travelled very far from his own fireside for the information which he contrived to obtain.

It seems that fruit culture prior to the 16th century was somewhat primitive in England. In the *Fruiterers Secrets*, by "N.F. 1604," we read—

I think meete to acquaint thee from whence our great plenty of fruit came. One Richard Harris, of London, borne in Ireland, Fruiterer to King Henry the eight [1500-1547], fetched out of France great store of graites, especially pippins; before which time there was no right pippin in England. He fetched also, out of the Lowe Countries, Cherrie graits and Peare graits of divers sorts

What stocks these grafts were worked on is not mentioned.

The Country-Man's New Art of Planting and Grafting, practised by Leonard Mascall. 1652, gives directions—

For to make young trees of the Pepins of Apples, Pears, Plums and Services . . . take of the Pepins or Pomes of the said fruit at the first pressing out of ye liquor before the kernels be marred or bruised [and plant them] When these wild Cions shall be great, as of the growth of one year, ye must then pluck them up all in the winter following . . . and make of them a wild Orchard . . . set yr wild trees so far one from another as ye think meet to be graited. . . . In what part soever ye do set yr trees yr must cut off the great master root, within a foot of the stock and all other big roots Then after five or six years' growth, when they be so big as yr finger or thereabouts, ye may remove any of the big whears you will have them grow and remain About two or three years after their removing ye shall graite them.

The next paragraph, headed, "Of negligence and forgetfulness," is most interesting.

If peradventure ye forget and have let small Cions two or three years grow about the roots of ye stocks . . . ye may well pluck them up and set them in ranks, as the other of the Pepins.

This, I think, points to the origin of the dwarfing stocks for Apples. Among Apples raised from seed, some will occasionally be found with a surface-rooting nature which make but little

growth. These would naturally get left behind in the wild orchard as the others were "plucked up," and eventually form stools as described above, the mother plants of dwarfing stocks. Mascall mentions that it—

the Pepins be sowed of the Pomes of Pears and good Apples ye shall find that some of them do love the tree whereof they came If ye will augmēt at trees of themselves, ye must take Grafts and so graite them.

In the chapter of "Setting Trees of Nuts," we learn that Peaches, Almonds and Apricots "all these do love the trees they came of," and, presumably, were not propagated in any other way than by seed.

Sower Cherries . . . will grow of stones, but better it shall be to take of the small Cions which do come from the roots; then plant them.

Great Cherries were to be grafted on their own seedlings or on trees of the sower fruit.

Ye must have respect unto the Healine Chery, which is graft on the wild Gomire [Gean] (which is another kind of great Chery), and whether you do prune them or not, it is not materiall, for they dure a long time.

Plums and Damsons were propagated by suckers, or

if your Plum tree be graft already and have the like fruit that ye desire, ye may take your graites thereof and graite them on your Plum tree.

So far, Mascall is reasonable, but after this he lapses into extravagant suggestions.

R. A. Austen, in his *Treatise of Fruit Trees*, 1653, recommends seedling stocks as being far better than suckers, and mentions different stocks by name. Also, he is under no illusions:—

. . . the Plants you intend to inoculate must be like (as to general kinds) with the Buds that you intend to set on . . . as Apricot Buds and other Plum-Buds on Plum-stocks that are wild stocks. The White Peare plum stock is accounted the best to inoculate Apricot buds on, or other choice Plums. As for stocks fit for Apple Grafts, I account Crab trees better than sweeter Apple trees to graft, because: they are usually free from the Canker . . . and I conceive will last longer than stocks of sweeter Apple trees. The best kind of stocks to graft Peare-grafts upon are such as come of the seeds or kernels of Peares. I know no difference amongst these, but all are good to graft upon. And I utterly dislike grafting these fruits upon White thorne, or upon any kinde of stocks beside Peare stocks. The fruits are naught (having a hard and stony core) if grafted upon a Thorne tree. Concerning Stocks fit for Chery-trees, I account the black Chery stock the best to graft any kind of Chery upon. Yet some say the red Chery stock is best for May Cherries. But the black Chery stocks are goodly straight Plants full of sap and become greater trees than the red Chery trees. There are very many kinds of Plums, many more than of Cherries. I esteem the Muske Plum one of the best, being a faire large black Plum, and of excellent relish and the trees beare abundantly.

The Mussel is now used for stocks perhaps more than any other Plum; the above description would be considered over-flattering for its fruit nowadays.

The White Peare-plum stocks are accounted the best and the Damson stocks the worst, as being dry stocks. I account the White Peare-plum stocks the best to inoculate Apricot Buds upon, although they may be done upon other Plum-stocks with good success. The best kind [of Nectarine] that I know is the Roman red Nectarine. But it is very hard to be propagated. . . . I hold it best to inoculate [it] upon the Branch of an Apricot which before hath been inoculated upon a good Plum stock.

This is the first notice I find of double-working.

Of Peaches there are divers kinds. . . . These require choice Plum-stocks to be inoculated upon, as the White Peare-plum stock, or else stocks coming of Peach stones.

It is curious that Austen says nothing of Quince stocks for Pears in the foregoing descriptions, as, in his "Observations upon some part of Sr. Francis Bacon's *Natural History*," dated only four years later, 1658, we find—

. . . . If we graft upon a stock that naturally beares a sower, harsh fruit, the fruit of the graft will not be altogether so pleasant as if it were grafted upon a stock that beares naturally a sweet and pleasant fruit; and hence it is that Peares grafted upon Quince-stocks will be more delicate then upon Peare-stocks. The Quince-stock gives an excellent tast to it, but these trees upon Quinces will never attaine to any bignesse.

Can it be that the use of the Quince as a stock had only just then been introduced?

Wm. Lawson, *A New Orchard and Garden, Particularly in the North*, 1656, remarks that for setting an Apple Orchard—

Some for readinesse use slips, which seldome take root. . . . A Burr-knot kindly taken from an Apple-tree is much better and surer. . . . Or if it please the planter he may let his lough be crooked and leave out his top end one foot . . . wherein will be good grafting; if either you like not or doubt the fruit of the lough (for commonly your Burr knots are Summer fruit). The usual kind of Sets are plants with roots growing of kernels of Apples, Pears and Crabbs, or stones of Cherries, Plums, &c., removed out of a Nursery, wood, or other Orchard, into, and set in your Orchard in due place.

John Evelyn, in *Pomona*, 1678, an appendix to *Sylva*, concerning fruit trees in relation to cider, says—

We shall find the Wilding to be the hardest and most proper Stock for the most delicate Fruit. . . . However they do in Herefordshire, both in practice and opinion, limit this rule; and to preserve the gust of any delicate Apple . . . rather graft upon a Gendet-Moyle . . . than a Crab stock, but then indeed they conclude the Tree lasts not so long. . . . The Gendet-Moyle is commonly propagated by cutting on the branch a little below a Burr-Knot and setting it without any more ceremony.

According to Koch, *Die Deutschen Obstholzer*, 1876, the French Paradise was known in France as early as the beginning of the 15th century, the first published account of the fruit appearing in Jean de Ruelle's *De Natura Stirpium*, and was considered as one of the most highly flavoured Apples then grown. This evidently is not the Apple which is used as a stock, accurately and succinctly described by Parkinson, *Paradisus Terrestris*, 1629.

The Paradise apple is a faire, goodly yellow apple, but light and spongy, and of a bit-rich sweet taste, not to be commended.

John Reid, *The Scots Gard'ner*, 1683, is the first English gardening author I have come across who mentions this stock and its object—

To make dwarfie Aples, Graft or bud on the paradise or any that hath Burry-knots, Codlings, Red-stracks, &c. Dwarfie Pears on the Quince, but no Pear holds well on it (that I have try'd) save Red Pear Achans and Longavil, but you may re-graft for varieties. . . . Dwarfie Cherries on the Morella, or on the common Red Cherrie. Or on that Red green which is more Dwarfie than the black.

Horticulture in France was earlier developed than in this country, as we have already seen from *The Fruiterer's Secrets*. The training of fruit trees in various shapes was something of a fine art, and stocks for them received, therefore, closer attention. The appearance of *The Compleat Gard'ner*, by the famous Mons. De la Quintinye, Chief Director of all the Gardeners of the French King (Louis XIV., 1643-1715), made English by John Evelyn, Esquire, 1693, no doubt gave a great impetus to our fruit culturists. He mentions special

Quince Stocks . . . such as are very sound and produce large Leaves and fine shoots, and have a smooth shining blackish Bark (. . . call'd Females) . . .

Apples upon "Paradise-stocks"

with this difference only, which seems surprising between the Quince and Paradise-stocks, that the Paradise-stocks being anything large, are extraordinary good Grafted in the Cleft, and seldom succeed Grafted with a Scutcheon [i.e., budded]; whereas it is the clean contrary with Quince stocks . . . Apple-trees . . . Grafted upon Paradise-stocks . . . quickly bear Fruit and shoot but little wood; [those grafted upon Apple Wildlings] are a long while producing nothing but a vast quantity of Wood.

Plum trees are grafted or budded upon other Plum-Trees, and that only upon a small number of kinds, for Instance, upon St. Juliaus, Black Damask and Little Chery-Plum, &c.

Peaches, to succeed well, must be Budded . . . either upon St. Julian Plums, or Black Damask, or upon Apricot Trees already Grafted, or upon young Almond-Trees of that year's growth; they seldom succeed upon Stones of other Peach, or Apricot Trees.

All . . . kinds of Cherries are Grafted except the Merriers, or small white bitter Chery which are not worth it, but . . . [as] Suckers, are very good Stocks to Graft other Princpal kinds upon.

John Lawrence, *The Clergyman's Recreation*, 1714, mentions—

the Pear-plum, Muske or Bonum Magnum Plum, which have been found by long experience to be better and more lasting than any other [stocks for Peaches and Apricots]. The best Plum will do on any ordinary Plum or Sucker. Black Cherries are the only Stocks, whereon to raise all the several sorts of Cherries. . . . Many recommend Grafting the Pear on a Quince-Stock . . . but they are not long-lived, do not bear such fair large Fruit, nor make such handsome regular trees, as those grafted on a Pear stock.

Batty Langley, *Pomona*, 1729, says—

Apples are grafted on Crab Stocks, raised from the Kernels of the Crab, as also on Stocks raised from the Kernels of Apples, of which that called the Paradise, is the best to graft on, to make Trees of a small Growth, and produce Fruits in great plenty very early.

Stephen Switzer, *The Practical Fruit-Gard'ner*, 1731, speaks of Nectarines doing better on the Margaret Stock (as it is call'd) much resembling the French stock [? St. Julian] in its shooting, but differs in its leaves.

This stock is never heard of nowadays.

Speaking of the double-working of Peaches upon Apricots—

I am told of the Brussel kind [? of Apricot] that at Brussels and Brada. . . they bud on White Bullace Stocks, which they say is of much Advantage to them, as to their bearing a greater number than ordinary. To conclude this Account of the Kinds of Stocks proper for grafting, &c., the Dwarf-Medlar is by some in vogue

for dwarfing of Peaches the Paradise Stock is for dwarfing of Apples and the Bullace for Apricots.

(Miller says the Brussels Apricot was usually budded on St. Julian.) Again, in a note to the plan of a garden (p. 305)—

The little Dwarf-Trees which are in the middle border, between each Wall are designed for Apples on the right French Paradise stock, Pears on the Dwarf Medlar.

It looks as if they had more than one Paradise stock even then.

A *Treatise of Fruit Trees*, by Thomas Hitt, 3rd edition, 1758, makes mention of several stocks not previously spoken of—

The stocks upon which I have found the Apricot to prosper best and yield the most palatable fruit are the common red wheat Plums, they have a tart taste, and are stocks tolerably free from gum and suckers, and may be raised from stones or layers. . . . Of stocks proper for Apples there are several sorts made use of, as those raised from crabs and apple kernels, from layers of the codling, paradise and creeper apple-tree. I don't well know what sort of fruit the last bears, but trees which I have known propagated upon them are of an extremely low growth, and may therefore very justly be called dwarfs.

Was this the right French Paradise and the "Paradise" the Doucin?

He says the stocks generally used for Nectarines and Peaches are the Muscle and Wheat Plum, and recommends double-working for those kinds which will not thrive direct on them, using, as intermediary, seedling Peaches and Nectarines, or else Apricots.

The best plum stocks for peaches and nectarines are the greengauge, either raised by stones or layers.

On which stock he also says the best sorts of Plums do mighty well

Philip Miller, *The Gardener's Dictionary*, 1759, says—

The Paradise Apple hath, of late years, greatly obtained for Stocks to graft or bud upon, but these are not of long Duration, nor will the Trees grafted upon them ever grow to any Size, unless they are planted so low as that the Cyon may strike Root into the Ground, when it will be equal to no Stock, for the Graft will draw its Nourishment from the Ground, so that it is only by Way of Curiosity, or for very small Gardens, that these Stocks are proper, since there can never be expected any considerable Quantity of Fruit from such Trees. These Trees have been much more esteemed in France, where they were frequently brought to the Table in the Pots growing with their Fruit upon them; but this being only a Curiosity, it never obtained much in England, so that the Gardeners do not propagate many of them here at present. There is another Apple which is called the Dutch Paradise Apple, much cultivated in the Nurseries for grafting Apples upon, in order to have them Dwarfed, and these will not decay or sink as the other, nor do they stint the Grafts near so much, so are generally preferred for planting Espaliers or Dwarfed, being easily kept within the Compass usually allotted to these Trees.

The first stock seems to answer to the right French Paradise, the second to the Doucin.

A standard work of its time is the *Traité des Arbres Fruitières*, Duhamel du Monceau, 1768, who mentions the Mahaleb—

Stocks of Quince, Crisier de Sainte Lucie (Mahalé), Doucin and Paradise are more generally raised from layers, than as seedlings.

Miller describes the Mahaleb Cherry, but does not mention its use as a stock

Apples are grafted, firstly on the tree-stock, which produces trees suitable for the orchard. Secondly on Doucin, this forms middle-sized trees, bushes, espaliers and half standards, when the soil suits the Doucin the trees grow almost as large as those on the stocks. Thirdly apples grafted on the dwarf Apple of Paradise do not grow trained trees or very small bushes, since they are not high. They fruit much sooner, give larger proportional crops, and the fruit is much bigger than on the tree or Doucin stocks.

An Encyclopædia of Gardening, J. C. London, 1824 gives as the dwarfing stocks for fruit trees—the tree stock, Doucin and creeper, for apples, the quince for pears, Bullace for plums, and pertumel (Mahalé) and wild red cherry for cherries.

The first English mention I have found of the Mahaleb as a stock,

In *A Guide to the Orchard and Kitchen Garden*, John Limley, 1831, speaking of the Doucin stock, says it—

is most generally, in our nurseries, called the Paradise stock, although widely different from the Paradies of the French, a sort now worth growing in this country. Apricot stocks are budded principally upon two sorts of stocks, the Muscle and the Common Plum, and are, however, by many nurserymen, budded upon the Brussels, and another by name of the Brompton stock. When temporary standards are wanted, the practice of budding standard trees upon Brompton stock may be allowed; but the best Apricots are raised from upon the Brompton stock, a practice which ought to be discontinued even for a temporary purpose.

Trees on the Brompton make very long, sappy, long-jointed growth and flower very sparsely.

Finally, we come to the *Miniature Fruit Garden*, 1859, 8th edition, by Thomas Rivers, my grandfather, in which he mentions—

About forty years since (1820), I raised a large number of apples from the pips of the Golden Pippin, Golden Reinette, Ribston Pippin and other esteemed sorts. These in course of time all bore fruit, but as not one was found superior to its parent, I didn't cultivate them. Why I mention this is, that among my seedlings were several that put out roots near the surface, and the cuttings of which struck root. It is only within these few years that I have had my attention drawn to one of these, which has very broad leaves, and a most healthy and vigorous habit. It roots freely at the surface, and bids fair to be a very superior stock for garden apple trees.

This stock is again spoken of in the 17th edition, 1875, and another with

a habit equally vigorous, but with a great tendency to form fruit spurs. The former I have named the Broad-leaved Paradise, the latter the Nonesuch Paradise—they are likely to form a revolution in apple culture, as the varieties of apples grafted on them formed such healthy and fruitful trees.

This then is the origin of the stocks which are now recognised as fulfilling all my grandfather claimed for them. We should especially note that the Broad-leaved Paradise, which is "a variety of Doucin," was simply a seedling from one of our ordinary dessert Apples.

Again we read (17th edition)—

I have at this moment (Sept. 1879) a full collection of all the Paradise stocks known in Europe. There are three varieties of the French Paradise all making very dwarf trees, then come three Dutch Paradise, all much alike, but slightly more vigorous than the French sorts, next to them are two English Paradise, both of them from old English nurseries—they have much resemblance to the French Doucin stock, but are better, swelling with the graft. The Creeper Paradise is probably that mentioned by Miller, in the last century, since it is very remarkable for putting forth suckers from the roots, objectionable, but not common with the apple tribe. The Nonesuch Paradise stock, raised here from that very old apple the Nonesuch of Queen Bess's time, is quite sui generis, for it has downy leaves and a knotted stem, but is wonderfully fertile. The Broad-leaved is as much like the best of the Doucin stocks of which there are endless varieties, one of the best in my plantation is good and much like the last-named. The Miniature and Piny Paradise, both raised from seed here, have the dwarf habit of the French Paradise.

I have thus enumerated 14 kinds of Paradise stocks, the three first and the two last remarkable for giving very dwarf trees, all the others are of the same nature as the Doucin, all giving healthy trees.

The Pommer de Paradis, or the French Paradise, seems identical with the "dwarf Apple of Armenia," referred to in the *Journal of the Horticultural Society of London*, vol. iii., part ii., p. 115 (1848). It is exceedingly dwarf in its habit and too tender for this climate, unless in very warm and rich soils. Out of 2000 imported in 1845, more than half died the first season, and two-thirds of the remainder the following. The same result attended an importation in 1866.

Much confusion has prevailed about Paradise stocks, and many have been the theories as to their origin and introduction. I think, judging from the preceding extracts, we may safely conclude that they are all simply Apple seedlings, i.e., free-stocks, which have arisen in an ordinary way in Italy, France, Holland or this country.

The name, applied to many totally different varieties of the Apple, has greatly helped to muddle matters. A fruit which seemed to possess extraordinary beauty must have been worthy of the Garden of Eden, if it did not originate there, and was christened "Paradise." What more striking and worthy of the name than the first little Apple tree, 3 feet high and loaded with fruit, grafted on a dwarfing stock which appeared amongst the other free stocks in the nursery. A gift of the gods, direct from Paradise! Most of the stocks now in use, and many which have dropped out, have, I think, now been mentioned.

I seem to have quoted very freely, but, in the words of John Evelyn, it "preserves the gust" of my authorities which would otherwise be lost.

Dates.	Stocks.
1655.	White Pear Plum, White-thorne.
1658.	Quince French Paradise (1600).
1683.	Paradise, Motello, Codling, Redstrack.
1693.	St. Julian, Black Damask, Cherry Plum.
1714.	Muscle, Bonum Magnum.
1731.	Margaret, White Bullace, Dwarf Medlar.
1758.	Red Wheat Plum (Codling), Creeper Apple, Greengauge.
1759.	Dutch Paradise.
1768.	Mahaleb (1824) Doucin.
1831.	Brussels, Brompton.
1859.	Broad-leaved Paradise.
1870.	Nonesuch Paradise.

(To be continued.)

INTERNATIONAL HORTICULTURAL EXHIBITION, 1912.

OCTOBER 25.

ON Tuesday last at 12 o'clock noon a meeting of the secretaries recently appointed to represent counties in England and Scotland, Ireland and Wales was held in the Hotel Windsor, Victoria Street, Westminster, to consider certain details regarding this exhibition. Mr. Gurney Fowler, chairman of the Executive Committee, presided, and the attendance numbered between 40 and 50 representative officials.

At 1 p.m. the provincial secretaries joined the members of the General Committee at luncheon. There were 100 members present.

Immediately after luncheon, in the Hotel Windsor, the Chairman, Mr. J. Gurney Fowler, said: On behalf of the Executive Committee of the International Exhibition, 1912, I beg to thank you all heartily for having come to this meeting and for showing the interest you take in the affairs of the exhibition which is to be held. You will remember the meeting which took place in April of this year, at which Sir Albert Rollit was present, and at which an exhibition was decided upon, and a Provisional Committee appointed to take the preliminary steps. This Provisional Committee came together and elected other gentlemen to join them to assist in forming an Executive Committee. The first thing the Executive Committee dealt with was the financial responsibility devolving upon those gentlemen who had met and decided to hold this exhibition. It was conceded that it could not be carried out without considerable expense, and it was recognised that, in the event of their being a loss, the members of the Executive Committee would have to bear it. It is expected, however, that the cost of the exhibition will be defrayed out of the receipts. The Committee thought the matter over and came to the conclusion that the best course to adopt was that a Company should be formed to carry out the work of this exhibition. We went to the Board of Trade and obtained their authority to form a company, as I have described, and, inasmuch as the profits, if any, will go to some charity or some kindred philanthropic or scientific institution connected with horticulture, and in respect of the directors having no remuneration for the work which devolves upon them as directors, the Board of Trade have authorised the company to be registered without the word "limited" being added to its name. All that the Executive Committee has done has been done provisionally, and their acts will have to be adopted by the company which is about to be registered. It has a capital of £1,000 nominal, and I believe all the members of the Executive Committee will put their names to the articles of association, making them responsible for the amount of the capital. One of the first things the Executive Committee did was to appoint a Finance Committee, a Schedule Committee, a Reception Committee, and a Show and Site Committee. These committees have met on several occasions, and have passed resolutions which I propose to deal with shortly. First, a circular was sent out to the principal people in the country, to the King and Queen, and to all the members of the Royal Family, practically all of whom have agreed to become patrons, to men of influence in the country, and most of these have consented to become vice-presidents. There are, no doubt, some names which we have omitted. If any gentleman knows of any such, and will send the name to the Executive Committee, we shall be very glad of it. The next step which the Executive Committee took was to get together a General Committee, and the members of that committee are present in the room now to a large extent. I am glad to see that so many gentlemen have attended, and it is understood that all present will do their utmost for the benefit of the exhibition. We had a meeting at 12 o'clock, at which about 40 secretaries of local committees from the counties attended, and we discussed generally the duties which will devolve upon the local committees which are about to be formed all over the country, our object being to get the whole of England, Scotland, Wales and Ireland interested in the exhibition which is to be held. We next approached the official representatives of the various

Colonies, and they have all accepted the invitation to serve upon the list, which ought to be called the "list of honour." Invitations have been accepted very cordially from France, there is a very keen interest being taken among Continental horticulturists in the exhibition, and I have no doubt we shall have a great number of visitors from abroad. As to finance, I have mentioned that it has been decided that any surplus funds will be devoted to some scientific or charitable purpose connected with horticulture. The cost of the 1866 exhibition was about £12,000, and they were not only able to pay that sum, but had an available profit of £3,500 after paying all expenses. We hope that this exhibition will be a much larger one, and that it will be equally successful. I shall not be at all surprised if it is not much more successful than the earlier one, though I do not wish to prophesy on the subject. As to the guarantee fund, the Royal Horticultural Society has promised us £4,000; the guarantee has not been entered into yet, but it will be so soon as the company is registered. If we get £4,000 from other parties, we shall get £4,000 from them. We shall want considerably more than that, however, but we give certain privileges to guarantors in the way of tickets which I may describe to you. If we have a guarantor of £100 we give him a free transferable ticket for the whole period of the exhibition. A guarantor of £50 will have one transferable ticket for the opening day and one day during the period of the exhibition. Subscribers of 10 guineas and upwards will receive tickets to the value of about 20 per cent. above the value of their subscriptions. Subscribers of less than 10 guineas will receive tickets to the value of 5 per cent. above every two guineas subscribed. This works out in this way: a subscriber of 10 guineas will be given tickets for 12 guineas, 15 guineas to the value of 18 guineas. I may say that several donations and large subscriptions have already been promised, but we are not attempting to secure guarantors and subscribers until the company has been formed, and the first thing to be done then will be to adopt all that has been done by the Executive Committee. We are going to prepare very shortly a statement showing what we expect the expenses of the exhibition will be, so as to be able to approach the guarantors and say how much we want them to guarantee. Sir Jeremiah Colman has taken upon himself the honorary work of the treasurer, and we could not have found a man more capable of carrying on the work. The Schedule Committee have had an immense amount of work. I am sure all the members of that committee deserve the greatest amount of credit for their labours. I am thankful to say I am not a member of that committee. Mr. Veitch, Mr. Hudson, Mr. Fielder, and several other gentlemen have had a heavy burden upon them for the past two or three months in preparing that schedule. Everyone has their own hobby and wants more space than they are entitled to, and it is a very difficult matter for the committee to decide what space is to be given to each different object exhibited in the show. The limitations of the space imposes great difficulty on the committee. There will be no Temple Show in the year in which this show is held, which shows the goodwill of the Royal Horticultural Society towards this of ours. There has been a great deal of criticism about our exhibition—that it will be little more than a glorified Temple Show. I should like to say that it is the wish of the Executive Committee, so far as it lies in their power, to hold a real international exhibition. We appointed a Site and Show Committee, who went very carefully through the various sites available for the exhibition, and they have fixed upon the Chelsea Hospital gardens site. It was thought that that land, of about 16½ acres, with an additional three or four acres of trees and shrubs, and within five minutes walk of Sloane Square Station, was the best. It is rather smaller than we should like to have, but the shrubs and trees will form a very good background to the various outdoor exhibits. We have arranged to allow ample time before the show for the receipt of exhibits, and also after the show for their removal, and the rent will be £500. With regard to the date of the show, that required some serious consideration, and we have fixed upon May 22 to May 30, 1912. The former date is a Wednesday, and the Monday after that is Whit-Monday, and the 30th is a Thursday. During that week is Derby Day, so that, from various reasons, we hope our show

will be held in what may be called the centre of the London season. People may come up to town for Whit-Monday and the show, and others may come for the Derby and the show. We will get them all into the net. The Royal Horticultural Society has not only promised us a guarantee of £4,000, but also £1,000 for expenses, which latter sum is not returnable in any shape or form. As to the Reception Committee, no definite programme has been decided upon, and we hope that a series of entertainments worthy of the occasion will be organised. We have asked the Royal Horticultural Society to hold their hall at our disposal for a certain period of time, so that we can make up our minds as to what is to be done in the way of entertainments—either an exhibition of paintings or something of that sort. We should have some hall to fall back upon, as it would give us a little more time to turn round. As to the posters, we have asked Mr. John Hassall to design an advertisement poster, which will be used instead of a crest of the exhibition without our having to pay anything for amorial bearings. Ours will be something after the style of the Brussels Exhibition poster—and, whilst the general posters will be very large, the same design will be reduced to the size of a stamp, which will be embossed on envelopes sent out from the exhibition. As to advertising, we have asked the nurserymen to put a slip in their catalogues, and some 400,000 slips have been so issued. More will be sent out next year, much to the advantage of the exhibition. We approached the members of the Press to appoint a Press Committee, and the result was that Mr. R. Hooper Pearson was appointed a member of the Executive Committee as their representative. As the work which we have done is work of a preliminary character, that work will have to be taken up by the company when it is registered, and we hope that when the circulars are sent out inviting guarantors and subscribers they will be received and met on a business footing. Concluding, the Chairman said that Mr. Edward White had been appointed hon. secretary of the Executive Committee, and he might say for himself, as chairman of that committee, we should have found great difficulty in finding such another for the work.

Sir Albert K. Rolit moved the first resolution. It was, he said, a pleasant and easy task. They were now to be asked to join him in expressing approval—and after the luncheon they had enjoyed, they would have no difficulty in doing so—of the show. The resolution he was going to ask them to approve was, "That this general meeting"—men proposed and the public disposed and, therefore, it was necessary to have general assent—"approved of the proposal for an international horticultural exhibition in 1912, in accordance with the explanations of the chairman of the executive committee, and pledged itself to work in order that it may be a thorough success and creditable to the country." The chairman had told them that a great deal of organisation would be necessary, and the fact that some guarantors and subscribers would be necessary must not be overlooked. They could do the Samaritan on "the oil and tuppence"; but, at some period, they would be asked for "the oil and the tuppence," whatever excuse they might give. The assent was necessary, because in this democratic age, one did not like one-man shows; they liked everybody to take their part and join in the ultimate group and design, and by organisation, by attracting all the energy, and enterprise, and public spirit, and local patriotism of the whole country, to show that the horticulture of England, like nearly every other form of enterprise, was still capable of meeting and beating the whole world. Most of them had no part in the show of 1866; they only admired what was then done. It was a great success. But they had the names of those who managed it—the Veitches and others still surviving, and Mr. White, the secretary, with the chairman of the executive and schedule committees, and these were, in themselves, a guarantee of success. Now what was wanted was that, while they were proud of their nation, while they knew—thanks very much to the R.H.S. and their support of it—that British horticulture headed the horticulture of the world, and there were no shows which were equal to theirs—probably there never was an assemblage of plants and flowers equal to those at the Temple and Holland House Shows—that was the standard they had

to maintain. They meant to keep this country in the van and the leadership of the world. But we lived in an international age. Every day, thanks to the telegraph and the telephone, the world is made one, and, within certain limits, national enterprise is being compared with national enterprise, and hence there were many excellent exhibitions, such as Milan and Liège, in which they met the forces of the world. If they were to teach the world lessons then, they must do all they could to make this show a grand success. We were not often first in the race, all our great industries, textile and others, were brought from abroad into this country; but when we applied to them British practical insight and enterprise, we soon assumed first rank, and entered into friendly competition with the rest of the nations of the world, and this would affect the peace of the world. It was this comparison of enterprise which stimulated them to attain to the headship of the world. Exhibitions were a great advertisement. Shakespeare said, "Sweet are the uses of advertisement." He didn't say so, but it was all the same; we had to illustrate what we could do by following other nations, as well as to use and take advantage of what they were doing. The trade of the world moved in cycles, times of prosperity and times of depression, which ought to be used to more advantage. We had seen times of depression succeeded by a wonderful development of the industry and trade of our own country, and in that way they promoted the trade not only of this country, but the trade of the empire to which they were proud to belong. He suggested that in the programme of the show they should include a conference on horticultural education. It was only by bearing the accumulated experience of the world that they could advance in the practice of their profession. They must not ignore theory and science; it was quite wrong to say that what was theoretical was not practical. What he wanted them to realise was that, whatever they had accomplished, there was still a great deal more they could do; that the old exhortation about making two blades of grass grow where one grew before was now obsolete, and that more could be accomplished by union with science and the promotion of practical knowledge, and thus carry on the work of horticultural education. One more reason for this conference. We lived in an international age, and no sane man could escape contemplating the possibility of a great European war. The fact that such an event was possible made the position of our country constantly uncertain, and the promotion of interchange in matters horticultural, inter-communication with and welcoming foreigners, and extending to them our hospitality and goodwill, would teach our potential enemies that we wished to be friends with them, and with all the world, and to do all they could to bring about the day when the barrier would fall down between nation and nation, and be set up only between right and wrong. It was in the hope of the extension of the Olive branch to their foreign friends that he asked them, as citizens and patriots, to render a great and creditable success this international gathering.

Mr. Graham Anderson, who seconded the proposal, said the question had been asked him before: far this exhibition was international? Had the Executive Committee made any representations to Continental nations? He understood that a representative of the Holland Ministry of Agriculture was present, and that he would be willing to cooperate with others in this matter. He suggested whether it would not be advisable to have on the executive committee representatives of any Continental nation who might be in London, so that they could go hand in hand with them. He thought the conference at the exhibition should take some practical form, and that papers might be read, for instance, on the life and history of insect pests, and the methods of exterminating them.

Mr. Alex. Dean pointed out that the absence of a show at the Temple would be a great loss to the Fellows of the Royal Horticultural Society. He would like to see at the exhibition a great gathering of the gardeners of the United Kingdom. His heart went out to the gardeners because of the isolated positions they occupied, and any proposal that would bring them together, even for a short period, would be very desirable.

Dr. Van Ryn thought they did well to stretch out the hand of welcome to the foreigner, because

nothing could tend more to strengthen the desire for international peace than this bringing together of an international gathering, at which there could be interchange of ideas—it would be of the very greatest importance. If it was desired to make the exhibition truly international, they should seek the good offices of representatives of the countries likely to send exhibits. Then there should be committees abroad who would take charge of the exhibits. On behalf of the country he represented, he said he would be very glad indeed to do all he could to make the exhibition a success. As regarded the quality of the exhibits, he thought it would be difficult to beat the Englishmen. He had been living in this country for years, and he knew, as regarded the growing of flowers, the high standard that was maintained here. The gardens of the International Peace Palace at the Hague were to be laid out by an Englishman.

The Chairman remarked that in a few days the exhibition schedule would be out, giving the various classes for which exhibits would be asked.

Mr. Reginald Farrar advocated a section for Alpine plants, and he suggested that such plants should be judged by specialists in Alpines.

Mr. Spencer Pickering, referring to the mention of garden pests, thought it would be an excellent thing to see that some part of the proposed conference dealt with them. Gardeners knew very little of the life history of these destructive insects, and the public still less, and this ought to be remedied.

Replying to the observations made, the Chairman dealt first with the suggestion of Mr. Graham Anderson that there should be foreign representatives on the Executive Committee, that question had, he said, been carefully looked into, and it was found that in the international exhibitions which had been held all the work had been done by gentlemen belonging to the nation giving the exhibition. They had several gentlemen on the executive who had attended many foreign exhibitions and knew how these matters were conducted. Mr. O'Brien hoped that the exhibits of foreigners would be well looked after while here—he could promise that this would be satisfactorily attended to and that every facility would be given to foreign exhibitors. As to Mr. Dean's remarks, they did not want shareholders; what they wanted were—guarantors and subscribers; shareholders would have the pleasure of holding to the shares, on which there would be no dividend, and he did not think anyone would aspire to that undesirable position. As to the judges, they would do their best to have men of standing for the different classes and they would get foreigners to assist in the judging. Then, as to the Reception Committee, it would arrange special days for special objects, but no programme had been arranged, as the committee had not yet met. They had practically decided to do what Dr. Van Ryn had suggested. He did not think they would approach the Governments of foreign countries, but the committee thought of having gentlemen who would represent their respective countries to get together and arrange for the exhibits being sent over here. He (the Chairman) was glad of the suggestion as to approaching the Governments, and he would see what could be done with it. The Executive Committee were discussing whether it was desirable to have money prizes, or, on the contrary, limit the awards to diplomas of honour and medals.

The Chairman here put the resolution, and it was carried enthusiastically.

Mr. Arthur W. Sutton proposed a vote of thanks to the Chairman. They all knew, he said, the strenuous work Mr. Gurney Fowler had done for this exhibition. It was no easy task to be chairman of the Executive Committee and to explain for the first time with such lucidity the extraordinary ramifications this exhibition had acquired. To be chairman of such an enterprise was to be one man among ten thousand.

Mr. John Green having supported the vote, it was carried with applause.

Mr. Veitch proposed a vote of thanks to the secretary, Mr. White, whose extraordinary efforts he hoped would result in a successful show. This was seconded by Mr. Whitton, and carried amid applause.

The Chairman and Mr. White having acknowledged the compliments paid them, Mr. Veitch announced that the committee had received the promise of a valuable case of insect exhibits from France, if room could be found for it.

ENQUIRIES AND REPLIES.

TO DESTROY ANTS (see p. 308).—If 8 ounces of soft soap are divided into small portions and allowed to dissolve, with an occasional stir, in a gallon of cold water, the solution will destroy ants without injuring the roots of plants. Petroleum has been known to kill Peach trees when applied near their roots. *Wm. Taylor, Bath.*

ANSWERS TO CORRESPONDENTS.

APPOINTMENT IN THE COLONIES: *A. H. H.* Most gardening appointments in Government Stations in the Colonies are filled through the Director, Kew Gardens. The posts usually fall to young gardeners selected from the staff at Kew Gardens.

BISULPHIDE OF CARBON: *E. H. J. Townsend.* The application of bisulphide of carbon is best made with a glass syringe, or the special apparatus (Vermorel injector) sold for the purpose. If the former is used the fluid must be injected into holes previously made with a pointed stick from 1 to 1½ inch in diameter. The depth of the hole required depends upon the stratum in which the pests occur; anything between 8 and 12 inches will do, but the gas given off is heavier than air and will find its way downwards. Close the holes by pressing the soil firmly. Tiles may be placed over the apertures if desirable. You cannot remove the carbon bisulphide after it has once been applied. It is highly inflammable. The specimens sent are millipedes, not "wire worms." As a preventive, do not use leaf-mould or an excess of manure. Lime is a good deterrent, and, if bits of Mangolds are buried shallowly, the insects may be trapped in numbers.

CELERY AND BEGONIA DISEASED: *J. J.* The Celery is affected with Celery heart rot caused by Botrytis. The soil contains the spawn of the fungus, and should be treated with gaslime. The plant of Begonia Gloire de Lorraine is attacked by "dub." Cuttings from diseased plants should not be used for propagating purposes. Diseased plants cannot be cured.

CELERY DISEASED: *J. H.* The disease is caused by the fungus *Septoria Petroselinii* var. *Aph.* a fungus disease which is much on the increase. Nothing preventive can be done this season, but the affected foliage should be collected and burnt. Next season spray the foliage before the disease appears with the Bordeaux mixture. This specific may be made as follows: Shake 1 lb. good quicklime (in lumps) with 6 gallons of water; dissolve 1 lb. of bluestone (copper sulphate) in 6 gallons of water in a wooden receptacle; mix the two together, and apply at once in the form of a very fine spray.

INSECTS ON CHRYSANTHEMUMS: *J. Page.* The larvae on the Chrysanthemums are those of one of the Hoyer flies, *Syrphus* sp. All the members of this genus of flies are predaceous, feeding exclusively on plant lice of various kinds. They are, therefore, beneficial in the same way as the larvae of ladybird beetles (Coccinellidae), and should not be destroyed.

NAMES OF FRUITS: *C. King.* 5, Castle Major; 7 and 25, Lady Hemiker; 17, Small's Admirable; 34, Manks Codlin; 20, Winter Hawthorned. We cannot undertake to decide which are dessert or cooking varieties; several sorts are suitable for both purposes. Nor can we say the best time for gathering the fruits; as much will depend upon the locality and other circumstances. A good guide is to split the fruits, and if the pips are black or nearly so they are ready for gathering.—*C. W. T.* Minchill Crab.—*E. T.* The brownish fruit is Northern Greening; the green one French Crab. It is not remarkable to find two sorts growing on the same tree.—*H. B.* Flower of Kent.—*Paper Mill.* 1, Mère de Ménage; 2, Hubbard's Pearmain; 3, Dean's Codlin; 4, Golden Requette; 5, Pile Rasset.—*W. T. C.* Dredge's Queen Charlotte.—*W. S.* 1, Herefordshire Beefing; 2, Crofton Scarlet; 3, Kerry Pippin; 4, Old Nonesuch; 5, The Queen; 6, Lane's Prince Albert.—*H. T.* *Eldridge.* Apple, No Core.—*E. Sherwell.* 1, King of the Pippins; 2, Dunelov's Seedling (syn. Wellington); 3, Small's Admirable; 4, Lord Burghley.

NAMES OF PLANTS: *A. S.* *Glos.* 1, *Choisya ternata*; 2, *Levcosteria formosa*; 3, *Diosma ericoides*; 4, *Jasminum ligustrifolium*; 5, *Cymbidium giganteum*.—*I. RASPBERRY CANES UNFRUITFUL: *D. H. G.* There is no disease present in the canes, but as the plantation is an old one, it is advisable to plant new canes, selecting, if possible, a fresh site. You could destroy a few of the old rows each year for a season or two.

R.H.S. EXAMINATIONS: *J. C.* The questions set at previous examinations may be obtained from the Secretary, Royal Horticultural Hall, Vincent Square, Westminster, price 2s.

RIDGE CUCUMBERS: *G. L.* The ordinary ridge Cucumbers such as Short Prickly and Stockwood, given the same cultural treatment, never attain to the same length as the ordinary frame varieties, but the varieties King of the Ridge, Long Prickly, Pershore Long Ridge, and Cheltenham Long Ridge would attain to the same length under like cultural treatment as some of the ordinary frame varieties, such as Abbot's Early Prolific and Lion House. All the same, such varieties as Rochford's Market, Butcher's Disease Resister, Telegraph, and Cardiff Castle are much superior both in quality and appearance for growing in frames or pits, as well as being excellent varieties for growing in borders or boxes in glasshouses. The varieties King of the Ridge and Long Green are not, in our opinion, quite so hardy or prolific as the old Prickly Green (Short Prickly). The latter is only inferior to the former in respect to length.

SOIL FROM AN OLD MOAT: *E. R.* It would be better to place the soil in a heap where it could be exposed to the air before using it as a top-dressing for the shrubbery. Your friends were quite right in advising you to mix lime with it, as this will neutralise any acidity, thus sweetening it. But lime is disliked by certain shrubs, including all those of the *Rhododendron* (Ericaceae) family, and it was probably because of this the other authority guarded you against its use. In any case, lime will not injure the other shrubs, and unless it is employed in extravagant quantities, it will not greatly affect the species of Ericaceae.

SOIL INFESTED WITH INSECTS: *M. K. Craddock.* The sample of soil submitted contained a few examples of the common white springtail, *Lipura ambulans*. If the pests occurred in sufficiently large numbers, they may have been the cause of the failure of the crops to which you refer; though it is just possible that some other agent may have assisted in the work of destruction. As a means of prevention, the soil should be roughly ridged, so that it may be exposed thoroughly to the action of frost—as, judging from the sample, it needs such treatment. Give the land a good dressing of lime or lime and soot mixed; if it needs manure, apply some of the artificial fertilisers.

AUTUMN-FLOWERING IRISES.

ALTHOUGH a garden that is devoted mainly to Irises can never be as gay in the autumn months as it may reasonably be expected to appear in May and June, there are, nevertheless, a fair number of Irises that can almost certainly be depended upon to bloom in the months between August and Christmas. It is, therefore, not impossible to have some Irises in bloom during every week in the whole year. To obtain this end, it may be necessary to buy each year newly-imported bulbs of *I. alata* and *I. Vartani*, but it is worth some sacrifice to have flowers in the open in the dark days of November and December.

The time at which these two species flower depends to some extent on the weather, but still more on the date at which the bulbs are put into the ground. Sound, well-ripened bulbs, planted early in August, should be in flower by the first week in October, and as *I. alata* generally produces several flowers in succession, the display lasts some time if the weather is not too boisterous or severe.

Iris alata is a native of the western shores of the Mediterranean, being found in Spain,

Morocco, Algeria, Sicily and Italy, and it appears to be largely cultivated in the last-named country for export purposes. As in the case of the other members of the Juno group, its fleshy roots are easily broken off from the base of the bulbs, and those bulbs to which few or no roots remain attached can hardly be expected to produce fine or numerous flowers. It seems to do best in a rich, well-drained, if somewhat heavy, soil, in a warm corner which catches the winter sun. Its eastern relative, *palestina*, from Mount Carmel and other parts of Palestine, is very similar, but smaller, and the flowers are usually of a green or yellow colour, though forms have been found that resembled the deep blue of *alata*. For some reason it seems disinclined to flower much before Christmas, but early planting might overcome this difficulty.

The third bulbous Iris that may be depended upon to flower before Christmas is *I. Vartani*, which is interesting as coming from the neighbourhood of Nazareth, and as being, therefore, the southernmost representative of the *reticulata* group. Its colour is apt to be a rather poor slaty blue, but it atones for this by giving out the most delicious scent of almonds when the sun shines for a moment upon it.

The difficulty of keeping these three bulbous Irises from year to year lies in the fact that they expect to be able to develop their foliage immediately after flowering, and then go slowly to rest and aestivate during the summer months. Unfortunately, with us their young leaves suffer sadly in the worst months of the year, and it can scarcely be a matter for astonishment that the bulbs are seldom sufficiently ripened to do well in the following year.

So much for the autumn-flowering bulbous species, and, if we had no others, September and October would be usually blank. Fortunately, however, several non-bulbous species seem to bloom at this time with very fair regularity, and I am inclined to think that this is the case not only in the warm, dry Surrey sand, but also in heavier and damper soils.

I. rubro-marginata, a variety of *I. pumila*, from the neighbourhood of Sentari, flowers here regularly in September and October in sunny nooks on the rockery, and, if anything, is more floriferous than at its other flowering season in April. The peculiarity of this plant is that the crimson edge to the leaves and spathes is but slightly marked, it is visible at all, except at the flowering season. This character is found again in the form of *I. germanica* from Kharput in Asia Minor, and in another, which was sent to me a year or two ago from Kashmir. In these, too, it is not persistent throughout the year, and scarcely constitutes a sufficient difference to justify a specific name.

Another curiously local Iris, namely *I. lacustris*, which appears to be a form of *cristata* and only to be found on the shores of Lakes Huron and Michigan, also flowers regularly at this time, and, with me at any rate, more freely than in spring. Its claim to specific rank is somewhat doubtful, for it differs in no way from *cristata*, except in its diminutive size, and moreover, it possesses in common with that Iris a peculiarly characteristic seed, which does not occur in any other

known species. Last year I obtained a few seeds of *lacustris* and a plant that I have already raised from them bids fair to grow to larger dimensions than its parents.

There is one unique plant here, which, within the diameter of a little more than a foot, has now for the third year in succession produced at this season a sheaf of spikes about 2 feet in height. This year there are at least 15, and each stem bears four or five flowers. It is the solitary product of a cross between a stray flower of a form of *I. Chamæiris* which happened to appear late in June and *I. trojana*. The flowers of the hybrid are intermediate between those of the two parents, being of a rather dull blue purple with a blue beard. In stature, too, the hybrid is a compromise, and, though compromises are never entirely satisfactory, this plant is, nevertheless, a very welcome addition to the Iris garden at this time.

Another regular flowerer is a form of the ubiquitous *I. Goldenstaediana*. The flowers are small, of the usual dingy yellow or pale purple, and the plant can hardly claim to be even of botanical interest, the euphemistic term beloved by the compilers of nurserymen's lists.

A prettier plant is a pearly-grey-flowered hybrid of *I. Albertii*, which was raised by Sir Michael Foster, but of which he did not know the pollen parent. This plant is apt to flower at any time, and the blooms show clearly the influence of *I. Albertii* in the curious way in which the heavy veining at the base of the falls ends abruptly at the level of the end of the beard. This is always a marked characteristic of *I. Albertii*, and persists in seedlings, even in two yellow forms of that species that appeared for the first time this year.

This ends the list of the Irises which can be relied upon to produce flowers in autumn, though many others are sometimes so good as to favour us at this time. Last year I remember that the *variegata* *Gracchus* flowered most freely in October, and this year there are in flower now *I. Milesii* and a hybrid of *Germanica* crossed with *benacensis*, raised by a neighbour, and affording one of the very few instances of hybrids of *Germanica* raised in this country. *W. R. Dykes, Charterhouse, Godalming.*

ORCHID NOTES AND GLEANINGS.

OSMUNDA REGALIS FIBRE FOR ORCHIDS.

A USEFUL little pamphlet, written by that clever Orchid expert, Mr. H. G. Alexander, relating to the merits and method of using *Osmunda* fibre and *Polypodium* fibre has just been published by Messrs. Wm. Wood & Son, Ltd.

Mr. Alexander, like most other experienced Orchid growers, finds no fault with British Orchid peat when it can be obtained of the proper quality and at a reasonable price, but the scarcity of the article and its great cost renders it imperative that other materials should be tried. After experiments extending over several years, he decided that *Osmunda* fibre was the best material procurable, and for some time it has been used largely in the Westonbirt collection. Some of the strong-growing kinds being potted in *Osmunda* fibre alone. It is pointed out that experimenters must not think that potting in *Osmunda* fibre alone is sufficient to ensure success, for with this as with other potting materials the other essentials of successful Orchid culture must be given careful attention. In order to make the remarks more useful, short notes of

shading, watering, ventilation, &c., and on all the details connected with the preparation, use, and storage of Osmund fibre are given.

CYPRIPEDIUM PRINCESS MARY (NIVEUM - HELEN II.).

IN the raising of any new variety, where a desirable character exists in one or the other parent, the problem of the hybridiser is how to retain that character and yet improve the size and form of the flower in the progeny. In the bloom of *C. niveum* the purity of the white ground is an excellent feature, but the flowers are small, and it is a difficult matter to raise large-flowered seedlings from it without sacrificing the pure white ground.

In the variety Princess Mary (see fig. 136), this has been obtained and the raisers, Messrs. Sanders & Sons, are to be congratulated. The new variety was awarded a First-class Certificate by the Orchid Committee of the Royal Horticultural Society on October 25. (Helen II.), one

is pale emerald green with purplish spotting on the lower half, and pure white above; the petals and lip are honey-yellow with a pale purple flush and veining. The class to which it belongs is a favourite one with *Cypridium* specialists, and very desirable for general purposes on account of the long time its handsome flowers last in perfection. The parentage of this hybrid is unknown.

THE ROSARY.

CULTURAL HINTS FOR NOVEMBER.

THE hot weather experienced during September and up to the middle of October has dried the ground, and no attempt at planting should be made until there is a heavy downpour of rain to thoroughly moisten the soil for 2 feet at least below the surface. If the vacant ground is manured and trenched in readiness it will allow

ters of their depth in lines at a few inches apart and 1 foot between the rows; the beds may be made 4 feet wide. The seedling Briar is a very useful stock, but it takes three years from the time of sowing to obtain it sufficiently strong for budding. The hips should be gathered when ripe and put into a heap mixed with sand until the fleshy parts rot. The seeds should be sown in drills during March. I should have remarked earlier that the usual distance for planting the stocks intended for budding next summer is from 2 feet to 2 feet 6 inches between the rows and 9 inches between the plants. The distances for the Standard Briars have been given already.

Roses of all sections have this year made strong, and, in many instances, superfluous, unripened and crowded growths. These unsatisfactory shoots are best removed at once, so as to give more space, light and air to the remaining branches, which will not only ripen better. Moreover, their removal now will entail less strain on the plant at the March pruning. The pegging-down of long, ripened rods of the current season of Hybrid Perpetual and hardy Noisette Roses can now be undertaken. Bend the shoots carefully down and distribute them at equal distances apart, thinly and within 6 inches of the ground. Secure them in the ground by long, hooked pegs. In this position, varieties that are tender can easily be afforded protection in severe weather by dried Fern or light litter.

Established Roses in pots placed under glass for forcing early will soon be breaking freely. The surface soil in the pots should be stirred frequently to keep it sweet. As the plants advance in growth, a sprinkling of Clay's Fertilizer will prove beneficial. A start may be made with those of the Tea section, by placing them at the warmest end of the house. For the present, a temperature of 50° should not be exceeded, permitting a little top ventilation for a few hours in the daytime during favourable weather; at other times a little fresh air may be admitted through the bottom ventilators near the hot-water pipes. Well vaporise or fumigate the plants directly they are brought into the house. A light syringing overhead may be given in the mornings of bright days, damping down occasionally at other times to maintain a humid atmosphere. On the first appearance of mildew, it must be promptly checked by painting the hot-water pipes with a solution of soft soap and "sulphur vivum." Plants potted in October should remain outside plunged in ashes until the end of December.

GRAFTING UNDER GLASS.

The middle of November is the usual time for grafting Roses under glass, but the sap being unusually active, and the growth later this season, the operation may be deferred until the end of the month. Late spring-potted, well-established Briar and Manetti stocks are the best and most reliable for the purpose, but if such are not available, grafting must be delayed until the freshly-potted stocks are fairly established. Movable glass frames on slate benches covered with fine ashes immediately over two 4-inch hot-water pipes and placed in the front of a light, span-roofed house should be employed. There should be a clear head space in the frame of from 10 inches to 15 inches. The growth of the stock should be in advance of that of the scion, the graft and stock to be as nearly as possible of equal girth. Graft in the usual manner and bind the stock and scion together with soft bast or yarn and brush some grafting wax over the union. The graft should be of firm wood, and not taken from the top of a shoot. A temperature of 50° is high enough for a start, keeping the frames closed a week after grafting; if there is too much condensed moisture, the sashes may be kept open for an hour or two each morning. When a union is effected, increased heat, with a little fresh air, may be afforded until growth is well developed, when the plants can be removed from the frames altogether. Careful watering in all stages is an absolute necessity, and moisture must be

FIG. 136.—CYPRIPEDIUM "PRINCESS MARY": FLOWER WHITE, WITH VIOLET-PURPLE SPOTS.
(R.H.S. First-Class Certificate, October 25)

of the parents of the new hybrid, was obtained by crossing *C. bellatulum* and *C. insigne* Chantini, both of which have flowers with decided colours, from which *C. Helen II.*, in its many varieties, derives its more or less yellow tint. When crossed with *C. niveum*, however, the cloudy colours vanish, and the pretty, clear-white flower of Princess Mary, with bright violet-purple spotting, is the result.

CYPRIPEDIUM > BRITANNIA

THE illustration (fig. 137) represents a flower of this handsome *Cypridium*, which was raised by Messrs. Sanders & Sons, who obtained an Award of Merit for it at the Royal Horticultural Society's meeting on October 25 last. Reference to Mr. Worthington Smith's illustration will show that it is an excellent production of the *C. Eson giganteum* class, with a peculiar arching forward of the dorsal sepal. This sepal

the rain to penetrate the soil, which will then be easier to work. If the selection of Standard Briars has been made, the planting can be completed as soon as the conditions are suitable. These can be followed by the Manetti, De la Griffera and seedling Briars. The two former stocks may be planted firmly to half their depth, and the seedling Briars right up to the collar of the plant. These can all be budded next year. Rooted Briar cuttings also make useful stocks for budding after the second year. All the above stocks have their growths cut back before being planted. The best of the shoots from the strongest plants form good material for making cuttings wherefrom to raise other stocks to follow on as required. Cuttings can also be obtained from the tops of the plants budded last year. The cuttings should be about 9 inches long, they should be disbudded to within three or four eyes of the top and planted three quar-

afforded only when the plants are dry. The Tea scented, Hybrid Tea and Noisette Roses take more kindly to the Briar and the De la Griffere stocks, whilst the Hybrid Perpetual and Bourbon varieties do best on the Manetti stock as dwarfs.

All pot Roses raised during last autumn and spring and plunged outside, may now be brought into a cool house to ripen off their growths. They should be kept somewhat dry at the roots for the present. *J. D. G.*

NOTICES OF BOOKS.

ROOT AND STEM VEGETABLES.*

THIS volume is not the least useful in Mr. Hooper Pearson's series of "Present-day Gardening," nor is it lacking in attractiveness. The author is one of the oldest, yet one of the most active of present-day horticulturists. Though what may be termed an all-round practitioner, Mr. Dent has given special attention to vegetables, their cultivation and exhibition, whilst a more competent judge of these products it would be most difficult to find. Moreover, though he is no stranger to the spade, he is not less expert in the use of the pen, and he expresses what he has to say in a pleasant, readable manner.

After making brief historical reference to the cultivation of vegetables, the author goes on to say that at the commencement of the nineteenth century the kinds of vegetables were nearly as numerous as they are to-day, but the varieties were few and lacking in merit as compared with modern sorts. Still, he says, "there are new sorts every year that, with superior culture, excel all previous forms, and this will be the case as long as gardening is practised. We cannot stand still: if we do not progress, we shall retrogress. That condition must never arise: vegetables are the best and purest of food, therefore economic necessity will always secure their cultivation.

After a serviceable chapter on the preparation of the land, the subject of enriching the soil with natural, artificial, and green manures is dealt with in a clear, yet concise manner. Then follow cultural details for the various kinds of root and stem vegetables.

The small chapter on Shallots is perhaps a little out of place, since these bulbs are so closely allied with Onions: beside, the bulbs illustrated are not the small, true Shallot (*Allium ascalonicum*), but the Jersey or false Shallot (see *The Vegetable Garden*, Robinson and Barron, p. 525). The true Shallot seldom produces seed, and should be exhibited in clusters, three to a dish; the large or false Shallots in 24 individual bulbs (see R.H.S. Rules for Judging).

Root and Stem Vegetables is beautifully illustrated by eight coloured plates from photographs, in which 35 varieties of vegetables are admirably represented. It is a volume that should find its way into the hands of all young and old gardeners, cottagers, and allotment holders in the kingdom. *J. Wright, F.M.H.*

GARDENING IN THE TROPICS.†

MR. MACMILLAN, Curator of the Royal Botanic Gardens, Peradeniya, Ceylon, has rendered a signal service to tropical horticulture in writing this excellent, comprehensive treatise on tropical gardening and planting. As Sir William Thiselton Dyer has well said, "Agriculture in the tropics is essentially extended gardening; it has little relation to the agriculture of temperate countries, and its methods are those of horticulture." It is from this standpoint, as he indicates in the preface, that Mr. Macmillan has attacked the problem of providing a manual which shall

be of service to planters living in tropical countries, both in aiding them in their commercial horticultural undertakings and in the efforts, which are apt at times to be sporadic, toward beautifying the surroundings of their bungalows.

Inasmuch as planters are often men who have had no horticultural training, and also because horticultural methods suitable for the tropics are not always those in vogue in temperate regions, Mr. Macmillan has done well to deal in his opening chapters with the principles of horticulture. After an excellent account of climate and soil and their relations with plant life, chapters are devoted to manures, soil operations (including irrigation), propagation, cultural operations, and garden planning. The chapters which follow are devoted to the subject of fruit cultivation, and contain excellent accounts and illustrations of the

of habit of various introduced trees induced by change of climate; thus, as Mr. Macmillan remarks, the Pear is practically an evergreen, and the same is true, we believe, of the Cherry.

Having dealt with fruits, the author proceeds to give an account of the vegetable- and food-crops, spices, and condiments which are grown in Ceylon. It is interesting to find that far more European vegetables are cultivated now than formerly, if the present writer's memory serves him. Fifteen or twenty years ago vegetables, such as Cabbage and Celery which, according to Mr. Macmillan, grow very well in the hills, were rare or unknown.

A considerable portion of Mr. Macmillan's book is devoted—as should be the case—to trees, and a special chapter is set apart for the important subject of shade trees. Needless to say, adequate space is given to the most important crops of

FIG. 137.—CALADIUM "BRITANNIA," EXHIBITED BY MESSRS. SANDER AND SON.

(R.H.S. Award of Merit, October 25.)

chief tropical, sub-tropical, and temperate fruits which may be cultivated in different parts of the island of Ceylon; for, as visitors to that green island know, it contains a wide range of climate, and hence is capable of supporting not only tropical but also temperate forms of plant life. The writer of this notice recalls with pleasure some weeks spent at Hakgala in enjoyment of the kindly and generous hospitality of the late curator, Mr. Nook, and was privileged to taste Strawberries grown at that hill-station. On the subject of introduced fruits, the home-keeping reader will find much that is of interest in this volume; thus the Cherry grows well but fails to blossom; the Plum produces fairly heavy crops in the neighbourhood of Nawara Elya, though the fruits rarely ripen owing to the advent of the monsoon rains. Equally interesting in the change

Ceylon; namely, Tea (the area of cultivation of which is 395,000 acres and the yield 186 million pounds), Cocoa (24,000 acres), Coconut Palm, Rice (cultivated by the natives and yielding 4½ million bushels annually), and rubber, the export of which (counting only Para rubber) has increased in value from £859 in 1900 to over £480,000 in 1909.

To give an adequate account of the rich and varied contents of this volume is, however, beyond the limits of our pages. To the traveller who knows the wonderful vegetation of Ceylon, the turning of these pages recalls in vivid fashion the sight of majestic trees and vast climbing plants embracing them; the slim Coconut trees with their feathery crowns of foliage, the brilliant red foliage of *Amherstia nobilis* in plant introduced from Malaya, the great, powdery butters-

* *Root and Stem Vegetables*, by Alex. Dent, F.M.H. (Present-day Gardening Series). (T. C. and E. C. Jack.) Price 1s. 6d. nett.

† A handbook of Tropical Gardening and Planting with special reference to Ceylon, by H. F. Macmillan. Published by H. W. Cave & Co., Colombo, 1910, pp. 524 illustrated. Price 7s. 6d.

of the roots of *Ficus elastica*, and a hundred other sights at once commonplace and marvellous. More than this, however, do these pages recall, namely, the fact that they represent a fine record of progress. Instead of the careless attitude of some decades ago, there is in Ceylon particularly, and also in other crown colonies, an official carefulness with respect to horticulture. In this change of attitude which must mean much for tropical agriculture, Ceylon has borne an honourable part in the foremost rank. The volume under review testifies not only to the fertility of Ceylon, but to the fertility of resource displayed by the Director and his colleagues of the Royal Botanic Gardens. In future editions of this book it might be well to include a brief historical account of the development of agriculture in Ceylon, and at the same time to remedy the only important omission we have noted, namely that of an index.

SCOTLAND.

THE EDINBURGH ROCK-GARDEN IN AUTUMN.

DURING a visit to the rockery at the Royal Botanic Gardens, Edinburgh, in October, I made a few notes of some of the plants and shrubs in flower there, in the hope that they might prove of interest to those who possess a small or large rockery, and who may wish to add to their store of treasures.

It must always be a source of keen enjoyment to visit this rock-garden at Edinburgh, so well known for its beauty and interest. The enormous blocks of granite and of sandstone are so cleverly placed, and the little paths wind about so cunningly, that many times one feels that here is the untrammelled home of nature, and that one is on some beautiful mountain-side, which has been untouched by the hand of man. This illusion is wonderfully carried out, considering how small an area of ground is occupied by the rock-garden; and the number and variety of rare plants to be found there are little short of marvellous.

On the day of my visit, I entered the rockery at a somewhat low-lying and shaded corner, and here I found a large mass of *Veronica Tenebrum* var. *dubia* (bright blue) in bloom; whilst not far from it the bright-yellow flowers of *Linum campanulatum* showed up well on their erect stems some 12 inches to 14 inches high. Just above, and covering a miniature mountain-top, was a large patch of *Daboecia polifolia atropurpureum*, a most beautiful shrub of the Heath order, which was bearing numerous large, purplish-red bells. In other parts of the garden I noted the type and the white variety, and all are highly ornamental. In a low-lying, shady situation, the rich, violet-blue flowers of *Viola heterophylla* provided a good display of colour; while in another part of the garden *V. lutea* was an equally effective patch of bright yellow.

Perhaps the most striking feature was a cluster of some 25 plants of *Yucca filamentosa*, situated on a dry ridge, where they stood out boldly against the sky. This is an elegant and graceful kind, some 3 feet to 4 feet high, each slender spike bearing numerous white bells, which are set some distance apart.

Following one of the little paths upward, I passed *Arenaria montana* var. *grandiflora* (white), in full flower; *Cistus allyssoides* was a sheet of yellow; and also in bloom were *Lithospermum prostratum* (blue), *Potentilla Forzneri* (flame-orange), *Hypericum aureum* (yellow), and *Chrysopsis villosa* var. *Rutteri* (yellow). This last-named is to be commended for its showiness, but is of a rather coarse and weed-like appearance. Next to it were two species of *Achillea*, both having white flowers, *A. Thomasiana* being 15 inches high, and *A. Clavenna* about 9 inches, with silvery leaves, and of a much neater habit. Near them was *Scabiosa graminifolia* (pale mauve), and higher up, in a shaded position, grew *Androsace lanuginosa*, which had been blooming

since early July. On the same exposed peak were some plants of *Polygala Chamæbuxus*, a neat sub-shrub, about 6 inches high, and covered with yellow-tipped purple flowers. On the summit of this miniature mountain was a fine patch of *Spiraea callosa rubra*, in full bloom, and presenting a very gay and striking appearance; while near it was creeping *Antirrhinum sempervirens*, with pale-yellow tinged pink flowers. Another species, *A. Asarina*, which is more handsome, with large, yellow flowers, I found creeping under an overhanging block of sandstone in the newer part of the rockery.

Another mountain peak further along is the home of various members of the *Campanula* family. They had mostly finished blooming, but there were still flowers on *C. rotundifolia*, *C. Hendersonii*, *C. garganica* var. *hirsuta*, and a few on one or two others. On a high ledge I found *Dianthus armeria* var. *roseus* blooming

blooming profusely. These were *P. affine* (pale salmon-red, 9 inches high, and a perfect sheet of colour), *P. capitatum* (a creeping species, only 2 inches or 3 inches high, with prettily-marked leaves and pinky-white flowers), and a species 12 inches to 14 inches high with vivid rose-coloured flowers. The two last have been in bloom since July. *Geum tyrolense* (bright yellow) was looking well, and *Campanula pusilla* and its white variety were both out; while *Acana microphylla* had formed a pleasing carpet of minute, bronze-coloured leaves. In a more sunny position, *Peustemon heterophyllus* was still producing many of its gay, majenta and blue flowers; while a New Zealand plant, *Craspedia uniflora*, had two of its yellow, pincushion-like flowers left in bloom. These are borne singly at the end of each stiff, upright stem, some 12 inches high; it is a rare plant, more curious than lovely.

The only member of the *Aster* family which I saw in flower was *A. Lyonsiis*, but, for those

FIG. 138.—COLLECTION OF VEGETABLES SHOWN BY HON. VICARY GIBBS, AWARDED THE "SUTTON" CHALLENGE CUP AT THE R.H.S. MEETING ON OCTOBER 25.

(See p. 320 ante.)

away as gaily as when I first saw it in July, and I was again struck by the vividness of its flame-pink colour. It is a most desirable little plant, and, apparently, as hardy as it is beautiful. The same might, perhaps, be said of *Potentilla nepalensis*, which I also saw still in flower from July, and which is also of a peculiarly vivid shade of pink.

In a sheltered, dry, and sunny nook lower down, *Oenothera macrocarpa* seemed thoroughly at home, and was opening numerous handsome, yellow flowers to the sun; while near by was a large colony of *Veronica Bidwillii*, a dwarf species, with small, white flowers. In a high but sheltered nook grew *Anaphalis japonica*, an uncommon, silvery-leaved plant, producing a single upright stem, about 10 inches high, terminated by a cluster of small, white flowers.

There is one part of this rock-garden which is very shaded and somewhat draughty, and I was curious to see what grew there. Three species of *Polygonum* seemed most flourishing, and were

who like them, there were many dwarf kinds suitable for a rockery, which would bloom at this time of year, such as *A. ericoides*, *hyssopifolius*, *horizontalis*, *Thomsonii*, and others.

I must also allude briefly to some of the dwarf coniferous trees and evergreen shrubs which were planted with good effect. Of the former class, especially noteworthy were *Juniperus nana*, *J. communis procumbens*, *Picea excelsa repens*, *Abies concolor*, and *Podocarpus alpina*, none of which exceeded 18 inches in height. Of the evergreen shrubs, *Berberis stenophylla* var. *Irwinii* was also about the same height, and looked pretty, covering a group of rocks. *Euonymus radicans variegata* is too well known to need description; while *Cotoneaster horizontalis* had covered a large surface, and the low, spreading branches had formed an impenetrable bank of dark, shining, green leaves and scarlet berries. *Leucophyllum buxifolium* is a tiny shrub of the Heath order, and it still had a few white flowers left on it. *M. E. Stebbins*.

SOUTH AFRICA.

NOTE FROM JOHANNESBURG.

WRITING from Johannesburg on September 11, the veteran florist, Mr. James Hall, says:—Our weather since September came in until the 8th was bitterly cold, but on the 8th we got our first spring rain (early this year), and since then it has been much warmer. The rain rapidly changed the whole aspect of the country: the grass, which had not received any rains for four months, and had become quite brown, is rapidly changing to green. The natural grass is called sweet grass. It is the same as that known as Couch, or Spear grass in the old country; the farmers here consider it the best for feeding sheep and cattle, and it also makes the best lawns and bowling greens.

I noticed in the *Gardeners' Chronicle*, August 6, p. 105, Mr. Gardner's praise of the perpetual-flowering Carnation for the open ground. I can endorse all that the writer says in praise of these Carnations. I saw plants doing well in a friend's garden, and obtained and planted a good batch about this time last year. They soon began to flower, and have been flowering ever since without intermission, and have still plenty of buds. They bloomed all through our winter, although we had some sharp frosts and very trying weather which affected most of the other flowers, Marguerites, both white and yellow-flowered, being killed. I also read in the *Gardener's Chronicle* for August 20, p. 137, the note on Roses on their own roots. Here, too, I am entirely in agreement with the writer. I may say that the whole of my Roses are on their own roots, and they give entire satisfaction, whereas those grafted on stocks in other gardens are unsatisfactory. I may mention, however, an exception. Some 12 years ago I wanted to increase my stock of Marsehal Niel. I had no Briar stocks on hand, but fortunately I had some strong-rooted cuttings of the yellow Banksian Rose, and, noticing the clean growth and vigour of these, I used them as stocks with great success. I also tried it for grafting other Teas, and it is certainly the best stock out here, for it never throws up suckers. I have between 5,000 and 6,000 Rose cuttings, most of them well rooted, this year, and some of the strongest roots will be in bloom at Christmas and January in the open ground without shade or shelter of any kind.

FLOWER BORDER.

VERBASCUM PHLOMOIDES ALBUM.

I was much struck with the conspicuous and uncommon beauty of this fine hardy border plant when I saw it for the first time at the last Temple Flower Show, where it was shown by Messrs. Gibson, of Leeming Bar, Yorks. I obtained a plant, now in flower in my garden, with which I am even more pleased than when I saw it at the show. Its individual flowers are of large size and of a beautiful shade of creamy-white, with conspicuous yellow anthers. The blooms are very thickly placed on the stem, which has also several lateral or subsidiary branches, promising a long continuance of bloom unless checked by frost, with which, however, we are not much troubled on this usually mild and moist Irish sea border. The plant is properly a biennial, flowering in its second year from seed, and then dying. This, however, is not invariably the case, as Messrs. Gibson inform me that in their nursery several plants, which flowered last year, are again blooming finely this season. This beautiful albino does not, unfortunately, reproduce itself true from seed, a large number of the seedlings producing yellow flowers with only a few white ones. W. E. Gumbleton.

BRITISH AND IRISH HEATHS.

ONE or two small points arise in connection with B.'s note in *Gard. Chron.*, p. 245, on "British Heaths in the Garden," but I am quite with him and with Mr. Wm. Robinson in suggesting in *The English Flower Garden* that "we should take more hints from our own wild plants and bring the hardy Heaths of Britain into the garden."

Erica ciliaris is one of the most beautiful of small shrubs. It is easily grown, and flowers not only in June and July, as B. says, but right on into October. During the last week of September it was a glorious sight on one of the undulating Dorset moors, and the rich-brown, tided flowers are as handsome on a sunny autumn day as the almost crimson blossoms are. It grows sometimes mixed with *E. tetralix*, with which it freely hybridises, and in drier places with *E. cinerea* and *Calluna*. Though "a dry situation" may suit it in the garden, in Dorset it prefers the damper parts of sandy heaths with *E. tetralix* and *Gentiana Pneumonanthe*. In fact, several times during the recent dry September

The hybrid *ciliaris* × *tetralix* (Watson, Benth.) is also well worth cultivating, if it can be procured or raised artificially. It may be a distinctly English hybrid, for I see no notice of it in any Continental flora I have consulted. It is generally smaller in stature than *ciliaris*, and the wiry stems cannot so easily be pulled up from the root-stock, in which respect also it resembles *tetralix*; but the foliage of what I saw in Dorset has more of the pretty *ciliaris* character about it. The flowers are longer than those of *tetralix*, but they do not have the protruding deflexed style of the other parent, nor are they so urn-shaped. The colour of the hybrid plants I have observed is generally a pale pink, but with less of the waxy appearance of *tetralix*.

E. tetralix is such an exquisite plant and so variable in colour, from white to a deep flush of rose, that it is surprising it is not more often seen in gardens, and especially as it grows less rank and shrubby than many Heaths. In Germany *E. cinerea* is only found in one place, above Besen, and in Switzerland the only Heaths, besides the Ling, are *E. carnea*, which prefers stony, mountain woods on limestone, and *E.*

FIG. 139.—PORTION OF MESSRS. VEITCH'S GROUP OF CHOICE STOVE AND GREENHOUSE PLANTS EXHIBITED AT THE R.H.S. MEETING ON OCTOBER 25.

(See p. 318 ante.)

have I seen it flourishing in very wet, peaty soil, interspersed with Sphagnum of the richest greens, yellows, browns and reds, with *Gentian* and the brilliant, orange-red fruiting-spikes of *Narthecium ossifragum*, a combination which, even without the Sphagnum, would be charming if introduced into the bog-garden, and particularly in autumn. A mixture of peat and sand would suit it best, as, indeed, it suits most of the European Heaths. It is astonishing how much water is absorbed by Heaths, both growing and when cut and placed in a vase. In the west of France and in Spain and Portugal this Heath is found in sandy woods as well as on heaths. The tendency on the Continent is for Heaths to grow in sandy woods and thickets more than they do in the British Isles. This not only applies to *E. ciliaris*, but to *E. vagans*, and, to a greater extent than in Britain, it applies to *E. cinerea* and *Calluna*. *E. mediterranea*, however, seems to be found only on damp heaths abroad, just as it is in Mayo and Galway.

Possibly too much is made in books of the one-sided or unilateral inflorescence of *E. ciliaris*, for I notice this feature is by no means universal.

vagans, which is rare. This fact probably accounted for a display of *E. tetralix* "rosea" (the ordinary pink form) at the Geneva International Horticultural Exhibition about a year ago.

The position given to *E. Mackayi* in B.'s note is unfortunate, for in the same paragraph with *E. mediterranea* we are told: "The only other British species is Mackay's Heath (*E. Mackayi*), which is regarded as a sub-species, and is found only in Co. Galway." It is a pity this sentence was not placed after *E. tetralix*, of which species Mackay's Heath is sometimes called a variety, though most of the modern writers, except Williams, rank it as a species. Lloyd Praeger says the "habit recalling that of *E. tetralix*, among which it grows, and from which it is at once picked out by the broader, ciliate leaves and the flowers rose-coloured on the sunny side, almost white on the other." A double-flowered form, found in Galway by the late P. C. Crawford, has been named by nurserymen *E. Crawfordii*, but the description has not been published, and the name may be allowed to drop. Elsewhere *E. Mackayi* has been found only in the mountains of Castile and Asturia.

E. Mackayi & *mediterranea* (E. Stuartii, Lin-tou) was first considered a variety of *E. tetralix*, but has recently been described as a hybrid between the two local Heathis named above. It was found very sparingly in W. Galway in 1890 with *E. Mackayi*, the nearest habitat of *E. mediterranea* being 2½ miles southward.

It is a noteworthy fact that, according to Keller and Schinz, no fewer than 9 of the 13 Swiss plants belonging to Ericaceae have been seen in that country up to 2,420 metres (7,870 feet), and three reach 3,000 metres.

The uses to which Heath is put in various countries are interesting. For example, in the south of France, as at Cogolin in the Var, the roots of *E. arborea* are converted into "briar" pipes, the word, of course, being a corruption of the French *bruyère*. In the neighbourhood of Poole, Dorset, hundreds of cartloads of Heath are used in the making of new roads, for an 8-inch bed of Heath is strown on the foundation of the road before an upper stratum of gravel and flints is added. This, I understand, tends to mat the whole together into a firm, compressed mass when the steam roller has done its work. At any rate, Heath forms a cheap road metal in this district, and one of the finest roads near Poole has just been made in this manner.

Having alluded to *Gentiana Pneumonanthe* growing in company with *Erica ciliaris*, I might mention that I recently found in Dorset a white specimen of *G. Pneumonanthe*, which had the usual green (but very pale) markings. It is now in the Herbarium at the British Museum. In the Alps, albino forms of blue *Gentians* are very rare, but it is not infrequent to find blue or violet forms of *G. nivalis* and *G. verna*. Once, in June, 1908, in the Mont Blanc chain, I came upon a large area of *G. bavarica* with violet flowers growing with the blue ones. Prof. Schinz informed me the species had never been recorded that colour before. *H. Stuart Thompson.*

The Week's Work.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir LESTER CASSELL, G.C.B., Moulton Paddocks, Newmarket.

Tree planting.—The present month is suitable for planting under glass such fruit trees as Peaches, Cherries, Plums, and Pears. Where any alteration of existing arrangements is contemplated, or new houses have been put up, the work should be taken in hand without delay.

Peaches and Nectarines.—The border should be well drained, and consist mainly of fibrous loam, with a good proportion of lime, in the shape of old mortar rubble. In order to get the trellis covered and to provide a crop as early as possible, extra trees may be planted between those which are intended to ultimately furnish the space. These extra trees will be lifted in the course of a few years or whenever they begin to crowd their neighbours. When planting walls, standard and dwarf trees may be placed alternately. Make holes large enough to allow the roots to be spread straight out to the tips, and keep the roots well up towards the surface of the border. Allow the soil a few weeks to settle before tying the trees permanently to the trellis. Twelve good varieties of Peaches in their order of ripening are as follows:—Waterloo, Duke of York, Early Alexander, Hale's Early, Diamond, Royal George, Violet Hative, Stirling Castle, Noblesse, Prince of Wales, Sea Eagle, and Nectarine Peach. Good varieties of Nectarines are Cardinal, Early Rivers, Précoce de Crouseis, Lord Napier, Rivers's Orange, Elrige, Pineapple, and Victoria. These are also given in their order of ripening.

Cherries.—Particular attention should be paid to drainage when preparing borders for Cherries under glass, as they soon resent the least approach to sourness of the soil resulting from water-logged borders. Like other stone fruits, they require a fair proportion of lime in the compost. The soil should be comparatively dry when planting, in order that it can be made the roughly firm. Good varieties for cultivation indoors are: My Duke, Bigarreau de Schreken, Governor Wood, Elton, Noble, and Bigarreau

Napoleon. The names are given in the order of ripening.

Plums.—When grown as cordons in wall cases or lean-to houses, Plums are not only useful in providing fruit in advance of that which ripens out-of-doors, but, being independent of climatic conditions, they may be relied on to produce crops when those outside are destroyed by spring frosts or other causes. Varieties which succeed in this manner are as follow, the names being given as they ripen: Czar, Brandy Gage, Early Green Gage, De Montfort, July Green Gage, Kirke's Transparent Gage, Jefferson, and Prince Englebert.

Figs.—Fig trees fruit best when the roots are confined to small borders. These should be composed of rather poor, gritty soil, not necessarily soil of poor quality, but such as contains little manurial substance which tends to promote rank unfruitful growth. Liberal additions of old mortar rubble, and broken bricks should be made to the compost as the Fig roots revel in such material. The border should also be raised a few inches above the level. This will allow the water to pass away freely from the roots, and will also tend to keep the border warm and free from excessive wet. Varieties of Figs are fairly numerous, but only a few are of general utility, namely Brown Turkey, White Marseilles, Brunswick, and Negro Largo.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir FRANK LAWRENCE, Bart., Portland, Dorset.

Mexican House.—This division is usually devoted to those plants needing much direct sunshine at all seasons of the year. The principal species of Mexican *Laelias* are *L. albida*, *L. autumnalis*, *L. Marriottiana*, *L. Gouldiana*, *L. purpuracea*, *L. anceps* and its varieties; in addition there may be found in this house such hybrids as *L. amona*, *L. Nemesis*, and *Laelio-Cattleya Wrigleyi*. At the present time many of these plants are developing their flower spikes, and care should be taken that none of these is allowed to get so near the roof glass as to suffer injury from cold. In lower cold houses, where the head room is insufficient for the spikes to develop naturally, they should be carefully tied down to neat sticks, training them in that direction where there is most light and sunshine. Carefully examine the plants at night, and after each watering, for woodlice, which cause much damage to the young roots. During the flowering season the plants need only sufficient water to keep the roots moist, and afterwards still less will suffice until growth recommences. A warm, sunny corner of this house is a suitable position for *Vanda teres*. There is nothing in the formation of the growth to indicate the beginning of the resting season, but, generally speaking, the plants have made sufficient growth by this time, therefore, less moisture is needed than they have been given hitherto, but they should not be kept so dry as to cause the stems to shrivel. If afforded a light spraying overhead on warm, sunny days, they will keep plump, and bloom profusely. The different species of *Barkeria*, now placed as synonymic with *Epidendrum*, as *B. elegans*, *B. spectabilis*, *B. cyclotella*, *B. Lindleyana*, and *B. Skinneri*, are difficult to cultivate for long together. These plants thrive best when suspended to the roof in shallow pans with *Osmunda* fibre to root into, giving them plenty of water during the growing season, and treating them afterwards as advised for other Mexican species. The warm growing *Odootoglossum citrosimum* generally thrives very well suspended to the roof of this house, but now that the plants are completing their growth, they will benefit from a slightly warmer and more genial atmosphere for another month, still affording them plenty of water at the root till growth is completed. The Mexican house should be ventilated well on all favourable occasions, especially at night, and but very little damping down will be necessary unless there is much sun heat or extra fire heat has to be used.

Dendrobium.—*D. thysiflorum*, *D. densiflorum*, *D. Griffithianum*, *D. Farnesi*, *D. suavisimum*, *D. chrysotum* have finished their growth, and should be placed in a cool, intermediate temperature. Afford them just sufficient water to keep the leaves fresh, and the pseudobulbs from shrivelling. Sponge the under sides of the leaves occasionally to prevent red spider

Laelia harry-phylla.—Plants of this light, orange red flowered *Laelia* should be removed to a light position in the Cattleya house, and afforded plenty of water at the root only until the flowers open, when the plants should be returned to a dry shelf in the cool intermediate house.

Odontoglossum.—Such plants as *O. grande* and *O. Schliepenmanni*, that have recently bloomed, should be placed on a dry shelf in the cool house, where they will rest. *O. Inslyai*, and its varieties *leopardinum* and *splendens*, need a similar position, but as they are now producing their flower-spikes, they require copious waterings. When the flowers fade, afford them a period of rest with *O. grande*. Owing to the partiality of slugs for the flower-spikes of this species, the plants should be isolated, by standing them on inverted pots placed in pans of water, or a ring of wadding may be placed around the base of each flower-spike.

PLANTS UNDER GLASS.

By JOHN DORRIGT, Gardener to JOSEPH PICKERSGILL, Esq., Barton Hill, Westwood, Yorkshire.

Chrysanthemums for exhibition.—By this date *Chrysanthemums* for exhibition will have reached a most interesting stage, and cultivators will be able to make a selection of the most meritorious varieties. I prefer to cut the blooms early in the morning a day or so previous to the show. A selection of the best flowers cannot be made in a few moments; it requires time. The necessary numbers of varieties must be borne in mind, and the flowers must be cut with about a foot of stem and the name of each variety correctly retained and secured safely to each flower. The labels will be needed for future reference should the flowers be staged, as is often the case, by artificial light, which has a curious effect upon some of the colours. Another important item to be kept in view is that the show boards are nicely enamelled a dark-green colour, which will show up the flowers to advantage. The boxes will need cleansing thoroughly, so that the flowers will not get dusty during their journey to the exhibition. The flowers are best arranged in their positions and the names attached during the afternoon prior to the show, in order to avoid confusion at the exhibition. The colours must be blended as nicely as possible. Some excellent growers advise the smaller flowers to be arranged along the front of the boards, but the first impressions of judges are often the most forcible, and I recommend the smaller blooms to be kept out of sight as much as possible. The blooms in the back row should be raised from 9 inches to a foot clear of the boards and the centre raised accordingly, while the florets of the front row may remain just clear of the boards. Whilst the exhibitor with the best blooms generally succeeds, it must also be remembered that every judge admires good staging, and, all else being equal, it certainly is a point or two in favour of a particular exhibit. Cupping up of the Japanese varieties is of a simple nature, except that they ought not to be cupped too tightly, or the depth of bloom suffers in consequence. In regard to incurved blooms, much dressing of the florets is sometimes required, and extreme care is required to get the cup into the proper position. The brushing of petals should be persevered in as long as time permits, so as to present the exhibit at its best in time for the judges to make their decision.

Cyclamen.—If these plants are required in large quantities, let a second sowing be made at the present time. The seedlings may remain undisturbed in their seed-pans until the turn of the year, at which time they may be transferred into single pots and kept growing steadily throughout the spring. The earliest batch of last season seedlings are now almost at their best, and are producing an excellent display of bloom. In order to prolong the flowering season, attend carefully to the watering, and apply top-dressings of an approved chemical fertiliser or applications of diluted farm-yard liquid.

Shading.—The shading may now be removed from the plant houses with few exceptions, as the sun's influence upon plants at this season is of great value. Select a dry day for removing the materials, and store them away in as dry a condition as possible.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Potatoes.—Tubers that were lifted a month ago and stored temporarily should be examined and sorted as soon as possible. Any that are to be stored till late in spring may be placed in pits and covered with a 6-inch layer of straw, over which a covering of soil must be placed to the depth of 8 or 9 inches. This will afford sufficient protection until severe frosts are experienced, when some other covering must be applied to render the tubers quite safe from frost. This last covering should be removed when danger from frost is over. While the tubers are being sorted, select those intended for next season's planting, and place them in single layers on shelves in some frost-proof store, where ventilation can be freely afforded in mild weather. Potato "sets" treated in this manner will give better results than those left in a heap until the spring, as, in the latter case, spindly growths will result.

Lettuce.—Lettuces planted late in the season in the open garden should be lifted now with good balls of soil and transplanted carefully into frames. Following this, a good watering should be given them to settle the soil about the roots, so that the plants may re-establish themselves as soon as possible. After a few days, the lights should be removed and the soil between the rows stirred with a small hoe. The present is a good time to sow Lettuce seed in a cold pit for planting out in early spring. If the bed is made up to within 1 foot of the glass, strong plants should be ready for planting on a south border by the end of February if the weather is favourable. As soon as the young plants appear, air must be given freely, to keep them stocky. Hardy White Cos and Standstead Park are good sorts for this sowing.

Mushrooms.—Horse-droppings should be collected and placed in open sheds, where they can be turned frequently in preparation for making successional beds. It is necessary to turn these droppings five or six times, to allow the escape of gases, previous to their removal to the Mushroom house. The turning should be repeated after the droppings have been placed on the shelves, until all danger of sourness is over. When the temperature is still declining, the whole surface of the bed should be covered with sifted maiden loam to the depth of 1 inch, and made tight by beating with the back of a spade. The soil for this purpose should be placed in the Mushroom house at least 24 hours before it is required for use, so that it may become nearly the same temperature as the bed. After several days the bed may be covered with a few inches of straw, to prevent excessive evaporation. The temperature of houses in which Mushrooms are now growing should be kept as near 55° at night as possible. The walls and floor may be damped whenever the atmosphere becomes too dry, but frequent waterings of the beds should be avoided as far as possible. When waterings are really necessary, rain-water should be used.

Tomatos.—Tomato plants for fruiting in winter may be given a temperature of 55° to 60° at night, and the ventilators should be left partly open to allow the escape of superfluous moisture. Extra attention to watering is necessary during winter. If plants are growing freely, they may be watered once or twice each week with liquid manure. Side shoots may be reduced to admit light to the fruit, but more freedom of growth should be allowed now than in summer for the purpose of encouraging root-action. The fruits should be gathered before they become over-ripe, and placed in a cool fruit-room, where they will keep fresh for some time.

Cucumbers.—The plants which were put out in August should now be at their best. Do not overcrop them, but remove all deformed fruits, and do not allow any to remain on the plants now beyond what are necessary to maintain a daily supply. Top-dress the beds whenever young roots appear, using loam and leaf soil in equal quantities. Syringe the plants on fine afternoons and close the house early. Young plantations made in September should be given a temperature of 65° at night, and their foliage should be well thinned out. If it is allowed to become crowded, soft growth will be the result, and although such growth would be welcome in spring, it would not be likely to stand through a dull winter.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of Northampton, Castle Ashby, Northamptonshire.

Planting bush fruits.—The season has been very favourable up to the present for planting all kinds of fruit trees. Where the work has been delayed a start should be made at once, and every endeavour made to hurry it forward, as trees planted late seldom grow so satisfactorily as those planted whilst the ground is fairly warm and with the prospect of a few weeks of open weather afterwards. The trees are retaining their foliage late this season, but the wood seems to be well matured and the trees are in a good condition for moving. Any well-drained, moderately deep soil is suited to the Gooseberries, also Red and White Currants, and the situation should preferably be an open one. Black Currants generally succeed best in a partially shaded position. It is not essential to select an exposed position for any of these small fruits, and good results may be obtained under the partial shade of orchard trees, a system usually adopted by market growers. But it must be remembered that the best dessert fruits of Gooseberries are not produced under such conditions. The bushes may be planted at distances of 5 feet to 6 feet apart each way. In the case of Red and White Currants, and Gooseberries, the bushes should be trained on a stem about 1 foot high, as this will enable the ground to be cleared beneath them and suckers prevented. In the case of Black Currants, however, suckers are desirable, and the bushes should be encouraged to form them, as strong, basal growths furnish the best fruits. A selection of Gooseberries includes Whinham's Industry, Keepsake, Crown Bob, Langley Beauty, Whitesmith, Trumpeter, Thumper, Dan's Mistake, King of Trumps, and Green Gascoigne. Good varieties of White Currants are Versailles, White Dutch, and Transparent; the best Red Currants include Red Grape, The Comet, Fay's Prolific, La Versailleise, Ruby Castle, and Red Dutch, whilst Boskoop Giant, Lee's Prolific, and Carter's Champion are excellent varieties of Black Currants.

Pruning.—The pruning of these bush fruits may be proceeded with, except where birds are destructive to the buds, in which case it should be delayed till later, unless nets are employed. In pruning the Gooseberry, it is important that the centre of the plant be well thinned out, so that the sunlight and air may reach all the shoots, and that the fruits may be gathered easily. Shoots having a tendency to grow in a downward direction should be removed. The best Gooseberries are obtained from bushes which have been pruned severely and fed copiously with manure water. Black Currants produce the finest berries on the strong shoots that arise from the base of the bush, therefore remove all old and superfluous wood, including weak suckers. Red and White Currants bear their fruits upon spurs, therefore they must be pruned quite differently from Black Currants. All shoots of Red and White Currants which are not required for extension should be shortened to two or three buds to form spurs. After the pruning is finished and the ground made tidy again, dust the bushes with a mixture of quicklime and soot, to check fungus diseases and render the buds distasteful to birds.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Outdoor Chrysanthemums.—The genial autumn has been most favourable for the flowering of these plants. Although border Chrysanthemums will pass safely through the winter in the open ground, we prefer here to lift the stocks after the flowering period and replant them in spring. By this system better facilities are offered for obtaining stock by cuttings in the spring. Lift the plants carefully, and keep the labels attached to them. A good plan is to tie the label to the portion of stem that is left after the plant is cut down. The plants should be placed closely together in a cold frame, and the roots just covered with soil. Admit an abundance of air whenever the weather will allow, and on fine days the lights may be removed entirely.

Montbretia.—The bulbs of Montbretias may now be lifted for storing away for the winter, as excessive wet would cause the bulbs to decay. We place them closely together in boxes contain-

ing a light, sandy compost. Stand the boxes in a cold frame on an ash bottom, where plenty of light may reach them in a position free from drip. The newer varieties are greatly superior to those of the old type, and are indispensable for cut flower and decorative purposes.

Protecting plants. To what extent protection has to be carried out in a particular garden depends partly upon the species it contains and the district in which it is located. To cover a plant unnecessarily and so coddle it is almost as bad as insufficiently protecting it, for when the protection is removed the growth is so tender as to be very susceptible to late spring frosts. For tender subjects a covering has often to be placed of sufficient thickness to make it almost permanent for the winter months, though this has in many instances a deleterious effect on the plant. If plants with foliage have to be covered in this manner, it is desirable to remove the covering on favourable occasions to admit light and air. This may often be done during open weather if precautions are taken against sudden changes. Tender shrubs of moderate size may be protected by placing a few pieces of Spruce branches around them, inserting them firmly in the ground. Those that require more protection and are not too large, may be enclosed with a wire cage and packed, not too tightly, with bracken. Larger shrubs on walls, that are likely to be injured only by very severe weather might be easily protected temporarily by placing reed mats or wattle hurdles before them. The hurdles are especially useful in the early spring for affording protection from cold winds and frosts. Herbaceous plants should be given a covering of finely-sifted cinder ashes placed round the base, or if further protection is required, as in the case of Gunneras, the crown should be covered well with straw or bracken, and then firmly inserted and pegged down. This preserves a neat and tidy appearance throughout the winter, but temporary shelter will be again required when this is removed. Many subjects in the rock garden will be much benefited by the protection of a small handlight, or a sheet of glass placed above them to shield them from heavy rains. Make the plants secure from the attacks of slugs, and place baits for this pest.

THE APIARY.

By CURRIER.

An apiary in an uproar.—Unfortunately bees sometimes get out of hand in apiaries. It is ignorance that causes nearly all the trouble that arises from stinging. A beginner had been told that it was quite safe to extract honey very near the apiary, when bees were actively bringing in honey. A severe thunderstorm occurred early in the afternoon and drove all the bees home. When the storm had passed he began his work again, thinking all was well, but the rain had washed all the nectar out of the flowers from which the bees were gathering their stores. When the beekeeper went to his hives for a fresh supply of shallow frames, to his astonishment the docile bees of the morning were now wholly unmanageable. He was severely stung, and completely driven away from the apiary. Sometimes a beekeeper during a "slack" season manipulates the frames, and the bees, being disappointed because the food supply has been cut off, are then easily roused. They are best left alone at such times, for a week or more, until they have become accustomed to the new state of affairs. Even then, the hives should not be opened for a longer period than is absolutely necessary, for strange, lazy bees, with robbing instincts, will be ready to gain an easy load from the open hive. This will soon set the whole apiary in an uproar. At other times the careless apiarist leaves bits of honeycomb about during this period of enforced laziness, and this is sufficient to so arouse the bees that passers-by, even in roads some distance away, will not escape injury from stinging. When the beekeeper is feeding with syrup, the robbing spirit is easily roused, especially if a little of the sugary fluid be spilled, and then stinging becomes a common practice. An apiarist should cultivate the spirit of observation and he will soon be able to judge when it is safe to work among the bees, and thus save himself and his neighbours much unnecessary annoyance.

EDITORIAL NOTICE

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, NOVEMBER 8—

Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Cecil H. Hooper, on "Observations on the Blossoming of Hardy Fruits.") Birmingham & Midland Counties Chrys. Sh. at Bingley Hall (3 days). British Gard. Assoc. Ex. Council meet. Ulster Hort. Soc. Sh. at Belfast (2 days). Oxford Chrys. & Fruit Sh. Southampton Chrys. and Fruit Sh. (2 days). Worthing Chrys. Sh. (2 days). Finchley Chrys. Sh. (2 days).

WEDNESDAY, NOVEMBER 9—

Northampton Chrys. Sh. (2 days). Bath Gard. Soc. Chrys. Sh. at Assembly Rooms, Bath (2 days). Liverpool Hort. Assoc. Autumn Sh. (2 days). Highgate & Dist. Chrys. Sh. (2 days). Doncaster Chrys. Sh. (2 days).

THURSDAY, NOVEMBER 10—

Wandsworth & Dist. Chrys. Sh. (2 days). London Branch of B.G.A. meet. Weston-super-Mare Chrys. Sh.

FRIDAY, NOVEMBER 11—

Sheffield Chrys. Sh. (2 days). Altrincham Chrys. Sh. (2 days). Chrys. and Fruit Sh. at Corn Exchange, Mark Lane. Huddersfield Chrys. Sh. (2 days). Bradford Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—44.3°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 2 (6 P.M.): Max. 48°; Min. 39°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 3 (10 A.M.): Bar. 29.3; Temp. 45°; Weather—Sunshine.

PROVINCES.—Wednesday, November 2: Max 99° Ireland S.W.; Min. 30° Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—Dutch Bulbs at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

MONDAY—

Sale of Nursery Stock at The Nurseries, East Grinstead, by order of Messrs. J. J. Wallis & Sons, by Protheroe & Morris, at 12.

TUESDAY—

Sale of Nursery Stock at Burnt Ash Hill Nurseries, Lee, S.E., by order of Messrs. B. Maller & Son, by Protheroe & Morris, at 11.

Azaleas, Palms, &c., at Protheroe & Morris's rooms at 5.

TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—Sale of the Ninth Portion of Nursery Stock at St. John's Nurseries, Worcester, re R. Smith & Co., Ltd., by Protheroe & Morris, at 11.30.

WEDNESDAY—

200,000 Fruit Trees at Perry Hill, Cliffe, near Rochester, by order of Messrs. Horne & Sons, by Protheroe & Morris, at 11.30.

THURSDAY—

Roses, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.30.

FRIDAY—

Orchids in variety, at Protheroe & Morris' rooms at 12.45.

In the death of Dr. Melchior Treub, who was until recently **A Great Botanist.** Director of the Botanic Gardens of Buitenzorg and of the Agricultural Department of Java, botanical science has lost one of its ablest exponents and the world one of its great men. For Treub was more than a botanist; he was an administrator of the first order, and one who did the world a great and lasting service by extending the hand of fellowship and help to scientific men of all lands. Born at Voorschoten, near Leyden, in 1851, Treub entered the famous University of Leyden in 1869, and at the conclusion of his University career became assistant in the Botanical Institute from 1874 to 1880. In this position, his intellectual and personal qualities so impressed the Dutch Government that he was appointed at the age of 29 to the Directorship of the now famous garden at Buitenzorg. There, for 29 years he

laboured, and there, he has erected for himself a lasting monument, which reflects honour on his name and on the Government which he served.

A great idea dominated Treub's work, and guided his policy. Science to him was not an end in itself but an instrument to be used for the progress and welfare of mankind. But to give real effect to that idea, science must lead, and not be merely an occasional ally, in the practical affairs of this world. To carry out his dominating idea, he addressed himself with equal energy to two great tasks: one, to make of Buitenzorg the tropical Mecca, whither all the world's botanists should desire to make pilgrimage; the other, to rear a great Agricul-

in the world and a fine symbol of Treub's greatness is the "Laboratoire des Savants Etrangers," which he erected in the gardens at Buitenzorg for the use of foreign botanists. It is worth more than a passing thought: a fine conception and a noble achievement, this building a laboratory exclusively devoted to the service of "foreigners." It was characteristic of the man, of his splendid energy and fine suavity, of his keen intelligence, and, above all, of his belief that science shall help and direct the progress of mankind.

Of Treub's many contributions to botanical science it is unnecessary to speak here in detail. They include subjects dealing with almost every branch of the science; it may be said without hyperbole that "he touched no-

THE LATE DR. TREUB.

tural Department for Java, based on scientific knowledge, and conducted by scientific men.

Both tasks were crowned with success. The volumes of the *Annales du Botanique Jardin de Buitenzorg* were all, save the first, issued under Treub's editorship, and contain invaluable contributions both from the editor and also from workers attracted to Buitenzorg by Treub's ever-increasing reputation. This series of volumes provide an enduring testimony of Treub's devotion to pure science and to the importance of his botanical discoveries.

The existence and activity of the Java Agricultural Department, of which he became the first Director, are witness that his aspirations to make scientific discovery serve the interests of mankind have been accomplished. Unique

thing which he did not adorn." Like the man himself, his style had a singular charm, lucid, simple, sincere, and yet always virile. His world-wide circle of friends mourn his death, which followed so speedily on his retirement from active service in Java. Worn out at last by almost 30 years' strenuous work in a tropical climate, Treub returned to Europe last year. After visiting Egypt, he proceeded to the Riviera. There, at St. Raphaël, near Cannes, on October 3, death overtook him.

The portrait of Melchior Treub, which we owe to the courtesy of Messrs. E. J. Brill, of Leyden, depicts the mingled strength and sweetness which made for him friends and admirers everywhere, but nowhere more than in this country.

FIG. 141.—NEPENTHES X NOBILIS.

NEPENTHES NOBILIS.—This is a recent hybrid *Nepenthes*, raised by Messrs. JAMES VEITCH & SONS, who have provided horticulturists with so many valuable additions to this genus. It is the result of a cross between *N. sanguinea* and *N. Curtisii* *superba*, both parents being remarkable for rich colouring. Our illustration in fig. 141, which is reproduced from a sketch by Mr. WORTHINGTON SMITH, is slightly reduced, the pitchers being as much as 15 inches in length. As will be seen from the illustration, the rim is very prettily marked, whilst the upper part of the pitcher is remarkable for the dark-red mottling on a ground of lighter red, which gradually disappears, until, at the bottom, the colour is a tint of green. The specimen exhibited by Messrs. VEITCH at a meeting of the Royal Horticultural Society on October 25 last bore ten finely-developed pitchers, and Messrs. VEITCH obtained for it an Award of Merit, which was recommended by the Floral Committee.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place on Tuesday, November 8. In the afternoon Mr. CECIL H. HOOPER will deliver a lecture on "Observations on the Blossoming of Hardy Cultivated Fruits."

GOOSEBERRY - MILDEW.—In consequence of the spread of American Gooseberry mildew during the past summer, the Board of Agriculture and Fisheries recommend all purchasers of Gooseberry bushes, from whatever source they are obtained, to examine their purchases very carefully on delivery, to cleanse the plants thoroughly from all earth, and to remove and burn the tips of the shoot before planting. If any trace of disease is found, the purchaser should communicate with the Board, and supply full information as to the source from whence the consignments were obtained, in order that the matter may be investigated.

FRUIT AND CIDER INSTITUTE.—Sir EDWARD STRACHEY, Parliamentary Secretary to the Board of Agriculture and Fisheries, has become a member of the Managing Committee of the National Fruit and Cider Institute.

EXHIBITION AT BOSKOOP.—The exhibition of forced shrubs and perennials at Boskoop in April, 1911, will occupy a space of 3,400 square metres.

TURIN INTERNATIONAL EXHIBITION, 1911.—The Exhibition Branch of the Board of Trade has issued a "Memorandum of Information" relating to the Turin International Exhibition. The exhibition is to open in April, and to remain open for about seven months. The exhibition grounds cover some 247 acres, and embrace the whole of the Valentino Park, which is situated on either side of the River Po. The site secured for the British section amounts to about 220,000 square feet, and is situated in a central position. The sections of horticultural interest include the following:—Economics of Forestry; Forest Management; Meteorology; Agricultural Geology and Study of Soils; Methods and Systems of Manuring; the Cultivation of the Vine; the Cultivation of Fruits, Vegetables and Flowers; Gardening Implements and Tools; Teaching and Appliances for Teachers; Plant Pathology, &c. In addition to the permanent exhibition there will be three temporary horticultural

exhibitions, the first on May 15-25, the second September 16-24, and the third October 25 to November 1. The schedules of the temporary exhibitions are now published and may be had, together with the Memorandum and the complete schedule, from the Director of the Exhibition's Branch of the Board of Trade, Queen Anne's Chambers, Broadway, Westminster, London, S.W. Among the members of the Agriculture, Horticulture and Food Products Committee are the following representatives of horticulture:—THOMAS BEVAN, W. A. BIRNEY, E. A. BOWLES, M.A., H. B. MAY, SIR DANIEL MORRIS, K.C.M.G., C. HARMAN PAYNE, Lieut.-Colonel PRAIN, Sir ALBERT K. ROLLIT, ARTHUR W. SUTTON, and HARRY J. VEITCH.

APPLE "HOUNSLOW WONDER."—Our artist and a contributor draw attention to a mistake in the sketch of Apple Hounslow Wonder, published in the issue for the 22nd ult. The blunt ends of the pips should point in the reverse way to that shown.

GREASE-BANDING OF FRUIT TREES.—An interesting contribution from Professor F. V. THEOBALD on the subject of grease banding is contained in the current number of the *Journal of the Board of Agriculture* (October, 1910). Professor THEOBALD records the results of observations and experiments initiated with the object of ascertaining why, though some, perhaps the majority, of fruit-growers, have found the practice successful, others have not. The general conclusion to which his observations point is that if the banding is properly carried out it is of great benefit to standard trees though not to all bush trees. The contribution is rendered particularly interesting by reason of the tables giving lists of the insects actually caught in grease-bands on three Apple and three Plum trees in 1908-9 and in 1909-10. The lists show that, of the winter moth, 125 females and 275 males were caught from October, 1908, to February, 1909, and that, in addition, large numbers of other noxious insects were trapped by the grease-bands. Experiments made to determine the best position for the bands lead to the conclusion that for them to prove effectual they should be placed at not less than 4 feet from the ground, and that 4½ feet is safer. It is owing to this fact that, for bush trees, banding is probably not to be advised. Of the greases generally employed, those of the birdlime type or tangle-foot are to be recommended on the ground that they retain their "tackiness" for long periods of time. Another matter which counts for a good deal in practice is the quality of the paper used; thick parchment paper, grease proof if possible on both sides, is what is required. Professor THEOBALD's article should be read in its entirety by all fruit-growers, and possibly those who have given up banding as of little use may thereby be induced to give the method a further trial.

THE DESTRUCTION OF ANIMALS IN SOIL.

An interesting article in the *Revue Horticole* (No. 20, October 16, 1910), by Mr. L. MAGIN, gives a summary of the methods usually employed to destroy the various soil animals injurious to plants. To rid the soil of worms in places where they are undesirable, in spite of their beneficial effects on soil fertility, Mr. MAGIN recommends watering the ground in the evening with a two per cent solution of ammonium carbonate. Worms and also millepedes are driven to the surface by the ammoniacal vapour given off by the carbonate of ammonia, and may be collected and destroyed. Of the poisons which are most suitable to destroy the smaller noxious soil animals, mention is made of lysol (five per cent. solution), formaline (five per cent.), and carbon-bisulphide, all of which give off poisonous vapours. Copper sulphate, mercuric chloride,

and zinc salts are highly toxic for animals, but unfortunately they are poisonous also for the roots of plants, and so—if used at all—are to be used with great caution. Mr. MAGIN recommends that a trial should be made of arsenite of potassium in very dilute solution (1-5th part in 1,000 parts of water). In this strength it is said to be without injurious effects on plants. In common with arsenical salts in general, arsenite of potassium is in the highest degree poisonous to animals and to man, and should therefore only be employed after all proper precautions have been taken. Inasmuch as many animals pass into a resting stage and inasmuch also as the eggs, e.g., of eelworms, &c., are possessed of great powers of resistance, it is necessary to "repeat the dose" once or twice at fortnightly intervals.

PUBLICATIONS RECEIVED.—*The Fruit Magazine*, October, 1910. (Vancouver: *The Fruit Magazine Publishing Co.*, Ltd.) Price 10 cents, (5d.).—*United States Department of Agriculture. Bureau of Entomology.* Bulletins: Papers on Deciduous Fruit Insects and Insecticides. On the Nut-Feeding Habits of the Codling Moth, by S. W. Foster. Papers on Cereal and Forage Insects. The Cowpea Curculio, by Geo. G. Ainslie. The Anatomy of the Honey Bee, by R. E. Snodgrass.—*Land Tax Valuation: How to Fill up the Forms*, by John F. Mellwraith. (London: Eittonham Wilson, Threadneedle Street, E.C.) Price 2s. net.—*Old Moore's Almanack, 1911*. (London: T. Roberts & Co., Crane Court, Fleet Street.) NEW CHIEF OFFICER OF L.C.C. PARKS.

[THE London County Council has once again given effect to its previously enunciated and unfortunate theory that the chief officer of parks need not be possessed of horticultural experience. The triviality of the arguments by which this naive theory is supported by its exponents may be judged by anyone who cares to read the report of the Council meeting which we reproduce below. We have protested before against this attitude of the Council, and we protest again. The arguments which we used on a former occasion remain unanswered and unanswerable. We need not repeat them. Our report will go throughout the world, and places on record the reasons advanced by the Council in support of a policy which must be condemned by everybody who knows how unnecessary it is to go outside the ranks of horticulture in order to find men capable of filling this post.]

The London County Council, at its meeting on Tuesday, appointed, on the recommendation of the General Purposes Committee, Major Philip Maud, R.E., C.M.G., F.R.G.S., to be chief officer of the Parks Department, in succession to Major Enthoven (deceased), at a commencing salary of £700 a year.

Mr. ERNEST GRAY (chairman of the committee), in moving the appointment, dwelt upon the process of selection followed after 145 applications had been received in answer to the public advertisement. A sub-committee made a preliminary selection of 25 candidates, and subsequently reduced this number to 16. Having interviewed these candidates, the sub-committee finally recommended six selected candidates to the committee. After careful consideration of the merits of each candidate, the General Purposes Committee now recommended the appointment of Major Maud, but, to comply with the Standing Orders, submitted three names as follows:—

Mr. A. D. Blaschek, F.C.H.
Maj. Philip Maud, R.E., C.M.G., F.R.G.S.
Maj. C. B. Winter

They were asked, preceded Mr. Gray, to appoint, not a chief gardener, but the chief of a department—an official who would control a

large staff, act with discretion and judgment, and be in a position to advise the committee with which he would be associated. He would have to supervise the gardens and open spaces of London. While he agreed that the possession of technical qualifications was desirable, it was equally desirable that the man should have those qualities which would bespeak the confidence of a large staff. Major Maud was a man in whom every workman would realise that he would have justice. It was not suggested that either of the three applicants whose name was upon the list was devoid of technical qualifications. As a matter of fact, the committee had no small difficulty in making their selection from the candidates before them. Neither in the committee nor in the sub-committee had the appointment been made a party question, and, so far as he was concerned, he had not the faintest idea what the political views of any single candidate might be. It was said that they ought to have a man with high gardening qualifications. He appreciated that point of view, but he put it to the Council that that was not the most desirable of all qualifications. They had in the park service a number of men possessed of technical qualifications, but the difficulty confronting them was to find such a man who also possessed that power of control and supervision which he thought was essential in the head of a large department. At all events, they were submitting the name of a man who had rendered excellent service to his country. It was a rather sorry comment on the public life of Great Britain that a man who had rendered such service to his country should find himself, in the very prime of life, without occupation—that he should find himself without State occupation likely to attract a man of his high qualifications. He had also heard it put forward as being a disadvantage that the candidate was a soldier. He wished to enter an emphatic protest against the suggestion that, because a man serves his country in the Army, he was not fit to serve that Council in the capacity proposed. The committee had before them two groups of candidates—the one of gentlemen highly qualified technically and the other of men highly qualified in other directions. They were not unconscious of the lines of argument on behalf of both groups, but their instructions were to appoint the head of a department, not a chief gardener, and he believed, in submitting the name of Major Maud, the Council would be fortunate in obtaining the services of one who possessed those high qualifications which fitted him to take his place in that brilliant group of men already in the Council's service.

Mr. STANLEY HOLMES, who moved the reference back of the report, said the fact that Mr. Gray had found it necessary to make such a long speech in the nature of an apology for the recommendation, showed that there was something about the appointment which needed a good deal of explanation. There was a similar debate when the office was filled in February last, and then the discussion ranged round a statement by Capt. Swinton that the Council did not require a gardener, but that it was essential for the purpose of maintaining discipline that either a naval or military man should be appointed. Once again the proposal was to fill the post with a military officer. They did not object to the man in any possible way because he was a soldier, but they did object that it should be laid down as a principle that a soldier, and only a soldier, should be appointed as chief officer of the Parks Department for London. The advertisement said that members of their staff were not precluded from the appointment. If it were laid down that only a military man should be appointed, then it was a dishonest advertisement which was inserted in the *L.C.C. Gazette*. They had before the General Purposes Committee the chief officer of the Birmingham Parks Department. They paid his expenses to come to London out of the rates, and he had to ask the Birmingham Council for time to come up. All the while they had no intention whatever of appointing that man, because he was not a military man. The whole thing was a piece of humbug. The party opposite decided all along to appoint a military man, and the advertisement was really so much window dressing. As regards Major Maud, the one thing in his favour was his name—they had always associated the name of Maud with coming into the garden. Beyond the fact that he was undoubtedly

an eminent soldier and had served his country well, it was difficult to find any sufficient reason why he should have control of London's parks. His qualifications showed that in 1903-4, at Aldershot, he had control of the canteen, grocery-shop, coffee-shop and supper-room. The last three were worked by contracts, given out and supervised by him; the canteen was under his personal management. Were they going to have canteens in London parks? He thought the soldier's view of a canteen was something very different from their refreshment rooms. Perhaps his best qualification, however, was that he "has frequently been called upon to carry out work of which he had no previous practical experience." This would account for his appointment under the London County Council to do work of which he had had no previous practical experience. They seriously objected to men being set aside who had worked their way up from the bottom of the ladder, and were now in charge of the parks of the chief cities of this country.

Mr. C. J. MATTHEW seconded. He had, he said, no intention of sneering in any way at Major Maud or his great services to the Army. He felt, however, very strongly that the appointment was setting up a very dangerous and bad principle. It was a matter of very little credit to the Council that they had appointed men to subordinate positions who were not now fit to take charge as heads of departments. Failing their own staff, they should have gone to those who had charge of parks in the country. The head of that department was, in point of fact, to be their chief gardener. They talked about discipline, but he ventured to think that a man who had done most of his work in India, and had been engaged in the management of large quantities of black labour was not quite the sort of man for Englishmen. He had heard it said over and over again that they could not treat a white man like a black man, and he therefore submitted that Major Maud was not the right man. Even in the panic-stricken condition some of them were they did not want a man to tell them how to fortify Lincoln's Inn Fields. They did not want anybody to drill the Daisies, but somebody to show them how to grow grass. He wanted the recommendation to go back, not with any reflection upon Major Maud, but so that the committee could bring before them one or two names of qualified gardeners. This was not India. They wanted primarily a man who understood gardening in London, and if not London, then in England. They would never think of having a soldier at the head of the sewers. He was told that the committee had before them a candidate who had had great experience in looking after the parks in Birmingham; he, at any rate, had learned to dig, and knew which end up to plant Crocuses. It was a disgrace to the Army that it could not give such an officer as Major Maud the occupation for which he was best suited.

Mr. H. E. A. COTTON complained that the Parks Committee had been ignored in the matter of selection. He gathered that Major Maud had reviewed the strategic situation of the Galapagos Islands. Whatever his knowledge of those islands was, it would not help him in the management, say, of Battersea Park. He also noticed that he had won for himself a reputation for rapid plate-laying. That being so, why was he not secured for the tramways? At the end there was, however, a real qualification. Last year he designed and laid out a private garden for a friend. The Council regarded those qualifications now as jests, but they were actually put before them in print as reasons why Major Maud should be appointed chief officer of the Parks Department. How could anyone exercise an efficient and intelligent supervision over a business he confessedly did not understand? Who was going to teach Major Maud horticulture? Meanwhile the men under him could lead the Major by the nose. Having some personal knowledge of Anglo-Indian methods, he for one did not want to see them introduced into the Parks Department or any other department of the London County Council.

Mr. H. C. LEA said he sincerely hoped Major Maud would be appointed. It was easy to poke fun at a man. He felt that a good many members on that side of the House had a rabid antipathy to giving a chance in life to an ex-Army or Navy man. "That is so," he added with emphasis, "and so long as

I am here I shall protest against it." He challenged any member, unless he confessed himself prejudiced, to find fault or cavil at anything in Major Maud's records of service. There was not a single point in his history which did not redound to his credit. Since last Sunday he had made inquiries of ex-engineers and sappers who had served under him, and they all gave him the highest-possible character. It would be a scandal and an outrage not to give Major Maud a position which would be a gain to the rate-payers of London, though a loss to the tax-payers, consequent upon his severance with the Army.

Mr. E. SPICER said to him it was not a question whether the candidate was a soldier or a sailor, but whether he was theoretically and practically a gardener. Major Maud's life had been spent in soldiering, and not in gardening. They had about 2,000 acres of garden land to look after, and he asked whether the Duke of Westminster or the Duke of Norfolk would appoint a soldier to drill the gardeners in their parks? They wanted a man who could go into each park and advise the superintendents. The committee had committed a great error of judgment.

Sir GEORGE GOLDIE, in supporting the appointment, urged that it was really an organiser that the Council wanted.

Mr. GEORGE LANSBURY said the Labour members objected to the work of the Council being reserved in any sort of way for old soldiers or old Navy men. They did not want it to become understood that if a man went into the Army there would be a "nice, soft job" for him under the municipalities later on. Major Maud, probably, was one of the best candidates, but they were actuated by a feeling that there were plenty of civilians who were quite capable of organising the department. He had been told that the money spent on London parks was largely wasted because the department had never had at its head an expert horticulturist.

Mr. J. D. GILBERT, referring to a statement made by Mr. Gray, said Major Maud was not without occupation at the present time, for he was on the general staff of the Army headquarters. The reason he wanted to give up his appointment was because he did not think his chances of promotion there were as good as they ought to be. Twenty-two of the candidates were in their own service, and the sub-committee came to the conclusion that three of them were worthy of consideration for appointment, but the committee did not interview one of them. That was one reason why he disagreed with the report, for in an appointment of that sort members of the staff ought to be given equal consideration with people outside.

The Rev. STEWART-HEADLAM said there was no kind of suggestion that Major Maud knew anything about gardening. He urged upon those in authority to induce Major Maud, if he were given the appointment, to devote part of his time to this beautiful art of gardening. He appealed to Sir George Goldie not to be content with the candidate's military experience.

The reference back was defeated by 69 votes to 47, and the recommendation of the committee was then agreed to.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

TRIALS AT WISLEY.—At a meeting of the Council of the Royal Horticultural Society, on October 25, a letter was read from one of the leading seed firms pointing out that it was not fair in the trial of Peas at Wisley to compare and to adjudicate on the merits of varieties sown on different dates; and urging that all Peas sent for trial ought to be sown on one and the same day. The Council quite saw the point, but felt, on the other hand, that it would not be fair on an admittedly late Pea to sow it on the same day as an admittedly early one. After consideration, it was decided, for 1911 and in future, to ask for 1 pint, instead of $\frac{1}{2}$ pint, of seed Peas, and divide it into three parts, and make sowings of all varieties on three different dates, sowing early, mid-season, and late Peas, as in this way only could the two difficulties mentioned

be overcome. It is desired, therefore, to correct the list of trials which appeared in these columns a fortnight ago by substituting 1 pint for $\frac{1}{2}$ pint of Pea seed required to be sent to Wisley. W. Wilks, Secretary.

—A special Sub-committee of the Floral Committee of the Royal Horticultural Society visited Wisley on October 18 last, when Awards of Merit were recommended to the following, and which were confirmed by the Council at its meeting on the 25th inst.:—Chrysanthemum—Crimson Queen, October Gold, Bouquet Rose, Eden (all from Messrs. Dobbie & Co., Edinburgh), Freedom (Messrs. Wells, Merstham), Wells's Scarlet (Messrs. Wells and Messrs. Dobbie & Co.), Mrs. Tom White (Messrs. Wells, Merstham), Snowstorm (Messrs. Wells, Merstham). W. Wilks, Secretary.

INTERNATIONAL EXHIBITION, 1912.—I wish to support your suggestion that a discussion on Phylloxera regulations be arranged at the forthcoming International Horticultural Congress, at which many foreigners will be present. To show how the matter is looked on by one of the leading French nursery firms, I translate the following remarks from a letter recently received from one who is now a German subject:—"The German custom house is so uncertain as regards living plants coming from England, that I cannot accept your amiable offer of seedlings. Generally, plants are disinfected at the frontier, or so much delayed, that usually one cannot use them. This is because England has not adhered to the International Phylloxera Convention of Berne. She did well not to adhere, because the thing is a pure 'blague'; but Governments as insane as ours profit by that to impede exchanges with countries not included in this union." H. J. Elwes.

MONTBRETIAS.—Mr. Divers states on p. 318 that Montbretias require transplanting every two or three years, or they become weak and refuse to flower. There is a variety growing in cottage gardens in East Cardigan that I have known as *Crocsmellora*, flowering freely that have not been disturbed since they were planted many years ago. At Hayod, as well as in other gardens, I have seen Montbretias that did not seem to have been disturbed lately, flowering well. In the cottage gardens the soil is light and shallow, resting on the carboniferous rock, which, in some places, is within 18 inches of the surface, and the locality is bleak and cold. At the Hayod gardens the soil is light, the situation low and well sheltered, and near a river, the water from which in winter percolates into the garden, so that if an excavation be made 2 feet or 3 feet deep the water level is reached. Mr. James, the gardener, who is my nearest neighbour, informed me that he has to afford protection to such hardy plants as Cabbage, and that he is forced to winter most of his Strawberry plants under glass, planting them out in spring. Here the Montbretia grows under the most opposite conditions to those described by Mr. Divers. W. P. R. Cwmystegh.

WHY NEED THERE BE EQUAL PRIZES? See pp. 297, 318.—My answer is, because occasionally it is unavoidable. The one object that judges should keep before them is justice to the exhibitors, and not the carrying out of any particular fad or principle which they may have or hold. It is agreed that there is always a "dividing line" between two exhibits. I admit that any judge who starts with the idea that he will not award equal prizes will find a difference at least of a half or a quarter of a point between any two exhibits. But no judge is infallible, and when two extensive and varied exhibits have only a quarter of a point between them, it is a matter of opinion, and not always of fact, as to which should be awarded the premier prize. Let me illustrate my contention. Two judges have before them two exhibits of 36 Chrysanthemum blooms in distinct varieties. One prefers No. 12 exhibit and the other No. 14. The judges decide to "point" the exhibits, allowing a maximum of six points for each bloom, and these are again divided into four quarters. (I have heard of some judges who allow a maximum of five, representing five shillings, and divide each again into 12, representing 12 pence.) The judges agree as they go on as to the number of points each bloom is worth. It may happen both exhibits receive the exact number of points. Now the judges are

faced with the fact that "equal prizes are objected to," and that they, the judges, will be told that they do not know their business. They rejudge the exhibits, with the result that they find a difference of half a point, and No. 12 gets the 1st prize of £12 and the other the 2nd of £8, and everyone is satisfied except the exhibitor of No. 14. But should the same exhibits be rejudged by the same two judges, a slightly different decision may, and probably would be, arrived at, and the previous award be reversed. Of course it will be argued that these judges do not understand their work, but let six of the best and most practical men of the day be divided into three couples, and set to point an extensive collection of fruit, and no one will say that each couple will produce the same total in the result. My contention is that where two exhibits run each other equally, and there is a considerable amount of money between the 1st and 2nd prizes, it does not become any set of judges to refuse to make equal awards, dividing the two amounts of prize money equally. There can be no objection to rejudge and thoroughly rejudge the exhibits, but not with the object of "saving their faces," but rather that of justice to the exhibitors. *W. J. Cooper.*

Judging by some of the opinions recently printed, it would seem to be a serious error on the part of judges to place any two exhibits or collections exactly equal. What is to be inferred from these opinions is, that if any two exhibits happen to be exactly equal in every respect, yet it is the judge's duty to make one better than the other, not for the sake of justice but to save their reputations; that is strange philosophy. In such case one exhibitor benefits and the other has to suffer. Happily, such remarkable equality of merit in competitions seldom occurs, but it does sometimes. If judges are disposed to deal with exhibits generally on the *laissez faire* principle, easy judgments might be frequent. But that is far from being the case, and when two or three good men find it is impossible for them, if they are to be just, to separate two exhibits because merit is absolutely even, why should their conscientious action be adversely criticised? *D.*

CASH PRIZES OR PLATE?—Although Mr. Garney Fowler, when presiding over the recent meeting at the Windsor Hotel, in relation to the forthcoming International Exhibition, invited discussion of the question as to whether prizes at that show should take the form of cash or plate, no opinions were publicly expressed, but many were freely given after the meeting was over. What presents itself to the minds of many exhibitors is the great cost of getting exhibits to the show, keeping them there for 10 or 12 days, and getting them home again. This cost has to be paid for in cash, and prizes in kind, however valuable, do not repay. Were the opinions of the secretaries of the great provincial shows, such, for instance, as Edinburgh, York, Wolverhampton, or Shrewsbury, invited, I think they would say that the principal exhibits at their exhibitions are there primarily because valuable cash prizes are offered. In all competitive shows, from the greatest to the smallest, the practice of giving money prizes prevails. A trading firm may have some return for its outlay, in the advertisement it gets and in additional trade. That is, perhaps, taking rather an optimistic view of such exhibiting, but it is generally assumed to be correct, although trading firms usually keep their own counsel. The position of the private gardener is a very different one. No trade benefits can follow on his exhibiting. As a rule, he has to bear all expenses incidental to getting his products to the exhibition, and to getting them home again, but he hopes for some reimbursement in the form of cash prizes. Were the prizes of kind such as plate, of course his employer, the assumed competitor, but not the real one, would no doubt claim those for his own sideboard, and the poor gardener would get nothing. It is obvious that exhibiting in several classes at the international exhibition would be a very expensive effort, because of the long time it continues, and only good cash prizes can recompense competitors. There is, of course, much truth in the contention that money, when paid, has no tangible or permanent status. It so soon disappears, whilst prizes in kind, whether of plate or of work of art, endure as mementoes. What seems desirable to enable all competitors to be rewarded as they may wish,

is to have at the exhibition a great assortment of articles, all legibly priced, from which any competitor could make a personal selection to the value of his prize or prizes, if he so desired, or he should have the full value of such prizes in cash if he prefers this form of reward. *A. B. C.*

ABUTILON THOMSONII.—There can be no doubt that the plant mentioned by *Mr. Lynch* (p. 297) is rightly named. I have a record of it reaching back to 1831, and it appeared to have been at Chiswick for some time previously. It was stated to be a hybrid, but, judging from the colour and size of the flowers, it may only be a seedling or variegated sport from *A. striatum*. In 1836 and 1837 it was still cultivated in the old gardens at Chiswick in company with several other hybrid and varietal forms when Abutilons were enjoying some vogue as winter-flowering plants, reared from cuttings during the previous spring. Along with it was a double-flowered form, *A. Thomsonii* flore-pleno, but neither of them appeared to great advantage beside the other Abutilons, because the colour of the foliage faded, owing to the feeble light of winter, and the flowers of the double form did not open freely. The downy-leaved variety is evidently *A. Darwinii*, if it has brick-red flowers and leaves blotched and spotted with pale and creamy-yellow on a deep green ground. It was grown in the same batch as the above, and, besides being in robust vigour, it had a brilliant and attractive variegation. This is no doubt the reason for its existence at the present time. *A. Thomsonii* is of most service as a bedding plant, having been extensively used in the London parks and at Hampton Court in subtropical gardening between the years 1834 and 1894. *J. Fraser.*

SAXIFRAGA FLORULENTA.—Is not Mr. Farrer rather too hasty in his criticism of the nomenclature of *Saxifraga florulenta*, as given in the *Kew Handlist of Herbarious Plants?* (see *Gardeners' Chronicle*, October 29, 1910, p. 311). In the second edition of the *Handlist*, published in 1902, *S. florulenta*, Schott., is certainly given as the synonym of *S. lingulata* var. *lautescans*, but if Mr. Farrer will refer to the first edition, published in 1895, he will find the true *S. florulenta*, Moretti, *Botanical Magazine*, tab. 6102, given as growing in Kew Gardens at that date. The omission of the authority of the name of a plant, especially in a critical genus, only leads to "confusion worse confounded." *G. B. Milne-Redhead, Millard's Hill, Frome.*

POLLINATION OF SPENCER SWEET PEAS (see pp. 257 and 285).—Regarding the unfavourable colour factors which Mr. Charles Foster indicates, and the varieties he instances as examples, I regret I cannot criticise or in any way combat his statement. It is a pity he did not confine his remarks to sorts that ordinary growers have cultivated—there are plenty of these—and not to kinds that are as yet untried. How many, for example, grew "Earl Spencer" this season; and, again, how many will grow "Stirling Stent" even next year? These aside, however, the characteristic of non-seeding is by no means confined to these colours, but is fairly distributed over many of the other "Spencer" Sweet Peas. The question of the sterility of the pollen of some varieties is, I think, not yet sufficiently established, but I strongly suspect that one or two kinds are deficient in fertility from this cause. Every seed grower will envy the experiences of Mr. Foster with regard to the production of seed. Your correspondent has a wide and valued experience in the growing of the Sweet Pea, and I take this opportunity of adding my tribute to the admirable work he is so ably conducting, for all growers are indebted to his labours in this field. I cannot agree with him when he declares he knows of no colour of "Spencer" Sweet Pea that will not set seed as freely as any other annual plant in good summer weather, and I leave the "Earl Spencer" group out of consideration at present. I, among many, complain of the difficulty of obtaining seed, and it is not the same, in my experience, with edible Peas and other garden flowers. I have ripened all the seed I wanted of edible Peas, Mignonette, Antiphrasinus, Larkspurs, Calceolaria, Stocks, Wall-flowers and Auriculas, and I have totally failed, unless where artificial pollination has been resorted to, with all the "Spencer" Sweet Peas

I have grown. They are cultivated under precisely the same circumstances as mentioned by Mr. Foster, that is on a sandy soil in a single long row facing the prevailing wind, and the wind can blow through them without hindrance. His remarks about growing this flower for seed would seem to indicate that the "Spencer" Sweet Pea is anemophilous, an idea that I cannot subscribe to for a moment. Then he declares that he is no believer in any bee or beetle, or any other insect being the cause of untrue stocks of this flower. After careful observation of the matter, I have such a belief, and I am now in possession of seed pods, set by bees, which I believe will confirm my statement. I have given long and careful attention to ascertain the true state of matters. As I already mentioned in my remarks on p. 257, my contention is that the modern Sweet Pea is adapted for fertilisation by insect agency, for the arrangement of the reproductive organs has been upset by selection and by the hybridist, and the flower has consequently had to adapt itself to other means of pollination. I only got a copy of *The Sweet Pea Annual* for 1910 this week, and I have just been reading there the able lecture on "The Imperfect Seeding of the Waved Sweet Pea," delivered by that experienced cultivator Mr. William Cuthbertson before the general meeting of The National Sweet Pea Society in December last year. I note that in the discussion following upon that lecture one of the speakers practically confirms my experiences with bees, so that I do not stand alone in this matter. My previous remarks dealt, partially, with this flower being untrue sometimes, apart from careless breeding, and the contention made by Mr. Foster that many "Spencers," when artificially pollinated, produce nothing but perfectly plain flowers in the F₁ generation, is outside the scope of what I had then to say, and it raises another question altogether. I do not agree with that statement, and would say that if the variety is breeding true to begin with this result is impossible. I am glad to hear from such an authority that the impurity of stocks is decreasing, but certain recent reports on the subject would seem to show that much improvement is still wanted. *George M. Taylor, Mid-Lothian.*

SUGAR-BEET.—Reading your interesting leading article with reference to the proposed trials of Sugar Beets by the Royal Horticultural Society, I was reminded of some very interesting results I obtained some years ago in Essex. The educational authorities of the County Council at Chelmsford induced several farmers to grow Sugar Beet on trial. Hearing of these trials, I resolved to have one also. I applied to some of the leading Continental seedsmen for seed of the best strains. These were sown and cultivated exactly as we grow Mangold. The result was that the roots were considered to be too large. They averaged from 2½ lbs. to over 4 lbs. in weight, the tonnage per acre being 25 tons to 30 tons. The most interesting fact in connection with the trial was that the roots yielded a record percentage of sugar. The analysis was made by Mr. G. Clark, F.Sc., who was then the analytical chemist at Chelmsford laboratory. Subjoined is a copy of Mr. Clark's report, the roots being grouped in the way he recommended me to plant them as mothers to produce seed the following year. Set A: 2 V.I.B., 18.6 per cent. sugar; 4 V.I.B., 17.2 per cent. sugar. Set B: 1 V.I.B., 17.1 per cent. sugar; 3 V.I.B., 16.7 per cent. sugar; 5 V.I.B., 16.9 per cent. sugar. Set D: 11 S.B., 19.6 per cent. sugar; 15 S.B., 18.5 per cent. sugar; 19 S.B., 19.0 per cent. sugar. I must explain that the analysis was conducted exactly as described by you in your article. Samples were taken from the roots while growing, and those giving the highest percentage were carefully transplanted for seed. The foregoing trial was made in 1905. It was not until 1908 that we had roots grown from the produce of the seed saved from the mothers referred to. The 1908 roots were analysed by Mr. B. H. Kirkham, B.Sc., of the Chelmsford laboratory. He found that the percentage of sugar had gone down to quite a normal figure. I have not his figures beside me while writing. The varieties of Beet referred to under letters above are as follow:—V.I.B.—Vilmorin's Improved; S.B.—Silesian. The B in each case refers to Benary, Erfurt, from whom the stocks giving the best results were obtained. *Wm. Cuthbertson, of Thobbe & Co., Edinburgh.*

FOUR NORTHERN COUNTIES FRUIT CONGRESS.

(Continued from page 326.)

VARIETIES OF APPLES FOR CUMBERLAND AND WESTMORLAND.

The following extracts are from a paper on this subject, read by Mr. W. B. Little:—

The choice of varieties is a very important matter. Of those enumerated in a nurseryman's catalogue, only very few can be relied upon to give satisfaction. Many may produce good fruits, but the constitution of the trees is weak, and they are, therefore, liable to be attacked with canker.

Experience shows that certain varieties, such as Bramley's Seedling, Newton Wonder, and Lane's Prince Albert, thrive in practically all soils, but some others, such as King of the Pippins, Lord Grosvenor, and Ecklinville Seedling, succeed only in light soils.

Early and late varieties are more profitable than Apples which ripen at mid-season. Early varieties to be recommended for these counties are Golden Spire, Domino, Early Victoria, and Liddle's Seedling.

Mid-season varieties include The Queen, Grenadier, Royal Jubilee, and Bismarck. Late varieties: Bramley's Seedling, Newton Wonder, Lane's Prince Albert, and Scotch Bridget.

The three best varieties for amateurs are: Early Victoria, Royal Jubilee, and Lane's Prince Albert.

room for the development of those on the free stocks.

If the soil is light, Lane's Prince Albert and Golden Spire should be worked on free stocks, Bismarck succeeds best on the Paradise stock.

MANNERS AND CULTURE OF FRUIT TREES.

Mr. George Bunyard, Royal Nurseries, Maidstone, gave a lecture entitled "Manners and Culture of Fruit Trees," a summary of which we reproduce:—

Plums, as a rule, do fairly well as standards, but where bushes or pyramids, or even wall fruits are grown, some root-pruning every second year is advisable, combined with thinning of the shoots in August and helping the roots by the addition of lime, burnt earth, &c.

Apples, as a most important crop, should be principally confined to the early varieties for the north, such as (*cooking*) Early Victoria, Ecklinville Seedling, Grenadier, Potts's Seedling, Lord Grosvenor, Golden Spire, Warner's King, Royal Jubilee, and Stirling Castle; (*dessert*) Gladstone, Juneating, Quarrenden, Langley Pippin, Beauty of Bath, Irish Peach, Ben's Red, Worcester Pearmain, James Grieve, Margil, and King of the Pippins; but such hardy kinds as Bramley's Seedling, Hornead's Pearmain, and Lord Derby should do well for keeping.

Preferably all Apples should be on the Paradise stock, and the roots should be attracted to the surface by annual mulchings with short stable dung or by scratching into the soil

should be given to heavy soils, and kainit and basic slag to light soils.

Gooseberries and Currants rejoice in the cooler and more moist climates of the north, but they should be heavily manured yearly with strong manures—as fish guano, rabbit fur, cow and pig dung. Gather the first green Gooseberries from the boughs next the soil and then mulch with short litter under the boughs; treat Red and Black Currants in a similar manner.

Keep the boughs of Gooseberries and Red Currants free and open the spur in the side shoots of Red Currants in August. The old bearing wood of Black Currants should be cut out each year. The best fruit is gathered from yearling shoots.

Start to thin all fruits as early as possible, taking out such fruits as are set in awkward places, and leave the rest where they get full benefit from sun and air.

In the month of September any leaves which shade the fruits can be removed.

Mr. John W. Robson (Messrs. Robson & Sons, Nurserymen, Hexham) said the four northern counties were but poorly represented in the fruit industry of this country, and Northumberland the worst of all, there being only one county, Rutland, which showed a smaller acreage under fruit. In Northumberland there had only 59½ acres of Apples, 16½ acres of Pears, and 9 acres of Plums. In Durham there were 91 acres of Apples, 16½ acres of Pears, and 3½ acres of Plums. In Cumberland there were 266½ acres of Apples, 11½ acres of Pears, and 8½ acres of Plums; while in Westmorland there were 156 acres of Apples, 16½ acres of Pears, and 61½ acres of Plums. In the years 1903-5, he pointed out, over £6,000,000 was paid by this country for foreign Apples. That was a serious outlay for an article which under favourable conditions could have been to a great extent produced in the United Kingdom. In that case the money would have been circulated in Great Britain. Upon the selection of the right varieties depended the success of the whole undertaking. He was quite ready to admit that Northumberland could not at the present be called an Apple county, and that both soil and climate were not so favourable for the production of many varieties of Apples as were some of the southern counties, but he was quite certain that by careful selection of suitable kinds success might be assured, and he thought a most important step had been taken in this direction by the keeping of records of the bearing qualities of fruit trees at Cockle Park, Hexham, Carlisle, and other places. From his own observations—having had 88 varieties of Apple in his grounds at Hexham—he concluded that the Apples which had done the best in this district during the past three years were Domino, Lord Grosvenor, Northern Spy, Potts's Seedling, Prince Albert, New Hawthornden, Lord Suffield, Nonesuch Pippin, Stirling Castle, Sipton Shield Seedling, Cellini Pippin, Warner's King, Liddle's Seedling, Adams's Pearmain and Worcester Pearmain. The best Pears had been Hesse, Jargonelle, Green Chisel, Summer Portugal, and Williams's Bou Chrétien; and the best Plums Victoria, Pond's Seedling, and Magnum Bonum. With regard to the cultivation of fruit for profit, there was undoubtedly a good opening in the north of England. There were good markets within easy reach, and a steady demand for fruit of good quality. At Newcastle, in 1908, 95,000 cwt. of Apples, of the value of £40,000, were received from foreign ports, and over and above that fruit of various kinds to the value of £50,000. But, in 1909, the Apples received at Newcastle from foreign ports only totalled 34,750 cwt., valued at £16,425. The figures, however, showed the enormous amount of money that was being sent out of the country for fruit. Newcastle was the best market in the north for that particular district, and although the railway rates were high, they had still considerable advantage over the Continental producer. He advocated co-operation to meet foreign competition, and in giving advice to intending planters, he said they should only plant such kinds as were known to do well, and not plant too many kinds. He thought the prospects of the fruit cultivator in the north of England, if he recognised his limitations and worked carefully and on business lines, were as good as in any other part of the country.

ORCHARD PESTS.

Mr. F. V. Theobald, M.A., gave a lecture on "Insect and Allied Pests of the Orchard, Bush,

FIG. 142.—MESSRS. GEO. BUNYARD AND CO.'S EXHIBIT AT THE FOUR NORTHERN COUNTIES FRUIT SHOW.

Of early dessert varieties the best are: Beauty of Bath, Mr. Gladstone, and Worcester Pearmain; of late sorts Allington Pippin and Fearn's Pippin succeed well.

Many of the well-known varieties, such as Cellini Pippin, Ecklinville Seedling, Stirling Castle, and Warner's King were very liable to canker in these counties.

Regarding stocks there are three sorts in general cultivation, namely, The Crab, free stock, and Paradise.

Generally speaking, only the two latter are in use. The stock influences the character of the tree to a considerable extent. It is well known that varieties worked on the Paradise stocks come into bearing very early. This is probably owing to the fibrous nature of the roots, the free stocks are not got into this condition until root-pruning has been practised two or three times. On the contrary the Paradise stock is not so long-lived as the free stock, probably owing to the fact that the stock does not swell proportionately with the tree trunk; the latter consequently sickens and dies, as it seems incapable of getting sufficient nourishment.

If a large piece of ground is to be planted with Apples half the number of trees should be on the Paradise stock and half on the free stock.

They should be interplanted at distances of 12 feet. Alternating with these should be the bush fruits. After several years, those on the Paradise stocks will deteriorate, and they will then have to be taken out, thus giving more

some fertiliser in May and June, but no tree should be mulched that is not bearing a crop, as this tends to make the trees run to wood and prevents the formation of fruit buds. Excess of growth must be prevented by root-pruning in November, and useless shoots should be removed in August—standard trees must not be root-pruned. Choice Apples should be grown on walls as Espaliers or Cordons—care being taken to leave an open space next the stem of not less than 3 feet and to keep this space hard, only forking the surface over 4 inches deep.

Pears that should succeed as open bushes or pyramids are Hesse, Crawford, Williams's Bou Chrétien, Doyenné Boussoch, Louise Bonne de Jersey, Comte de Lamy, Beurré d'Amanlis, Colmar d'Ete and Conference; while Jargonelle will succeed as a standard as well as the two first-named varieties. Choice Pears should all be grown on walls either as Espaliers or as Cordons on the Quince stock; special care must be taken (as with Apples on Paradise) to plant them so that the junction of stock and scion is 3 inches below the surface. Such trees as are carrying crops should be watered with liquid manure.

Never plant fruit trees too deeply. Most kinds on free stocks are worked about 7 inches from the soil, and this "leg" should always appear full length above the soil.

It is essential to keep the land free from grass or weeds, hoeing the surface over frequently to let in the sun and air.

Occasional dressings of lime, soot and guano

and Hot-house Fruits." The lecture was illustrated with lantern slides. The two first subjects dealt with were the winter moth and the Codlin moth. Mr. Theobald briefly related their life histories, and explained the best methods of combating them. The Pear slug-worm and the Ermine moth were then illustrated and referred to in a similar manner. Other pests described were aphides, woolly aphis or American blight, the Pear midge, and Raspberry beetle.

SMUDGE FIRES IN ORCHARDS.

The next paper was one upon "Smudge Fires or Orchard Heating in the United States and Elsewhere," by Mr. H. Hogbin, of the Colorado Orchard Heater Company. The lecturer described experiments made in the Colorado fruit orchards with a view to preserving the blossoms from the effects of spring frosts, and said that it was not enough to have mere smudge fires for the production of smoke, but that better results were obtained by a system of heating the atmosphere of the orchards by the use of the orchard heaters or similar means.

EFFECTS OF SPRING COLD ON FRUIT TREES.

Mr. S. T. Parkinson, B.Sc., read the following paper on the "Effects of Spring Cold on Fruit Trees."

Various methods have been tried in the attempt to save plants from the effects of spring frost, but two only appear to have met with any reasonable amount of success. One consists in the application of irrigation, the other in the use of heating devices. In respect of the latter I desire to say a few words with regard to various experiments generally referred to as "smudging." It should be observed that investigators have approached the subject with *two* distinct ideas in mind:—

(1) To prevent the plant getting cold.

(2) To prevent a sudden thawing of the cooled plant tissues.

It is obvious that the second method can only succeed where the tissues have not been actually destroyed by the cold, and must fail after a very severe frost. Experiments I have carried out by means of artificial frosts and gradual thawing have convinced me that *cold itself* is responsible for the death of the plant in many cases. Still, that the method is effective in restoring certain plants in cold weather is well known.

Thus, turning the hose on Potatoes and Tomatoes before the sun rises is a recognised way of trying to save them from the effect of a spring frost. Again, covering Peas and Beans when they are stiff after a cold night, and before the sun gets on to them, is often resorted to.

Professor Sorauer draws attention to the fact that parts of a frozen leaf touched with a warm hand, and thus rapidly thawed, will often perish, although portions not so touched and thawed will survive. Experiments made by Prof. Muller-Thurgau (1886) and Prof. Molischi (1897) indicate that sudden thawing does *not* as a rule produce injurious effects; yet the latter mentions that *Apples* and *Pears*, some of the very plants we are interested in, and also the leaves of the *Agave americana*, remained alive after moderate freezing (if gradually thawed), but *died* when thawing was rapid. I may have given undue prominence to this point, but I do so because there seems a tendency just now to overlook it. Although the subject has come to the front in this country during the last few years, it may be well to remember that the process of smudging is a very old one. Theophrastus seems to be the first author that refers to it (lib. 5, cap. xx.). Pliny, nearly 2,000 years ago, advocated the use of bonfires of chaff or weeds to manufacture artificial clouds. Boussingault mentions that the Incas of Peru used fires of wet straw to save their Maize long before the invasion of S. America by the Spaniards. Olivier de Serres tried to prove its effectiveness in 1639, and it was revived again by Hogstrom in 1757.

In these days, when we have a Destructive Insect and Pest Act and the subject of State Legislation is so much to the fore, it is interesting to read that, at the close of the 18th century a sort of ordinance existed in Wurtemberg, which provided for co-operation in the kindling of smoke fires when there was danger of frost injuring the vineyards.

In considering the question of smudging we must note the object underlying the experiment. In *all* cases, whether smoke smudges or fires only are used, the fundamental idea is to prevent the plant from cooling.

To accomplish this:—

(1) Heat alone may be mainly relied on. This is the case with such devices as the Colorado orchard heaters.

(2) Or we make use of heat plus water-vapour, as when damp shavings or hedge-clippings are used. The vapour itself in this case preventing loss of heat.

(3) Or heat and a dense, dry smoke may be tried. In this latter case, direct heat from the flame itself plays a somewhat subordinate part in the process, the cloud or blanket of smoke being the chief thing. The effect relied on is not so much the direct heat from the fire as the effect of the smoke-cloud or blanket, which has a double part to play. It prevents excessive cooling in the night and too sudden thawing at sunrise. This method is illustrated in the use of such pots as those tried by Messrs. Heeper and Martin, and described in the *Journal* of the Board of Agriculture for April 10, 1907.

So far as my experience goes, this method has two or three disadvantages which make it well-nigh impossible for general use:—

First: In the case of a really severe frost the temperature in the smudged area is not raised sufficiently above the rest.

Second: It is very difficult to keep the cloud still. Even on a very quiet night the smoke will drift away if there is the slightest air-current, and there always seems to be one on sloping ground and down a valley.

Third: After burning some time the smoke tends to issue from the pots in less dense clouds and to ascend perpendicularly. This is especially the case where the trees are small and do not hold the smoke.

Fourth: It is a very *messy* job; the trees and bushes become covered with oily, black smuts, and it is unpopular with the neighbours. On an absolutely calm night, on level, low-lying ground, in an isolated place, I believe it would be successful.

Heat and Water-vapour.—A smudge made of damp materials adds moisture to the air. Smudges of damp straw, wood, and hedge-clippings should, if accompanied by sufficient heat, be better than dry heat alone, because, in addition to smoke, they add water-vapour, which helps to prevent loss of heat by radiation and evaporation. Again, the vapour meeting cold air or coming into contact with the cold surface of the plant or ground condenses and sets free heat which is of use in preventing an excessive cooling. On the other hand, when the sun rises, the condensed water turns back into vapour, and helps to prevent a too sudden heating.

The first method, that of applying heat pure and simple, is illustrated in such appliances as the Colorado orchard heaters. My own experiments with such methods have not been successful in raising the temperature to the extent required. I have tried charcoal stoves, and also the coal pots, and have been somewhat disappointed in both. At the same time I must admit that conditions, both as regards the places worked in and climatic conditions, were not ideal. There seems to be no doubt that, given favourable conditions, a considerable rise of temperature ensues.

The most satisfactory account of a smudging experiment is the report of the Riverside Horticultural Club. This takes us back to 1897. The report says: "Under certain conditions we are convinced it may be a valuable means of protection. We think this especially true in localities where the temperature falls only a little below the danger point."

Professor Howard, of Missouri University, in the *Rural Pacific Press* of April 16 of this year, writing about oil and coal pots (the heat-alone method) says: "Beginning with the spring of 1907, the use of oil and coal for heating orchards of Apples and other deciduous fruits has become very popular in Colorado. . . . By the use of orchard heaters, burning either coal or crude oil, it is claimed that the temperature can be raised 8, 10, or even 12°. To accomplish such results it is necessary to use the burners at the rate of 100 to the acre, and to heat large areas at the same time. . . . the fruit-growers united and combated the elements all night for five

nights, and every newspaper reader is familiar with the details of their brilliant success in saving their crop of Apples, amounting to almost 4,000 cars."

The latest pamphlet on the subject is the *Farmers' Bulletin*, No. 401, U.S. Dept. of Agriculture, published last June. It describes, in detail, experiments in orchards of the N.W. Pacific. In the introduction we read: "Notwithstanding the favourable results obtained, it must be acknowledged that there is still considerable doubt as to the possibility (under varied conditions) of warding off the damage from frosts by fires, and also some question about its practicability in open orchards."

Finally, I would mention three unalterable factors which make smudging an uncertain process:—

(1) The great "streakiness" of the frost.

(2) The excessive lowness of the temperature at times.

(3) Even if smudging, performed at considerable cost, is effectual in saving the crop from frost damage, there are other meteorological conditions in connection with cold weather which may affect the crop at seasons of low temperature.

I consider the question of the effectiveness of smudge fires to be as yet unproven. I do not doubt that fruit can be saved by this means, but I consider that our knowledge of the subject is very unsatisfactory, and that (if we are to hope to apply the process with any certainty of result) we need further experiments. My opinion is that such experiments, properly carried out, would be of value to the fruit-growers of the country in throwing light, not only upon the effectiveness of smudging, but on other conditions that cause damage in cold weather.

In conclusion, I offer a few remarks which suggest other methods by which frost damage might be minimised:—

(1) Care in selecting varieties of plants known to suit the locality, with special reference to their cold-resisting capacity.

(2) The breeding of varieties resistant to cold.

(3) The thorough study of the temperature and air currents on any piece of ground where fruit-planting is contemplated. The behaviour of the grass or any crops already on it should be noticed, also its position as regards slopes, water and air currents. Over a particular farm there are always patches that are warmer than others and patches that are liable to frost. An intelligently-thought-out plan of laying out the ground may often save much loss.

(4) Air drainage. The cutting down of a hedge halfway down some slope, for example, might cause a drainage away of cold, stagnant air which accumulates during a frost.

In opening the discussion which followed the reading of the papers, Mr. Gray, M.A., of the Armstrong College, Newcastle-on-Tyne, drew attention to the principles upon which attempts to deal with insect pests are based—especially pressing home the need for recognition of the mode of feeding of the insects to be dealt with, whether they bite the leaves or whether they suck the sap, and the need for an accurate knowledge of the details of their habits and life histories. He disclaimed any practical acquaintance with methods of protection from frost in orchards by means of heaters, &c., as did Mr. Chittenden, of Wisley. Mr. Chittenden emphasised the remarks made by Mr. Parkinson as to the great variations in temperatures recorded at the same time in places only a few yards apart, where the conditions were apparently very similar, and as to the many troubles often attributed to frost which were in reality due to other causes altogether, namely, the brown rot fungus, or the Apple Psylla, and unsuitable weather conditions. Mr. Chittenden said that in his experience it was better to use caustic alkali sprays as late in the season as possible, for he had found that then almost all the nearly hatched eggs of aphides were killed. Mr. Theobald had said that lime and salt applied in the winter delayed or prevented the hatching of the eggs of aphides, and in the same way he had found that a similar application delayed the hatching of the eggs of the Apple sucker (*Psylla mali*) that no practicable wash seemed to kill, though nicotine washes were deadly to the insects when hatched if they reached them. He inquired whether Mr. Theobald had found the

spreading of Kainit beneath Pear trees useful as a means of dealing with Pear midges.

Mr. Britten, who followed, said that the Apple sucker was very rarely seen in orchards in the district, though the Plum sucker was very common. He had also noted that the Plum sawfly had appeared in the past season, and considered that American blight, which was very common on Apples, could not be stamped out, as it fed freely upon the Wild Crabs so numerous in the hedges. In the same way, the Gooseberry sawfly was spreading, in spite of the efforts of gardeners to check it, for it fed on wild plants. He commented on the prevalence of an insect boring into the flesh of Apples this season, tunnelling it in all directions, which he considered was probably *Ragoletis pomonella*.

Mr. Theobald, in reply, said that the use of Kainit under trees was fatal to a large number of the Pear midge larvae, provided it was spread sufficiently early, but in his experience the dressing of Kainit had a bad effect upon the growth of the trees in the succeeding year. He regretted to hear of what appeared to be an attack of the American pest *Ragoletis*, for he knew of no well-authenticated report of its previous occurrence as a pest in this country, though its work was often apparent in imported fruits.

NATIONAL FRUIT-GROWERS' FEDERATION.

A meeting of the National Fruit-Growers' Federation was held at Hexham during the Fruit Congress (October 22), and exhibition held under the auspices of the Four Northern Counties. Mr. C. H. Hooper, in opening the proceedings, said that the Federation was anxious to enlist the northern fruit-growers as members. Most of the present members were from southern counties, but the objects of the Federation should commend it to those in all parts of the country interested in the commercial welfare of fruit-growing. Fruit-growing countries such as the different provinces of Canada and Australia had strong associations looking after the welfare of the industry.

Mr. W. Miskin (secretary) said that the Federation was formed in 1902 by a few prominent fruit growers. Its objects were:—

To create a permanent Central Organisation representative of the fruit-growers, market-gardeners, and others interested in fruit-growing in the United Kingdom, for the promotion of their common interests as a whole, while reserving perfect local liberty of action to the constituent members.

To promote, support, or oppose legislative or other measures affecting the fruit-growing industry.

The collection and dissemination of statistical and other information relating to the fruit-growing industry.

To prevent, by every possible means, the granting by Railway Companies of preferential rates and facilities for the carriage of foreign fruit and market-garden produce.

To secure quicker means of transit and facilities from Railway Companies, and consider conditions which are likely to be ignored by Companies when made by individual growers.

To prevent jams and other preserves made of foreign fruit being sold by misdescription.

To affiliate with any other kindred society or societies.

To assist such societies in the organisation of meetings of a business or educational character. To assist in the formation of local Societies and to give them as far as possible the full benefits of the Federation.

The doing of all such things as may be conducive to the prosperity of fruit-growers and market-gardeners, such as urging upon the Government the necessity of putting into force the first recommendation of the Departmental Committee of the Board of Agriculture on Fruit-growing, namely, "That a special sub-department of the Board of Agriculture be established to deal with matters connected with the fruit industry."

At present, said Mr. Miskin, the Federation is not adequately represented in the northern counties, and I hope this congress may be the means of increasing our membership. It is absolutely essential for the welfare of the industry that there should be some central body to deal with matters of general, as opposed to those of merely local importance.

Mr. W. Fearnside, Pershore, said that he hoped that the recommendation with respect to a sub-department of Horticulture, would be pressed forward by the Federation. This country was far behind our Colonies and foreign countries in collecting information as to the methods of grading, packing and distributing fruit. On Thursday they had at Pershore a deputation from Japan, who are here for the purpose of studying English methods of co-operation and organisation in agriculture, and he would suggest that the Federation should urge that special commissions be sent to our Colonies and foreign countries that have specialised in co-operation and organisation to study their methods. The Federation

had a very influential and hard-working committee, and he (Mr. Fearnside) hoped the growers in the northern counties would give them their strong support.

Mr. W. Lawrenson, of Eaglescliffe, South Durham, laid stress on the importance to the nation of horticulture, and the desirability of having a special Board of Horticulture to look after its interests. As an example of what horticulture is capable of doing, he reminded his hearers that Mr. Reclford bought a 50-acre field in Hertfordshire, which would be only a small part of a farm, yet this 50 acres, now largely covered with glass-houses, employs 500 men.

BRITISH GARDENERS' ASSOCIATION.

On the last day of the Fruit Show at Hexham (October 22), opportunity was taken to hold a meeting of this association. Mr. W. B. Little presided, the principal speaker being Mr. W. Hall, of Sunderland.

Mr. Hall said that there were several tests, by which a man who claimed to be a practical gardener could be proved, such as a proper manipulation of tools or the cultivation of plants under various conditions. Examinations such as are held by the R.H.S. have no value as a practical test of a knowledge of gardening. He asked if nurserymen or employers sought out men holding such certificates. It is necessary for gardeners to combine for their common good and to seek to raise the status of a gardener.

Mr. Hall said all gardeners should join together for mutual help in matters pertaining to their profession, and there was room in the British Gardeners' Association for men of all shades of opinion.

INTERNATIONAL HORTICULTURAL EXHIBITION, 1912.

OCTOBER 25.

A MEETING of the provincial secretaries appointed by the Executive Committee of the International Horticultural Exhibition took place at the R.H.S. Hall on the 25th ult.

Opening the proceedings, the chairman thanked the representatives for attending in such large numbers, and said that the business before them was to consider the resolutions passed by the Executive Committee at a meeting held on Tuesday, June 14, and to make recommendations thereon. These resolutions were:—

(1) The country be divided into Territorial District Committees, making individual counties into separate districts where their importance justifies it.

(2) Presidents and hon. secretaries be appointed. The hon. secretaries to be consulted as to the appointment of local committees proposed to consist of about 10 members. The list of names on the local committees to be submitted to the Executive Committee for approval, and names to be added by the Executive where desirable.

(3) The duties which local committees shall be invited to undertake shall be clearly defined, viz., getting exhibitors, guarantors, and subscribers, and making known in their respective districts that an international exhibition will be held in London in 1912; also that local committees shall be invited to make recommendations to suit local conditions.

(4) That every president and secretary of a local committee should have a ticket for the opening two-guinea day; that members and local committees should have one ticket each.

(5) That the local hon. secretaries should be invited to London to meet the Executive Committee to consider and discuss a common course of action. The third-class railway fares to be paid by the exhibition if requested.

(6) That Scotland, Ireland and Wales should have a committee each to organise their respective countries.

(7) That members of the general committee be appointed members of the local committees of their respective districts. At a later meeting, it was resolved that each hon. sec. should be styled the local representative of the Executive Committee.

The earnest wish of the Executive Committee, the chairman said, was to carry the provinces

with them, and make this exhibition one for the whole of the United Kingdom, and one in which everyone connected with horticulture might personally feel interested. On the question of making the exhibition known, he mentioned that posters were being prepared to be exhibited at local shows, and local secretaries were to be asked to have paragraphs and similar announcements inserted from time to time in newspapers circulating in their respective districts. The question of the tickets of admission was one on which the Executive desired the opinion of the local secretaries. So far as the disbursements were concerned, the Exhibition Committee would be willing to pay all proper disbursements of the local secretaries and certain other items authorised at headquarters.

A discussion followed the programme laid down by the chairman. Ultimately, Mr. Edwin Molyneux proposed that there should be a committee for each county, and with regard to the chairman or president of each particular committee, that the name proposed should be submitted to the Executive before appointment.

Mr. Hudson seconded, and this was carried unanimously.

The chairman said that it had been suggested that the chairman and secretary should send a list of names to be formed as a local committee, not necessarily ten, which was a tentative number; and with reference to Scotland, that that country be divided into two districts.

Mr. James Whitton suggested that a public meeting should be held in Glasgow, at which the chairman of this meeting or some other representative of the Executive Committee should attend. Such a meeting would incite very considerable interest in the exhibition.

The chairman thought this a valuable suggestion, and one that should be acted upon.

It was also decided that the tickets to be granted in recognition of services rendered should not be accounted as commission, the services of the local committees and officials being regarded as voluntary. The meeting further recommended that the railway fares of provincial secretaries attending meetings should be paid within a reasonable limit, this motion being proposed by Mr. W. P. Wright and seconded by Mr. Foster.

The chairman intimated that the opinions expressed would be submitted to and considered by the Executive Committee. The meeting then adjourned.

GENERAL COMMITTEE.

Below is a list of those present at the meeting of the General Committee. The proceedings were reported last week:—

- | | |
|------------------------------|--|
| L. Abercromby Alexander. | P. O. Knowles. |
| E. Backhouse. | Edward Layton. |
| W. G. Baker. | Stuart Low. |
| N. F. Barnes. | R. Irvine Luch. |
| F. Rudolph Barr. | George Macrae. |
| W. E. Beem. | Douglas McDonald. |
| Edwin Beckett. | F. J. McLeod. |
| W. A. Binney. | E. Moyleux. |
| Peter Blair. | Harry Murray. |
| A. T. Boscawen. | George Munro. |
| A. Bullock. | C. G. A. Nix. |
| Edward A. Banyard. | K. C. Notcutt. |
| T. Challice. | James O'Brien. |
| J. Charlesworth. | W. H. Page. |
| Joseph Cheal. | A. W. Paul. |
| Fred. J. Chritenden. | Geo. Paul. |
| T. H. Cook. | *C. Harman Payne. |
| W. F. Cooling. | Rev. Hooper Pearson. |
| Thomas Coomber. | Rev. Joseph H. Pemberton. |

| Dr. F. Keeble, M.A. | W. P. Wright. |

Members of Executive Committee

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

OCTOBER 25.—*Present*: Rev. Prof. Henslow, M.A., V.M.H. (in the Chair); and Messrs. W. Cuthbertson, G. T. Drury, A. W. Hill, A. Worsley, W. Hales, R. Hooper Pearson, J. T. Bennett-Poe, E. A. Bowles, Drs. A. Voelcker and F. W. Keeble, and F. J. Chittenden (hon. sec.).

Malformed Orchids.—Mr. E. A. BOWLES showed two malformed Orchids, a *Dendrobium* and a *Cattleya*, both showing doubling of some of their parts. They were referred to Mr. Lionel Crawshaw for examination and report.

Fodder plant.—Dr. A. VOELCKER showed the basal part of a plant used in Mexico as food for cattle. The portion shown consisted of the overlapping basal portions of the leaves, their upper parts having been removed, and the axis from which they had sprung. The mass measured about 12 inches in diameter and was about 10 inches deep. The leaves are exceedingly glossy and hard. The mass is broken up with a chopper and fed to cattle, which devour it greedily. It contains about 2 per cent. of cane sugar. It is apparently from a species of *Hechtia* and belongs to the Bromeliaceae.

Nerine crosses.—Mr. A. WORSLEY showed a spike of *Nerine* × *Haylockii* to illustrate the fact that reciprocal crosses are not always of precisely the same nature. *N. Mansellii* is the result of the reciprocal cross in this case, but it differs in colour from *N. Haylockii*. Dr. KEEBLE pointed out that such differences may arise because the pollen may not carry the chromoplasts. In addition to this, it is not certain that the same forms of the species were used in the making of both crosses, and if different forms were used the result would naturally be different.

Fertility of "green" Wallflower.—Prof. HENSLAW said that he found the fruits of this plant to contain numerous fertile seeds, but he had not been able to satisfy himself that the supernumerary carpels formed in place of stamens produced good seed.

Fasciation in Rose.—Mr. W. PATTERSON sent a fasciated branch of *Rose* from St. Vincent, W.I. He remarked that it had been taken from a bush which had been severely cut back. He thought fasciation was somewhat rare in *Roses* as compared with many other plants.

Pear with lateral proliferation.—Mr. ROGERS, of Falmouth, sent a *Pear* which had produced a bud upon its side. This malformation is rather common and is due to the fact that the fleshy part of the *Pear* is a stem structure.

Macaranga saccifera.—Messrs. VEITCH exhibited, on behalf of M. LOUIS GENTIL, a plant of *Macaranga saccifera*, a native of the Congo district, belonging to the Euphorbiaceae, and possessing very curious saccate growths of the nature of stipules, a pair at the base of each leaf. The Committee, on the proposal of Mr. BOWLES, seconded by Mr. HALES, unanimously recommended the award of a Botanical Certificate.

Plant breeding, &c.—The Rev. Prof. HENSLAW made some remarks upon the Mendelian phenomenon of segregation. He first drew attention to the fact that dissociation of the characters of the parent plants crossed—when the dominant offspring (F_1) was self-fertilised and bore offsprings usually like each parent (F_2)—often appeared in the first cross, so that this (F_1) was intermediate in characters, as of that of *Prunella sinensis* "Crimson King," with a white (Star) "Lady" variety (Bateson's *Mendel's Principles of Heredity*, pl. vi.). Mendel's dissociations appear to be a previously-unknown instance. Prof. HENSLAW gave as examples among hybrids the two species of *Petunia* with a purple or violet and white flower respectively, the offspring of which are mostly striped. *Cytisus Adami* is another case. Of crosses with floral or fruit dissociations he mentioned *Azalea indica*, the York and Lancaster *Rose*, Sweet *Williams*, *Chrysanthemums*, *Delids*, &c., and the fruit of Red and White currants. Another cause of dissociation arose when naturally compound colours as orange and purple are crossed with a white variety. Thus the orange *Martini* *Darwini* and *Rhododendron javanicum* have supplied reds and yellows. Now the question arises—When one parent is quite

divisible and recessive in F_1 , why is the other dominant? Judging from the examples given in Mr. Bateson's work, the answer is that the dominant characters are mostly, if not always, those representing the original specific type. Thus tallness of stems, round and yellow Peas, are dominant in the kitchen *Pea*. The purple and flat standards of the Sweet *Pea* are specific and dominant. In fruits, the normal and prickly forms of *Ranunculus arvensis* and of *Datura* are dominant. If, therefore, the species be known as the earliest varieties, such may be expected to supply the dominant characters.

He then read the following note on the influence of starvation on sex. In the note on this subject, read September 30, it was mentioned that in one of the 5-inch pots there were 75 seedlings of *Mercurialis annua*. Of these, 59 proved to be males and 10 females on August 20. All these were removed. Of the 24 left, 14 bore female flowers by September 25. Of the remaining 10, seven more proved to be also females by October 30. The three remaining died. Hence, the 24, when not crowded, developed only female flowers. In another experiment with a 6-inch pot there were 45 seedlings. Of these, 27 were males and 18 females, i.e., in the proportion of three to two. These plants grew much taller than in the smaller pots, the males being from 9 inches to 12 inches high, the females from 4 inches to 6 inches, whereas in the 3 inch pot they flowered when only about 4 inches.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

OCTOBER 20.—*Committee present*: E. Ashworth, Esq. (Chairman), and Messrs. Arthur, R. Ashworth, Ashton, Chapman, Cowan, Crombleholme, Cypher, Holmes, Holden, Keeling, Lee, Parker, Smith, Stevens, Shill, Sander, Thorp, Ward, and Weathers (hon. sec.).

The outstanding feature of this meeting was a display made by Mr. O. O. WRIGLEY, of Bury. It was composed of masses of *Odontoglossum grande*, *Vanda coerulesa*, *Dendrobium Phalaenopsis* var. *Schroderiana*, *Cypripedium Fairrieanum*, and *C. × Mandia*. A Gold Medal was awarded to Mr. Rogers, the gardener.

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), staged a charming group of choice plants, which included two good forms of *Odontoglossum crispum* var. *Nanthes*, *Cypripedium* × *King George V.*, a new hybrid, the parentage of which is not recorded, was voted a First-class Certificate, and Awards of Merit were given to *Cypripedium* × *Hermes* (*Euryades* × *Lecanum*) and *C. × San-ac-dere Plumpton Hall* var., a similar award being granted to *Laelo Cattleya* × *Black Prince*, a cross between *L.C. × Bletchleyensis* and *C. × Hardyana*.

Mr. A. J. KEELING, Bradford, received an Award of Merit for *Cypripedium* × *San-Luce*, a pretty form between two yellow types of *C.* insigne.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), staged a bright group of plants, for which a Silver Medal was awarded. *Cattleya labiata* var. *Mrs. R. Ashworth*, an albino form, received an Award of Merit.

Mrs. A. K. WOOD, Glossop (gr. Mr. Gould), exhibited a few seedling *Cypripediums* raised from the same seed pod, all varying in character.

F. A. HINDLEY, Esq., Gl. Horton, Bradford, was awarded a Bronze Medal for a small group of miscellaneous plants. A distinct form of *Cattleya* × *Iris* was noticed, also a pretty form of *Cypripedium Fairrieanum*.

W. THOMPSON, Esq., Stone (gr. Mr. Stevens), exhibited a few good *Cypripediums*: *C. rubens* (*C. × Harrisianum* × *C. Germain Opoks*) and *C. × Lord Ossulston Walton Grange* var. received Awards of Merit.

The Rev. J. CROMBLEHOLME, Clayton-le-Moors, exhibited a distinct *Cypripedium* named *C. Monteni* (*C. × Lecanum* × *C. Chamberlainianum*).

J. J. HOLDEN, Esq., Southport (gr. Mr. Johnson), exhibited the beautiful and well-known *Cattleya* × "Countess of Derby," to which a Silver Medal was awarded. It was pleasing to find this beautiful Orchid in such a flourishing condition; the flower-spikes bore five fully-developed blooms.

Messrs. J. CYPHER & SONS, Cheltenham, were

awarded a Silver Medal for a good display of popular species and hybrids; prominent in the group were several distinct forms of *Dendrobium Phalaenopsis Schroderianum*.

Mr. E. V. LOW, Vale Bridge, was awarded a Silver Medal for a choice collection of plants, which included white forms of *Cattleya labiata* and the rare *Odontoglossum grande* var. *aureum*.

Other exhibitors were Messrs. HARTLAND, Cork, J. ROBSON, Altrincham, KEELING & SONS, Bradford, J. BIRCHENALL, Alderley Edge, and the LIVERPOOL ORCHID NURSERY Co. L. W.

CROYDON CHRYSANTHEMUM.

OCTOBER 27, 28.—The 22nd annual show of the above Society was held in the hall at the Adult School, Park Lane, Croydon, on the above dates. The exhibition brought together a good display of Japanese and Incurved varieties of great merit.

A challenge cup was offered in the open class for 50 cut blooms of Japanese varieties, distinct, shown with *Chrysanthemum* foliage, in six vases, of five blooms each. The challenge cup is offered on the condition that at least three entries are staged, but there were only two exhibits on this occasion. The 1st prize was awarded to NEWTON MAPPIN, Esq., Headley Park, Epsom (gr. Mr. T. Beeson). His varieties were *Valerie Greenham*, F. S. Vallis, Mrs. L. Thorn, Mrs. H. Knox, G. Mileham, Mme. G. Rivol, Rose Pockett, Lady Talbot, Mary Inghis, Splendour, Geo. Terry, Pockett's Crimson, Reginald Vallis (the premier Japanese bloom in the show), Sir Frank Crisp, Master James, Mrs. C. H. Totty, Hon. Mrs. Lopes, Mrs. R. H. Pearson, Algernon Davis, Bessie Godfrey, Miss Hilda Rowley, Mrs. G. Mileham, John Peed, Walter Jenks, Miss Ellie Greene, Mrs. R. H. B. Marsham, Mrs. Norman Davis, Mrs. A. T. Miller, Miss E. Smith, Mme. P. Radaelli, all of them finely developed and in perfect condition. 2nd, Exors. of the late Lady ASHBURTON, Melchet Court, Romsey (gr. Mr. Geo. Hall), who showed excellent blooms of Mme. P. Radaelli, Edith Smith, John Peed, Mary Mason, Mrs. A. H. Lee, Marquis of Northampton, Algernon Davis, and others.

In the class for 15 cut blooms of three Japanese varieties, to be shown in three vases, the 1st prize was awarded to Mr. NEWTON MAPPIN, for grand blooms of Lady Talbot, Reginald Vallis, and Mrs. A. T. Miller; 2nd, Lady ASHBURTON's Executors, with Edith Smith and Lady Talbot as the best; 3rd, E. H. COLES, Esq., Burntwood, Caterham (gr. Mr. C. Lane), who had blooms of smaller size, those of Mrs. A. T. Miller and Mrs. W. Knox being the finest specimens.

A class was specially arranged for gardeners residing within five miles of the Town Hall, Croydon. It was for 15 cut blooms of Japanese varieties, one or more to be shown in each vase with *Chrysanthemum* foliage. The 1st prize was won by Mr. G. EDWARDS, Windmill Cottage, Shirley. A five-guinea cup, presented by Mr. Alderman Allen, was included in the 1st prize.

There was also a class for local amateurs. This was for 10 Japanese blooms, in not fewer than two distinct varieties. The 1st prize was awarded to Mr. H. E. MARDEN, Godstone Road; 2nd, Mr. W. PHILIPOT, 57, Church Street, Croydon, who had fine examples of *Rose Pockett*, *Lady Talbot*, and Mrs. G. Mileham.

The best group of *Chrysanthemums* was staged by A. E. CROOK, Esq., Selbourne Road (gr. Mr. Tyrrell); 2nd, E. WOOD, Esq., Church Road, Upper Norwood (gr. Mr. A. Dyer).

Prizes were offered for five blooms of incurved varieties; the winner of the 1st prize, Lady ASHBURTON's Executors, showed fine examples of *Romance*, Mrs. C. Crooks, W. Biddle and *Triomphe de Montbrun*; a flower of *Romance* was adjudged as the premier incurved variety in the show. Mr. T. BEESON was the winner of the 2nd prize in this class.

The vegetables were hardly equal to the displays of some recent years, and the same may be said of the Apples and Pears shown, although several fine exhibits of both were observed. Good bunches of Black Alicante Grapes were shown by Sir W. GREENWALL, Bart., Marden Park (gr. Mr. W. Lintot), who won the 1st prize offered for this variety; Mr. BEESON being placed 2nd.

Trade exhibits were contributed by Mr. T. BUTCHER, Messrs. PEED & SON, West Norwood, and Messrs. WELLS & CO., Merstham.

NEW TRADE SOCIETY.

NOVEMBER 1.

A REPRESENTATIVE meeting of London florists and fruiterers was held at Anderson's Hotel, Fleet Street, E.C., on Tuesday night last, for the purpose of considering a scheme for forming a trade organization for these two branches of retailers. Mr. E. L. Vinden (Fulham Road) presided, and in opening the proceedings, explained the objects of the gathering. It would perhaps be news to most of them, he said, that in the area of greater London there were about 4,200 fruiterers and greengrocers and 2,500 florists, nearly 7,000, with no association for the retailers. With such numbers there must be some grievance and wrongs which required righting; some injustice which needed ending, besides many equalities which should be adjusted. With regard to the local by-laws there were some anomalies which needed serious attention. Probably no one person felt equal to combating these matters alone; what they could not undertake individually they might achieve collectively. At the present time they were face to face with proposed legislation which, if carried into law, would prove extremely unwelcome and irksome to many, and a serious infringement of their liberties. The Shop Hours Bill (No. 2) had been planned by someone whose aims were doubtless lofty and well-meaning. From their practical knowledge of the trade they could furnish many objections and difficulties. It was obvious that the public generally did not recognise the serious difficulties associated with the dealing in perishable goods, such as fruit and flowers. With a view to having their case properly stated representation must be at once made to the Home Secretary. To bring this into effect they must organize. In the matter of organization London was lamentably behind. In the provinces there were associations of retailers which had achieved certain advantages for their members. What had been done in the provinces could be done in London. Why should London wait? He formally moved that the London Retail Fruiterers' and Florists' Association be formed.

Mr. F. D. Mash (Bilham) seconded. He stated that he had attended the meetings of the National Federation of Retailers' Associations, and had seen the benefits which had been secured for the trade. The Federation were able to attend before Mr. Churchill as a deputation with greater weight than if they had been merely private individuals.

Mr. J. G. Taylor (City and Hampstead) supported the proposal, as did also Mr. Denton (Kensington), Mr. Walter Brookes, Mr. Looker (Messrs. Henry & Co., Westminster), and Mr. W. B. Shearn (Marylebone).

Mr. W. E. Boyes (President of the National Federated Associations of Fruiterers and Florists) congratulated Mr. Mash and Mr. Vestey (organising secretary) for the success which had attended their efforts in arranging that meeting. He referred to the various questions which the Federation had effectively taken in hand, particularly as regards the charges made for the Strawberry chips. The Federation organised a deputation to wait upon Mr. Churchill respecting the Shop Hours Bill, and pointed out to him the difficulties of treating the fruit trade upon the same footing as other trades. The Home Secretary had granted some important concessions, and had promised to meet the deputation before Parliament assembled.

The proposal to form the Association was adopted. Another meeting is to be called to elect officers and formally approve the rules. Mr. F. D. Mash is acting as Treasurer, and Mr. W. Vestey as Organising Secretary.

On the proposal of Mr. Somers, seconded by Mr. Looker, the following resolution was passed, and a copy ordered to be sent to the Home Secretary:—"That this meeting of retail fruiterers and florists unanimously considers: (1) that the Shop Hours (No. 2) Bill as at present drafted is entirely unworkable and unacceptable to the London traders in fruit and flowers. (2) That any amelioration of the working hours of the shop assistants can better be made by restricting the number of ordinary working hours per week, allowing for reasonable overtime during ten weeks per annum covering the busiest periods, than by the enforced closing of shops."

INTERNATIONAL HORTICULTURAL EXHIBITION AT BRUSSELS.

OCTOBER 29-NOVEMBER 2.

An exhibition of horticultural products was opened in the grounds of the International Exhibition of Brussels on the 29th ult. This exhibition was promoted under the auspices of the Royales de Flore et Linneenne Societies in the place of several others which were abandoned owing to the disastrous fire which occurred some time ago. The display is a magnificent one, and the promoters are to be congratulated.

THE ORCHIDS.

The exhibition of Orchids is one of the most important which has yet taken place in Europe. Nothing like it has yet been seen in Germany, France, or Holland, and it is only equalled in splendour by the Spring Shows of the Royal Horticultural Society in London. The plants occupy nearly 300 square metres. The visitor can traverse this gaily-flowered parterre for a distance of more than 200 metres, and at each step a new marvel is displayed. The exhibitors in this section include, of Belgian amateurs, M. F. LAMBEAU, M. JULES HYE DE CROM, and M. C. DIETRICH. Among professionals, we would mention the names of MM. PEETERS ET FILS, of Laeken, MM. DUCHESNE ET LANTHOINE, of Watermael, MM. COGEN, of Tervueren, MM. VUYLSTECHE, of Loochristy, M. PAUWELS and M. VERDOECK, of Ghent. Among the foreign exhibitors are M. MARON ET FILS, of Brunoy, Messrs. CHARLESWORTH & Co., Sussex, and Messrs. STUART LOW & Co., of Enfield, England.

M. LAMBEAU'S collection would make an exhibition in itself. Rarely have so many valuable plants been shown by a single exhibitor. The collection contains a considerable number of albinos. Among the coloured forms, the different tones and shades are infinite.

The exhibit of MM. PEETERS ET FILS, Laeken, is quite as noteworthy, though not quite so large. This old established firm had not, for some time past, exhibited at Brussels, but they may now be said to have surpassed themselves. I first remarked a beautifully-flowered specimen of *Vanda cœrulea*, with long spikes of blossoms of the most delicate blue. Then there is a collection of beautiful hybrids raised by the exhibitors.

M. DIETRICH, the proprietor of Val Duchesse, is showing some beautiful products. His collection is remarkable for the most excellent culture. A superb *Cattleya* bears about 50 flowers.

M. FL. CLAYS, Etterbeek, has a splendid exhibit of *Cattleya labiata*.

The firm of MM. DUCHESNE ET LANTHOINE are showing a collection of *Cattleya aurea*, and another collection of 100 various Orchids. This lately established firm is vying an important position in the Orchid world.

The exhibits from the Belgian provinces are not less important than those from Brussels itself. M. PATWYLS, Mirelbeke, shows two collections of very beautiful and well-cultivated specimens: M. VERDOECK, the Burgomaster of Gentbrugge, sends a hundred very interesting Orchids; M. JULES HYE DE CROM, an amateur, has only a dozen specimens, but they are 12 gems; M. COGEN, Tervueren, is exhibiting some very beautiful products; and, lastly, M. VUYLSTECHE, Loochristy, shows, in a miniature greenhouse, some superb *Odontoglossums*, with long branches of flowers blotched with the most varied colours.

It is impossible to leave the Orchid section without admiring the *Cattleyas* and *Lælia* hybrids of M. MARON ET FILS, a French nurseryman, who, like the firm of Peeters, exhibits hybrids of his own raising.

The fine plants shown by Messrs. CHARLESWORTH & Co. and Messrs. STUART LOW & Co. were very much admired. These were the only English firms represented in this section.

MISCELLANEOUS FLOWERS.

Chrysanthemums form a striking spectacle in vast masses, and the difference is very noticeable between the original Japanese Chrysanthemum, and the flowers exhibited by M. DUBUIS-SON-FOUBERT, one flower of which measures 45 cm. in diameter. It is an indisputable fact that, at this time of the year, no flower can take the place of the Chrysanthemum, the Orchid, as has been said before, alone excepted. In no other flower is there to be found the same variety of form and colour. Except for blue, they are of all shades, and the forms vary from the little Pom-

pon to the large, dishevelled Japanese flowers, with florets curved, curled and regular. Among Belgian amateurs, the best exhibitor is M. FIRMEN DE SMET, Burgomaster of Vinderhaute, who has a collection of 150 plants. He is closely followed by Mme. THEO. MOREL DE WESTGAVER, who is showing, in conjunction with M. LEON GROSJEAN, a collection of 100 varieties in remarkable specimens.

Among professionals we notice MM. VITTON VERELLEN ET FILS, of Berchem, who carry off the palm for some really marvellous flowers of excellent culture.

M. LUYCKX, a gardener at Berchem, has a very beautiful collection of 50 varieties. M. BURGER is showing his speciality, the small-flowered *Chrysanthemum* *Baronne de Vinols*.

The plants shown by MM. STEPMAN DE MASSE-MAEKER, those of Mme. ISABELLE DE BACKER, and of Major MOREL-JAMAR also deserve mention.

M. DE GOES, of Jette St. Pierre, is showing some very fine flowers. Altogether, so many Chrysanthemums of such good culture have never before been seen at Brussels. When one sees the quantity of flowers crowded into the immense hall of the Cinquantenaire, it can be realised the great part played by the Chrysanthemum in particular at the approach of the *Joussaint*.

If the vast hall contained nothing but Chrysanthemums, the effect would be very poor, but here and there a fine Palm emerges from their midst, with majestic fronds, which break the monotony of colours. These fine Palms, which are placed amongst the flowers, or decorate a corner, are provided by the two presidents of the Organising Committee, MM. DU PRÉ and F. LAMBEAU. They are magnificent plants.

A gayer note is struck by other flowers, such as the Dahlias of M. SCHOVAERS, of Brussels, and M. RIVOIRE ET FILS, of Lyons; the Violets of M. HEINRICH WREDF, of Landburg, Germany; the 3,000 Lilies of the Valley of M. HUGO MOLDRIKX, of Sudmühle; MM. MENGELS and VANDEN EDELE, of Cappellen; the Gerberas of M. ADNET, of Cap d'Antibes; the Gloxinias of M. DIETRICH; the American Carnations of MM. FERARD, Paris, and Messrs. STUART LOW & Co., London; the Begonias of M. SAMSON JOSSE, of Neufchâteau; the Begonia "Patrie" of M. LAMBEAU; the Cyclamen of MM. MENGELS and VANDEN EDELE; and the flowering Heath (*Erica hymalis*) of M. TRAVOUILLO, of Tours, France.

We may mention in conclusion the fine collections of plants with coloured leaves, which strike so brilliant a note from the entrance, and give quite a tropical effect in this palace of flowers. These fine plants, with scrubby leaves, are *Dryas*, of the variety *Père Charon* and *Gentilia*, exhibited by the firm of MM. DRAPS-DOM, of Laeken. A little further on we come to the fine specimen Ferns sent by M. DEQUESSNOY, of Ghent; then those of the firm of MM. DURIEZ FRÈRES, of Wondelgem. Pretty specimens of *Phoenix Roehelini*, with very graceful foliage, are exhibited by M. EDUARD DRAPS.

The floricultural section occupies the whole centre of the hall, and this is the first time that it has been attempted in Brussels to fill so great a space with flowering plants.

FRUITS AND VEGETABLES.

Belgium has always been noted for its culture of Apples, and the exhibition of these in the Cinquantenaire is excellent, notwithstanding the unfavourable season. The principal centres of production have sent up very fine and varied collections of Grapes and other fruits, the vine-growers of Hoeylaert, especially, having done wonders. Foreign countries, notably Holland, France, and Germany, have sent competitors from their most important centres of production.

The collections of vegetables are not less important than those of fruit, and here the localities round Malines have scored the greatest triumph. The Dutch market-gardeners have also sent a good collection. These are exhibited in co-operation, under the auspices of the Federation of the Horticultural Societies of the Low Countries. *Correspondent.*

SCHEDULE RECEIVED.

Chester Paxton Society's fruit and Chrysanthemum exhibition, to be held on November 16, 17, in the Town Hall, Chester. Secretary, Mr. G. P. Miln, Grosvenor Museum, Chester.

National Chrysanthemum Society.

NOVEMBER 2, 3, 4.

CHRYSANTHEMUMS are at their best when the summer splendour of the garden is past, and this is one of the chief reasons why they are favourites with all. They have long enjoyed a great popularity as exhibition flowers, and the shows of the National Chrysanthemum Society are always looked forward to with

been interest by gardeners. The show which opened at the Crystal Palace, Sydenham, on Wednesday last, was probably the best since the old Aquarium days. The Japanese blooms were never shown finer, whilst the nurserymen's exhibits surpassed all former occasions. No fewer than 74 novelties were presented for award, and the Society's First-class Certificate was granted to nine of these. The usual competitive classes for vegetables were omitted this year.

The weather on the opening day was fine, and a good number of visitors attended the show. The arrangements were admirable, under the management of the secretary, Mr. R. A. Witty, and his assistant.

GROUP CLASSES.

The first class in the schedule was for a display of cut Chrysanthemums, with suitable subjects of other kinds for relief, arranged in a space of 300 superficial feet. There was only one exhibitor, Mr. FRANK BRAZIER, Caterham, who showed pot plants of Chrysanthemums, and these were not in accordance with the requirements of the schedule.

There were three exhibits in the class for a display of Chrysanthemums arranged with decorative plants on a space of 200 superficial feet. The 1st prize was won, as usual, by Lady TATE, Streatham Common (gr. Mr. W. Howe), who had a fine, circular exhibit, containing large Japanese blooms, decorative varieties, and singles, relieved with Cadiemms, Retinipora, Aralias, Palms, and Ferns. It was regrettable that the Chrysanthemums were not named. 2nd, J. B. ENO, Esq., Wood Hall, Dulwich (gr. Mr. R. B. Leech), who showed good Chrysanthemums, but a few of them, the exhibit being rather overdone with greenery. 3rd, Sir D. F. GOUGH, Bart., Hylands Park, Chelmsford (gr. Mr. P. Wilkinson), who showed, mainly, single varieties.

An interesting class was the one for 50 plants of Chrysanthemums in pots, as grown for market, and the 1st prize was awarded to a collection of great excellence, the plants being dwarf and with about eight to twelve good blooms each. They were eminently suitable for room decoration or for conservatory and greenhouse stages. The exhibitors were Messrs. BUTLER BROS., Bexley Heath, Kent. The more striking plants were La Pactole, Dazzler (red), Hortus Tolosanus (bronze), W. H. Thorp (white, Incurred), Diane Nomin (white), Westcourt Yellow, and Tapus d'Or. 2nd, Mr. FRANK BRAZIER, Caterham, with the variety Miss Mary Pope predominating.

AFFILIATED SOCIETIES' CLASS.

A special class was provided for societies in affiliation with the National Chrysanthemum Society, but the response was poor, only two societies being represented. These were the DULWICH CHRYSANTHEMUM AND HORTICULTURAL SOCIETY and the REIGATE AND DISTRICT CHRYSANTHEMUM SOCIETY. The former association put up a very excellent exhibit, the blooms being of remarkably good quality and staged most effectively. The 2nd prize was awarded to the exhibit from Reigate, which was also very pleasing. Both exhibits would have been more interesting had the varieties been named.

CUT BLOOMS.

BLOOMS SHOWN ON BOARDS.

INCURVED VARIETIES.—There were three exhibits in the class for 36 blooms of incurved varieties, distinct—three very even displays well up to the average quality. The 1st prize was won by A. TATE, Esq., Downside, Leatherhead (gr. Mr. W. Mease), who arranged his finest specimen in the back row. These were Clara

Wells (a fine rosy-buff flower, one of the choicest specimens in the collection), Edwin Thorp (a white bloom of good form), Geoffrey's Eclipse (yellow), Mrs. G. Denys (a large, blush-tinted flower), Buttercup (of the richest yellow colour), H. W. Thorp (a white variety with large florets), Pantia Ralli, Mrs. J. Bryce, W. Biddle, Mrs. J. Hygate, Emblème Poitevine, and Lady Isabel. Other notable varieties were Mrs. J. Wynne (white), Daisy Southam (yellow), Romance (yellow), Frank Trestrian (bronze), and W. J. Higgs (claret red). 2nd, PANTIA RALLI, Esq., Ashted Park, Leatherhead (gr. Mr. G. J. Hunt), with fine, large blooms, rather less compact in shape than in the preceding group. A selection of the finest blooms includes Duchess of Fife (one of the best of the white varieties), Buttercup, Clara Wells (a grand bloom), Pantia Ralli, Emblème Poitevine, Lady Isabel, Daisy Southam, Geoffrey's Eclipse, W. J. Higgs, and Frank Trestrian. 3rd, Miss LANGWORTHY, Gays House, Holyport (gr. Mr. T. J. Brown), with a very bright lot of blooms.

Twelve Incurred blooms, distinct.—There were only three exhibits in this class, but they were all good. The 1st prize was won by Mr. TATE (gr. Mr. W. Mease), who showed a fine dozen blooms in Mrs. G. Denys, Buttercup, W. J. Higgs, Clara Wells, Emblème Poitevine, H. W. Thorp, Daisy Southam, Lady Isabel, Mrs. J. Wynne, Romance, Mrs. J. P. Bryce, and C. H. Curtis. The 2nd prize was won by PANTIA RALLI, Esq. (gr. Mr. G. J. Hunt), who had very large blooms of Duchess of Fife, Emblème Poitevine, and Clara Wells. 3rd, A. T. MILLER, Esq. (gr. Mr. G. Milham).

Six Incurred blooms of one variety.—In this class also there were three exhibits, the prizes being awarded to Miss LANGWORTHY, Holyport (gr. Mr. T. J. Brown), Mr. PANTIA RALLI, and Mr. A. T. MILLER in this order for the varieties Romance, Clara Wells and J. W. Higgs respectively.

JAPANESE BLOOMS.

The greatest test of the growers' skill in this section is seen in the large class for 48 blooms of Japanese varieties, distinct. On this occasion there were seven exhibits, all of choice quality. Competition was keen, but the judges had no difficulty in awarding the 1st prize, which was won by E. MOCATTA, Esq., Woburn Place, Adlestone (gr. Mr. T. Stevenson), with blooms of outstanding excellence, being large, fresh and coloured magnificently. The varieties were F. S. Vallis (the largest bloom in the collection), Rose Pockett, Valerie Greenham, Willie Rawlins, Mrs. R. H. B. Marsham, Sir Frank Crisp, W. Iggliden, John Peed, Superbe, Mme. Paola Radaelli, Mrs. L. Thorn, Walter Jinks (a finely tinted bloom), Shanklin, Marquis of Northampton, Purty, Lady Talbot (a companion flower to F. S. Vallis, but of paler yellow), Reginald Vallis, Lady Crisp, Mrs. Norman Davis, W. Mease, Mrs. W. Knox, Mrs. Robert Holmes, Harry Wood (a fine red Chrysanthemum), Mrs. C. Penfold, Evangeline, Buchan Keeling, Algernon Davis, W. A. Etherington, George Henning, Chrysanthemum Montigny, Master Daxill, W. Gee, Duchess of Sutherland, Miss A. Nichol, O. H. Broomhead, Mrs. A. T. Bott, Pockett's Surprise, Mrs. C. Beckett, Mme. G. Rivol, Master James, Lady Frances Ryder (a seedling), Splendour, Frank Payne, James Lock, Mrs. G. Mileham, J. H. Silsbury, and Hon. Mrs. Lopes. The 2nd and 3rd prize groups were so close in regard to quality as to necessitate pointing, with the result that A. C. HAMMERSLEY, Esq., received 172½ points, and the Executors of LOUISA Lady ASHBURTON, Melchet Court, Bomsop (gr. Mr. G. Hall), 172 points. 4th, Mrs. Geo. CLARK, Fleensham Road, Farnham (gr. Mr. C. Moore).

PRESIDENT'S CLASS.

A silver cup was offered by the President, Sir Albert Rollit in the class for 24 blooms of Japanese varieties, distinct. This brought five exhibits. Mr. MOCATTA had no difficulty in beating his competitors, his stand of blooms being very choice, and contained exquisite examples of F. S. Vallis, Master James, James Lock, Mme. Paola Radaelli, Hon. Mrs. Lopes, Marquis of Northampton, Purty, Lady Talbot, Reginald Vallis, Lady Crisp, Harry

Wood, Mrs. Geo. Mileham, Superbe, Algernon Davis, Chrysanthemum Montigny, Walter Jinks, Mme. G. Rivol, Mrs. R. H. B. Marsham, Splendour, Frank Payne, Mrs. W. Knox, Lady Frances Ryder, J. H. Silsbury, and Mrs. A. T. Bott. 2nd, Mme. STUART, Convent Gardens, Rotherhampton (gr. Mr. A. Smith). Outstanding varieties in this exhibit were Mrs. A. T. Miller, Master James, J. W. Molyneux, Lady Talbot, Rose Pockett, J. H. Silsbury, and F. W. Lever. 3rd, Rev. A. E. COOPER, Marsden, Borstal-dene, Bickley (gr. Mr. W. Rigby).

Twelve Japanese blooms, distinct.—This proved a well-contested class, no fewer than 12 growers competed. The Ichthemic Guano Company offered a special prize to the exhibitor of the finest blooms. The successful competitor was Mr. MOCATTA (gr. Mr. T. Stevenson), who had a superb dozen in the varieties F. S. Vallis, Master James, Shanklin, Lady Talbot, Reginald Vallis, Lady Crisp, Walter Jinks, Hon. Mrs. Lopes, Superbe, Harry Wood, James Lock, and Mme. G. Rivol; 2nd Mrs. Geo. CLARK (gr. Mr. C. Moore), with bright blooms of Hon. Mrs. Lopes, Pockett's Crim-on, Splendour, Mrs. C. Penfold, Mrs. A. T. Miller, and others; 3rd, A. T. MILLER, Esq. (gr. Mr. G. O. Milham); the variety Geo. Henning, claret and crimson, was conspicuous in this exhibit.

BLOOMS SHOWN IN VASES.

The principal class in this section was for 12 vases of large Japanese blooms of distinct varieties, three blooms in each vase. The exhibits were strikingly handsome, the large blooms being seen to advantage with their stiff stems furnished with foliage. There were four collections, and the 1st prize was awarded to Mr. W. IGGULDEN, Lock's Hill Nurseries, Frome, with 57½ points. This exhibitor showed Mrs. W. Iggliden (yellow), Reginald Vallis, Mme. G. Rivol (yellow, with rose tinting), Mrs. R. H. Marsham (white), Francis Joffe (yellow and rose), F. S. Vallis (yellow), Mme. P. Radaelli (a fine vase of this grand variety), White Queen, Lady Talbot, Master James, Hon. Mrs. Lopes (a fine shade of yellow), and Algernon Davis (darkest yellow). 2nd, A. C. HAMMERSLEY, Esq., Abney House, Bourne End (gr. Mr. T. Waller), with 56 points. Lady Talbot (sulphur yellow) was shown grandly by Mr. HAMMERSLEY, and others of especial merit were C. H. Totty, W. A. Etherington (blush-pink), Mrs. A. T. Miller, and Leigh Park Wonder (red). 3rd, J. B. HANKEY, Esq., Fetcham Park, Leatherhead (gr. Mr. W. Higgs) who showed a magnificent trio of blooms of the beautiful Mrs. Geo. Mileham variety and another of Mme. P. Radaelli. This exhibitor received 53 points.

INCURVED BLOOMS.—These were arranged on a low table, so that their good points were readily seen. The best of four collections was put up by J. B. HANKEY, Esq. (gr. Mr. W. Higgs), whose blooms were large, well finished, and of good form. They included Mrs. B. Hankey (silvery-buff) Daisy Southam (dark yellow), Mrs. J. Wynne (white), Mrs. G. Denyer (pink flush on white), Frank Trestrian (apricot), Lady Isabel (palest pink), Buttercup (yellow), Mrs. J. Hygate (green), Clara Wells (yellow), and J. Agate (white). 2nd, W. A. TATE, Esq. (gr. Mr. W. Mease). 3rd, PANTIA RALLI, Esq. (gr. Mr. G. H. Hunt).

SINGLE VASE CLASSES.

White.—Some remarkable blooms were seen in this class, which was contested by seven exhibitors. The 1st prize was awarded to magnificent specimens of Mrs. A. T. Miller, shown by Mrs. Geo. CLARK (gr. Mr. C. Moore). The 2nd and 3rd prizes were also awarded to this variety, shown by Mrs. McDOWEL NATHAN, Little Heath Wood, Potter's Bar (gr. Mr. W. Newton), and A. T. MILLER, Esq. (gr. Mr. G. Milham), respectively. The varieties Mrs. R. H. B. Marsham and Mrs. Norman Davis were shown by other exhibitors in this class. **Yellow.**—The best of five vases was also from the gardens of Mrs. CLARK, who won easily with huge specimens of Hon. Mrs. Lopes. 2nd, the same variety, shown by Mr. IGGULDEN. 3rd, Mrs. W. Knox, exhibited by Mr. B. J. HENDE Kinkdale Nursery, Sydenham.

Any other colour.—Mr. IGGULDEN won the 1st prize in this class with the variety *Mme. Paola Radielli*, 2nd, Mrs. C. H. Totty, shown by R. H. B. MARSHAM, Esq. (gr. Mr. D. H. Fairweather), 3rd, Reginald Vallis, shown by A. T. MILLER, Esq. There were five exhibits, the other two being of the variety *Reginald Vallis*.

Twelve bunches of Chrysanthemums, divided.—There were two classes for these, one for yellow and bronze varieties and the other for colours other than these. In the yellow class the 1st prize was won by Mr. R. D'ENCOURT DAY, The Nursery, Sutton Scotney, Hampshire, with *Lizzie Adeock* and *Nagoya*. In the other class, Mr. PAGE, nurseryman, Broadway, Bexley Heath, won the 1st prize with an assortment, all different, of market sorts, prominent being the green-tinted *Mme. Rogers*.

Anemones and Pompon varieties.—There was only one exhibit of 12 large-flowered *Anemone Chrysanthemums*, Japanese excluded, shown by T. L. BOYD, Esq., North Frith, Tonbridge (gr. Mr. A. C. Horton), who staged *Lady Margaret Therpe*, *Juno*, Mrs. Judge *Benedict*, *Nonvelli*, *Alveo*, *Mme. Godereau*, and *Gluck*. The 1st prize was awarded. T. L. BOYD, Esq., was also the only exhibitor in the similar class for 12 large-flowered Japanese *Anemone* varieties, and was again awarded the 1st prize.

F. BRABY, Esq., Bushey Lodge, Teddington (gr. Mr. F. Fitzwater), excelled in the class for six vases of *Pompons*, and he also won the 1st prize for six vases of *Anemone Pompons*.

Reflexed blooms.—Miss LANGWORTHY, Gay's House, Holyport (gr. Mr. T. J. Broom), was the only exhibitor of 12 large-flowered reflexed *Chrysanthemums*.

AMATEURS' CLASSES.

The best stand of 12 blooms of Japanese varieties was staged by Rev. A. E. COOPER MARSDEN, Bickley (gr. Mr. W. Rigby), in competition with three other exhibitors. He had excellent blooms of *Lady Talbot*, *Leigh Park Wonder*, *Miss Annie Nicoll*, *Reginald Vallis*, *Mme. G. Rivol*, Mrs. H. Perkins, *Rose Pockett*, and others, 2nd, Mrs. LANGTON, Hendon (gr. Mr. C. H. Martin), 3rd, W. H. STONE, Esq., Sydenham (gr. Mr. G. W. Stevens).

B. E. DAVIS, Esq., White Lodge, Biddenden, showed the best exhibit in Mr. Thorp's class for 12 Japanese blooms, distinct, followed by J. KING, Esq., Hendon. Both showed well.

There was good competition in the class for six Japanese varieties, there being 11 exhibits. The 1st prize was awarded to W. M. HEATH, Esq., Woodford; and the 2nd prize to J. King, Esq., East View, Hendon.

The best six blooms of a Japanese variety were shown by T. WICKHAM JONES, Esq., South Norwood (gr. Mr. L. Gooch), the variety being *F. S. Vallis*, 2nd, Mr. STONE, Sydenham, with Sir Frank Crisp.

In the class for 12 incurved varieties, there were two displays, Mr. KING winning the 1st prize with creditable blooms, 2nd, Mr. W. GOODING, Edenbridge, Kent.

C. TODD, Esq., Carshalton (gr. Mr. H. W. Edwards), had the best six incurved blooms of one variety, *Chara Wells*, 2nd, E. WOOD, Esq., Upper Norwood, with *Lady Isabel*.

For three vases of *Pompons*, P. DAWSON, Esq., Sydenham (gr. Mr. G. Bowyer), was placed 1st, whilst for three vases of single *Chrysanthemums*, G. MOORMAN, Hampton Court Palace, was the only exhibitor, being awarded the 1st prize.

DECORATIVE CLASSES.

No fewer than 19 tables were decorated with *Chrysanthemums*, and it was a most difficult matter to decide which was the most pleasing exhibit. The judges gave their decision in Mr. Felton's class in favour of Mr. T. STEVENS, The Gardens, Donnington, Laurie Park, Sydenham. Mr. STEVENS employed yellow and bronze *Chrysanthemums* daintily arranged with *Codiaeum* leaves, grasses, and *Ampelopsis*.

In the Society's class for table decorations, Mrs. A. ROBINSON, Carshalton, won the 1st prize with an arrangement of pink *Chrysanthemums* and light foliage.

The better of two tables decorated with *Chrysanthemums* arranged for effect was shown by Mr. W. GOODING, Edenbridge, Kent, a very pretty exhibit, neat and effective.

The best vase of single *Chrysanthemums* and the best basket of berries and coloured foliage was exhibited by Mrs. MASLIN, Ongar Cottages,

Addlestone; the best two vases of *Pompon* varieties by Mr. F. FITZWATER, Bushey Lodge Gardens, Teddington; the best basket of *Chrysanthemums* by Mrs. G. DAVIS, Upper Norwood; and the best vase of single *Chrysanthemums* by Mr. KING, Hendon.

FRUIT CLASSES.

Grapes.—The best three bunches of white Grapes were shown by Sir WALPOLE GREENWELL, Bart., Marden Park, Caterham (gr. Mr. W. Lintott), the variety being *Muscot et Alexandria*.

Sir WALPOLE GREENWELL also excelled with black Grapes, having well-finished bunches of *Black Alicante*.

The finest bunches of *Gros Colmar* were shown by T. L. BOYD, Esq., Tonbridge (gr. Mr. A. C. Horton), the berries being very large.

Apples and Pears.—Culinary Apples were best shown by the Rev. O. TURNER, Weybridge (gr. Mr. A. Basile), who had remarkably good fruit, 2nd, Mr. BOYD.

The Rev. O. TURNER was easily first for dessert Apples, followed by R. GIRVIN, Esq., Sydenham (gr. Mr. J. Harrison).

The Rev. O. TURNER also won easily for six dishes of dessert Pears.

AWARDS.

First-class Certificates were awarded to the following varieties:—

Mrs. Richard A. Watly (Japanese).—A variety of chestnut-red colour with buff reverse.

Cedric Mason (single).—A variety with chestnut-red florets. (Both these shown by Messrs. WELLS & Co., Merstham.)

D. B. Crane (Japanese).—Rich gold colour, tinted with bronze. (Shown by Mr. MARTIN SEBURY, Isle of Wight.)

Budler Caprice (decorative).—Old rose, tipped with yellow.

Mrs. Greening (decorative).—A very soft shade of rose, specially recommended for pot culture. (These two were shown by Messrs. BUTLER BROS., Bexley Heath.)

Snowflake (single).—A large white variety, (shown by Mr. P. LADDS, Swanley.)

Ethel Thorp (incurved).—Of silvery pink shade. (Shown by Mr. H. W. THORP, Worthing.)

Mrs. W. Roots (decorative).—A pure white variety. (Shown by Mr. W. ROOTS, Cranford.)

Countess of Grauard (Japanese).—A fine flower, buff-yellow tone. (Shown by Mr. NORMAN DAVIS.)

NON-COMPETITIVE EXHIBITS.

Mr. NORMAN DAVIS, Framfield, Sussex, excelled with his group of *Chrysanthemums*, winning two Gold Medals, one being an extra prize as being the finest display in the show. The group was one of the best exhibits of *Chrysanthemums* we have observed at an exhibition; the execution was bold, ample space being available, and no feature was obtrusive. Sufficient greenery and decorative plants were employed to enhance the whole without overshadowing the effect of the flowers. Along the centre were arranged big epergues filled with large Japanese blooms. Especial mention may be made of *Countess of Grauard* (tawny yellow), Mrs. A. Herbert (creamy-white), *Mary Poulton* (delicate pink), Mrs. Norman Davis (white), *George J. Bruzard* (a fine red variety), Mrs. F. C. Stoop (pink flush on cream), *Geo. Hemming* (amaranth), and *W. Mease* (carmine amaranth). There was also a selection of the best single and decorative sorts.

Messrs. H. J. JONES, LTD., Hither Green, Lewisham arranged an imposing group of choice *Chrysanthemums*, utilising many handsome vases to display them, with bamboo epergues and, as relief, Ferns, *Pandanus Veitchii*, *Dracaenas*, *Abutilons*, Ferns, &c. Especially noticeable were vases each containing as many as 20 choice Japanese blooms, of such fine sorts as Mrs. L. Thorn, Sir Albert Rollit (rich red), Hon. Mrs. Lopes, Master David, Capt. Mitford, Mrs. Hygate, and Sir Frank Crisp. The ground was covered with dwarfier vases of choice single and decorative sorts, *Gaiety* (rich bronze), *Sandown Radiance* (crimson), and *Robert Thorpe* (white). Amongst new Japanese varieties we noticed *Lady Frances Ryder* (white),

Ernest G. Mocatta (yellow sport from *Edith Jamieson*), *Harry Wood* (crimson scarlet), and *Miss Elspeth King Clark* (primrose tipped with rose).

Messrs. W. WELLS & Co., Merstham, was also awarded a large Gold Medal for a fine exhibit of *Chrysanthemums*. The display measured 75 feet frontage, and was arranged with much taste. At the back were tall stands of large Japanese varieties with Pampas grass, and set off by big clumps of *Michaelmas Daisies*. The exhibit contained many promising seedlings. *Marie Loomis* is a new variety of brick-red colour with golden reverse; Mrs. J. C. Kelly is also a fine new red variety. Amongst the singles none was more beautiful than the new *Merstham Red* variety, crimson with a yellow disc.

Mr. F. BRAZIER, Caterham, showed ornamental *Conifers*, *Michaelmas Daisies*, *Phloxes*, and other border flowers.

Mr. PHILIP LADDS, Swanley, Kent, had a very handsome exhibit of *Chrysanthemums*, of all types, principally of sorts best suited for market cultivation. The style of arrangement was admirable, and the quality of the flowers left nothing to be desired.

Mr. H. W. THORP, Durrington, Worthing, showed Japanese and incurved *Chrysanthemums* of fine quality, prominent in the group being the new *Ethel Thorp*, an incurved flower of soft pink shade.

Messrs. H. CANNELL & SONS, Swanley, showed a bright group of *Zonal Pelargoniums* and single *Chrysanthemums* against a background of tinted Beech foliage, and set in *Adiantum Ferns* and other greenery. Of the *Pelargoniums*, London (a scarlet magenta colour), *Salmon Paul Crampel*, *Naples* (crimson-scarlet, more than 3 inches across the individual flowers), and *Uranus* (cerise) are especially choice. Amongst the *Chrysanthemums* *Cannell's King* (red), *Golden Pagram*, Mrs. F. J. Collet (*terra cotta*), and *Starfish* (bronze) may be instanced as good sorts. This firm also showed a display of hardy fruits of fine quality.

Messrs. GOLDFREY & SONS, Exmouth, showed *Chrysanthemums* and bunches of *Zonal Pelargoniums*.

HOBBIES, LTD., Dereham, Norfolk, staged a large bank of *Rambler* and other *Roses*, also a showy group of *Peony*-flowered *Dahlias*, with a few *Cactus* kinds intermixed.

Messrs. J. CHEAL & SONS, Crawley, showed *Dahlias* of all types, having especially choice varieties of single and *Pompon* sorts.

Mr. G. L. CASELTON, Superintendent, Crystal Palace Gardens, arranged a beautiful group of *Begonia Gloire de Lorraine*, intermixed with *Pandanus Veitchii*.

Messrs. H. MARSH & SON, South Darenth, displayed Apples, &c., packed for market in boxes and baskets.

Messrs. JOHN PEED & SON, West Norwood, exhibited a large number of Apples, all finely selected fruits.

From the Colony of British Columbia was seen a collection of Apples in boxes and baskets, with a few other fruits preserved in bottles.

Garden furniture was shown by Messrs. H. SCOTT & SONS, Woodside, and Mr. G. W. RILEY, Herne Hill, London. Mr. J. HAWS, Clapton, showed watering-cans of his special make.

The ICHTFEMIC GUANO CO., Ipswich, showed their specialities in manures.

Mr. SPENCER MURRIN, Bristol, was awarded a large Silver Medal for a table of floral devices.

MEDALS.

Gold Medals were awarded to Messrs. H. J. JONES, Lewisham; W. WELLS & Co., Merstham; PHILIP LADDS, of Swanley Junction; NORMAN DAVIS, Framfield; H. CANNELL & SONS, Swanley; and J. PEED & SONS, Norwood.

Dean Memorial Gold Medal to Messrs. BUTLER BROS., Bexley Heath.

Silver-gilt Medals to Messrs. H. J. JONES; Messrs. HARRIET SCOTT & Co., Norwood; H. W. THORP, of Worthing; GOVERNMENT OF BRITISH COLUMBIA; and the CRYSTAL PALACE COMPANY, per G. L. CASELTON.

Large Silver Medals to Messrs. FRANK BRAZIER, Caterham; J. CHEAL & SONS, Crawley; DAVID RUSSELL, Brentwood; SPENCER MURRIN, Bristol; and J. AUSTIN, Brixton.

Small Silver Medal to Mr. J. WILLIAMS, of Ealing.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

CHRYSANTHEMUM SPORTING: *Spring Hill.* It is not uncommon for a Chrysanthemum to produce flowers of a totally distinct colour to the normal. The abnormality is known as sporting, and many new varieties have arisen in this way. Roses and Dahlias frequently exhibit this colour sporting in the flower.

CULTIVATION OF GRAPES: *La Jardinier, Essex.* Mr. Jefferies has been good enough to send the following information in reply to your questions:—Black Hambro and Black Hambro are one and the same Grape. The rods in the vineyard at Moor Hall, Essex, are 4 feet apart, and they are single rods. The area of the house is 30 feet by 15 feet, with a lean-to roof, and it contains eight vines. The back wall is 14 feet high, and at the front (inside) there is room enough to walk in the path which goes by the side of a front stage. The vineyard has long, sliding lights, and was erected about 45 years ago; I planted the vines 11 years ago in February, when I first came here. I allow 12 to 14 bunches per rod, according to the size of the bunches. The house is at present packed with Chrysanthemums, and it is nearly always in flower. It is started in January very slowly, so that it will not be necessary to burn much coke; it is then filled with hedging plants. If I thought the bunches would weigh 4 lbs. each I should not allow more than 10 to remain on each rod, as first-class quality is the highest consideration in Grape growing. The vines ought to be 13 inches below the glass, but ours are only 15 inches. I have never notched any roots; as a matter of fact, I interfere with them as little as possible; they were top-dressed (3 inches) two or three years ago, but it will not be repeated this year, although I hope to pick into the border (which is outside and raised above the ground level) 1 cwt. of bonemeal. The border is 10 feet wide, and there is 2 feet 9 inches depth of soil at the back near the front lights, but only 2 feet of soil at the front; this is kept up by boards. The drainage is a foot deep. The drains run from back to front, and one drain runs in front and "picks" up the others, which are 3 feet apart. The composition of the soil was as follows:—The soil was ploughed 2½ inches deep from a field that had been laid down to grass 15 years. It was of a very heavy nature. I had 40 cartloads of this, and I put with it 80 barrow-loads of lime rubble, 40 of burnt garden refuse, 30 bushels of coarse charcoal, and one ton of Bentley's vine border compound; I could not add more burnt earth or charcoal as I had not got it. The two plants of Muscat of Alexandria are planted at the lighter end of the house, three rods of Madresfield Court next, and then the three Black Hambro's; eight vines in all. I endeavour, by judicious ventilation, to keep the Muscat end the warmer. I syringe a little clay water on the glass when the days get hot; this prevents Muscats from scorching and it is beneficial to the Black Grapes. Madresfield Court requires much care in ventilation when colouring. I am careful not to let the border get dry, and 50 gallons of water are afforded each front light space of border when watering is done, so as to well soak the soil. I cannot get liquid manure, so I apply 1 cwt. of Thompson's manure.

CUTTINGS OF ROSES: *G. S. O. B.* You will find directions for making and inserting cuttings of Roses in the issue for September 3, pp. 173, 192.

FERN AND PALM FOR EXAMINATION: *Lothian.* The Ferns are very badly infested with brown scale. There are such numbers of the pest present as to render any attempt at their eradication by means of ordinary treatment, such as spraying or sponging, futile, and the only way is to cut off and burn all the fronds,

taking care that none of the scale lurks in the old stool. The Palm root is attacked by *Ripersia terrestris*, a creature allied to mealy bug. Carbon bisulphide will destroy this pest. See directions for applying this remedy in the last issue, p. 328.

GRAPE CANON HALL MUSCAT: *J. M.* This variety is an extremely bad one in failing to "set" the berries, owing probably to a deficiency in pollen. It is usual to plant a vine of some free-setting variety, such as Black Hambro, in the same vineyard as Canon Hall Muscat. At the time the bunches are in flower, keep the surroundings dry, and the air moving, permitting a little warmth in the hot-water pipes, so that the top ventilators may be opened a trifle. At noon, tap the rods sharply to disperse the pollen.

HEDGE: *W. H. D.* You will find a list of the most suitable subjects for forming a hedge quickly, with cultural directions, in the issues for August 14, 21, pp. 107, 126.

MOLES IN A LAWN: *H. S.* Having failed with traps, your best plan is to make their burrows untenable or to employ poison. If half a peck of slaked lime is stirred in about 20 gallons of water and the liquid poured into one of the holes, the moles will vacate their runs. If poison is employed, it must be given as follows:—Secure a quantity of worms and mix a little strychnine with them and place in their runs below the ground, where fowls or domestic animals cannot reach them.

NAMES OF FRUITS: *Gordonston.* 3, Ribston Pippin; 5, Stirling Castle; 6, Wyken Pippin; 7, Blenheim Pippin; 8, Dumelow's Seedling (syn. Wellington); the numbers were detached from the other fruits. The tall one is Twenty Ounce; the red-striped fruit Hoary Morning.—*B. H.* 1, Ronald's Gooseberry Pippin; 2, French Crab; 3, Harvey's Wiltshire Pippin; 4, Golden Nonpareil; Pear Beurre D'Or.—*Dudier.* Crab not recognised.—*T. S. S.* Golden Ducat.—*T. Pollard.* The red fruit is Barnack Beauty; and the other, Gravenstein. *H. H. H.* 1, Tom Pitt; 2, Lane's Prince Albert; 3, Cockle Pippin; 4, not recognised; 5, Lady Henniker; 6, Ribston Pippin; 7, Cox's Orange Pippin; 8, Fondante d'Automne.

NAMES OF PLANTS: *A. A. Tedford.* *Nicandra physaloides.* *Bothy.* 1, *Solanum Dulcamara*. 2, *Tamus communis*.—*E. W. R.* 1, *Abies grandis*; 2, *Picea sitchensis*; 3, *Cypripedium montanum pendula*; 4, *Pseudotsuga Douglasii*; 5, *Escallonia floribunda*; 6, *Symphoricarpos orbiculatus variegatus*. *H. J. W.* *Micromeria Douglasii*.—*The Dorer.* Possibly *Tecoma* sp., but the specimen is insufficient for proper identification.—*O. R. T.* 1, *Begonia Martiana*; 2, *B. imperialis smaragdina*; 3, *Maranta regalis*; 4, *Dracena terminalis*.—*H. H.* 1, *Selaginella involvens*; 2, *Pteris scaberula*; 3, *Cyrtomium falcatum*.—*P. R.* 1, *Cypripedium Leeatum*; 2, *Cymbidium giganteum*; 3, *Odonoglossum mulnis*; 4, *Calanthe vestita luteo-oculata*; 5, *Oncidium varicosum*; 6, *O. Forbesii*; 7, *Maranta Massangana*; 8, *M. Makoyana*.—*G. C.* *Pulmonaria officinalis*.—*J. C. G.* *Origanum Dictamnus* (Dittany of Crete).

PARCELS LOST IN THE POST. The Postmaster-General has sent us two labels detached from parcels addressed to the *Gardeners' Chronicle*, Wellington Street, London, one bearing the London post mark, October 19, the other Woolton Hill, October 21.

POTASH SALTS: *B. E.* There are three kinds of potash on the market: (1) Kainit, which contains 12 per cent. of potash, 34 per cent. of common salt, and 13 per cent. of magnesia; (2) sulphate of potash, which contains 50 per cent. of potash; and (3) muriate of potash, which contains 43 per cent. of potash. Kainit and muriate of potash must not be used on land deficient in lime. Kainit is too impure to use by itself for plants growing under glass, but it is a cheap source of potash for vegetables and fruit trees. It should be applied in the autumn at the rate of 4 to 6 ounces per square yard. Sulphate of potash is most commonly used, as it mixes well with other fertilisers; from 2 to 4 ounces per square yard is a suitable dressing. This form of potash is very soluble and readily taken up by plants. Muriate of potash is not to be recommended for garden work, the disadvantage

being that the acid it contains forms chloride of lime in the soil, which is easily washed away by heavy rains. Garden soils, as a rule, contain so little lime that they cannot afford to lose any. Muriate of potash may be applied at the rate of about 4 ounces per square yard.

ROSE LEAVES WITH ORANGE PATCHES: *J. P. J.* The plants are affected by the Orange-rust fungus, *Phragmidium subcorticatum*. Collect and burn all the fallen leaves in autumn, and in the spring spray the plants before the buds expand with sulphate of copper, at a strength of two ounces in three gallons of water.

TARRED ROPE AND ROSES: *A. B.* Employ Stockholm tar (not ordinary coal tar), and apply it at once, so that the ropes will be dry and hard before the Roses are trained to them in the spring. Another good method of preserving rope is by soaking it in tan. Procure some tan from a tannery, boil it in water in a cauldron, and then soak the rope in it whilst hot. Tan would not harm the plants.

TREATMENT OF LILIUM SULPHUREUM: *B. D. K.* After the flowers of *Lilium sulphureum* are over, the roots should be watered as before until the stem commences to die down, when the soil may be kept somewhat drier. At no time, however, must it be allowed to become parched as Lily bulbs quickly suffer from the effects of drought. The pots should be kept in a greenhouse, where a minimum night temperature of 40° to 45° is maintained. They will be better placed on the stage than in any other position. The bulbs must not be shaken clear of the old soil, as, when allowed to remain in their pots, the roots keep in the best condition. This Lily is a vigorous grower, and early in the New Year the bulbs may be shifted into pots a size larger than those in which they have been growing, using for the purpose a mixture of loam, peat, and sand. In potting, the large, fleshy roots at the bottom of the ball of earth should not be disturbed, but some of the old soil at the top may be taken off with advantage. After potting, sufficient water only should be given to keep the soil fairly moist, but the amount of moisture should be increased as the roots take possession of the soil and the stems develop. The small bulbs should be taken off at once, and planted in pans or boxes of sandy soil. They must not be dried; roots will commence to form soon after they are planted.

WEEVILLED GRAIN: *V. Sackett.* The grain is infested with the common granary weevil, *Calandra granaria*. You can destroy large numbers of the beetles by placing shallow vessels of bisulphide of carbon (highly inflammable) on the surface of the grain and covering it with a tarpaulin sheet. The method generally adopted in the United States is to fumigate with hydrocyanic acid gas (poison); but both this and the former method involve risk, and should be carried out by an expert only. We would recommend as the better course to get rid of the grain as soon as possible by feeding it to stock. Meanwhile, it should be turned frequently (at least once a week), and when completely removed, the whole of the interior of the granary should be most thoroughly sprayed with hot paraffin and soap emulsion applied freely with an ordinary garden syringe. If there is a space between the floor and the ceiling or other structure below, it will, in all probability, be found filled with grain and swarming with weevils; if so, it will be necessary to remove the flooring and refuse, so that the whole may be thoroughly sprayed. The formula of the emulsion is as follows:—Soft soap, 1½ lbs.; paraffin (White Rose or Solar distillate), 1 gallon; water, 5 gallons. Dissolve the soap in boiling water. When still boiling, or immediately after it is removed from the fire, add the paraffin. Churn by means of a force pump or syringe, and apply the emulsion as hot as possible. The operator should wrap a piece of cloth around the barrel of the syringe to prevent burning.

THE ARNOLD ARBORETUM.*

(See figs. 143 and 144 and Supplementary Illustration.)

FOR many years past the most generous contributor of hardy trees and shrubs to Kew has been Professor C. S. Sargent, Director of the Arnold Arboretum, near Boston, U.S.A. It has long been known to us that in the establishment he controls there exists the richest collection in the world of the hardier North-East American and North Asiatic woody plants, and, with a view to ascertaining what was lacking in, and might be obtained for, the Kew collection, I was deputed by the Director to pay a visit to this establishment, and afterwards to see as much of the horticulture—especially the tree and shrub growth—of the surrounding country as was possible in the 20 days I remained there. I landed in Boston on June 16, and sailed for home from New York on July 6 of the present year. About half my time was spent in the Arnold Arboretum, and I also visited the public gardens of Boston, New York, and Rochester, the Victoria Park on the Canadian side of Niagara, as well as some private gardens of repute in the neighbourhood of Boston and New York.

I have to acknowledge my indebtedness to Professor Sargent not only for many courtesies received whilst I stayed in the Arnold Arboretum, but also for using his good offices to make my visits to other establishments easier and more profitable.

HISTORY AND ORIGIN.

The Arnold Arboretum extends over some 220 acres, and is situated in Jamaica Plain, one of the suburbs of Boston, easily reached from any part of the city by electric trams. It owes its name and origin to Mr. James Arnold, a wealthy merchant of New Bedford and a member of a well-known Quaker family, who, about the year 1870, left 100,000 dollars "for the promotion of agricultural or horticultural improvement." One of the trustees of this fund was Mr. George B. Emerson, the author of the well-known work on the *Trees and Shrubs of Massachusetts*, and, largely through his efforts and influence, Harvard University was induced to devote 125 acres of land belonging to it, known as "Bussey Farm," to the purpose of forming an arboretum. Ultimately the fund grew to 150,000 dollars, and a chair of arboriculture, with Professor Sargent as its first occupant, was instituted in 1875. The area has since been increased by some 90 acres.

The income from 150,000 dollars was a small sum with which to make and carry on an arboretum of the dimensions contemplated, yet with this sum Professor Sargent was expected to convert over 120 acres into a scientific garden, and without (as he observes) a library, or collection of plants, or public interest and support to begin with. Difficult as the task was, it has been accomplished and the Arnold Arboretum is to-day a remarkable monument to the hard work, perseverance, diplomacy, and skill of one man. Since its foundation, Professor Sargent has raised some 1,200,000 dollars (chiefly, I believe, from private sources) to develop and maintain the institution, and his aim is to secure an endowment fund of at least 1,000,000 dollars to carry it on permanently. Considering the work the Arboretum has done and is doing, that sum seems a very modest one, and, in a country so rich as the United States in public spirited men, will, no doubt, be obtained. Besides an incalculable amount of work, Professor Sargent himself has given his books, illustrations, and herbarium to the Arboretum a princely gift, for it forms the bulk of a library now consisting of 23,000 volumes, all of which deal, in greater or less degree, with the woody vegetation of the globe.

The aim of the establishment is to provide facilities for the study of the trees and shrubs of the whole world, but especially those of North America. A handsome building, known as the Museum, was built in 1892, mainly at the cost of the late Mr. H. H. Humewell, of Wellesley; and recently an extension of it has been erected at a cost of £3,000. The older part is now used to hold the library, and to provide offices for the members of the staff. The newer portion houses the herbarium, and consists of four storeys, fitted with air-tight steel cabinets sufficient to hold 1,000,000 sheets. These steel cases reach from the floor to the ceiling, so that there can be no accumulation of dust above them, and they are a great improvement on the common wooden ones of the older herbaria, as they are fireproof, economise space, and do not warp or admit dust. They are, of course, much more costly. On the ground floor of the Museum there is a fine collection of specimens of North American timbers, which are part of the famous Jesup collection, the main portion of which is now exhibited in the Natural History Museum at New York. In an adjoining room there is an excellent collection of the fruits of Conifera. Many of these, especially the cones of Firs, Spruces, and Pines, are too large and bulky to be accommo-

dated on the shelves of ordinary cabinets, and are here arranged in drawers.

The herbarium is under the immediate charge of Mr. C. E. Faxon, Professor Sargent's co-worker, and the most famous of American botanical artists. He prepared the illustrations for the great *Silva of North America*, for the *Manual of the Trees of North America*, and was the regular artist for *Garden and Forest* as he is now for *Trees and Shrubs*.

BEAUTY OF LANDSCAPE.

To one who enters the Arboretum for the first time, the most striking impression received is that of its great beauty of landscape. Only a very small proportion of its surface is level, and at several points it swells into bold prominences, such as Peter's Hill, Bussey Hill, and Hemlock Hill. The last-named is, indeed, the most remarkable part of the grounds. It is a steep hill, with out-ropping rock, and almost precipitous on one side, covered with a primeval growth of "Hemlock"—the American name for *Tsuga canadensis* (see figs. 143 and 144). Some of the older trees are splendid examples. I measured one over 9 feet in girth of trunk. It is a peculiarly fortunate circumstance that this wood should have been preserved to a public body in whose hands its continued existence is assured, for but little of the primeval forest of the New England States remains, and the fact that this tract is almost within the confines of a large city makes it doubly precious. At its northern base a brook finds its exit from the grounds, after having traversed them in various phases, and makes a charming feature; especially where it has passed through a flowery meadow, the gully it has worn out fringed with native vegetation, amongst which, at the time I saw it, the Elderberry (*Sambucus canadensis*) made a pretty display.

To the top of the sister prominence, Bussey Hill, a carriage drive has been made, and from this point a great expanse of beautiful country can be seen, especially the rolling outlines of the Blue Hills in the far distance.

Another beautiful feature of the Arboretum, and one which makes a special appeal to the Briton, is the native undergrowth. In place of the lawns and grass, which cover so much of the ground in English gardens and parks, there is here a very interesting ground-covering consisting of native plants, amongst which are various species of *Vaccinium*, *Aster*, *Rubus*, *Golden Rod*, *Aselepias*, *Baptisia tinctoria*, *Comptonia asplenifolia*, and the Poison Ivy (*Rhus Toxicodendron*). Very abundant in places—for it has thoroughly naturalised itself—is the European dyer's Greenweed (*Genista tinctoria*), making a gay display in early July. Springing up freely every year amongst this low growth is a crop of seedling Oaks and Hickories, so numerous that, in view of the needs of the exotic trees, they have to be mainly treated as weeds. Professor Sargent finds that this low ground cover is not only more beautiful and interesting than meadow, but it is also much more favourable to tree growth. It keeps the earth shaded and cooler than a covering of turf, and does not rob the ground of moisture so much. With the crowds that visit Kew, a general treatment of the ground in this way would be impossible; but we have found that for trees rare and difficult to grow, a ground-cover of Heath is very advantageous, providing shade and shelter for the roots and stem without unduly robbing the soil.

In the more secluded hollows and glades, Professor Sargent is developing a rich growth of Ferns and shade-loving plants.

Another feature in the landscape of the Arnold

* Mr. W. J. Bean, in the *Kew Bulletin*, No. 8, 1910.

Arboretum: the artistic treatment of the walls and boundary walls. Unlike Kew, the grounds are open to horse-drawn carriages (not motor), and are traversed by a system of broad, tree-lined roads, which were made and maintained by the Park Department of the City of Boston. It may here be mentioned that, in making these roads, in providing police protection, and in holding the property for ever free of tax, Boston does something towards the support of the most beautiful of its open spaces. On each side of the road, and separated from it by a few feet, there is a path for foot traffic. A triple track of this kind is not, of course, in

stone, which makes an effective boundary, but is not at present high enough to exclude trespassers—as it is hoped eventually to make it. This wall is covered with a variety of climbing plants, amongst which the species of Clematis, Vitis, and Felastans are most conspicuous. These plants, which are pruned back annually in spring, had, by the time of my visit, about hidden the walls in a beautiful tangle.

THE COLLECTIONS.

It would, of course, be impossible to give any detailed mention of the collections of trees and shrubs. In a general way, they are extremely

shapely form of the Sugar Maple, rarely or never seen in perfection here.

The climate of Boston, judging by its vegetation, bears about the same relation to the British Isles as that of Central Europe. The summers are much brighter and hotter; the winters much colder. In consequence, deciduous trees and shrubs flower with much greater certainty and freedom than they do in Britain; they bear fruit more plentifully, and the colouring of the decaying foliage in autumn is richer than anything ever even suggested in our climate. The climatic conditions of Boston are evidently very favourable to the growth as well as the flowering of

FIG. 113.—A PRIMITIVE GROWTH OF *THUJA CANADENSIS* IN THE ARNOLD ARBORETUM.
(See also fig. 114.)

its own object of beauty, but by planting the space between the carriage drive and the foot path with a varied shrubby growth, which provides usually a low, irregular fringe to the foot path, but sometimes is high enough to exclude them entirely. Prof. Sargent has grown them in a similar plan. Through the wider parts of the grounds grassy ways have been made, which are kept closely mown to the width of a single row of a mowing machine. Winding through the tree collections or across the hill slopes, the paths of the pleasure of walking tracks are made.

The Arnold is surrounded by a low wall of

rich in North-east American and North Asiatic species, but comparatively weak in European and West North American, whilst the floras of New Zealand and South America are scarcely, if at all represented.

To one who has never been out of Europe before, the perfect development of the native American trees naturally appeals most strongly. Especially does one admire the splendid, full-grown Hickories, only known as comparatively small trees in the country; the various White Oaks, which do not thrive at all with us; and especially the beautiful plumose branching and

many North Asiatic trees and shrubs. The Oaks, for instance, introduced by Professor Sargent from Japan 20 years ago, such as *Q. crispula*, *Q. glandulifera*, and *Q. groseserrata*, have made splendid progress, and are proving admirable trees. *Cercidiphyllum japonicum*, which at Kew, owing to its young growth being cut back by frost once or twice every spring, has never got beyond the dimensions of a scrubby bush, is, in the Arnold Arboretum, represented by several vigorous, cleanly-grown trees 30 to 40 feet high. The bush Honeysuckles (*Lonicera*) have a value as ornamental fruiting shrubs beyond anything

we ever experience. By the latter part of my stay in Boston many of them had become covered with crops of fruit, beautiful in their abundance and in the translucence of their red, yellow, or other colouring.

Perhaps the most noticeable difference between the general aspect of the vegetation of the Arnold Arboretum and that of English gardens is the absence of our common evergreens. Neither the Holly, the Yew, the Ivy, the Aucuba, nor the Box appears to be genuinely hardy, and only a small proportion of our garden varieties of Rhododendron succeed well. The Chilean Berberis Darwinii, the New Zealand Veronicas, the Bay Laurel, Magnolia grandiflora, the Arbutuses are

peculiar understandings of plant life which enables its possessor to divine by intuition the treatment best suited to his charges, and the happiest devices for increasing their number. Mr. Dawson has done much by his genius as a propagator and cultivator towards making the collections so rich as they now are. He was about the first to recognise the value of *Rosa multiflora* and *R. Wichmaniana* for hybridising, and he has raised such fine Roses as *The Dawson*, *Lady Duncan*, *E. C. Egan*, and *Arnoldii*.

I was fortunate to see a new Rose in flower which Mr. Dawson has raised and called "*Professor C. S. Sargent*" (see Supplementary Illustration). The original plant, raised in 1903, is now

THE MARKET FRUIT GARDEN.

PLANS AND OBSERVATIONS.

Now that the busy season of fruit marketing has nearly come to an end, the fruit grower has time for making plans for the future and observations in relation to various points of policy in the treatment of his orchards. He may have the results of experiments in planting, grease-banding, pruning, or spraying to examine, and this is a profitable use of his time, which, judging from my own case, is sometimes sadly neglected. With shame I confess that, time after time, I have carried out experiments, and carefully noted them down, and then have forgotten to examine the

FIG. 144.—TRUNKS OF *TSUGA CANADENSIS* ON HEMLOCK HILL, ARNOLD ARBORIUM.
(See also pg. 143.)

all too tender to be grown in the open. In the matter of evergreens as a whole, English gardens have much the advantage.

Several notable hybrid Roses have appeared in the Arboretum, raised by Mr. Jackson Dawson. Mr. Dawson has, like Professor Sargent, seen—and helped in—the development of the Arboretum since its inception, and, in regard to the outdoor department, he has, in a great measure, played the part of builder to that of the Professor's architect. Trees now 60 feet high he himself raised from seed, or collected as seedlings in the forests. Gifted with that

3 feet high and 9 feet through, a sturdy bush, with splendidly vigorous foliage. It bears large, flattish trusses of semi-double flowers, 5 inches across, of a delicate, Apple-blossom shade, and from 50 to 50 in a truss. In June it was carrying thousands of flowers—a wonderfully beautiful picture. Its parentage is as follows: Pollen-bearer, "*Baroness Rothschild*"; seed-bearer, an unnamed hybrid between *R. Wichmaniana* and "*Crimson Rambler*" &c. In this interesting combination the influence of *R. Wichmaniana* is only seen in the very glossy, thick, dark green foliage.

(To be continued.)

results at the proper time. The recognition of this ought to lead up to a plan of recording in a manner that must attract attention all experiments that may be carried out during the next 12 months. The best way of accomplishing this purpose will be to write the date and character of each experiment, and under it the date when results should be examined, on a placard that can be hung up in the office or study, and one for each record being left for notes on a card, making a point of glancing over it at certain intervals, as on the first working day of each week. Hitherto my records have been made in what

may be styled a field book, in which important operations carried out in each field are set forth. This is all right so far as it goes, and is necessary as a permanent record; but something more is needed to call frequent attention to the need of observing results.

GREASE-BANDING.

It has been a question for consideration whether the plan of grease-banding such Apple trees as lend themselves to the process should be adopted by me, as it has been by a great number of other fruit-growers. My abstention from it has been due partly to the argument that, as the operation does not save a single spraying, it is not worth the considerable amount of labour and expense which it involves. However many wingless moths may be caught on the bands, some of their caterpillars are certain to be found on the trees, while the bands are almost useless for the destruction of winged moths. Therefore, spraying to poison the food of the larvæ of the Codling and other fruit or leaf-eating pests cannot be dispensed with in consequence of grease-banding. Leaf-eaters can be killed by spraying with lead arsenate as soon as the leaves expand, and where the Codling moth is troublesome it must be applied shortly after the blossom has fallen, if mischief is to be prevented as far as possible. Then why not trust to spraying alone, and save the expense of banding trees, perhaps 300 on an acre, and greasing the bands at least twice during the autumn and winter?

The only reason for any hesitation as to continuing to dispense with grease-banding that has had any weight with me is this—that leaf-eating caterpillars often do much damage inside bunches of leaves before the latter unfold, and the pests emerge to feed in the open. So long as they are inside closely-folded leaves, the caterpillars cannot be poisoned. But then my oldest trees are in bush form, branching out close to the ground, and it is generally admitted that banding is out of the question with them; while the younger trees are on short stems, encircled with wire netting, which reaches nearly up to the lower branches, so that there is no room in many cases for a band above the belting, and it would be comparatively useless lower down, because the moths could crawl up the netting and thence on to the trees. On the whole, the conclusion is that in cases like mine it is not worth while to go in for grease-banding, if it is in any case.

FRUIT PLANTING.

The results of last season's planting are not favourable to the Woburn method of puddling trees in. The land was so extremely wet during nearly the whole of that season that a great number of the Apple trees were practically puddled, and never before have there been such a large proportion of dead trees after a planting as there are in my young plantation made under the conditions indicated. Usually the deaths have hardly averaged one to the acre, whereas the proportion among the trees planted in the autumn and winter of 1909, after the land became thoroughly wet, is about five to the acre. There are no dead trees in the portion first planted when the land was in good condition.

With respect to plans of planting, some misgivings have arisen in my mind as to whether the one uniformly adopted by me is altogether the best in plantations of top and bottom fruit. In order to allow of horse drawn cultivators up and down and across a field for some years after planting, the distance from bush to bush or bush to tree has been made 6 feet, while the trees are 12 feet apart in the rows and a little more crossways, as they are angled, a tree in one row being placed opposite to a bush in the next tree and bush row. Now, this distance between trees on short stems, trained in bush shape, is the best on my land, taking all varieties into account; but the bushes do not need so much as 6 feet, and the question arises as to whether it would not be more advantageous to allow them only 4 feet in the rows, still leaving 6 feet from row to row,

This would prevent horse cultivation crossways, and the rows would require hand-hoeing to the width of about 2½ feet along their entire lengths, instead of only the squares about 2½ feet across around the trees and bushes. The expense of each hand-hoeing would be increased by about 2s. an acre, but that would be a trifle in comparison with the return from the great increase in the number of bushes. Probably bushes only 4 feet apart would meet in time (and the distance must be 4 ft. or 6 ft.), but not in my soil much before the trees would overshadow them enough to render their removal desirable.

It must be admitted, too, that the great economy and efficiency of horse cultivation in fruit plantations cannot be secured without some sacrifice: for, if it were not entertained at all, the distances between trees of different varieties might be varied, in accordance with robustness or feebleness and habits of growth. But the advantage of using horses, apart from economy, is very great, particularly where extra hands for hoeing cannot always be obtained just when they are wanted. The cultivator can be set to work whenever a dry day, with appear-

needed cutting back not more than half their lengths. Why did the fruit-buds form prematurely on the young branches of the exceptional row? Simply because the roots had not recovered from the transplanting process sufficiently to nourish the branches properly. Therefore, the theory of the advocates of deferring pruning till the second season seems to me baseless, and I am persuaded that if there is any advantage in their plan it is due to the necessity of pruning in the second season much more severely than appears to be necessary with trees cut back in the first spring after planting. If the grower in the first spring would cut back the latter voluntarily as severely as he is obliged to cut back the former in the second season, I am persuaded that the trees pruned in the first spring would be better than the others, and would be fully furnished with branches a year sooner.

AN UNPLEASANT TASK.

Some of my men have been engaged recently in grubbing up over an acre of King of the Pippins, Pott's Seedling, and Stirling Castle Apples planted 10 years ago. The first two varieties

FIG. 145.—ALEKTORURUS YEDOENSIS.

(See p. 333)

ances of settled weather, occurs, and the work is done so quickly that there is a good chance of killing weeds, while it can be stopped immediately if rain comes or threatens. On the other hand, even if a gang of hand-hoers can be obtained precisely when needed, the men who have had the work let to them cannot be expected to be idle while the soil is too wet for killing weeds well, or when rain is apparently approaching, and there is always time for an unfavourable change in the weather while their slow work is going on.

Examination of a row of trees rammed when planted five years ago, as on former occasions of observation, shows no difference from the rows adjoining it, not rammed.

The same verdict applies to a row not cut back until the second spring after planting, the adjoining rows having been dealt with in the first spring. The young branches of the trees not cut back till the second season had formed fruit-buds along almost their entire lengths, so that they had to be cut back to within 2 or 3 inches of the trunks, whereas the other trees were furnished with twice as many branches, which

were big trees smothered with canker. Treatment was unavailing to check the disease, as the pestilent fungus permeated their entire systems, breaking out in places in all parts of them, even up to the tips of the young shoots and in the fruit spurs. Close to them were other varieties almost or quite free from canker; so the condition of the soil, a light one, does not account for the virulent attack. These two varieties should be banned from growing for market purposes. Stirling Castle was dwarfed beyond hope, through regular cropping, in spite of much thinning of fruit in the early years after planting. It was also cankered, but not in the same way as the other two varieties were. There were patches of canker on trunks and main branches, but the disease did not boil up, so to say, throughout the whole-branch and young-shoot system.

IS CANKER MERELY A "WOUND PARASITE"?

No doubt, as all authorities declare, canker is a wound parasite; but is it not something more? When the disease breaks out all over a tree, it seems to spread through the sap. The marks of it can be seen below and above a place of

outbreak inside the shoot, if the latter be cut. Probably aphid causes wounds enough to let in canker, but this does not account for all its outbreaks; and the same may be said of frost, which may burst the outer bark of young and tender shoots, and so let in the spores of the fungus.

SILVER-LEAF.

It is a great comfort to learn from the valuable experiments described in the 12th *Report* of the Woburn Experimental Fruit Farm (see p. 356), that there is no danger of spreading silver-leaf in Plums or other kinds of fruit liable to it by means of the pruning knife, so far as the pruning of living trees or branches is concerned. This was fully proved by the trials carried out, as also was the fact that silver-leaf is the result of the attack of the fungus *Stereum purpureum*. The fungus produces spores only on the dead wood of trees or branches killed by it, and therefore it is only by getting spores on to a pruning knife by cutting a dead branch or shoot that infection can be carried on the blade. The importance of promptly removing and burning trees or branches dead from silver-leaf is obvious. Some fine specimens of the fungus from a dead tree are sent with these notes. *A Southern Grower*.

ALECTORURUS YEDOENSIS.

This interesting plant belongs to the natural order Liliaceae, and is closely allied to the well-known genus *Anthericum*. Probably it is better known in gardens under the name of *Anthericum yedoense*. As far as is known *Alectorurus* is a monotypic genus. *A. yedoensis* is a native of Japan, being found on Mount Tebake in the province of Tosa. It grows from 1 foot to 2 feet high. The distichous leaves are 6 inches to 12 inches long, and $\frac{1}{2}$ inch to $\frac{3}{4}$ inch broad. The inflorescence is a widely-branching, pyramidal panicle, set with pale rose-purple flowers, having the stamens exerted twice the length of the perianth segments. The flowers are dioecious, each plant bearing one kind only. In its native home it is known as "Keibi-ran or Keibi Orchid." The plant is quite hardy in this country, succeeding in similar positions to those suitable to the *Anthericums*, and will flower freely in sheltered situations, but it is not seen to the best advantage outside. In pots it makes a very attractive plant, producing its flowers freely in July and August. Its introduction into cultivation in this country is due to Mr. A. K. Bulley, who presented a plant of it to Kew in 1901. The plant shown in fig. 145 produced staminate flowers only, so that no seed was formed. The species is figured in the *Botanical Magazine*, t. 8336. *W. L.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

MICHAELMAS DAISIES AT THE HERMITAGE.—"Season gardens" are fast and deservedly becoming fashionable, and for autumn nothing can exceed in beauty a good arrangement of the perennial Asters or Michaelmas Daisies. In an April number you published some cultural notes from the pen of Mr. R. Richards, gardener at The Hermitage, Holmes Chapel, and on the 19th of October the writer was privileged to see that unique display, and was charmed thereby. The space devoted to this feature is on sloping ground, and comprises two straight borders about 70 feet in length, 15 feet wide, separated by a broad, gravel pathway, at the higher end of which is a cross border, the whole being backed by Yew hedges. Planted about 3 feet apart each way, and each plant carrying five or six well-flowered shoots—which are artistically tied out on neat canes, instead of being hunched up like brooms—the effect produced is both massive and gracefully elegant. Then, too, the colours are selected to blend well—white, blush-mauve and light blue predominate, with a few very fine pinks. Oftentimes the strong-growing varieties of Aster are so tall that in mixed borders they are anything but elegant,

but Mr. Richards treats these in the manner of *Chrysanthemums*, and cuts them back in the early part of the season—I think May. I should have said, too, that the borders slope upward from the path, and with the arrangement of the varieties according to height, present a gradually sloping bank of blossom. Experience is the best guide as to the relative positions of the sorts, and, as Mr. Richards takes his plants up each season after flowering, an opportunity is afforded to rectify any mistake made in this matter. This annual replanting affords opportunity for trenching and manuring the soil; it also admits of the best young crowns being selected for the coming season's display, and, as seen here, the result well compensates for all the trouble incurred. Some of the varieties specially noted are:—*Delight*, a graceful, small-flowered sort; *Captivation*, a pretty, rosy flower; *Enchantress*, *Esther*, *Cordifolius elegans*, *Photographer*, *Freedom*, *Decorator*, *E. C. Buxton*, *King Edward VII.*, *Marie*, and of the larger-flowered section, *Mrs. Raynor*, a rosy variety, was conspicuous, *Royalty*, too, *Triumph*, *Grandis*, *Ericoides superba*, and a showy variety of the *Novae-Angliae* type all compel notice. The charm of these borders is enhanced by the perfect balance secured by a corresponding arrangement of varieties on either side of the path. It only remains to add that the pleasure of Mr. H. J. Reiss and his family is increased by sharing the view with those who appreciate beautiful garden effects. *Visitor*.

THE BARR AND THOMSON MEMORIALS.—As a subscriber to both these memorials, I trust I may not be considered impertinent if I enquire as to their present position. Over six months, I think, have elapsed since appeals for subscriptions to these memorials were issued, but I do not remember to have seen any recent reference of any important kind made to either. If there has been such, then I am probably to blame. If, however, anyone in official position in relation to these memorials can give some information, it will be read with much interest generally. When long periods of time are allowed to elapse between an appeal and its final consummation interest is apt to die out. *Subscriber*.

APPLES AT THE R.H.S. FRUIT SHOW.—The presence at this show of many fruits which were grown under conditions other than normal served to show that there is a wide difference between fruits produced in ordinary conditions of culture and those produced by semi-artificial conditions. The exhibition schedule makes no distinction; indeed, one regulation specially favours the growing of Apples on walls and beneath glass copings. Fruits thus treated are nevertheless held to have been grown "in the open air." That numerous fruits produced under those highly-favoured conditions were staged was evident. Dessert fruits showed all the colour and thorough ripening common to fruits grown in orchard houses; cooking Apples were seen of abnormal size and finish, all plainly proving their highly-favoured conditions of culture. Such conditions of production cannot possibly be profitable, for not merely are the fruits thinned severely, but the general crop is far too small to repay the labour and expense involved. Is it worth while for the Royal Horticultural Society to encourage a system of culture that cannot possibly be commercially profitable? If the annual fruit show is not intended to encourage national fruit-culture with a view to making it a great commercial industry it is difficult to understand what may be its special object. In admitting these highly-forced fruits as coming within the condition of growth "in the open air" in the case of fruit on walls protected, it may be, by 2 feet wide glass copings, how is the stipulated condition fulfilled when frame lights are stood along the wall on end in front of the fruits to induce rich colouring and precocious ripening? Dessert fruits in this class were awarded prizes on the first day of the Show, and on the second day they were half rotten; surely that is not worth encouraging. If it is desired to encourage Apple-culture under such conditions, then certainly provide special classes for them. By so doing those growers who adopt no such artificial methods, but grow their fruits really in the open air on bush, cordon, or espalier trees, would compete on equal terms, all fruits grown on walls being relegated to their proper classes. In tens

of thousands of gardens, professional and amateur, Apples are grown on profitable lines. That is the aspect of Apple-culture that merits all possible help and encouragement. It would hardly be too much to ask that in naming every dish the nature or form of the tree on which the fruits were grown should also be specified. It is desirable that our great fruit show should be made educational. *F.R.H.S.*

EQUAL PRIZES.—I quite agree with *An Outlook* (p. 297) that it should not be necessary to award equal prizes when judging collections of garden produce, but it seems to me that Mr. H. W. Ward (p. 318) has, for the moment, overlooked the smaller shows and the "any other variety" classes. At the larger shows, where there are so many classes that exhibits compete with their like, it should very rarely be necessary to award equal prizes, but in many small shows the classes are, of necessity, comparatively few. Many of us have judged at small country shows, where, for example, there has been at a summer show only one class for Apples, and we have found five or six, and sometimes more, distinct kinds in competition. In such cases as this, one is now and then compelled to award equal prizes, and I submit that these exceptions, which are more numerous than many would have us believe, should make a careful judge hesitate to assert that equal prizes are unnecessary and a sign of faulty judgment. *A. C. Barlett*.

— I have had a pretty long experience in judging, and have many times found it impossible to divide two exhibits. Even at Shrewsbury, the show which Mr. Ward quotes (see p. 318) as free from this practice, my colleague and I last year found it necessary to resort to pointing in a class of 12 bunches of cut flowers, and on comparing notes discovered that they came out equal, leaving us no alternative but to make the exhibits equal 1sts. In judging artistic arrangements the difficulty of separating them is often even greater than in classes of a specified number of vases. I repeatedly find myself awarding equal prizes, there being no satisfactory way of pointing pieces of work composed of many different flowers for the purpose of forming an artistic exhibit. *R. F. Felton*.

CULTIVATION OF GRAPES.—A mistake has crept in the notes published on p. 348 about the Vine borders here. There are two Vineries, one early and the other late, side by side. The late Vinery contains three plants of Muscat of Alexandria, one plant of Lady Downe's two Black Alicante Vines, one specimen of Mrs. Pince, and one of Appley Towers; the length of the two borders is 60 feet and they are 10 feet in width. The two borders will be given 1 cwt. of bonemeal this autumn, and 1 cwt. only of Thompson's Vine manure in the summer is applied to the two borders, not to one border. The 40 cartloads of soil were used to form the two borders. *A. Jeffries, Moor Hall Gardens, Harlow*.

QUEEN WASPS.—Very few persons can remember a year in which the country generally has been so free from the destructive wasp as has been the case this year. If we are to enjoy a similar welcome freedom next autumn, no effort should be spared to kill as many queen wasps as possible before they safely ensconce themselves in winter quarters. Just now, in warm, sunny places they may be seen almost drowsily flying about seeking some congenial place, and in this condition they may easily be killed. *A. C. Barlett*.

ABUTILON THOMSONII.—I may perhaps be permitted to thank some nine or ten correspondents who have kindly sent me flower specimens of what they know as *Abutilon Thomsonii*. No one has sent me the true *A. Thomsonii*, and no one has been able to give me the history of the plant so extensively grown under that name. What the true plant is, is well known. It is a Veitchian introduction, and Mr. Harry Veitch kindly informs me that he remembers well taking it out of a Wardian case from Jamaica somewhere about 35 years ago. It came from a Mr. Thomson, a superintendent of gardens there, and once familiar to me as a Kew correspondent. Mr. Harry Veitch suggests that the plant now extant as *A. Thomsonii* is a seedling from it, and this is very likely correct, but someone should be able to relate the raising of it. *R. Irwin Lynch*.

VARIATION OF POTATOS IN DIFFERENT SOILS (see pp. 267 and 318).—I grew the variety Sir John Llewelyn a few years in Lancashire with other sorts on a south border in fairly friable soil, but it was such a poor cropper that I had well nigh discontinued planting it. Grown in pots and pits it was about equal with Veitch's Ashleaf and Sharpe's Victor. Here, in East Cardiganshire, it is a great favourite with the cottagers, and they tell me that they cannot get anything to equal it. I had five tubers brought to me, from one root, weighing 4 lbs., and another weighing 1 lb., and the same grower informed that he had one tuber last year that weighed 1½ lb. Coals being dear, the cottagers burn mostly peat, and the ashes and the small peat have been added from time to time to the soil, which is very little more than a foot deep, overlying shale, much impregnated with iron, and resting upon rock. The cottager prefers cow manure to any other. I was induced to give Sir J. Llewelyn a trial this season. The tubers were planted in a neglected piece of ground, covered with strong tufts of grass and some annual weeds. Commencing at one end of the plot I skimmed a yard width of the weeds and wheeled them to the opposite end, to be disposed of at the finish. I then threw out a trench and skimmed another breadth, and threw it into the trench, grass downwards, and so on until the other side was reached, when that which was wheeled came in for the last trench, which was completed a few weeks before planting time. I spread a fair quantity of manure in the trenches, and after the tubers were set the trenches were filled with soil. I had a good crop, but nothing like that of the cottager. The tubers were free from disease, as were those grown in other gardens; so were Up-to-Date and King Edward VII. The soil is poor and carboniferous; rock crops up in some places, so that it can be touched with the fork. *W. P. R. Cwmystwyth.*

MONTBETIAS.—My experience is the same as Mr. Divers, for unless Montbetias are transplanted every two or three years, they become weak and refuse to flower. Plants which have not been disturbed for more than three years become thickets of small corns, producing weakly, grass-like foliage, and few, if any, flowers. If they are lifted every second or third year, and the best corns replanted singly, these produce strong growths and flower spikes 2 feet and 3 feet tall. Our practice here is to have two beds or borders planted with them, and to replant them alternately, every second or third year. Some growers advocate the lifting and storing of the bulbs through the winter months every year, but I do not think this is necessary. I have heard of Montbetias dying outright sometimes when left in the ground throughout the winter, but the old shoots, if allowed to remain, act as a natural protection. The old growths on our plants are never removed till the young shoots are growing well in the spring. *Wilmot H. Yates, Rotherfold Park Gardens, Hants.*

CODIÆUM CROTON.—Amongst the many good things to be seen in the gardens at Aldenham House is a representative collection of Codiæums. They are cultivated largely as single stemmed specimens in small pots in low houses that admit an abundance of sunlight. The rich tinting in the leaves of the individual varieties is thoroughly developed. Some cultivators prefer the narrow-leaved, drooping kinds, while others prefer those having broad, bold foliage which, with the large blotches of deep colour characteristic of many in this section, are well suited to various forms of decoration. A mixture of both types, in my opinion, is desirable. For the information of those who do not know these plants well I append a list of the choicer sorts of both sections. *Narrow leaved.* Aigburth Gem, with narrow leaves that are slightly interrupted, and a colony of a rich crimson; *caudatus* tortilis, the twisted leaves are of medium size and a rich golden yellow colour; Aigburthensis, ivory white; *angustifolius*, still one of the best, with leaves of a rich golden yellow colour; *floubeum*, brilliant red; *Mrs. Dorman*, yellow and crimson; *G. H. in Ring*, the twisted leaves are golden yellow; *Johannis* elegantissimum, golden yellow; *Mooreana*, an effective yellow variety; *elegantissimum*, very graceful habit and with bright yellow foliage;

Edmontiensis, with bronzy-red twisted leaves; Prince of Wales, the medium-sized leaves are of bright orange colour; Princess of Wales, foliage long and narrow and of a creamy white. *Broad leaved.* Queen Victoria, orange-yellow tinted with red, still one of the best in the section; *Wosmannii*, variegated green and yellow; *Warrenii*, long, twisted leaves that are spotted with yellow and red; *Reidii*, a variety with extra broad leaves, coloured creamy pink and dark rose; *Thomsonii*, the trilobed leaves are bordered with green, the centre being yellow; *Etia*, the short leaves are of a fiery red colour, the plant being of a bushy habit of growth; *Williamsii*, of compact growth, with leaves of a fiery red colour; and *Evansianus*, having trilobed leaves of a brilliant red colour. *E. M.*

SAXIFRAGA TRIFURCATA CERATOPHYLLA.—I agree with all that Mr. S. Arnott (p. 295) says with regard to the attractive appearance of this mossy Saxifrage, as it is the most popular of this section in villa gardens in more than one of the southern counties of England, and is sometimes used as edgings, bordering the approach to the house. I would like to call attention to a peculiarity of the variety *S. trifurcata ceratophylla*. Some botanists do not regard it as distinct from the type, but as it has shorter flower stems, more divided and more rigid leaves, it is perfectly distinct for gardening purposes and recognisable at a glance. I was trying to cultivate it in pots, and two good-sized plants, as well as a small one I reared from a cutting, died one after the other. The pots were stood in a warm, sunny exposure, but not plunged, and possibly this would account for the gradual dying and browning that happened. It seems quite happy planted out on the rockery in the same garden. The name of this variety would indicate that Stag's Horn Rockfoil had first been applied to it, the botanical name meaning horn-leaved. The leaves are more rigid than in the type, indicating that the form is naturally a sun-loving plant in rocky situations, but evidently the roots are more susceptible of injury than the type. It is perfectly hardy, as I have grown it in the far north as well as south. *J. Fraser.*

The Week's Work.

THE FLOWER GARDEN.

By E. BOKLIT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Planting of Roses.—The present time is most suitable for the planting of Roses, with the exception of the Tea-scented varieties. To obtain the best results it is essential that the soil should be made as fertile as possible, and it should be a good depth, therefore, trenching is to be preferred to the ordinary method of digging. If this is well carried out in the first place excellent results may be expected to last for some considerable time. Thoroughly incorporate with the natural soil a good dressing of decayed farm-yard manure, and coarse bones, and some of the top spit from pasture land, if this can be obtained. Roses like a good, heavy loam, and good drainage; if the natural drainage is imperfect artificial drainage should be made at the time of forming the new beds, by placing a good layer of broken bricks or other suitable material before replacing the soil. These remarks apply specially to cases where climbing Roses are required for planting on clumps and other positions where the soil is poor or the aspect none too suitable. In many instances people cherish beds of Roses in which the plants are not only worn out, but representative of inferior varieties. Such beds should be renovated entirely, and better varieties planted. For general cultivation in beds, the Hybrid Teas will be found most floriferous, and most capable of resisting mildew, though no Rose is entirely immune from this pest, which so often mars their beauty. A typical instance of this class of Rose is General Schablikine, a profuse bloomer, and a splendidly formed Rose, which flowers late into the autumn; we have cut excellent blooms from this variety in the middle of November, and I have never once, during the time we have grown it, seen the slightest trace of mildew upon the plants. Though there are numerous methods of forming Rose gardens, the system of planting a bed with one variety ex-

clusively seems to be gaining in favour, and the plan has much to recommend it. Climbing Roses, as those of the Wichuraiana type, are effective for covering iron fences, or for forming a screen for partitioning off the Rose garden or other portion of the flower garden. Here we have almost a quarter-of-a-mile of ordinary iron fencing covered with Roses, and, contrary to the expectations of many people, these plants make strong and vigorous growth every year. It is advisable at the time of planting against such a fencing to place some temporary osier sticks or similar material on which to tie the growths, so that these do not come in contact with the ironwork. Shelter may be provided on the bleak side by hanging a few Spruce boughs on during the winter months. The present is a good time to inspect poles or pergolas, and make good those that have lost their stability. Rough Larch will be found as serviceable as anything, and if creosoted at the base the poles will be much more durable. The plants may then have the growths thinned, regulated and tied in position. Standard Roses should be given fresh supports if required, and the ties examined and made secure. Give the surface soil a good dressing of decayed farm manure. Take the greatest care with freshly purchased plants to place the roots in a frost proof position if not immediately required for planting. Should the plants exhibit any signs of dryness, it is a capital plan to thoroughly bury the whole plant, with a good depth of soil, and let it remain covered for a few days, when it will be found to have plumped up. Have a quantity of dry bracken in readiness to place round the base of the more tender varieties of Tea-scented Roses in the event of frost.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Fruit tree borders.—To maintain success with wall trees of all kinds, it is essential that the borders should be prepared thoroughly at the start, and this is especially necessary in the case of stone fruits. If the planting of wall trees is contemplated, and the borders have not been prepared already, the work should be commenced without further delay. Good drainage is of the utmost importance, and even where the soil is light and the water passes away readily, it is advisable to place several inches of drainage material, such as broken bricks, clinkers, or stones at the bottom of the borders, as this will assist in preventing the soil from becoming sour. A border from 2 feet to 3 feet deep down to the drainage, and about 4 feet or 5 feet in width, is of ample size for the production of good fruits. If the subsoil is of a cold nature and very retentive of moisture, it will be advisable to drain the borders by placing 4 inch agriculture pipes just below the drainage material, close to the front of the border. They should be placed in the best position to carry off any excess of water about the roots. The drainage materials should be covered with turves, placed grass-side downwards, to prevent the finer particles of soil from filling the interstices and obstructing the passage of water. The compost should be used in a moderately dry condition. Employ chiefly, good turfy loam, with a little ordinary garden soil added if considered suitable for the purpose. A quantity of finely-divided plaster or mortar rubble from an old building should be mixed with the compost; wood ashes and burnt soil are other excellent materials to mix in a fruit tree border. A freer use of mortar rubbish should be made in the case of borders for stone fruits. The compost should be made firm by ramming or treading each layer of soil as it is placed in the trench.

General remarks.—Special attention should be given to the ventilating of the fruit room, as both Apples and Pears are keeping badly this season. Aim at maintaining an even temperature, and take advantage of fine weather to admit fresh air in the room. The fruits should be examined frequently, and any that show the least sign of decay removed, as disease soon spreads. Avoid all unnecessary handling of the fruits. Pruning should receive immediate attention, and planting hastened whenever the weather is favourable, so that work in the fruit garden may be well in hand before the end of the year.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Begonia corallina.—Plants of this species are now producing a very pretty display of bloom, and are attractive for house or table decoration. With the aid of bottom heat, cuttings may be rooted at any season of the year, and the plants succeed best when grown in a porous compost, consisting of lumpy fibrous loam and peat, excluding fine particles, and some broken mortar, rubble, or charcoal roughly incorporated with the soil. If a temperature of 55° to 60° is available *B. corallina* may be grown to large size specimens from cuttings rooted at the present date or early in spring. In order to induce floriferousness a certain amount of root restriction is necessary, but when the pots have become well filled with roots applications of diluted farm-yard liquid may be applied. *Begonia corallina* is also well adapted for training under the roof, in which position the flowers are displayed to the best advantage. Where it is found desirable to cultivate the plants in permanent borders for this purpose, the roots should be confined to a limited area.

Allamanda.—The plants, having completed their growth and flowering for the season, may be dried off gradually with a view to affording them a season of rest. The weaker shoots and any which appear undesirable for any cause may be pruned away. Specimens in pots or tubs may be removed into an intermediate temperature, and afforded as much ventilation as possible. They should be examined at intervals with a view to watering those requiring moisture, as the wood must not be allowed to shrivel even during the resting period. Where *Allamandas* are growing as climbers in permanent borders they may be kept as dry as convenient.

Primula.—Primulas require rather drier surroundings during the flowering season than were maintained during the period of growth. A little clear soot water weakly diluted may be applied to the roots occasionally. Extreme care must be exercised in watering, and the plants are best kept rather on the dry side during the dull season, but care must be taken to prevent excessive dryness. Where the flower spikes appear likely to fall over, they should be tied to neat green stakes. In the case of smaller sized plants a few lumps of fibrous loam pressed firmly around the base of the plants will make them secure.

Ventilation.—With this diminished light and the natural resting season, very little ventilation is required in the plant stoves, but whenever ventilation is afforded care must be taken to keep the cold winds from coming into contact with the foliage. Careful attention must also be given to the heating arrangements, as sudden fluctuations in the temperatures often cause much damage.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to SIR TREVOR LAWRENCE, Bart., Burford, Surrey.

Winter treatment.—During winter it is necessary for the grower to keep the heat of the houses within a few degrees of what he considers to be the proper temperatures, endeavouring at all times to prevent sudden fluctuations. The temperature on bright, sunny days should be a few degrees higher than on those days when the weather outside is cold and there is no sunshine. The highest temperature of every house on each day should be at about mid-day, while the lowest should be during the hours of darkness. The difference between these two extremes should be from 5° to 10° when the temperature is maintained by fire heat alone, but several degrees higher must be allowed during intervals of sunshine. To prevent injurious fluctuations in the temperatures at night, to economise fuel, and to prevent an excessively dry atmosphere from overheated water pipes, it is advisable now to prepare coverings for the houses. These coverings may consist either of Archangel mats or waterproof canvas. The former material we have used at Burford for many years, and have found it very useful and convenient. The ends of these mats may be tied neatly and strongly, and several of them sewn together in different lengths as required for each house. They may be easily rolled along the lower part of the roof at dusk, and they should be removed at daybreak

Where a permanent framework is raised above the glass for the blinds to rest upon, the upright pieces may, in some cases, be so inconveniently placed as to prevent rolling the mats on the roof. This difficulty may be overcome by using short, single mats, and putting them straight up each light between the rafters. As a safeguard, all coverings should be made secure in some manner, and after they have been wet or frozen, they should be thoroughly dried before using them again. We leave the lath blinds in position during winter, and they are extremely useful in very cold weather, not only in assisting to maintain equable temperatures, but, when drawn down over the coverings, they prevent the latter from being blown about. In ventilating Orchid houses through the winter, the aim should be to admit sufficient fresh air without unduly lowering the temperature or causing a chill to the more delicate plants. At Burford, we find this is best done by opening those ventilators on the ground line which are opposite the hot-water pipes. Top air cannot safely be admitted where so many plants are suspended from the roof and near to the ventilators. In affording the daily supply of fresh air, the ventilators on the opposite or lee side to the wind are opened first, while those on the other side are gradually employed as the warmth increases. In a lean-to house facing due north, containing cool Orchids, the ventilators on the north side are kept closed whenever a north or east wind is blowing; while those on the south side are opened according to requirements. Everything should be done to expose the plants to the light, as far as it is possible, in winter. Wash all the glass both inside and out, and see that the laps in the glass are cleared of dirt, which may be loosened with a very thin, pliable piece of steel, shaped like the blade of a table knife, cleansing it out with a syringe or hose pipe. All woodwork, stages, pots, and pans should also be washed. If the brick walls are scraped clean and limewashed, it will afford a white appearance, and assist to increase the light in the houses. When washing the roof glass, see that all the stack pipes that lead into the tanks are stopped up, so that no dirty water is allowed to mix with the rain water which is used for watering the plants.

FRUITS UNDER GLASS.

By B. GOODRICH, Gardener to SIR LEWIS CLARKE, G. C. B., Moulton Park, Newmarket.

Early Peach house.—The trees, having been pruned, cleaned and trained, as advised in previous Calendars, the house may now be closed to starting. Only sufficient fire heat will be necessary at present to prevent the temperature falling below 45°. Should severe weather render the regular use of fire heat necessary, particular care must be taken to maintain a moist atmosphere, as the trees are very liable to drop their buds when started so early in the season, and this tendency is encouraged by a dry atmosphere. Syringe freely with tepid water on fine days, at about 1 p.m., and close the house at the same time to prevent evaporation. During dull foggy weather an occasional sprinkling of the paths with a rose-can will be sufficient to maintain a moist atmosphere. This may be done once or twice daily, according to the amount of fire heat used. Ventilate the house freely during the early part of the day whenever the conditions are favourable, and endeavour to change the atmosphere every day. This may be accomplished during dull, sunless weather by having the hot-water pipes gently heated for an hour or so about mid-day, at the same time opening the ventilators at the top of the house for about one inch. A few pot trees of reliable, early fruiting sorts may be placed in the house at the time of starting. These, being more confined at the root than trees growing in borders, will generally ripen their fruit a few days earlier. Since they are portable, they can sometimes be hastened by placing them in a higher temperature as soon as the fruits have formed stones. Pot trees are also useful for providing more variety in a given space, as in many cases the earliest house, being small, contains only three or four permanent trees.

Later Peach houses.—The trees may be pruned as soon as the wood is nicely ripened, after which cleaning and training may receive attention. The house should at the same time be thoroughly washed, the borders topdressed, and everything

put in readiness for forcing. In most cases, Peach and other fruit houses are utilised at this season for housing Chrysanthemums and other plants. Whenever possible, these should be cleared out for a month or so before starting the trees, in order that the doors and ventilators may be flung wide open, so as to give the trees a thorough rest. Late trees now shedding their leaves may be "switched" with a handful of Birch twigs about once a week, taking care not to injure the buds or bark, merely removing those leaves which would drop if exposed to the weather.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Forcing of Seakale.—If sufficient roots have been grown to maintain a supply throughout the winter, forcing may commence as soon as the crowns are ripe. In those establishments where only a small supply is desired, the Mushroom house provides a good place for the forcing, and 8-inch pots are the most convenient size for the purpose. Into these pots should be placed a number of crowns and the pot filled with sifted soil, pressed moderately lightly amongst the roots. If the soil is moist at the time of potting, no water will be necessary until the young shoots begin to grow, when a gentle watering should be given. In order to exclude light, a pot of the same size should be placed over the crowns in an inverted position. Where large quantities of Seakale are necessary, the best way to grow it is in brick pits provided with wooden shutters. A quantity of leaves can be used to provide the necessary bottom heat, and these should be made tight by treading. Over the bed of leaves place a 9-inch layer of light, rich soil, and plant the roots at a distance of 2 inches apart in lines 6 inches distant from each other. A spade is the best implement for this purpose, and the soil should be pressed firmly with the foot as each row is completed. The heat of the bed should not be more than 75°, or the soil will become dry and the quality of the crop reduced. At Windsor we force 14,000 crowns each year, in brick pits without fire heat.

Asparagus.—The forcing of Asparagus may commence as soon as ripe crowns are available. This is an easy vegetable to force and, if crowns are available, there need be no difficulty in maintaining a supply. Great care is necessary when lifting the roots for forcing that none is broken or exposed to cold drying winds before removed to the forcing pit. The forcing must be gentle or the young shoots will be spindly. At Windsor we prefer hotbeds, consisting principally of leaves formed in deep pits, where a little fire heat can be applied in very cold weather. The beds should be about 4 feet deep, and they are trodden tightly as soon as fermentation commences. Over this we spread 4 inches of decomposed, farmyard manure, which is covered lightly with finely-sifted leaf mould, on which the roots are placed as closely together as possible, and covered lightly with sifted soil. A watering is applied at a temperature of about 30°, or the same heat as the bed. When growth begins, and the grower knows that temperature of the bed will not rise above 30°, the whole should be covered with sifted leaf mould to the depth of 6 inches, and no more water given. A top heat of 55° is sufficient, and if this can be maintained without the use of fire heat so much the better.

French Beans.—If Beans are desired throughout the winter another sowing may be made to produce an occasional dish in the early part of January. Sow the seeds in 7-inch pots, and cover them shallowly with fine soil. When the young plants are a few inches high, move them to a position 18 inches from the glass, where the atmospheric temperature at night is 60°, rising to 70° by day with sun heat. Syringe the plants twice daily in clear weather.

Dipping and trenching.—This work should be proceeded with whenever the ground is sufficiently dry, but on no account should heavy land be dug while wet. The land intended for Peas should be trenched deeply, and given a liberal supply of manure, so that the manure may become incorporated with the soil before seed time arrives. The same remarks apply to Onions.

EDITORIAL NOTICE

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

- MONDAY, NOVEMBER 14—United Hort. Ben. & Prov. Soc. Com. meet.
- TUESDAY, NOVEMBER 15—York Chrys. Sh. (3 days).
- WEDNESDAY, NOVEMBER 16—Scottish Hort. Assoc. Chrys. Sh. (4 days). Chester Paxton Soc. Chrys. Sh. (2 days).
- THURSDAY, NOVEMBER 17—Barnsley Chrys. Sh. (2 days).
- FRIDAY, NOVEMBER 18—Leeds Paxton Soc. Chrys. Ex. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—42.6°.

ACTUAL TEMPERATURES:—LONDON.—Wednesday, November 9 (6 P.M.): Max. 48°; Min. 31°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 10 (10 A.M.): Bar. 30.1; Temp. 39°; Weather—Slight mist.

PROVINCES.—Thursday, November 9: Max. 46. Cornwall; Min. 36. England E. coast.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—Dutch Bulbs, at 67 & 68, Cheap-side, E.C., by Protheroe & Morris, at 10.30.

MONDAY AND TUESDAY—Clearance sale of Fruit Trees, &c., at Grove Park Nursery, Chiswick, by order of Mr. J. Smith, by Protheroe & Morris, at 11.30.

TUESDAY—600 lots Roses, Herbaceous Plants, &c., at 12.30; Azaleas, Palms, and Plants at 5, at 67 & 68, Cheap-side, E.C., by Protheroe & Morris.

WEDNESDAY—Clearance Sale of a Nursery Stock, at the Nursery, St. Albans, by order of Messrs. D. Spriggs & Co., by Protheroe & Morris, at 12.

WEDNESDAY AND THURSDAY—Unreserved Sale of a further portion of Nursery Stock, at the Tunbridge Wells Nurseries, by Thos. Clapps & Son, by Protheroe & Morris, at 11.30.

FRIDAY—Choice Established Orchids, at 67 & 68, Cheap-side, E.C., by Protheroe & Morris, at 12.45.

Silver-leaf Disease.

The twelfth Report of the Woburn Experimental Fruit Farm contains a valuable account of the investigations carried out by Mr. Spencer Pickering on the well-known Silver-leaf disease. This disease, which, as Mr. Pickering shows, may affect such widely different plants as Plums, Peaches, Apples, Pears, Laburnum, and Portugal Laurel, is known chiefly in this country by reason of its attacks on the first-named plant. The name Silver-leaf disease - or silver blight adequately expresses the external symptoms of the malady. The leaves of affected trees become of a silvery, or ashen-grey colour. Though the tree suffering from the disease may survive for some years, its fruitfulness is reduced very considerably, and in severe cases suppressed altogether.

Another very general, but according to Mr. Spencer Pickering not invariable symptom, consists in a dark discoloration of the wood (see fig. 152). As long ago as 1892 Professor John Percival to whose work on Silver-leaf disease Mr. Pickering pays a generous tribute described in the pages of the *Linnean Society's Journal* (vol. 35, p. 379) the general characters of this disease and attributed it to the activity of a fungus, *Stereum purpureum*,

which gains access to the tree through wounds in the bark.

With respect to the cause of the silvery appearance of the leaves, Percival showed that it is due to a rupture of the walls between the cells of the upper layer of the leaf. Thanks to the courtesy of the author and of the Linnean Society, we are able to reproduce the figures which were published in the paper above cited. Inspection of these figures shows that intercellular spaces (see *x* figs. 149 and 150) are formed beneath the cuticle between adjacent epider-

FIG. 146.—STEREUM PURPUREUM GROWING ON A DEAD BRANCH OF VICTORIA PLUM.

mal cells. On the same principle that pounded ice is white owing to the air entangled between the ice-particles, so the diseased leaf is silvery owing to the air which fills these innumerable spaces formed by the rupture or dissolution of the parti-walls between the surface cells of the leaf. Though Professor Percival brought forward strong evidence in favour of the fungous origin of the disease and demonstrated that the fructifications of *Stereum purpureum* may make their appearance on the surface of branches of Plums which have succumbed to the disease, it remained for Mr. Pickering to supply by means of experiments on a large scale final and convincing proof that *Stereum purpureum* is indeed the cause

FIG. 147.—TRANSVERSE SECTION OF THE UPPER EPIDERMIS OF A NORMAL PLUM LEAF.

of Silver Leaf. The mode of action of the fungus is remarkable. The fine mycelium or "spawn" which it produces does not appear to extend to the leaves, but to produce its effect thereon by the agency of a poison which it excretes. This poison is carried in the water-courses (vessels) of the wood, through the veins of the leaves, and produces in the latter organs the remarkable and local discoloration which we have described. A striking illustration of the distribution of the

poison responsible for the adverse effects produced by this parasite is given in fig. 151, which represents the result of an experiment made by Professor Percival on budding a sound scion on a diseased stock. The result was that the scion developed the characteristic symptoms of Silver-leaf disease. Such a mode of action is very general among parasitic

FIG. 148.—SURFACE VIEW OF UPPER EPIDERMIS OF A NORMAL PLUM LEAF.

fungi, though it is rare for such action to be evinced so far from the region in which the fungus occurs. For example, it appears probable that the deadly effects of *Botrytis cinerea* on Tulips, Lilies, &c., are due to the excretion of oxalic acid in such quantity as to poison the tissues.

Turning now to the constructive side of Mr.

FIG. 149.—SURFACE VIEW OF UPPER EPIDERMIS OF A PLUM LEAF AFFECTED WITH "SILVER-LEAF" DISEASE.

Spencer Pickering's work, it should be remarked that he has shown that the circle of plants liable to attack by the Silver-leaf fungus is wider than was supposed. Not only are Plums and Peaches liable to attack, but also, as noted above, Pears, Plums, Laburnum and Portugal Laurel. Moreover, it is possible to inoculate one of these trees with the fungus

FIG. 150.—TRANSVERSE SECTION OF UPPER EPIDERMIS OF A PLUM LEAF AFFECTED WITH "SILVER-LEAF" DISEASE.

obtained from another, though inoculation experiments indicate that the *Stereum purpureum* obtained from these several hosts are not all of equal virulence.

Another point which deserves emphasis is that different varieties of Plums exhibit different degrees of susceptibility. Thus, Mr. George Bunyard's view that soft-wooded varieties are more liable to attack than harder-

wooded kinds is borne out in the case of the Victoria Plum by the Woburn experiments. For example, of Victoria and Rivers' Early Prolific planted alternately, the former were attacked and the latter remained free from the disease.

A number of other varieties are cited which have resisted attack in plantations in which the disease was prevalent, viz., Black Diamond, Jefferson, Greengage, Denniston Mirabelle, Bullace, Sultan, Prince of Wales, and Prince Engelbert. These results, which represent the experience of large growers, appear, however, at first sight to be at variance with those obtained by Mr. Pickering as the results of extended inoculation experiments. From the tables in which the results of inoculation

means of spores of *Stereum* than do the latter. In other words, though all varieties of Plums may be equally susceptible, those with soft wood offer more opportunities for infection than those with harder wood.

Perhaps the most important of all the conclusions to be drawn from the Woburn experiments is that, contrary to previous opinion, Silver-leaf disease is not an incurable malady. Mr. Pickering records a considerable number of cases in which trees attacked by Silver-leaf disease have shown themselves in subsequent seasons to be free from it, or at all events so far free as not to exhibit the Silver-leaf symptoms. Unfortunately, recovery from an attack of Silver-leaf does not confer any noticeable degree of "acquired immunity" from subsequent infection. In this respect, Silver-leaf disease falls into the category of such animal diseases as influenza and not into that which includes small-pox, &c. For whereas, in the case of the former, recovery confers no immunity, in the latter it does. Nevertheless, the fact that Silver-leaf is not necessarily mortal allows us to predict with confidence that arti-

seems possible, therefore, that the destruction is effected by an acid, for example oxalic acid, which, as we have indicated already, is held to be the agent by the excretion of which certain other fungi exercise their destructive action. If that proved the case, dressings of the soil with lime or with calcium nitrate might prove effectual in controlling the disease, for soluble lime salts passing up in the vessels would serve to neutralise the oxalic acid. Mr. Spencer Pickering's conclusions with respect to the mode by which the disease spreads from tree to tree are of great practical importance. So long as *Stereum purpureum* is in the tree it is incapable of infecting neighbouring trees. But so soon as it forms its spore-bearing "fructifications" (figs. 146 and 151) on the surface of dead branches it becomes a source of danger to all the trees of the neighbourhood. Therefore, a vigilant watch should be kept on diseased trees, and their dead branches should be removed and burned without delay.

In conclusion we may observe that we shall none of us take in bad part Mr. Pickering's chiding at the lack of scientific interest in plant-diseases which he imputes to the commercial fruit-grower. Without labouring the question, we will only say that if the scientific men in whose ranks the present writer has a humble station—could provide the growers with more information of equal value with that contained in the twelfth Report the complaint would soon cease to have whatever measure of justification it now possesses.

MR. E. H. WILSON.—We regret to hear that an accident has befallen this well-known traveller and collector. It appears that whilst pursuing a mountain path he was overtaken by a landslip and a falling piece of rock was the means of breaking his leg. The scene of the accident was about three days journey from Cheng To, where medical assistance had to be procured. Mr. Wilson is now progressing favourably. His previous journeys have been singularly free from mishaps, but this accident serves to illustrate some of the dangers that explorers and collectors have to face in procuring new plants.

SOUTH-EASTERN AGRICULTURAL COLLEGE, WYE.—A meeting of the Governors of the South-Eastern Agricultural College, Wye, was held on Monday last at the Caxton House, Westminster. Lord ASHCOTTE presided. The Principal, Mr. M. J. R. DENSIAN, reported that there were 130 students in residence. Immediate additional accommodation was required, and it was decided to erect temporary buildings for lecture rooms. The Principal also reported that a fruit-growers' conference, in conjunction with the National Fruit-growers' Federation, had been arranged to be held at the college on Friday, December 2, for which invitations would shortly be issued and a programme published. The Governors resolved to apply to the Treasury for a grant from the Development Fund in aid of the work carried on by the college.

LINNEAN SOCIETY.—A meeting of this society will take place on Thursday next, 17th inst., at 8 p.m., when the following papers will be read:—
1. Theoretical development of certain species of *Plantago*, by the Rev. GEORGE HENSLOW, M.A.
2. Supplementary observations on Monocotyledons derived from aquatic Dicotyledons, by the Rev. GEORGE HENSLOW, M.A.

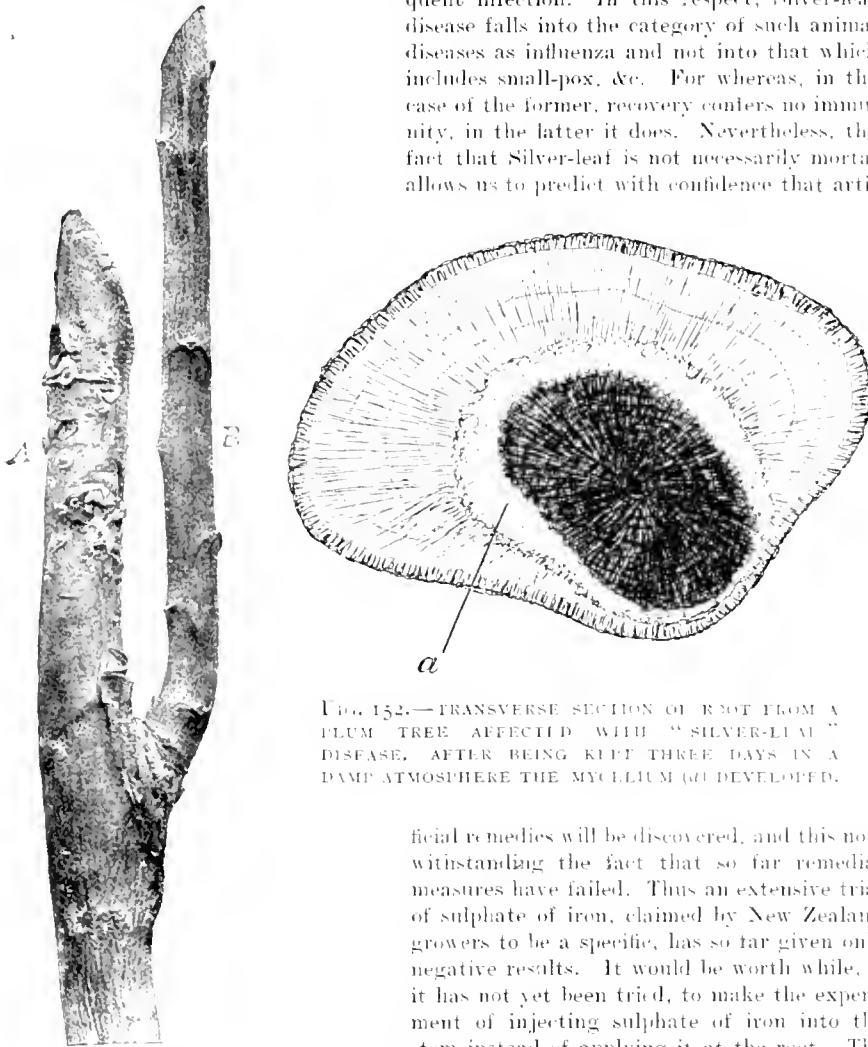

FIG. 151.—(A) DISEASED STOCK; (B) SHOOT FROM INSERTED BUD, ALL LEAVES OF WHICH WERE SILVERED.

FIG. 152.—TRANSVERSE SECTION OF ROOT FROM A PLUM TREE AFFECTED WITH "SILVER-LEAF" DISEASE. AFTER BEING KEPT THREE DAYS IN A DAMP ATMOSPHERE THE MYCELIUM (a) DEVELOPED.

ficial remedies will be discovered, and this notwithstanding the fact that so far remedial measures have failed. Thus an extensive trial of sulphate of iron, claimed by New Zealand growers to be a specific, has so far given only negative results. It would be worth while, if it has not yet been tried, to make the experiment of injecting sulphate of iron into the stem instead of applying it at the root. The value of injections of iron sulphate in cases of chlorosis has apparently been demonstrated by French experimenters, and though, of course, chlorosis is an altogether different disease from Silver-leaf, the injection method might prove to be as beneficial in the latter as in the former case. Other injection experiments might well be made with such antiseptic substances as salicylic acid, of which vegetable tissues appear to be fairly tolerant. Indeed, it would appear to be very probable that if any disease is amenable to this method of treatment Silver-leaf should be amenable.

Reverting to the possible nature of the toxic substance which destroys the cell wall: it is remarkable that the layer which is destroyed is that which is mid-way between contiguous cells. Now this layer, called the middle-lamella, consists of calcium pectate, and it

tests are recorded, it would appear that there is no marked difference of susceptibility between hard-wooded and soft-wooded varieties of Plums. When it is remembered, however, that *Stereum purpureum* is a wound parasite, that is one which gains access to a plant through a wound in the superficial tissues, a mode of reconciling the apparently contradictory results of experience and inoculation experiments suggests itself. For, as Spencer Pickering points out, soft-wooded trees are more liable to injury than are those with hard wood, and therefore the former provide more opportunities for the natural inoculation by

NEW ADDRESS FOR THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are asked to state that the offices of this institution have been removed from 175, Victoria Street to 92, Victoria Street, Westminster, S.W.

NATIONAL CHRYSANTHEMUM SOCIETY'S SHOW.—Amongst the many exhibits displayed by tradesmen at the recent Crystal Palace Show was a group of Chrysanthemums, for which Messrs. JOHN PFED & SONS, West Norwood, obtained the Society's Gold Medal.

ARBOR DAY AT EYNSFORD.—The usual festivities connected with tree-planting by the villagers of this delightful little Kentish town was celebrated on Saturday, November 5, with the usual enthusiasm. Mr. E. G. TILL, who is the moving spirit in the affair, was on this occasion supported by Sir JOHN ALEXANDER COCKEREN, K.C.M.G., late Premier of South Australia, and Mr. JOHN HENNIKER HEATON, M.P. The planting was associated with an exhibition of fruits, vegetables and flowers, and the proceedings included speeches and presentations.

WEED-SEED AND ADVERTISEMENTS. The ingenuity of the advertiser knows no limit. Among the latest devices for securing publicity, is the printing of an advertisement on paper shaped in the form of a flying insect, and the distribution broadest of this novel advertising flying machine. Unfortunately for the success of the method its inventor, seeking no doubt to add a last touch of reality to his paper insects attached to each the burr of *Arctium lappa*, the Burdock, and let the paper insects loose in Australia. Thus equipped the insect caught the vigilant eye of the chief quarantine officer for plants, who, according to the *Agricultural Gazette of New South Wales* (August 2), has drawn the attention of the Under Secretary for Agriculture in New South Wales to this unique method, whereby a noxious farm weed is being distributed. As a consequence of the energetic representations of the agricultural authorities the enterprising firm will in future fly their insect kites unballasted by Burdock.

PUBLICATIONS RECEIVED.—*Hybridization Methods in Corn Breeding*, by George Harrison Shull, from *American Breeders Magazine*, Vol. I., No. 2. (Washington.)—*Germinal Analysis Through Hybridization*, by G. H. Shull. Reprinted from the *Proceedings of the American Philosophical Society*, Vol. XLIX., No. 196. (1910.)—*Town Planting*, by A. D. Webster. (London: George Routledge & Sons, Ltd.) Price 3s. 6d.—*The Manuring of Market-Garden Crops*, by Bernard Dyer, D.Sc., and F. W. E. Shrivell. (London: Vinton & Co.) Price 1s.

FOUR NORTHERN COUNTIES FRUIT CONGRESS.

(Continued from page 34.)

DISEASES OF FRUIT CAUSED BY FUNGI.

Mr. E. S. SALMON, F.L.S., delivered a lecture on the diseases of fruit caused by fungi. He said that it is evident that a knowledge of the life history of the particular species of fungus causing a disease is of the greatest practical importance in dealing with that disease. In the life-histories of nearly all those fungi which cause diseases to cultivated plants, two distinct stages may be observed. In the first stage, the so-called "summer stage," the fungus forms enormous numbers of very minute spores, or seed-like bodies, by means of which the disease is spread rapidly, unless preventive measures are taken. To prevent these "summer-spores" from spreading the disease, the practice of systematic spraying at the right time, according to the life history of the particular fungus, is necessary. In the second

stage, the so-called "winter stage," the fungus forms "winter-spores," produced inside various fruit bodies. These "winter-spores" have the function of keeping the fungus alive, though in a dormant condition, through the winter months. As a general rule, these "winter-spores" are so protected by the thick walls of the fruit-body that they cannot be reached and destroyed by any spray fluid—a point of great practical importance. Various other methods—depending again on the life-history of the fungus—have to be adopted in dealing with the fungus in its "winter stage."

Inasmuch as the serious disease known as the American Gooseberry-mildew has spread recently to all of the four northern counties of England, and has reached Scotland, and outbreaks have occurred at Hexham itself, growers who are planting would be well advised to obtain their bushes only from those nurseries or growers whose bushes had been examined by an inspector of the Board of Agriculture. There is no hardship placed on the raiser of the bushes in requiring him to give such a guarantee, when selling, since such an inspection is now performed by the State free of charge. The treatment of infected Gooseberry bushes consists in well spraying the opening leaves throughout May with a fresh solution of "liver of sulphur" (one ounce dissolved in three gallons of water). Should any mildew have existed on the bush in summer, then at the end of the season all the affected shoots must be carefully cut off and burned. It is most important that this pruning should be done as early as possible in the autumn, as otherwise the fruit bodies containing the "winter-spores" drop to the ground during winter, and then in the spring these spores rise up from the ground underneath the bush and re-infect it. No winter spraying of affected Gooseberry bushes is of the slightest use. Where "returned empties" are used, these baskets should either be fumigated by placing them in a closed shed and burning sulphur, or they should be dipped in a strong liver-of-sulphur or copper sulphate solution (1 lb. to 25 gallons of water).

In the case of Apple mildew, which is sometimes a serious pest to certain varieties of Apple, e.g. Cox's Orange Pippin and Bismarck, spraying the young leaves with the liver of sulphur solution (one ounce to three gallons of water), is to be recommended. Practice has shown that a few good sprayings (at frequent intervals) in the early spring, when the mildew is just beginning to appear, are far more efficacious than a larger number of sprayings given at longer intervals through the summer. All mildewed tips of young shoots should be removed in pruning, or if this is impossible, the trees should be well sprayed in February with copper sulphate solution (1 lb. to 25 gallons of water).

The "Die-back" of the Gooseberry, a disease which has been very prevalent during the past two seasons, is caused by a fungus which is often a saprophyte (i.e. one which feeds on dead organic matter). This fungus enters the stem or branch, and soon causes the death of the latter or of the whole bush. A characteristic feature of the disease is the cracking and peeling off of the bark of the stem just above the ground level. Myriads of spores are produced there, and may attack the berries, leaves and young shoots. Owing to its saprophytic habit, the fungus can increase rapidly on all dead parts of the bush if such are allowed to remain in the garden or plantation. If, however, all dead branches or dead bushes are collected and burned, this disease is readily controlled without any spraying being necessary.

The successful treatment of Apple "scab" depends entirely on a knowledge of the life history of the fungus causing this disease. The "summer stage" exists chiefly on leaves, on which it forms "sooty" spots. Unless the leaves are kept clean by spraying, myriads of spores are formed at every "sooty" spot, and these are carried to the fruit by wind and rain, and a "scabby" crop is the result. If the grower keeps the leaves healthy by spraying them with

Bordeaux mixture, the Apples remain clean. This mixture should be applied first on the opening leaves just before the flowers open, and a second application should be given immediately the petals have fallen. In the case of Cox's Orange Pippin (and, possibly, Duchess's Favourite), the second spraying should be omitted, as at this time of year the foliage of a few susceptible varieties is liable to be "scorched" by Bordeaux mixture. The second important fact is that this fungus hibernates in the young wood of certain varieties of Apples—such shoots appear slightly swollen and blistered. Among varieties liable to have their young wood infested, Cox's Orange Pippin, Ecklinville Seedling, Lord Suffield, and Yellow Ingestre stand out as specially susceptible. Where "scab"-infested wood exists, a heavy spraying of the tree in February with the copper sulphate winter-wash (1 lb. of copper sulphate dissolved in a wooden receptacle in 25 gallons of water) should be given. Trees of Cox's Orange Pippin which have borne "scabby" Apples should always receive this treatment as their young wood is almost always "scabbed." Such "scabbed" wood frequently falls a victim to "canker," the ruptures in the bark caused by the "scab" probably affording an entrance for the "canker" fungus, which is a "wound parasite."

The "scab" of Peas is caused by a fungus which has precisely the same life-history as the above fungus. The young leaves of Pear trees which have borne a "scabby" crop should be well sprayed with Bordeaux mixture just before and just after blossoming. In this operation care should be taken to spray the under surface of the leaves, as it is chiefly here that the Pear "scab" fungus forms its spores. The young wood of most varieties of Peas is liable to become severely infested, and the winter-wash of copper sulphate should be given in February to all Pear trees which have borne "scabby" fruit.

The disease known as "brown rot" affects fruit of all kinds: Apple, Pear, Plum, Cherry, Medlar, &c. In this disease the fungus causes the fruit to dry up and become "mummied"; such fruit which contains the spawn (mycelium) of the fungus in a hibernating condition, hangs firmly attached to the tree through the winter months, and then in the following spring produces an immense number of spores which infect the flowers and young fruit. All dried up fruits—even when they are reduced apparently to merely a stone, as in the case of Cherry and Plum—hanging on the branches should be collected during the winter and burned.

With respect to Bordeaux mixture the strength for use on fruit trees should be 4 lbs. copper sulphate, 4 lbs. quicklime (in lumps), 50 gallons of water. The quicklime should be slaked with a small quantity of water until a thick, creamy paste is obtained; then dilute with water into "milk of lime" of make 46 gallons. The copper sulphate is previously dissolved in four gallons of water in a wooden receptacle. The two are then poured together, when 50 gallons of Bordeaux mixture of the best quality are obtained. Bordeaux mixture cannot be kept for long, and should be used not longer than 24 hours after being made. Separate "stock solution," however, of lime and of copper sulphate can be made of the strength of 1 lb. of quicklime or of copper sulphate to one gallon of water; the stock solution of lime must be well stirred before being used. Such stock solutions can be kept throughout the summer spraying season, and the required quantity of Bordeaux mixture can be made from them at any one time in a few minutes. The one point to remember is that freshly-burnt quicklime in lumps is required; air-slaked, powdery lime will not make Bordeaux mixture, and causes severe "scorching." The mixture must be strained through a fine "copper gauze" strainer, and applied by a nozzle which throws a very fine "misty" or smoke-like spray. Arsenate of lead—which protects foliage from all leaf-eating insects, can safely be added to Bordeaux mixture.

"FRENCH" GARDENING.

The Rev. T. FITZGERALD read a paper on "French Gardening," in the course of which he stated that he believed there was a great future for the practice in this country.

BEEES AS AN AID TO FRUIT CULTURE.

Mr. G. W. AVERY read a paper entitled, "Bees as an Aid to Fruit Culture." He related several experiments which he had carried out in conjunction with the Cumberland County Council. Various bushes and Apple branches were protected from the visits of insects during the time of flowering, with the result that they never set their fruits. On a branch of an Apple tree of Early Victoria the flowers were left exposed for a few days, and eventually covered with muslin, the fruit, however developed and came to maturity, although the muslin was left on until August. This was proof that the fact of the branch being covered did not prevent the development of the Apples once the flowers were fertilized. Mr. Little explained the photographs which were shown on the lantern screen.

SMALL HOLDINGS.

Mr. W. F. EMPLEAGE said that great care was needed in the selection of land for fruit culture on a small holding.

The saying that a family could make a living from two or three acres of Strawberries was pure fiction.

Landlords and land companies frequently offered land which was exceedingly dirty, with the result that the moway were trapped.

He suggested that in order to safeguard the interests of small holders, landlords might combine, or companies be formed to provide out of their estates suitable holdings for fruit culture.

CO-OPERATION.

Mr. W. CLAYTON, secretary of the Northern Co-operative Society, read a paper on "Co-operation in the Marketing of Produce." He dealt with the subject in a general manner, and said what was done in ordinary co-operative societies was applicable to market growers.

Mr. H. H. MASON read a paper on "Co-operation in the Marketing of Fruit and Market Produce." He stated that the great problem to solve is the means whereby all the advantages of unity may be secured without the sacrifice of individual initiative. The price put upon a bushel basket of Apples was generally in accord with the poorest specimen that could be picked out of the parcel; the levelling tendency was ever prone to be downward. It was possible to carry combination to a point that encourages abuses. Much, however, could be done in this direction before any point of conflicting interest was reached, and, in face of ever-increasing competition from Continental countries, where scientific organisation was an everyday thing, some measure of co-operation is absolutely vital to the existence of small growers.

An essential factor towards success in co-operation is to realise that the power of combination can only be accomplished by each man recognising his responsibility to his associates.

He concluded by giving the history and work of various co-operative market-growers' societies, and suggested that each member who betrayed his society by not dealing squarely should be subjected to a very heavy fine or expulsion from the society.

Mr. W. FEARNSIDE, hon. sec. to the Pershore Co-operative Fruit Market, gave particulars as to the progress of that society.

He said that market growers as a rule were reluctant to combine when the formation of his society was first mooted; they inquired as to the probable value of the produce that was likely to be sent to market. The only estimate growers would give was one for £500.

As this was not sufficient to warrant the necessity of the establishment of a market, a private gentleman came forward and offered to guarantee loss to the value of the sum already mentioned.

The fruit market was then formed, and directly the growers saw that good prices were obtained they supported the movement, and the sales during the first six months amounted to £4,700.

SOCIETIES.**ROYAL HORTICULTURAL.**

NOVEMBER 8.—Compared with recent exhibitions the show on Tuesday last was much smaller than usual. There was an almost entire absence of hardy flowers, including Dahlias, and practically nothing came before the notice of the FRUIT AND VEGETABLE COMMITTEE, although this body granted an Award of Merit to an Apple named Ard Cairn Russet, an old local, Irish variety. There was a good average display of Orchids for the time of year, and the ORCHID COMMITTEE granted one First class Certificate and two Awards of Merit. The principal exhibits in the floral section were displays of Ferns, Begonias, Carnations, Chrysanthemums, and ornamental-leaved shrubs. The FLORAL COMMITTEE granted three Awards of Merit, two to Chrysanthemums and one to a cerise-coloured Carnation of the perpetual-blooming type.

At the three o'clock meeting in the lecture room, an address on "Observations on the Blossoming of Hardy Fruits" was delivered by Mr. Cecil H. Hepner, of Wye College.

Floral Committee.

Present: W. Marshall, Esq., in the Chair; and Messrs. H. B. May, James Walker, C. T. Digby, G. Reuthe, W. J. James, Chas. E. Shea, W. P. Thomson, C. E. Pearson, E. R. Jenkins, W. J. Bean, E. A. Bowles, R. Hooper Pearson, Jno. Green, T. W. Turner, R. C. Neville, C. Black, J. F. McLeod, James Douglas, C. Dixon, Herbert Cutbush, J. T. Bennett, E. James, T. Wilson, George Paul, R. C. Notcutt, and W. Cranfield.

Messrs. J. HILL & SONS, Edmonton, staged a group of specimen Ferns, the exhibit having a frontage of 70 feet run. The display embraced 100 choice specimens, representing most of the genera cultivated under glass. Along the middle were tall tree Ferns at intervals. In the centre was a fine plant of *Dicksonia Schiedii*, the fronds having a spread of more than 14 feet. There were also large plants of *Dicksonia squarrosa* and *Heratium Sp. lat.* We noticed a fine plant of *Polypodium grandis*, a fern that, in the specimen, having numerous finely crested fronds. There were also large examples of *Davallia robusta*, *D. Mooreana*, and *D. filijensis elegans*. Amongst those with coloured fronds, *Lomaria L'Hermieri* and *L. latifolia* attracted notice. We also observed a remarkably fine specimen of *Nephrolepis exaltata superba*, a choice *Selaginella* in *S. Fendleri* variety, *Asplenium Nidus avis*, the *Puffin's Nest* Fern, *Branche insignis*, and many other fine varieties. (Gold Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, exhibited a representative collection of British species of *Polypodium*. They were all crested and plumose varieties, with the exception of the type plants. It was interesting to see the development of tasselling and other pinnate ramifications in the several kinds. The more notable were *P. caudatum* Barrow, *P. e. Prestonii* (the gem of the collection), *P. trichomanoides* (with fronds like the Killarney Fern), *P. vulgare grandiceps* Foxe, *P. v. g. Forsteri* (both with heavily crested foliage), and *P. puberulum* (the pinnæ being all enlarged and elegantly subdivided). Adjoining the Ferns, the same firm showed varieties of *Begonia* of the *Gleire de Lorraine* type, the most distinct being the form known as *rosea crispata*. (Silver gilt Banksian Medal.)

Messrs. W. CUTBUSH & SONS, Highgate, London, filled two long tables, facing each other, with flowering and ornamental plants. One was occupied exclusively with greenhouse subjects, amongst which were many *Pracenas*, Palms, Ferns, and Ericas. In the centre was a batch of Orange trees in fruit, and on either side batches of Lilies in flower, grown from retarded bulbs. Groups of *Astilbe*, Lily of the Valley, *Analia elegantissima*, and *Daphne indica rubra* were other features. The display on the other table embraced hardy plants arranged in a rock-garden, a few Chrysanthemums, and *Michaelmas Daisies*, and a showy group of Carnations. The Carnations were very numerous, and afforded a striking display of colours. The variety *Lord Rothschild* is dark-crimson, like the old *Clove*, and has much of the exquisite perfume of that old favourite. In addition the flower is of

good form and the stem long and stout. Miss Winnie Prier is a white-ground Fancy, a large, bold flower, striped sparingly with red. Mrs. Fortescue is a bright cerise coloured variety; *Lady Elphinstone* is one of the newer pink sorts, a lovely bloom; *May Day*, pink, is one of the best formed of all the perpetual-blooming Carnations, being a desirable variety in every respect; *Victory* is a striking scarlet flower, and others of note shown well included *White Perfection*, *Lady C. Wring* (yellow-ground Fancy), *Lady Coventry*, and Mrs. Burnett. (Silver Flora Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, arranged another fine group of winter-blooming Begonias, having the plants finer than ever. The trusses of rose blooms of the variety *Elatior* formed large pyramids; *Ideala* has a rather different habit, the inflorescences being produced mainly from the axils of the leaves and forming pyramids of bloom. Mrs. Head, *Julius* (pink), and *Ensign* are all desirable and free-flowering varieties. At one end of the table was a group of *Jacobinia chrysostephana*, and, at the other, varieties of *Gibberia Jamesoni*. The latter were of most shades of colour, there being blooms of white, pink, salmon, rose, bronze, orange, scarlet, and other shades, a delightful selection. Messrs. VEITCH also showed pot plants of Chrysanthemums, filling a large table with well-grown specimens. Miss May Pope (pink), *Lady Smith* (rose), Mrs. E. Notell (yellow), *Falern* (bronze), *Metta* (crimson), and *Devonshire Queen* (white) are suitable single varieties of their respective colours for cultivation in small pots. Of Japanese sorts, *Hutchings's Pink*, *Fellon's Favourite* (white), *Soleil d'Octobre* (yellow), and *John Shrimpton* (crimson) were all good. (Silver gilt Flora Medal.)

Messrs. STEWART LOW & CO., Bush Hill Park, Edgell, showed Carnations and a few greenhouse plants, the latter including *Cyclamens*, *Daphne indicum*, *Cercia cardinalis*, and *Asparagus myriophyllus*. The Carnations embraced extra choice blooms of the beautiful *Lady Alington* variety, which received an Award of Merit recently. *May Day* was shown well; *Roseate Dawn* has delicate pink flowers; *Finglow* is a showy yellow-ground Fancy, the markings of orange-tint being very heavy. An epergne filled with *J. Whitecombe Riley* (yellow) and *Royal Purple*, with Fern fronds, gave a pretty contrast in shades. (Bronze Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited plants of a *Zonal Pelargonium* named *Simon Paul Crampel*, recommended as a first-rate bedding variety. The growth and foliage are vigorous, and resemble the well-known bedding *Paul Crampel*, from which it is stated to be derived as a sport.

Mr. G. LANGE, Hanworth Road, Hampton, Middlesex, showed a small group of Carnations. There were three varieties of more than average merit; those were *May Day*, *Scarlet Glow*, and *Shasta* (white).

Mr. L. E. RUSSELL, Richmond, showed some exceedingly pretty foliage and bearded plants as small specimens in pots. It is remarkable how effective are small *Lilies* of golden and silver-leaved varieties in small pots and when grown so well as by this exhibitor. The various species and varieties of *Elaeagnus* are also charming as pot plants, such as *E. glabra aurea*, *E. Simm variegata*, *E. picta aurea*, *E. aurea maculata*, and *E. medio pecta*. *Penstemon*s and *Aucubas* in berry and large-flowered *Veronicas* found a place in the exhibit. (Silver Banksian Medal.)

A large floor group of Chrysanthemums was arranged by Messrs. JOHN FIELD & SON, West New Wood, London. At the back was a row of tall *Kentias* overhanging large blooms of Japanese varieties; next to these were staged single varieties, intermingled with large blooms of exhibition varieties, tall epergnes at the corners and in the immediate foreground being also filled with blooms. The more notable varieties were *W. Mease*, *Willie Rawlings* (yellow), *Miss Cona Steep*, *Emblème Pontevine* (Buttercup unvaried), *Mrs. Chas. Penford* (yellow), *Mrs. J. W. Cole* (white), *Mrs. R. D. Eyes* (bluish), *Reginald Vallis*, and *Leigh Park Wonder* (red). (Silver Banksian Medal.)

Messrs. CURTIS, PAGE & CO., 52 and 53, London Wall, showed Chrysanthemums, a bright batch of the scarlet-flowered *Salvia Pride of Zurich*, and bowls for growing bulbs in fibre. The Chrysanthemums included Japanese varieties of large exhibition sorts, shown in bunches

in vases, and an assortment of singles. We noticed the old *Sour Melaine* (white) once extensively cultivated in market nurseries. Model of Perfection is a pretty Pompon variety. (*Silver Flora Medal*.)

MESSRS. W. WELLS & CO., Merstham, Surrey, exhibited a stand of large blooms of Japanese *Chrysanthemums* and vases of novelties in singles and Pompons. A pretty Pompon *Chrysanthemum* was seen in the variety *Ada Vincent*, the rose and bronze colours making a pleasing combination. *White Baby* is a miniature-flowered Pompon. *Lady Bedford* is a new single variety of pale terra cotta colour.

MESSRS. G. WILLIAMS & SONS, Manor House Nurseries, Cardiff, showed *Chrysanthemums*, mostly of single kinds. The large-flowered single *Caledonia* was conspicuous, the big rosy-pink florets having a little white at their bases. *Florrie King* is a smaller flower of pink colour; *Archie*, bronze; *Mrs. W. Parker*, white; *Sylvia Slade*, rosy-crimson, with a white ring in the centre; *Charles Greeves*, creamy-yellow; and *Manor House Terra Cotta* are other good single varieties observed in the exhibit.

MR. G. REUTHE, Keston, Kent, showed Alpines in pots, a selection of *Nerines*, and a few foliage plants at the back. The rare and new *Ranunculus Enysii* from New Zealand was represented by a good plant; *R. insignis*, from the same country, was also shown; both are yellow-flowered species. *Androsace sarmentosa primuloides* is a pretty plant, even when not in bloom, resembling green buttons set in a paler green rosette. The *Nerines* were hybrids in various colours, and all had been grown in cold frames, where they flower well.

MESSRS. BAKER'S, Wolverhampton, showed fancy vases and bowls of uncommon designs, suitable for growing bulbs in moss fibre.

Paintings of floral subjects, shown by MR. FRANK GALSWORDY, Chertsey. (*Silver Banksian Medal*.)

AWARDS OF MERIT.

Carnation Mrs. C. W. Ward.—This variety belongs to the perpetual-flowering type. It has reddish-rose coloured flowers of good size, but only moderate form as exhibited. Shown by MR. S. LANGE, Hampton.

Chrysanthemum Mrs. Frank Hill.—A very refined variety with mauve-coloured flowers, having a white band around the disc. Shown by MESSRS. WILLIAMS & SONS, Cardiff.

Chrysanthemum Victorian.—This is a large-flowered Japanese variety, suitable for exhibition; the florets have a bronzy-yellow ground colour, but this is almost covered with reddish-mauve. Shown by MESSRS. STREDWICK & SON.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, H. Little, R. G. Thwaites, F. J. Hanbury, F. Menteith Ogilvie, C. H. Curtis, W. Cobb, F. Sander, J. Charlesworth, J. Cypher, W. H. Hatcher, H. G. Alexander, W. H. White, H. Ballantine, Gurney Wilson, J. Wilson Potter, R. Brooman-White, W. Bolton, C. J. Lucas, and de B. Crawshaw.

Lieut.-Col. SIR GEORGE L. HOLFORD, K.C.V.O., Westonsbirt (gr. Mr. H. G. Alexander), staged a small group of very fine hybrids, in which were *Cattleya Portia gigantea* (a very fine variety with a large head of bloom), *Laelio-Cattleya Arethusa* (a pretty and profuse flowerer), *L.C. Barbarossa* (with glowing ruby red front to the lip), the handsome *L.C. Olivia* (see Awards), and *Cypripedium Beacon superbum* (H. Howes × *nitens*-*Lecanum*).

SIR JEREMIAH COLMAN, Bart., V.M.H., Gattton Park (gr. Mr. Collier), staged a small group of very interesting plants, including the singular *Bulbophyllum mandibulare*, a fine specimen of *B. Eriessoni*, the greenish *Dendrobium epidendropsis*, *D. Cologyne*, *Liparis longipes* with many graceful sprays, *Epidendrum nocturnum*, a pretty little *Cirrihopetalum* with an umbel of rose-coloured flowers, and two good examples of his fine white *Phaio-Calanthe Colmani*.

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham (gr. Mr. J. M. Black), was awarded a Silver Banksian Medal for a selection of his pretty *Odontiodas*, in which were some rich scarlet *O. Bradshawiae*, a very deep red *O. Charlesworthii*, and the pretty new *O. Seymourii*. *Sophr-Cattleya Wellesleya perfecta* (*S. grandiflora* × *C. labiata* R. L. Measures) was

a charming, broad-petalled flower, red on a yellow ground, and with a slight bloom over the surface, as seen on ripe Grapes. Others specially good were *Cattleya labiata alba*, *C. Maggie Raphael alba*, and a very striking and sparsely-spotted form of *Odontoglossum Rolfeae*.

E. R. ASHTON, Esq., Camden Park, Tambridge Wells, was awarded a Silver Banksian Medal for a small but select group, in which were the very pretty *Cattleya Luegeae* Broadlands variety, of fine form and lighter in tint than the original; *C. Phrygia* (*Portia* × *Enid*), a large magenta-rose hybrid; *Laelio-Cattleya Mrs. Temple* (*L.C. Hy.* *Greenwood* × *C. Mossiae*); *L.C. Phoebus* (*L.C. Cappei* × *C. Iris*), a very bright and effective flower, reddish-copper colour, with a deep red lip, and various *Brasso-Cattleyas*.

Mrs. NORMAN COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman), sent *Cypripedium Oakwoodense*, of unknown parentage, bearing some resemblance to a dark *C. Fulshawense*; *C. Arthurianum* Oakwood variety (*insigne* *Sanderae* × *Fairricanum*), with light yellow ground colour, and *Calanthe Cooksoniae gigantea* (see Awards).

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), sent as *Laelio-Cattleya Ville de Bruxelles* (*L.C. callistoglossa* × *L.C. Clive*), a very handsome bluish-tinted flower with very broad and rich ruby-tinted lip, to which the Committee awarded a First-class Certificate, but after comparison with the drawings of *L.C. Epicasta*, they decided was a fine variety of that hybrid, and the certificate was withdrawn. Mr. WELLESLEY also showed *Sophr-Laelio-Cattleya Thalia* (*S. grandiflora* × *L.C. Cappei*), with a spike of several bright red flowers.

MESSRS. CHARLESWORTH & Co., Haywards Heath, were awarded a Silver Flora Medal for a fine group, in which the principal plants were some very showy *Cattleya Rhoda*, two very dissimilar *C. Venus*, the one shaped like a large *C. Iris*, but of a deep golden-yellow, and the other like *C. aurea* in form; *C. Luegeae*, *C. Fabia alba* with pure white petals, *C. labiata alba*, *Laelio-Cattleya Eurydice*, and other *Laelio-Cattleyas*; a selection of *Cypripediums*, including *C. Rossetii*; *Chondrorhyncha Chestertonii*, and *C. fimbriata*; the curious and rare *Zygopetalum Binotii*, near to *C. Murrayanum*; the pretty purple-spotted *Rodriguezia Batemanii*, some hybrid *Odontoglossums*, one of the prettiest being the pure white *O. ardentissimum xanthotes*; *Cologyne Veitchii*, with a long, pendulous raceme of white flowers, and the pretty *Polystachya paniculata*, with a branched, erect inflorescence of a dark orange-red colour.

MESSRS. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for an extensive and varied group, in the centre of which were several specimens of *Vanda corulena*, and a fine selection of blotched *Odontoglossums*, some of which were spotted forms of *O. crispum*. The best plant in the group was the very fine *Cypripedium Dreadnought*, illustrated in the *Gardeners' Chronicle*, December 5, 1908, p. 369. In the centre was a selection of pretty botanical Orchids, comprising *Eria marginata*, some singular *Polystachyas*, *Wahewa pulchella*, *Bulbophyllum Dearii*, *Imopsis paniculata*, *Promeneae xanthina*, &c., and in the body of the group were some handsome *Cattleyas*, and *Laelio-Cattleyas*, the most novel being *L.C. Walter Gott* (*C. bicolor* × *L.C. Bletchleyensis*), with a very attractive spike of flowers of a delicate apricot yellow tint, with a slight rose shade and with a well-displayed ruby-purple lip; *L.C. Black Prince*, the white-petalled *Cattleya Cooksoniae*; *C. Mary Measures alba*, &c.

MESSRS. STUART LOW & Co., Bush Hill Park, secured a Silver Flora Medal for a good group rich in bright yellow *Oncidium varicosum*, one form not having the usual dark markings on the sepals and petals. *Odontoglossum Pescatorei* and *O. crispum*, white varieties of *Cattleya labiata*, a very good selection of *Cypripediums*, *Dendrobium Phalaenopsis*, *Laelio-Cattleya Decia* and other *Laelio-Cattleyas*, *Cymbidium Tracyanum*, some good hybrid *Odontoglossums*, &c., were also shown.

MESSRS. J. CYPHER & SONS, Cheltenham, staged a very select group of *Cypripediums*, for which a Silver Flora Medal was awarded. The plants were splendidly grown and finely flowered, and among those noted were a very large and handsome *C. Fulshawense*, *C. Minos Veitchii*'s variety, a distinct new hybrid between *C. Swinburnei* and *C. Lecanum*; the dark *C.*

Tityns superbum, *C. Mr. F. Sander*, a well-formed flower; *C. Baron Schröder*, *C. Lecanum corona*, *C. Thalia giganteum* in excellent form, some fine *C. insigne Sanderae*, *C. insigne Harefield Hall*, and other forms of *C. insigne*. The group contained about 60 distinct varieties, all of good quality.

MESSRS. W. BAYLOR HARTLAND & SONS, Ardcairn, Ballintemple, Co. Cork, were awarded a Silver Flora Medal for a very fine and interesting group composed largely of good hybrids of *Cattleya Bowringiana*, which seems to thrive with them in a remarkable degree, the hybrids growing almost continuously and producing fine heads of bloom. Among the finest were several excellent *Laelio-Cattleya Parysatis* of fine rose-purple colour, one having 11 flowers on a spike; *Cattleya Portia*, equally good; the pretty *C. Chloris* (*Bowringiana* × *maxima*), which varies considerably, but always suggests *C. maxima*, one fine form with a broad, white margin to the lip being specially distinct; several forms of the floriferous *C. Brownia*, *C. suavior delicata*, a large, light flower; *C. Mantinii*, *C. Lord Rothschild*, together with good *C. labiata*, *Cypripedium insigne Sanderae*, *C. insigne Mrs. F. W. Moore*, and other yellow varieties; *C. Swinburnei magnificum*, various *Odontoglossums*, including two *O. Groganiae* (*Edwardii* × *Uroskinneri*), with long, branched spikes of rose-purple flowers, the lip being the lighter, and other showy Orchids.

MESSRS. ARMSTRONG & BROWN, Tunbridge Wells, were awarded a Silver Banksian Medal for a select group, in which were *Brasso-Cattleya Thorntonii* var. *Boydii*, a fine, white flower with a pearly flush on the tips of the sepals and petals and a greenish-primrose disc to the fringed lip. Among others noted were a fine *Cattleya Fabia*, *Cypripedium Fowlerianum magnificum* of a very dark colour, *C. Germaine Opoix*, the distinct *C. Lord Roberts*, with a yellow ground colour having dark spotting; *C. triumphans*, the handsome *C. Niobe Westonbirt* variety, *Cymbidium Lady Colman*, several of the pretty *Cattleya Armstrongiae*, and other handsome hybrids.

SAMUEL LARKIN, Esq., Ridgeways, Haslemere (gr. Mr. Hale), staged a small selection of hybrids, the most distinct of which were *Cattleya Portia Larkinsii* variety, a model flower in shape and of good size, the sepals and petals being of a clear, rosy-mauve colour, the front of the lip rose-purple; a good form of *Laelio-Cattleya eximia*, a well-flowered *Laelia splendens* (*crispata* × *purpurata*), with pale, rose-tinted sepals and petals and very bright, purplish-crimson front to the lip; *Cattleya Warriniana* (*Warszewiczii* × *granulosa* *Schofieldiana*), and *C. Zeo* (*Trianae* × *Leopoldii*).

MESSRS. J. & A. A. McBEAN, Cooksbridge, showed a magnificent *Cattleya Portia* with 15 flowers on a spike, several *Cypripedium insigne Sanderae* and *C. insigne Harefield Hall*; also a good hybrid between *C. insigne Harefield Hall* and *C. nitens*, and a bright-scarlet *Sophr-Cattleya Doris*.

MESSRS. STANLEY & Co., Southgate, showed an interesting selection, among which was the fine *Cattleya labiata virginea*, a large flower with pure-white sepals and petals, having a slight lavender tint at the tips, the very distinct lip having a light, mauve-purple front and pale-yellow disc. Messrs. STANLEY also showed *Laelio-Cattleya Whitinia* (*L. purpurata* × *C. Harrisoniana*), *L.C. Goffoiana*, the pretty *Cattleya St. Gilles*, *C. Fabia*, *C. labiata eximia*, a good dark form; several of a cross between *C. Forbesii* and *C. Mossiae*, and a very handsome *Laelio-Cattleya Lady Rothschild*.

MONSIEUR MERTENS, Ghent, showed a selection of hybrid *Odontoglossums*, one violet-coloured form being specially distinct.

AWARDS.

FIRST-CLASS CERTIFICATE.

Sophr-Cattleya Doris Cobb's variety (*C. Dowiana* × *S. grandiflora*), from WALTER COBB, Esq., Normanhurst, Sussex (gr. Mr. C. J. Salter).—A superb flower, the largest and best yet shown of this showy hybrid. The colour is bright scarlet with yellow base to the lip.

AWARDS OF MERIT.

Laelio-Cattleya Olivia (*L. Jungheana* × *C. Schroderae*), from Lieut.-Col. SIR GEORGE L. HOLFORD, K.C.V.O., Westonsbirt (gr. Mr. H. G.

Alexander).—A very fine hybrid with equally broad segments of fine substance. Sepals and petals of a delicate peach-blossom tint with pink veining, the greater part of the lip being deep orange with rose tinted margin.

Calanthe Cooksonia gigantea (vestita rubro-oculata gigantea × Harrisii), from Mrs. NORMAN COOKSON (gr. Mr. H. J. Chapman).—In this beautiful, pure-white hybrid the broad-lipped form of *C. Harrisii* is retained and enlarged.

Fruit and Vegetable Committee.

Samples of a Chutney shown by Mrs. MILLER at a previous meeting, having been submitted for tasting and being recommended for its excellent flavour, the Committee granted a Silver Knightian Medal to the exhibitor.

AWARD OF MERIT.

Apple Ard Cairn Russet.—This is an old variety of Apple growing in the Ard Cairn Nursery of Mr. BAYLOR HARTLAND, Cork, the age of the tree being estimated at nearly 200 years. The fruits are of handsome russet appearance, with a considerable amount of red. The shape is conical, the base being much broader than the apex. The flesh is solid and the fruits have the appearance of keeping in good condition late in the season. A dessert variety of considerable beauty. Shown by Messrs. BAYLOR HARTLAND & SONS, Cork.

MARLOW CHRYSANTHEMUM.

OCTOBER 26.—The second annual show of this society was held on this date in the Public Hall, Marlow, and was attended with great success. Mr. L. F. SMITH, Junr., ably discharged the duties of hon. secretary and treasurer, and is to be congratulated on the results.

H. F. SCATTERY, Esq. (gr. Mr. R. EVANS), gained many successes. He entered in six classes, and carried off the premier award in each. In the open class for a display of Chrysanthemums, designed with the purpose of showing the decorative value of the blooms, he was an easy 1st with a fine exhibit. The prize carried with it the winning of Sir Alfred Cripps's Challenge Cup, which the same exhibitor won last year. It now becomes his own property. He was also 1st for a splendid group of outdoor blooms; for a collection of 12 Japanese blooms; for three blooms; for incurved varieties; and he won the premier award for a display of flowers other than Chrysanthemums.

In the amateur classes, Mr. A. DAVIS, Senr., won Lady Higginson's prize for a display of outdoor flowers.

The cottagers made a very creditable show, and to Mr. G. DEAN fell the honour of winning Mr. W. J. Morgan's prize for the best exhibit in the amateur and cottagers' classes.

The entries in the ladies' classes were very effectively and artistically arranged. In that for table decoration, the 1st prize was won by Miss BROADBENT, Mrs. JORDAN being awarded the 2nd prize.

Mr. T. BLACKMORE, florist, of Springfield Gardens, Marlow, was deservedly awarded the 1st prize and the Royal Horticultural Society's Silver-gilt Medal for the best exhibit (open to the trade only) of Chrysanthemums, arranged for effect, with ornamental foliage and Palms.

COMMONS AND FOOTPATHS PRESERVATION.

OCTOBER 28.—Lord Eversley presided over the monthly meeting of the Commons and Footpaths Preservation Society, held on the above date. It was decided to invite the other open-space organisations to combine with it in issuing a circular recommending that, where necessary, village memorials of the late King's reign should take the form of the provision of recreation grounds or other open spaces. Also that kindred societies be invited to make a united protest against the fencing in of over an acre of Hampstead Heath to form a rubbish tip. The secretary reported that Lord Eversley's history of the movement for the preservation of commons, forests and footpaths was about to be issued at the instance of members of the Commons and Footpaths Preservation Society, who had contributed a large sum as a mark of respect to their president in order that the book might be circulated at a low price.

HEREFORDSHIRE FRUIT AND CHRYSANTHEMUM.

OCTOBER 26, 27.—This society held its nineteenth annual show on these dates in the Shire Hall, Hereford. Notwithstanding the unfavourable fruit season the numerous classes were well filled with produce of excellent quality, apart from exhibits of hardy fruits there were displays of Grapes, vegetables, Chrysanthemums, agricultural roots, and grain, together with trade exhibits.

FRUIT CLASSES (Open).

APPLES.—In the class for 50 dishes, arranged with foliage decorations, on a space of 70 square feet, the KING'S ACRE NURSERY Co. showed the best of five exhibitors. Amongst this firm's choicer dishes those of Allington Pippin, Rival, Lord Hindlip, James Grieve, Werder's Golden Reinette, Cox's Orange Pippin, Charles Ross, Hector McDonald, Tyler's Kernel, King Edward VII., Lawry's Cornish Giant, Warner's King, Lane's Prince Albert, Newton Wonder, Coronation, and Royal Jubilee may be mentioned. 2nd, Mr. CADDICK, Caradoc, Ross, whose exhibit was particularly strong in kitchen varieties. 3rd, Mrs. HILL, Moreton Court (gr. Mr. W. Jones).

J. RILEY, Esq. (gr. Mr. H. Taylor), was the only exhibitor of 50 dishes, arranged in a space of 40 square feet. He staged a meritorious collection, including Christmas Pearmain, Sturmer Pippin, Worcester Pearmain, Ross Nonpareil, James Grieve, King of the Pippins, Allington Pippin, Annie Elizabeth, Emperor Alexander, and others.

Seven good exhibits were staged in the class for 12 culinary varieties, the best by Messrs. GETTING & NEWTON, Glewstone Court, Ross (gr. Mr. Kelly), who showed Lane's Prince Albert, Lord Derby, Warner's King, Bismarck, Peasgood's Nonesuch, Hambling's Seedling, Sandingham, Bramley's Seedling, Stirling Castle, Scarlet Custard, Emperor Alexander, and Newton Wonder. 2nd, Capt. W. S. C. COX, Sellaek Fruit Farm (gr. Mr. C. Thomas). 3rd, Rev. G. H. DEVONPORT.

MESSRS. NEWTON were also placed 1st for eight dishes of dessert Apples amongst seven exhibitors. Mrs. BASHILL, Bridge Sellars, followed.

DECORATIVE GROUP OF FRUITS

This was for preserved or fresh fruit, arranged in a space of 50 square feet. It made an attractive class, in which three exhibitors took part. The KING'S ACRE NURSERY Co. was placed 1st with a fine stand, composed of Apples and Pears, arranged in dishes and boxes, dishes of Peaches, and a grand display of bottled fruits, with a background of fruit trees in pots. Mr. CADDICK was awarded the 2nd prize for a good exhibit, of which a fine assortment of Apples was the chief subject. 3rd, Messrs. PEWTERER BROS., Tillington Nurseries.

The best dish of kitchen Apples in the show was exhibited by Capt. W. S. C. COX (gr. Mr. C. Thomas). The variety was Lane's Prince Albert, and he also showed, in a dish of Cox's Orange Pippin, the best dessert Apples in the exhibition. The best dish of Pears was shown by Mr. WOOTON, Bayford, with Doyenné du Comice. Mr. WEBB, of Glewstone, won with Cox's Orange Pippin, the prize for the best dish of dessert Apples, staged in the Cottager Classes. The Rev. G. H. DEVONPORT had the best bunch of Grapes—a fine one of Muscat of Alexandria.

PEARS.—There were five collections in the class for 12 varieties, and of these the Rev. G. H. DEVONPORT, Foxley, scored chief honours, with splendid dishes of Beurré Diel, Pitmaston Duchess, Doyenné du Comice, Beurré Bosc, Easter Beurré, Marie Louise, Durondeau, Duchesse d'Angoulême, Emile d'Heyst, Beurre Rance, Le Lectier, and Nouvelle Fulvie; A. W. FOSTER, Esq., Brockhampton Court (gr. Mr. Parrott), was a good 2nd, and Mr. W. JONES, 3rd. The best of seven exhibitors, in a class of eight dishes of Pears, was shown by Sir J. COTTERELL, Garmos (gr. Mr. C. Liddle), who staged the following varieties in splendid condition: Doyenné du Comice, Durondeau, Pitmaston Duchess, Easter Beurré, Beurre Superfin, Nouvelle Fulvie, Marie Louise, and Josephine de Malines. 2nd, Mr. WHITING, Credenhill.

SPECIAL PRIZE CLASSES.

In the class for a collection of Apples (eight dishes of culinary, four dishes of dessert varieties), four fine lots were staged, the best being ex-

hibited by Mr. C. W. POWELL, Warham, who had Lord Derby, Annie Elizabeth, Newton Wonder, Bramley's Seedling, Stirling Castle, Charles Ross, and others. Mr. J. BOTT, Branton, was a close 2nd, and C. B. LEE WARNER, Esq., 3rd. There was only one exhibit of six varieties of recent introduction, and this from Mr. C. W. POWELL, who staged splendid fruits of Coronation, King Edward VII., Lord Hindley's Rival, James Grieve, and Charles Ross.

For 18 dishes, including 12 culinary and six dessert sorts, Mr. THOMAS led amongst five exhibitors; Mr. KELLY was placed 2nd, and Mr. A. PARRY, Palmer's Court, 3rd.

There were six entries in the class for eight dishes of culinary Apples, and Mr. THOMAS was again placed 1st; Mr. KELLY following closely.

Five exhibits were staged in a class for eight dishes of dessert Apples, the 1st prize being awarded to Mr. KELLY for beautiful fruits.

COLLECTIONS OF FRUIT (six dishes).—Four creditable collections were staged, Sir J. COTTERELL (gr. Mr. Liddle) being placed 1st, with good Muscat of Alexandria and Gros Maroc Grapes, Emerald Melon, fine Doyenné du Comice Pears, James Grieve Apples, and Cox's Golden Drop Plums; Col. HENRY (gr. Mr. Sykes) was placed 2nd; and Mr. W. E. HYDE, Norwood Hall, 3rd.

GRAPES.—These were well shown, more especially in the classes for black varieties. Mr. LIDDLE was 1st, and Mr. SYKES 2nd. In the class for Gros Colmar and in a class for any other variety Mr. LIDDLE took the lead with large, finely finished bunches of Mrs. Pince; Mrs. WOODHOUSE being 2nd, with well-finished bunches of Black Alicante. Rev. G. H. DEVONPORT had the best bunches of Muscat of Alexandria, followed by Mr. SYKES.

VEGETABLES.—Special prizes were offered by the King's Acre Nursery Co., Messrs. Sutton & Sons, Reading, Messrs. Webb & Son, Stourbridge, and Mr. J. Wilson, Hereford, for collections of vegetables, for which splendid produce was staged. T. KING KING, Esq., A. S. BURNEY, Esq., (gr. Mr. Holden), and Messrs. STANBURY and PRICE were the chief prize-winners.

CHRYSANTHEMUMS.—There were six classes for Chrysanthemums shown in vases, amongst which fine blooms of Mrs. F. S. Vallis, Reginald Vallis, Lady Talbot, Mrs. A. T. Miller, and Walter James were observed. The leading exhibitors were Mr. PARROTT, C. J. HOLFORD, Esq., and T. W. GRESWOLDE, Esq. Two graceful groups of miscellaneous plants were arranged, and both dinner-table plants, and those of Begonia Gloire de Lorraine, for which classes were provided, were staged in capital condition.

TRADE EXHIBITS.—These were of splendid quality, although not numerous. The KING'S ACRE NURSERY Co., staged a fine lot of pot fruit trees, with 60 dishes of Apples and Pears; they also showed floral designs. Messrs. YOUNG & Co., Batherley, Cheltenham, arranged a splendid display of cut blooms of Carnations of choice varieties, and Mr. J. WILSON, Hereford, had an exhibit of wreaths, bouquets, and other floral designs, with a group of Lily of the Valley in pots, and dishes of fruit.

PARIS INTERNATIONAL SHOW.

NOVEMBER 4-7.—The International Show of Chrysanthemums, fruit, vegetables, and other products, organised by the National Horticultural Society of France on the Cours-la-Reine, Paris, was opened on the 4th inst. under the most favourable circumstances. The schedule contained 11 sections, divided into about 160 classes. There were contributions from about 300 exhibitors, and their products were accommodated in a temporary building of similar dimensions to the one employed for the Spring Show in May, which was duly recorded in these columns. Many new seedling Chrysanthemums were exhibited, and were judged by the Floral Committee on the day previous to the opening. Certificates were awarded rather freely from an English point of view, and were for novelties from such raisers as Mme. CALVAT, MM. BAQUÉ, DOLOIS, the Marquis DE PINS, RAILLON, LIGER-LIGNEAU, NONIN, ROZAIN-BOUCHARLAT, CHANTRIER, MONTIGNY, CLÉMENT, TRAINSEL, VILMOBIN, ANDRIEU ET CIE, and DE CAULT. A special prize of the value of 100 francs was offered for the most remarkable novelty in new seedlings, and was by a large majority awarded to Mme. CALVAT

for a fine Japanese flower of immense size of a soft shade of bright rosy-mauve called *Létié Hélène de Taret*.

On the morning of the opening day the International Jury assembled at 8 a.m., and by 10.30 their work was finished, at which hour M. Fallières, President of the French Republic, paid an official visit and opened the Show. He was conducted through the exhibition by MM. Viger, Chatenay, Truffaut, and other officers of the society, and during his stay conferred several decorations upon various gentlemen connected with French horticulture. During the President's visit, Mr. Harman Payne was presented to M. Fallières by M. Viger. As we have mentioned on a former occasion, the two large greenhouses that once occupied the site on the Cours-la-Reine have been demolished, and the temporary building lightly constructed and covered with canvas has been erected in their place. This is approached through an attractive entrance gate, after passing which the visitor finds himself in a long promenade consisting of three pathways intersected at intervals with cross paths to facilitate the circulation of the visitors. Immediately inside the entrance were several most attractive groups of ornamental shrubs in beds of various shapes. M. LECOLIER had one composed of many examples of *Ilex*, *Yucca*, *Taxus*, *Abies*, *Juniperus*, *Cotoneaster*, *Privets*, &c. Close by, on the opposite side, were some from M. BROCHET and MM. CROUX ET FILS. Proceeding up the central alley of the promenade, we noticed a multitude of trained fruit trees of every conceivable form and size that French ingenuity can devise, even to one in the form of a bicycle. The chief exhibitors in this category were MM. CROUX ET FILS, G. BOCHER, KIEFFER, MOSER ET FILS, NOMBIOT BRUNFAN, and LECOINTE-MARIN. Further up and close to the main entrance of the Exhibition Hall were ornamental shrubs from MM. MOSER ET FILS with many berry bearing plants, and a similar lot from M. DURANDER. In the great Exhibition Hall the brilliant colour and wonderful artistic arrangement of the Show were apparent. The ground plan, designed as usual by M. Jules Vacherot, was a most effective piece of work. The most attractive feature, apart from the Chrysanthemums, were the fruit exhibits, which were staged in enormous numbers. The first lot to meet our view was that of M. OROUX, of the Luxembourg Garden, which filled a large room. It was a grand exhibit, including very fine Pears and Apples. We passed through an archway and there we saw a magnificent array of Vines in pots from MM. SOLOMON ET FILS, of Thionville. The vines, mostly in fruit, formed overhanging festoons, and embellished the arch on both sides. In several glass cases they staged Grapes in many varieties. A magnificent display came from M. DIEUX-BARBIER. It consisted of a run of 55 feet in length of ornamental plate glass, carved cases draped with crimson velvet. These cases contained Apples, Pears, Grapes, Peaches, and other fruits. Another similar exhibit came from MM. CORDONNIER ET FILS, Grapes being tastefully set up in fine bunches and arranged in small, flat boxes. M. MERCIER also had Grapes, as did M. TESSIER. The well known firm of MM. CROUX ET FILS had a long table with numerous Apples and Pears, and there were collections from M. NOMBIOT BRUNFAN.

The far end of the Hall was devoted almost wholly to fruit, including exhibits from MM. GERBOET, COTTARD, BRONNER, ABEL CHATROUË, THE ÉCOLE HORTICOLE DE PRESSIS-PICQUET and DE ROS. By far the grandest exhibit here was that sent by M. HENRI LEROUX, and consisted solely of Pears. Flat boxes in rows four deep ran along one side of the hall a length of 42 feet. The fruits were of the finest quality.

We must not omit the interesting display by M. PISQUET-GRENON, consisting chiefly of Apples and Pears, nor that of M. LOUIS RIET, who had a fine table of Apples and Pears presented in various kinds of receptacles, boxes containing the fruit standing on velvet-covered cases, huge circular pyramids and flat baskets. Grapes were shown by M. GUYARD MAQUET, Dr. BORIES, M. H. WUHR (a fine lot of big bunches), ERG, LÉVOT, and others. Among other fruit exhibitors were MM. LEON DESCHAMPS, MONSIEUX, DEBOST, THE ÉCOLE D'HORTICULTURE ST. NICOLAS, TH. ROUX, and E. FLETRY.

Vegetables were shown in a long room close to the far end of the Exhibition Hall. M. COMROUNT had a large display of Asparagus plants in a glass

case, and also bundles of cut Asparagus. The ÉTABLISSEMENT "A LA PENSÉE" put up an immense collection of vegetables. MM. RIGVAULT ET FILS showed Potatoes in variety; M. L. GAUTHIER had an exhibit of Strawberries in fruit in pots. MM. ANGEL ET FILS staged Onions, Potatoes and Carrots in a large display, and from the ÉCOLE D'HORTICULTURE ST. NICOLAS there was a good general display of Vegetables. Further down the room MM. VILMORIN, ANDRIENX ET CIE occupied two sides with a border filled with vegetables.

We must now return to the entrance to pass in review the contents of the side borders and the many artistically-shaped beds on the ground level devoted to the cut flowers and plants. At Paris none of these are staged on tables as in England, but are placed in beds edged with turf or on grass lawns, which greatly enhance the effect of the Show as a whole.

We first come to the artistic compositions sent by the famous florist, M. LACHAUME, of the Rue Royale. A dinner-table stands in the middle of a recess decorated in his usual style. Around it were huge vases on tall pedestals, and curiously-shaped wicker art baskets containing examples of floral artistic arrangement nowhere to be beaten in the world. Another floral decorative artist was M. Ed. DEBRIE. Opposite to his neighbour, M. LACHAUME. The former had a space in which there were some grand vases of White Lilac, Chrysanthemums, Rose Mince, Abel Chatenay, and Carnations displayed in many decorative ways. On his left, MM. TRUFFAUT had a group of Azalea Wm. Pettick and A. Abel Chatenay, Begonia Ensign and Gloire de Lorraine, the whole set in a framing of Palms, forming a most attractive group.

THE BANQUET.

Shortly after midday on the first day of the show a lunch was given to the members of the jury and the officials connected with the show at the Restaurant Ledoyen. There was a very large party of about 150. M. Viger, the President of the National Horticultural Society of France, occupied the chair. After complimenting the exhibitors and others on the successful result of their labours, M. Viger offered a warm welcome to the foreign visitors from England, Japan, Belgium and Germany. The proceedings were of the most brilliant character, and speeches were made by M. Maeda, a former Minister of Agriculture of Japan, by Sir Albert Rollet, M. Firmin Lambear, Baron von Solenmacher, M. Ch. de Bessière, Mr. Harman Payne, and others. Sir Albert Rollet referred to the approaching International Exhibition in London in 1912, and urged upon his hearers the desirability of a large French participation in the Show. He concluded by presenting to M. Viger and to M. Max de la Rochette, President of the French Chrysanthemum Society, a Silver-gilt Medal of the English National Chrysanthemum Society in recognition of their long continued hospitality to English visitors.

THE CONGRESS.

On Saturday there were two sittings of the Congress, one at 9 a.m. and the other at 2 p.m., in the hall of the National Horticultural Society of France, Rue de Grenelle. M. Viger presided.

During the proceedings a portable edition of the *Repartition des Couleurs* was discussed, and finally referred to a special committee. Mr. Harman Payne urged the need of a pocket edition, by which anyone interested could easily compare the colours of flowers at shows, floral meetings and elsewhere. The present edition, with 365 colour leaves, renders it almost impossible to be of service in the open air and at shows. M. Chautrice produced a model edition, which was considered a useful pocket edition in every way, and read a paper detailing its advantages. There were several speakers, amongst them M. René Oberthur, the publisher of the original edition, who stated that 750 copies had been sold by the English Royal Horticultural Society. M. Blot (of Vilmorin, Andrioux et Cie), M. Clément, M. Truffaut, and M. Cochet all spoke on the subject, and the president, dealing with the matter, added that, as a doctor, having to deal with railway employees, he could vouch for the fact how few people there were whose vision was perfect in colour. A paper was read by M. Couillard on the history of the Chrysanthemum, and another by M. Crévin on damping of blooms. There was also a practical demonstration on packing cut Chrysanthemums.

(To be continued.)

BIRMINGHAM CHRYSANTHEMUM, FRUIT AND VEGETABLE.

NOVEMBER 8, 9, 10.—The present was the fiftieth exhibition which this important society has held, and it must be particularly gratifying to the officers and committee to know that splendid as have been many previous gatherings, this one was equal to any that has gone before. Practically the whole of the available space in Bingley Hall was occupied by exhibits.

So far as the Chrysanthemum section was concerned, it was not an easy matter to decide whether the cut blooms shown in vases or the groups constituted the finer feature, but the former should, perhaps, merit the most praise. The Japanese blooms were superb in quality, whether regarded from the standpoint of size, form, colour or freshness. In the groups, too, the same general excellence was clearly observable, and there was, in addition, skilful and artistic arrangement. Table decorations were charming, as also were the groups of winter-flowering Carnations, Apples, Pears and Grapes were extensively and admirably exhibited, as also were vegetables of all kinds. Add to these facts that the show was most ably managed, and it will be seen that the whole gathering was a conspicuous success, and worthy such an epoch as the jubilee of the society.

SPECIMEN PLANTS.

Many years ago the specimen plants which were exhibited at Chrysanthemum shows required a considerable amount of space for their accommodation, and they attracted much attention; but the days of their glory have gone. On this occasion the several classes resolved themselves into friendly duels between two competitors, and the 1st and 2nd prizes were consistently divided. For six large-flowered varieties, distinct, Japanese excluded, E. MARTINEAU, Esq., Edgbaston (gr. Mr. O. Braster), was placed 1st with handsome examples of Mr. Bunn, White Beverley, Mme. Forlat and Clara Wells as his best specimens. J. A. KENRICK, Esq., Berrow Court, Edgbaston (gr. Mr. A. Craver), was awarded the 2nd prize; he had good plants of Mrs. J. Bryce and Mrs. N. Molyneux. In the class for six plants of Japanese Chrysanthemums, distinct, the positions of these exhibits were reversed. Mr. J. A. KENRICK had excellent examples of Charles Davis, Mrs. W. Knox, J. H. Silsbury, Mrs. J. Ritson, Vivian Morel, and Mrs. J. Hadaway. Mr. E. MARTINEAU'S best specimens were Mrs. J. Ritson, Vivian Morel and Mrs. W. Knox. Mr. E. MARTINEAU was the winner of the 1st prize in the class for three Japanese and singles; while Mr. J. A. KENRICK was to the fore with one large flowering variety, exclusive of Japanese, and one Japanese. In each instance the plants were well grown and trained.

GROUPS.

There were only two contestants for the awards in the class for a group of Chrysanthemums arranged for effect in a space measuring 20 feet by 12 feet. Mr. J. A. KENRICK was placed 1st for a magnificent display. The plants were splendidly grown and effectively arranged. Sir G. H. KENRICK, Whetstone, Edgbaston (gr. Mr. J. V. Macdonald), to whom the 2nd prize was awarded, relied upon single and decorative varieties, but although the result was attractive, it lacked the striking effect presented by the other group.

In the class for a group 14 feet wide at the back and front and 10 feet deep, in which the Chrysanthemums had to be shown as grown, with foliage plants, exhibitors in the preceding class were excluded. The premier position was gained by H. C. PINESENT, Esq., Lordswood, Harborne (gr. Mr. G. Corbett), with a beautiful exhibit; Mr. H. GREEN, Gravelly Hill, Birmingham, was a creditable 2nd, but the arrangement was rather flat; T. W. PIGOTT, Esq., The Leons, Park Hill, Moseley, was 3rd, with a crowded group.

Mr. C. H. HERBERT, The Nurseries, Acock's Green, was a splendid 1st for a group of decorative varieties arranged in a space 15 feet by 10 feet. Mr. J. A. KENRICK, with practically all single varieties, was 2nd, with a group which was thin in places. In the class for a group of cut blooms of Tree Carnations, to be arranged on a table space 18 feet long and 5 feet deep, Mr. W. H. LANESHIRE, The Vineries, Gurnsey, was a decided 1st with an exhibit that combined excellence of quality with artistic arrangement. The 2nd prize went to Mr. C. F. WATERS, Deanland Nurseries, Balcombe.

BLOOMS SHOWN IN VASES.

There were a magnificent feature of the show, the competition being extremely keen in all the classes, and the average merit of the blooms exceptionally high. The chief class was for six vases containing one bloom each of three distinct varieties in a vase, and the stems of the blooms had to be at least 18 inches long. There were six exhibitors, of whom Lieut.-Col. BEECH, Brandon, Coventry (gr. Mr. E. J. Brooks), whose exhibit was superb in every respect, excelled. The varieties shown were Algeon Davis, Lady Crisp, F. S. Vallis, Master James, Marquise V. Venosta, Mme. P. Radaelli, Mrs. C. Penfold, Bessie G. Payne, Hon. Mrs. Lopes, Valerie Greenham, Wm. Mease, Reginald Vallis, Lady Talbot, John Peed, C. H. Broomhead, Purity, Mme. G. Rivol, and President Viger; 2nd, Mr. W. JAGULDEN, Lock's Hill Nurseries, Frome; 3rd, H. ANDREWS, Esq., Toddington, Winchcombe (gr. Mr. J. R. Tooley).

There were eight exhibitors of four vases of Japanese blooms, three blooms of each variety in a vase. Lieut.-Col. BEECH was again 1st, with F. S. Vallis (probably as good a trio of blooms as has been exhibited this year), John Peed, Hon. Mrs. Lopes, and President Viger. J. H. WHEATLEY, Esq., Borkswell Hall, Coventry (gr. Mr. W. R. Westbury), was placed 2nd; he had Lady Talbot and F. S. Vallis in fine form; and the Rt. Hon. JOSEPH CHAMBERLAIN, Highbury, Birmingham (gr. Mr. J. Deacon), 3rd; Algeon Davis being his best variety. For one vase of any pink variety, Lieut. Col. BEECH was awarded the 1st prize, having Reginald Vallis; 2nd, Earl SPENCER, Althorp Park, Northampton (gr. Mr. S. Cole), with Mme. P. Radaelli; and Mr. H. ANDREWS 3rd, with Reginald Vallis. For one vase of any crimson variety, Mr. W. JAGULDEN won the 1st prize with Master David; F. E. MUNTZ, Esq., Umberslade, Hockley Heath (gr. Mr. H. S. Foster), was placed 2nd, with the same variety; and Mr. H. ANDREWS 3rd, with Master James. For one vase of any white variety, Lieut. Col. BEECH took the lead with Purity; Rt. Hon. J. CHAMBERLAIN was 2nd, with Mrs. A. T. Miller; and Mr. G. W. DRAKE, Cardiff, 3rd, with Purity. Mr. J. H. WHEATLEY excelled in the class for one vase of any yellow variety, Lieut. Col. BEECH being placed 2nd, both showing F. S. Vallis; Mr. H. ANDREWS was 3rd, with Hon. Mrs. Lopes.

The class for 12 Japanese blooms, distinct, to be shown singly in vases, with any kind of foliage, on a table 6 feet by 5 feet, brought no fewer than seven competitors, and the class thus became a most effective one. The prizes were awarded to the Rt. Hon. J. CHAMBERLAIN, F. E. MUNTZ, and H. ANDREWS, in the order in which their names are given. It must have been a remarkably close competition between the 1st and 2nd groups. Major EVERETT, Knowle Hall, Knowle (gr. Mr. W. Newton), was splendidly 1st for four vases of singles, distinct; Mr. H. WOOLMAN followed, and F. W. GRESWOLD WILLIAMS, Bradenbury Court, Bromyard (gr. Mr. H. Tribel), was 3rd; there were six exhibitors in this class. Some of the successful competitors in the numerous smaller classes for cut Chrysanthemums included Messrs. H. T. KEEP, G. W. DRAKE, T. W. PIGOTT, E. MARTINEAU, J. SHUER, C. JUDGE, G. BOLT, P. J. WORSLEY, J. ARCHDALE, W. J. WAREFIELD, J. A. BALD and E. DAREY.

FRUIT.

This section was almost restricted to Apples, Pears and Grapes, but if it lacked anything in the matter of variety it by no means did so in quality. Not only was the competition keen so far as numbers were concerned, but the exhibits showed very high quality. In the class for a table of hardy fruits, Mrs. HEARNE, Hanbury, Droitwich (gr. Mr. G. R. Morris), was an excellent 1st prize winner, having splendid Apples and Pears. The 2nd prize exhibit was also especially meritorious, but the grower's name and address could not be found. Messrs. PEWTESS BROS., Tillington, Hereford, was 3rd.

Mr. H. ANDREWS was awarded the 1st prize for six bunches of Grapes, Muscat of Alexandria and Black Alicante being very fine. The 2nd place was won by Mrs. F. NEED, York House, Malvern (gr. Mr. J. Jones), who showed Appley Towers, Muscat of Alexandria, and Black Alicante, all in good form. The Earl of HARRINGTON, Elvaston Hall, Derby (gr. Mr. J. H. Good

acre), was 3rd, with Muscat of Alexandria and Black Alicante.

For three bunches of Black Grapes Mr. H. ANDREWS was placed 1st, and Mrs. F. NEED 2nd, both showing Black Alicante.

Mr. H. ANDREWS excelled in the class for three bunches of Muscat of Alexandria. The Earl of HARRINGTON and C. WINN, Esq., Selby Hill (gr. Mr. T. Sheppard), being placed 2nd and 3rd respectively.

For two bunches of White Grapes, exclusive of Muscat of Alexandria, Mrs. F. NEED was placed 1st, having the variety Lady Holt. The Earl of HARRINGTON and Mr. E. MARTINEAU followed, both showing Golden Queen.

For two bunches of Black Grapes to be grown within four miles of Stephenson Place, Mr. C. WINN was 1st, with Black Hamburg, and the Rt. Hon. J. CHAMBERLAIN 2nd, with Black Alicante. For two bunches of White Grapes, subject to the same stipulation as to radius, the Rt. Hon. J. CHAMBERLAIN was 1st, and C. WINN, Esq., 2nd, both showing good bunches of Muscat of Alexandria.

The premier prize in the class for six cooking Apples, distinct, was won by Lady HENRY SOMERSET, who had grand examples of Peasgood's Nonesuch, Warner's King, Lord Derby, Tyler's Kernel, Charles Ross, and Mère de Menage; 2nd, Mr. C. W. POWELL, W. Ham, his fruits of Stirling Castle, Annie Elizabeth and Lord Derby being especially fine; Mr. C. WYATT, Harvington, Evesham, was a good 3rd. In the class for six dessert Apples, Lady HENRY SOMERSET retained the lead, with fine fruits of Ribston Pippin, Blenheim Pippin, Cox's Orange Pippin, Royal King of the Pippins, and Wealthy; 2nd, Mr. C. W. POWELL, whose exhibits included a handsome dish of Cox's Orange Pippin; 3rd, Mr. C. WYATT.

PEARS were excellent and numerous. For a collection of eight distinct varieties Lady HENRY SOMERSET was placed 1st, Mr. C. W. POWELL 2nd, and the Earl of HARRINGTON 3rd. The winning exhibit comprised Bland, Dnd, Duroidan, Pittaston Duchess, Doyenne du Comice, Conseiller de la Cour, C. France, Souvenir du Congrès, and Marie Louise. Lady HENRY SOMERSET also had four varieties, distinct, with handsome dishes of Pittaston Duchess, Doyenne du Comice, Marie Louise, and Beurré Superfin. Captain W. H. STARKLEY, Bligate House, Leamington (gr. Mr. C. L. Bilsburn), was a good 2nd, and Mr. C. W. POWELL 3rd.

VEGETABLES.

The prizes in the classes for vegetables were provided by various seed firms, and some produce of especially high quality was shown. We can only find space to mention the collections, and it must be understood that most of the smaller classes were well filled. In Messrs. Sutton & Sons' class for nine kinds the Hon. Vicary GIBBS, Aldham House, Elstree (gr. Mr. E. Beckett) won the 1st prize easily with an exhibit in this well-known grower's best style; Mrs. DAVIS, Radnor, was 2nd; and Mr. G. NEAL, Bampton, Oxfordshire, 3rd. No fewer than nine competed for the prizes offered by Messrs. Robert Sydenham, Ltd. for a collection of nine kinds, the 1st prize being won by Mr. T. JONES, Radnor; the 2nd by Mr. J. WHITE, Bampton; and the 3rd by Col. E. PALEY, Mickleton Manor, Gloucestershire (gr. Mr. C. Rowlands). In a similar class for local growers, Mr. E. DEVINE, Hay Hall, Hay Mills, was placed 1st, Mr. J. A. KERRICK 2nd, and Mr. F. WHITEREAD, Stockfield Road, Yardley Heath, 3rd. The prizes were offered by Messrs. R. Sydenham, Ltd. Eight competed in Messrs. Webb & Son's class for a collection, and Mr. J. HUDSON, Leicester, was a splendid 1st. The 2nd and 3rd prizes went respectively to Earl SPENCER and Mr. T. BARRETT.

NON-COMPETITIVE EXHIBITS.

The groups of plants, flowers, fruits and vegetables arranged "not for competition" added immensely to the interest and beauty of the exhibition.

Large Gold Medals were awarded to Messrs. WEBB & SON, Wordsley, for vegetables; THE KING'S ACRE NURSERIES, Hereford, for Apples; Messrs. JOHN WATERER & SONS, Bagshot, for shrubs; Messrs. GRAY & SONS, Olton, for floral

decorations and rockery; Messrs. YATES & SONS, Birmingham, for vegetables; and Messrs. SUTTON & SONS, for vegetables.

Gold medals were awarded to Messrs. CLIBRANS, Altrincham, for Chrysanthemums; Messrs. THOMSON & Co., Birmingham, for vegetables; Mr. H. WOOLMAN, Shirley, Birmingham, for Chrysanthemums; Messrs. TOOGOOD & SON, Southampton, for vegetables; Messrs. BAKERS, Wolverhampton, for shrubs; Mr. W. J. GODFREY, Exmouth, for Chrysanthemums; and to Mr. S. MORTIMER, Rowledge, Farnham, for winter-flowering Carnations.

Silver-gilt Medals were awarded to Messrs. W. WELLS & Co., Mersham, Surrey, for Chrysanthemums; Messrs. HEWITT & Co., Birmingham, for shrubs; Mr. H. N. ELLISON, West Bromwich, for Ferns; Mr. C. W. POWELL, Warham, for hardy fruits; Messrs. YOUNG & Co., for winter-flowering Carnations; and THE GOVERNMENT OF BRITISH COLUMBIA, for Apples.

Silver Medals were awarded to Messrs. W. H. SIMPSON & SON, Birmingham, for vegetables; Messrs. PEWTESS BROS., Tillington, Hereford, for Apples; and Miss THOMPSON, Handsworth, Birmingham, for Cacti.

A Bronze Medal was awarded to Councillor E. A. WILSON, for Cactaceous plants.

NATIONAL HARDY PLANT.

NOVEMBER 3.—The first general meeting of this society was held at the Hotel Windsor on the above date, Mr. A. J. Macself in the chair. The Chairman presented the report of the Provisional Committee appointed at Shrewsbury, which dealt with the Edinburgh meeting, and submitted draft rules and by-laws which the secretary had prepared and which were recommended by the committee for adoption after several minor amendments had been accepted, the rules and by-laws were adopted. The following officers were elected: Chairman of Council, Mr. A. J. Macself; vice chairman, Mr. Went; treasurer, Mr. Brunton; secretary, Mr. F. Bonskell. A representative Council of 43 was then elected.

AERIAL ROOTS ON VINES; H. B. The presence of these indicates (1) too much moisture in the atmosphere, and (2) an unsatisfactory rooting medium. Your best plan will be to thoroughly overhaul the borders at this season and keep the atmosphere in theinery drier during the spring forcing, affording more ventilation than you have permitted hitherto.

APRICOTS ON WALES; Notts. Your experience with these trees losing their branches is by no means an isolated one. Although neither science nor practice has yet been able to find a reason for this trouble, it is held by many to be a result of some injury to the roots, whilst others maintain that it is caused by the restriction of growth by pruning. It is found that a richer application of water at the roots than is usual will often mitigate the trouble.

BEGONIA; A. J. J. C. The brown markings on the Begonia leaves are not caused by any fungus or insect pest; it is due to some cultural condition.

CARNATIONS DISEASED; F. Godwin. The Carnations are very badly infested with the so-called "fairy ring" disease, caused by the fungus *Heterosporium echinulatum*. Remove all the leaves which are badly affected, and spray the plants once a week until quite healthy with liver of sulphur solution (see answer to *Archieus*, H. J.). Ventilate the house well, and avoid watering the foliage or allowing moisture to collect about the stems.

CHRYSANTHEMUMS AND BEGONIAS UNHEALTHY; F. T. B. The darkening of the leaves of the Chrysanthemum is not due to any fungus or insect pest. It would appear to be due to some physiological peculiarity of the variety. Plants, when crowded together and syringed frequently exhibit a darkening, and ultimately

rotting, of the lower leaves. The Begonias appear to have suffered from the Begonia mite. The house should be fumigated by evaporating nicotine.

CYCLAMEN LEAVES WITH BROWN MARKINGS: *Anxious, B.* The brown marks on the leaves are caused by the attacks of the fungus *Botrytis cinerea*. This fungus is very common on greenhouse plants, and under certain conditions becomes epidemic. It spreads from dead and drying parts of the plant to healthy foliage. Remove and bury all dead or dying vegetable matter (especially of Pelargonium, Primula, and Begonia), and spray the affected plants with liver of sulphur (1 oz. dissolved in three gallons of water). Remove the plants to another position if necessary for the spraying, as the spray discolours white paint. The grub is the common Weevil.

CYPRIPEDIUM AND BEGONIA LEAVES: *F. H. B.* The rusty appearance on the leaves is caused by thrips. As a rule, excessive heat, especially at night, is favourable to the increase of this pest. Cut off all the affected parts which can be spared, and repot the plants, after spraying them with a weak insecticide. Carefully attend to the regulation of the temperature of the house and the ventilation, leaving a little air on at night if the heating apparatus cannot be so arranged as to prevent excessive heat.

DAISIES ON A LAWN: *L. H. A.* If you apply some nitrogenous manure in the spring, it will cause the grasses to grow vigorously, and in time crowd out the Daisies. Sulphate of Ammonia would be suitable, and this should be mixed with some fine soil, and applied in the spring as a top-dressing, to ensure an even distribution.

FERNS WITH WHITISH FRONDS: *H. J.* Although we do not find any of the creatures on the fronds, there is evidence of attack by thrips. From the general appearance of the Ferns, they appear to have been kept in too dry surroundings. Search for the pest, and, if thrips are found, dip the foliage in a weak solution of tobacco water. Meanwhile, give the roots a little manure water, repeating the dose occasionally. Damp the floor and stage of the greenhouse whenever the weather conditions allow.

FRENCH GARDENING: *H. P. H.* We cannot vouch for the accuracy of statements which appear in the daily papers. It is, of course, quite possible to secure £240 worth of produce from an acre of ground by means of frames and lights. Indeed, a good deal more can be obtained by intensive methods practised by a man who knows his business, but there is a difference between gross returns and net profits. With proper heating arrangements and hotbeds, it would be possible to secure three crops of Dwarf Beans in the course of a year, if it were worth while to do so. It is, however, questionable if the three crops together would realise as much as one good crop of Canteloup Melons in an ordinary hot summer season. You evidently refer to the French system of intensive cultivation when you ask how long the hotbeds remain in good condition, the size of the beds, the crops and varieties to be grown, &c. To answer all these queries would take up a good deal of space. You will, however, find most of your queries answered in the *Calendar of Gardening Operations*, to be obtained from our publishing department for 6d. net, and a more detailed and elaborate account of the methods employed by French growers will be found in Mr. John Weathers' book on *French Market Gardening*, price 3s. 6d. If you wish to see a good French garden actually in working order you might visit the Burhill Golf Club, Walton-on-Thames, or write to the Manager, French Cloche Co., Caxton House, Westminster, for a list of places. There are good French gardens at Mayland, Althorne, Essex, at Eynham, at Eptree, Essex, at Thatcham, Berkshire, and elsewhere.

HOUSE FOR MUSHROOM CULTURE: *H.* A Mushroom house should be constructed with either a lean-to or span roof. Choose a situation that is fairly sheltered, as fluctuations in temperatures are injurious. A suitable place is a house leaning to a north wall at the back of a range of glasshouses, with a doorway that may be entered from these warm structures, thus preventing cold draughts. The roof may be

either made of thatch or of slates with an inner lining of match-boarding; it is essential to preserve an equable temperature. The front of the house may be either of brick or of wood with match-lining on the inside. A width of 10 feet is suitable, as this will allow for beds $3\frac{1}{2}$ feet wide on either side of a central path. Flow and return pipes from the hot-water cistern should run the whole length of the structure, and may be placed either along the centre of the path beneath a wooden trellis or by the side of the back wall.

MORAIINE: *Charles P.* If the moraine plant is already in fairly gritty soil, take away as much as can be done without causing the roots much disturbance, paying particular attention to cleaning all away from the collar of the plant. On the contrary, if the plant is growing in non-gritty soil, and, therefore, in soil quite unsuitable for it, by all means shake out the whole as carefully as possible, and plant it direct into the moraine. If such sticky soil is put into the moraine with the plant, it will, in course of time, choke the moraine itself, and certainly will take the chief advantage of the moraine away from the plant in question. If the operation of shaking-out be done with due care, much less harm will come to the plant from the shock than by allowing it to remain in the unsuitable soil, especially in the winter, when the correct moraine soil ensures rapid drainage, which is so essential to such plants.

NAMES OF FRUITS: *J. Cocks.* Barnack Beauty.—*J. Coombes.* 1. Wadhurst Pippin; 2. Golden Reinette; 3. Sweet Lading; 4. Fearn's Pippin; 5. not recognised.—*J. Hathaway.* Apple, a very fine fruit of Golden Noble. Pear General Todleben.—*H. B.* The large Apple is Blenheim Pippin, the other Belle de Boskoop.—*H. Collier.* Apple King of the Pippins. Pear Fondante d'Automne.—*Reader.* 1. Scarlet Golden Pippin; 2. Heavy Morning; 3. Brownlee's Russet; 4. Golden Knob; 5. Cellini; 6. Dandelow's Seedling.—*Lorraine.* Apples: 4. Bramley's Seedling; 5. Beauty of Kent. Pears: 1. Nonveau Poiteau; 2. Aston Town; 3. Pilmaston Duchess.—*T. S.* 1. Easter Beurré; 2. Beurré Diel; 5. Marie Louise; 4. Nelson's Codlin; 5. Lady Henniker; 6. the specimen is insufficient.

NAMES OF PLANTS: *J. C., Dumbarton.* Stapelia Hanburyana, see illustration in *Gardeners' Chronicle*, August 29, 1908, p. 167.—*F. R.* 1. Oncidium praxetum of the Pernambuco type called Gravesianum; 2. Brassia verrucosa; 5. Maxillaria phoenicantha; 4. Mystacidium filicome.—*V. H.* 1. Pteris longifolia; 2. Adiantum assimile; 3. Todea arborea.—*T. W., Hereford.* 1. Viburnum Opulus; 2. Euonymus europæus.—*H. A. H.* Aster, probably "Triumph."—*J. J. M.* Gunnera manicata.

PEARS FOR FLAVOUR: *H. Green.* The following is a good selection for flavour:—Marguerite Marillat, Triomphe de Vienna, Doyenné du Comice, Durondeau, Le Lectier, and Beurré Hardy. The cordons should be planted at 18 inches to 2 feet apart, and they should be worked on the Quince stock.

PRUNING CORNETS AND FILBERTS: *L. H. Appleford.* The best time to prune Filberts is when the male catkins are about to disperse the pollen. A considerable number of these male catkins will be cut off in the process of pruning, and if the branches are placed amongst other Nut trees where there is a deficiency of male flowers, it will ensure the pollination of the female blossoms. You will find information on the pruning and general culture of Cornets and Filberts in an article in *Gardeners' Chronicle*, February 9, 1907, p. 81.

PTERIS: *Dundee.* There is not the slightest trace of any fungus or insect pest on either of the specimens sent, and the injury must be due to some cultural defect.

RICHTARDIA AFRICANA LEAVES: *A. E. P.* There are no signs of any specific disease in the Arum Lily leaves; the injury must be connected with some wrong cultural detail.

ROSE TREES UNHEALTHY: *A. W., Windsor.* The roots of the Rose trees are infested with the spurn (mycelium) of some fungus, which has invaded the tissues of the root as well as covered the outside. The name of the fungus cannot be ascertained, as there is no fructification present. Such fungi as this frequently

spread from old roots in the ground, and those mentioned in this case should be grubbed up. Mix quicklime with the soil where the Rose trees have been growing.

SCARLET RUNNERS: *Continuous Reader.* It was a mistake to plant Scarlet Runners in August. The scarcity of pollen renders it almost impossible to get a satisfactory crop so late in the season. Try a good watering at the root, and give abundance of air night and day. If the atmosphere becomes dry the plants may be syringed. A good crop of Scarlet Runners is very seldom obtained under glass.

SETTING OF TOMATO FRUITS: *A. G. B.* If you adopt the usual practices you will ensure a good setting of the fruits without actually moving the bees into the glasshouse, although Tomatos, not less than other species, set their flowers most readily when winged insects have free entry into the houses. It is necessary at the time the plants are in flower, and especially in the case of the first blooms, to maintain fairly dry conditions in the house, so that the pollen will disperse readily. Afford the plants the lightest possible position, and do not over-stimulate them with manures in their early stages. Each day at about noon either gives the stakes to which the plants are supported a sharp knock to disperse the pollen, or touch each flower with a small, soft-haired brush.

SOIL FOR EXAMINATION: *E. W. S.* The sample appears to be a suitable medium for most garden plants, but it lacks vegetable loam. It is rather light and gravelly in texture, therefore use well-decayed manure, but not cows' dung. It will be benefited by adding garden refuse, decayed leaves, or any substance that provides humus. The benefit of trenching the land will be more apparent in future years. Land that is dug deeply, and especially light soil, is too loose the first season to produce the best crops.

SWEET PEAS FOR EXHIBITION: *B. L.* In order successfully to exhibit six distinct varieties, you must have not fewer than nine sorts from which to choose on the day of the show. Excellent varieties are Sun-proof Crimson, Asta Ohn, Etta Dyke, Helen Lewis (selected stock), Clara Curtis, Mrs. Hugh Dickson, Countess Spencer (selected stock), Mrs. C. W. Breadmore and Marie Corelli; you can ascertain the colours from any Sweet Pea catalogue. You should have five or six plants in each clump, and they should be put 15 inches asunder; two clumps of each will be ample if you grow the plants properly. The Secretary of the Royal Horticultural Society, Horticultural Hall, Vincent Square, London, S.W., will send you full particulars of the society's examinations upon receipt of a request for information accompanied by a stamped directed envelope.

VIOLA: *H. H. E.* The injury is known as fasciation, and is often due to over-feeding. Affected plants should not be used for propagation. The condition is not caused by a fungus or insect.

VIOLETS: *A. J. J. C.* The Violets sent with "blotches" on their leaves are affected with a species of *Cladosporium*. It is probable, however, that this fungus has attacked only those leaves already previously weakened by unfavourable weather, or wrong cultural conditions. Pick off and burn the diseased leaves, and spray the plants with liver of sulphur solution (see answer to *Anxious, B.*).

VIOLETS DISEASED: *C. A.* Your Violets are attacked by the fungus *Cercospora violæ*. The diseased portions of the leaves fall out, and infect the soil, and the only means of checking this complaint is to remove all the plants, pick off the diseased leaves, and replant in fresh soil.

ALPINE VALLEYS.

THE BORÉON.

THE Boréon Valley runs up in a curve from St. Martin Vesubie (Lantosque), to the high, rocky ridge between the Argentera and the Piagn. It is deep and densely wooded on either side; the walk from the Hotel Boréon (with its wonderfully beautiful waterfall, like a sheet of smooth glass falling into another of broken glass) is long and tedious and dull, a slow, interminable ascent through forest, beautiful, indeed, with Ferns and Moss and leaves of Pulmonaria, marvellously spotted, but empty of excitement for the collector. Gradually, however, the collector comes on to more open ground, and slowly approaches the upper levels. On the right, towers the vast wall of mountain that separates us from the Col de Fenestra; the Pine trees seem minute fur on the hill-side; I recognise the place where, many years since, on a dull October day, I climbed for my first sight of Saxifraga florulenta. In the highest rocks, now of both the ranges to right and left, the most ancient of Saxifrages has its haunt.

The formation of the Boréon Valley is granitic, and, therefore, even when one does at last emerge towards the Alpine barrens, there are no very rich marvels to be seen. Anthericum liliastrum is like snow over all the slopes and ledges; Senecio halbisianus occurs; Lilium bulbiferum is gorgeous in profusion. But the only Saxifrage is Azoon,

and, to the collector, there is nothing notable. Having heard of the wealth of the Boréon Valley, I pined, but in vain, to come out on the mountain limestone. In vain I say, for this district is wholly granitic to the very summits of Argentera and of Piagn, whose gigantic finger of nude granite is almost overwhelming in its grandeur now as one advances.

A last steep climb among Pines and Rhododendrons, and the upper Alp is gained. A great cirque of cliffs, with a grassy little river threaded plain in the foreground, where Gentiana verna—true verna is making patches of azure in mid-July, and G. acaulis showing diverse forms among the Alpine Clovers on drier hummocks. But still there is nothing to thrill. It is evident that one must climb far higher if one is to find the important things of which one has heard. One, indeed, I am certain by now, I shall not find; for M. Corveon can only by a slip of the pen have urged me to look out for Saxifraga linguata. It must be pellemontana that he meant, for never yet were the great Silver Saxifrages of the Maritime Alps discovered luxuriating anywhere but on the mountain limestone. However, there is consolation, for, go where one will at this elevation, it will not be possible to escape from a greater Saxifrage yet.

A last tough climb, then up a long, stony bank, where Gentiana acaulis is really beautiful (it so seldom is, in my experience) in different tones of rich blue, and one comes out on the highest level, immediately under the long screes and grim pinnacle of Piagn. Here, everywhere, is a tumbled wilderness of enormous stones, a little blue lake in the middle, and late snow-patches lying here and there. And on the first stone-slope the harvest begins. How often have I found in the Alps that only five minutes climb divides the land of dullness from the land of plenty. Thlaspi limosellifolium is in sheets of fragrant blue blossom; Saxifraga pellemontana is duly discovered; there are Achilleas and Myosotis in tufts; above all, in this sunny corner, Viola nummulariifolia has already begun to be lavish of those unique little flowers. The charm of this astonishing plant is hard to define. Awaiting a more precise note, I will only say that it has a wandering stoloniferous habit akin to that of Campanula Allionii. It is purely a moraine-plant, and the only reason, I believe, why we have never yet succeeded with it is that collectors so far have only, in their prudent economy, sent us mutilated lateral stolons, which are as obstinate about dying as would be those of C. Allionii. The innumerable flowers are Violets, not Pansies, flattened in shape, pencilled exquisitely with purple on a ground of very soft, clear blue, more tender, but no less definite, than that of the Periwinkle—a wonderful, indefinable colour. I forget whether it has fragrance; I should not need to go back there to find out, for, of my cautiously-collected plants, not one has failed to take hold and thrive prodigiously in sand or moraine.

Up and up the stone-slope to the cliff from which it falls away. Here there is a great snow-patch to be crossed. And then, standing in the dank hollow between snow and rock, one looks up at the cliff's face to see Primula marginata in bunches of blue-lavender blossom and P. graveolens hanging out statelily clusters of imperial violet. The snows

of this late season have thus retarded them. By their side is Anemone alpina sulfurea, and, most strange to me, Anemone narcissiflora, too, growing, like the Primulas, as a real crevice-plant. And then, higher yet, in stark and impracticable crannies, shine the lustrous, thorny rosettes of the great Saxifrage.

For all round this region, Saxifraga florulenta abounds; this is the centre of its distribution. And here it does not seem very greatly to trouble about aspect, although you will be certain not to find it in cliffs exposed to the most glaring sun. But on either side of every gully, on ledge or slope, those rich rosettes are to be seen clustering; up one such ghyll I climbed high, high, finding abundance of the plant wherever, in the moister, shadier side, there was any available place. Never does one weary of seeing it; no plant I know gives such an impression of opulence and sombre splendour. I saw many thousands of plants one day in those upper gullies, and I repeat, to engrave it on the cultivator's mind, that every flower-spike was being thrown up, not by an old, time-honoured rosette, but by a young one, wide in span, which luck had cast in so favourable a spot that it was able to grow on as quickly as the real nature of the plant desires, in face of the misleading name it bears, and its own inability to make headway against the unpropitious circumstances in which it too often puts itself. As one gets higher, the plant becomes less guarded in its stations; at last I found it growing between rocks out on the open moorland of the upper fells. It never, however, seems to sow itself far from its beloved gullies; the open slopes at this height of 8,000 feet or so, are jewelled all over their austere expanse with the golden cups of Tulipa celsiana, a strange, brilliant thing to find abounding up here among the mountain mists. A little higher than this and the Saxifrage diminishes and grows rare, as it its utmost limit were reached; descending, one finds it again abundant, and on the sunnier cliffs Androsace imbricata. And, to crown all, I found the Saxifrage at last growing large and handsome, even in moraine, on the stone-slopes themselves. *Reginald Farrer.*

NOTES FROM A "FRENCH" GARDEN.

YORK: Lettuce plants of all the varieties under the cloches are progressing favourably, and ventilation is given to every bell glass. At this time of the year we prefer not to use the ordinary 11-inch peg to give air, but small blocks of wood 1 inch by 2 inch by 2 inch, employed for packing the cloches during the summer, as these latter do not occupy so much room and are not in the way when covering at night. The plants must be grown very hardy, and they will not require any covering for another fortnight or so. The grower is very reluctant to use dry mats at this time of the year, as the opportunities for drying them are remote. The Cos Lettuces are now pricked out a second time, 14 plants in each cloche. Before placing the bell-glass in position a top-dressing of finely-sifted, decayed manure is spread over the ground. The Cos Lettuce "White of Paris" is generally pricked out in a frame, putting 150 plants into each light; this variety is only employed for open-air culture at the end of March. When the sowing or the seedlings have not been successful, or when a succession is required, a few more seeds may be sown

now on a small hot bed, to prick out early in December into another bed. The Lettuce "White Passion" can also be sown at this present time, to provide a succession to those sown six weeks ago. This late sowing is to be recommended especially in the North of England and in Scotland for the main batch, as the plants cannot be planted in the open until the middle of March in the most favourable conditions.

The Chicory "Witloof" sown last May has been lifted from the ground, and the roots placed in trenches 5 feet 6 inches wide, allowing a space of 3 inches or 4 inches between each row. The roots are covered 1 inch deep, with decayed manure or fine soil. If the soil is heavy clay, it is preferable to place the roots on the ground and cover them with soil. If frame lights are placed over the roots, they will serve to shelter them from rains. The forcing of Chicory roots starts at the earliest at the end of the present month. Part of the bed is covered with a layer 15 inches to 18 inches thick of good manure, and is covered with mats. The crown will require four weeks to grow to a marketable size, and when a succession is wanted another part of the bed is covered each week.

The preparation of the ground for next spring's work will be pushed forward as speedily as possible. The manure for the hot beds is now being collected gradually, to provide the necessary quantity before January. It is preferable to stack the manure a few weeks before it is needed, in order that it may sweeten and develop any fungi before it is employed for the making of the hot beds. The steady and mild temperature produced by the second fermentation has the greater value. *P. Aquatics.*

NEW OR NOTEWORTHY PLANTS.

PEONIA JAPONICA,* MIYABE ET TAKEDA.

THIS Peony has been known to Japanese botanists from the remotest time, but as *P. obovata* Maxim. v. also grows in mountainous districts throughout Japan, *P. japonica* has been confounded with it or believed to be a merely white-flowered variety, for the habit is very similar. *P. japonica* is, however, distinguished from Maximowicz's plant mainly by its flowers, which open less widely and have more concave petals and short stigmas, whilst the leaves are quite glabrous. Therefore, the plant is considered to be a proper species, and its name has been put back to *P. japonica*.

The plant has a stem 2 feet high, with obtuse scales at the base, usually bifoliate. The leaflets are ovate, paler and glabrous beneath, petiolulate. The flower is white, 5 to 6 cm. across, not widely expanded. There are usually three sepals, ovate, without leafy appendage, deeply concave, green and glabrous. There are five petals, obovate-cuneate or orbiculate-obovate, with undulate margins. The numerous stamens are about 1 cm. long. The three carpels are slender, glabrous and green, and the stigmas short and sessile.

The species is widely distributed in Japan as far north as the island of Yezo, but it has not been recorded from neighbouring countries, while *P. obovata* grows in several places of Northern Asia. In Japan it is known under the name of "Yama-hakuyaku," i.e., the wild Peony, and the plants flower in April and May. *H. Takeda.*

* *PEONIA JAPONICA* (Makino, Miyabe et Takeda).
Syn. *PEONIA OBOVATA* *P. japonica* Makino in *Tokyo Bot. Mag.* xvi (1902), p. 59.
PEONIA WATSUMIANA Finet et Gagn. *Contr. Bot. Herb. Acad. Sci. Paris*, p. 222, pro parte, non fide.
PEONIA ALBIFLORA Miq. *Prod. Fl. Japon.* p. 197, pro parte, fide, et Say. *Flores. Japon.* i, p. 11, pro parte, non fide.
Stigma *P. obovata* Maxim. valde similes, sed floribus non a ceteris, illas, petals obovato-cuneatis, vel orbiculato-obovatis, apicem versus undulatis, valde concavis, antheris connatis, staminibus brevioribus, stigmalibus brevissimis nec elongatis nec convolutis, totius distinctioribus. *H. Takeda.*

SMALL HOLDINGS.*

THE objects of increasing the number of small holdings are, firstly, national, and, secondly, the benefit of the individual. It has always been recognised that the owner has a greater interest in the welfare of his undertaking than the hireling. The agricultural labourer at the age of, say, 25, earns as much as at any time of his life, with but little chance of promotion, and if he rises to be a foreman it means usually only an additional wage of, say, 2s. a week; after reaching the age of about 60, in spite of long experience, his wages begin to decrease, and he has little to look forward to (unless he has saved money) beyond ending his days in the workhouse; whereas in factories, railways, and other employments there seems usually a greater chance of promotion for the capable and industrious man. One of the chief objects, therefore, of the provision of small holdings should be to give a chance to the "small man" who is thrifty, capable and industrious, to "become a little bigger," and to place him on the first rung of the ladder of possible success, to give him an

the cost expended upon it. What is true in the case of crops or animals produced on a large scale with a minimum of expense is, therefore, increasingly so with products in small quantity: hence it needs even greater care in choosing what crops to grow or stock to rear and feed on a small area than on a large one. It would seem, therefore, that crops and live stock responding most to the largest output of manual labour, skill and personal care are those likely to be most successful on a small holding. These include milk, cream, poultry, eggs, fruits, vegetables and special crops, in the production of which the assistance of wife and children is of value. Except under special circumstances, to be successful small holders must work shoulder to shoulder and co-operate.

Organisation and co-operation are of vital importance. Anyone acquainted with agriculture, especially with fruit-growing, knows that this involves many difficulties, especially to the naturally self-reliant Britisher, who is probably less easily shepherded than men of other nationalities. In this direction we have lessons to

FIG. 153.—PEONIA JAPONICA.

1, Flower. 2, Utricle carpel with withered stamens and persistent sepals. 3, Flower—some of petals removed to show stamens and carpels. 4, Stamens ($\times 4\frac{1}{2}$). 5, Stamens with anthers maturing ($\times 6\frac{1}{2}$).

object in saving, and by so doing lessen the emigration of the best farm hands into the towns, and to give an opportunity to the country born man to return to country life.

During the latter half of the 19th century many and varied labour-saving inventions in agricultural machinery had the effect of adding field to field and farm to farm in order to secure greater economy in working. In the 20th century, however, one hears more of cultivating small areas well than of farming large tracts of land with insufficient capital.

The price received for produce is, however, the crux of farming, and since the most favoured parts of the world each supply the several products of the farm prices have been effected adversely. It is quite easy in England to spend so much on labour and manure, feeding stuffs, &c., in producing either crop or animal, that the crop or animal does not equal in value

learn from Ireland and Denmark. In order to buy cheaply, ready money must be available. A small holder must start with sufficient capital. English agriculture is not sufficiently remunerative to pay interest on borrowed capital; therefore, in order to save the small holder from possible ruin when in a tight corner, it is very desirable that Credit Banks should be established, copying the best points of those of Germany, the system of which is excellent, since the loan made to a man is based on his character and guaranteed by those who know him. If the small holder is to succeed in England, "not a stone must be left unturned," both by the small holder himself and those who have created him. Among the benefits co-operation may give are the following:—

1. The formation of associations for renting land.

2. In purchase, by making up jointly orders for manures, implements, seeds, feeding stuffs, &c.

Lecture read by Cecil H. Hooper, at the Northern Fruit Congress at Hexham.

3. In sale of produce, the collection, grading and marketing, which constitute a more difficult problem than that of purchase; the finding of new markets, especially in times of glut.

4. Loans of implements, such as corn and manure drills, rollers, horse rake, mowing and reaping machines, cart, wagon, potato digger, spraying machines (for spraying potatoes and fruit trees), and also tools rarely required, at a small charge.

5. Improvement of live stock by good sires, such as bull, boar, male goat; sittings of eggs.

6. Joint erection of shed and apparatus near station for cooling milk before putting on rail; the establishment of a cheese and butter factory, possibly a bacon factory in a dairying district, a central packing shed for grading fruit and vegetables in a fruit-farming district, &c.

7. Insurance of workpeople on small holdings against accident, as also insurance of cows and horses, &c.

8. Check on reliability of salesmen and other buyers.

9. Credit banks.

10. Union to get the best possible treatment from the railways, at least as good as their terms to the foreigner.

11. Advice and education on agricultural subjects, for example, as to best manures to use for certain crops, in order to avoid buying extravagant, unsuitable or fraudulent manures, and the same with regard to foods for animals and poultry; also as to seeds and varieties most likely to be successful. There might be a model small holding in each county, upon the management of which all questions should be answered, especially as to expenses and returns; or a prize might be offered for the best managed small holding in the county, due regard being had to its receipts and expenditure. The association of small holders should keep in close touch with their local agricultural college and experimental station; visit it and ply the instructors with questions. I am sure all the agricultural colleges would take special interest in helping small holders, and provide short courses of instruction for them, the expenses of which might well be paid by the County Councils.

The Board of Agriculture provides in its leaflets, which are free, some of the best information available on nearly all subjects that a small holder deals with, and small holders should obtain copies of those dealing with the management of animals and poultry, and their diseases; with crops, their manuring, cultivation, insect pests and fungoid diseases; construction of cow-sheds, &c.

The small holder with garden, orchard, poultry, goat or cow and pigs should provide nearly all the necessary food for his family, and his frugal wife and daughters should be able to prepare it in an appetising manner.

Land and situation.—The soil for a small holding on which crops are to be grown needs to be good. If for market-gardening, plenty of stable manure must be available; if for soft fruit, the land should be within easy distance of a town or railway; so it is not by any means any land that would make a good basis for small holdings. These requirements do not apply so much to a pastoral holding; but with the latter it is desirable that it should be near farms where the man can get work when his own place does not require his labour.

Tenure.—(1) It is probable that everyone in principle would like to see the small holder a freeholder of the property he farms; this, however, involves a larger capital than if he rents, and the small holder usually will need all his available capital to work his holding, and, if purchased, the probability would be that the holding would be mortgaged; even in Canada many of the farms are mortgaged, and the mortgagee often has a heart of stone.

(2) On the other hand, it is advisable for the tenant to have a proper agreement with his landlord in order to assure himself of security of tenure.

(3) Under the County Council there would be fair rent, secure tenure, and compensation for improvements, but the rent must be paid promptly. The leniency and generosity of the private landowner cannot be expected from the Council.

(4) Experts consider Land Renting Associations

will be the best system, provided the County Council satisfies itself that they are financially sound, since such associations relieve the County Council of the sub-division of land and the selection of the tenants, all the members being responsible for the proper cultivation of the land and the punctual payment of rents, and these men having co-operated to obtain the land are more readily organised for purchasing their requirements and selling their produce jointly.

Railways.—I hope the northern railways are fairer to the farmers than those of Kent, which, whilst doing the Continental produce traffic extremely well, allow the fruit-growers on their lines to suffer very seriously from late delivery into market and rough handling of their fruit by the porters. The owners' risk consign-ment contract is a great injustice to growers, making the railways exempt as to delivering the fruit in the right quantity, proper condition or proper time, the joint railways now refusing all claims for compensation except, apparently, in a few cases where complaints are made by large senders. In the district in which I farmed, on account of this bitter experience large and small fruit growers send their fruit mainly by van or motor 15 miles to the London markets rather than suffer this treatment, the small growers getting other growers or contractors to take their produce up. Anyone will agree that the principle of bulking produce is right, but it needs a good deal of management. In the Swanley district the growers, after much work, got the Post Office telegraphic established, but the railway, to our disappointment, would not connect with it. If the four-ton rate is admitted as reasonable, the rates for small quantities seem to me to be quite out of proportion to labour in loading, handling, etc. However, bulking produce to reduce the cost of freight must certainly be done to the utmost by small holders, and in such things as Potatoes, green Gooseberries, Apples, &c., they should be able to take advantage of it. It will, therefore, be necessary, that small holders who propose to combine, should choose the same varieties of produce to grow.

I regret that I have not yet visited small holdings in the north of England. However, a few words about some of those in Kent may be of interest. Two years ago I had the pleasure of visiting and reporting on a considerable number. Most of these were between 10 and 20 acres in area with a good cottage and necessary buildings for the varying class of farming. The holdings seemed to group themselves into the four following classes, viz:—

1. Entirely grass—save a garden large enough for vegetables for family.

2. Market-garden, growing vegetables (and perhaps fruit) for a neighbouring town.

3. Fruit plantations or orchards, from which the fruit was sent by rail to a salesman in a London market.

4. Those which, situated near a common, have the right of pasturage.

It was a privilege to meet these hard working, self-reliant men, who told both of their successes and difficulties in their work. Some of them, in addition to work on their holdings, did outside work, such as thatching, hop drying, shearing, pruning, cartage work, woodcutting (buying an acre or two of underwood to cut during the winter), or fruit-buying. One was away during the winter time pruning in the Midland counties, another having grass land travelled in spring time with a stallion, which he kept and worked on his holding during the rest of the year.

It seemed to me that the man with a grass holding and garden just large enough to supply his family (say one-eighth acre) was freest from anxiety, since he worked regularly on a neighbouring farm, looking after his cow, sheep, pigs and poultry before and after work hours; his wife and family helped during the daytime, his grass was cut with a machine by a neighbour, his wife and family turning and tossing, raking and cooking the hay, and, when ready to cart, the small holders took a day off, hiring a horse and cart, and, with the help of one or two men, got the hay carted and stacked, each doing the thatching in his spare time. During the winter such a man takes another day off, hires a horse and cart, and carts out the farmyard manure to the grass land from which he has previously taken the hay.

The vegetable grower works almost entirely on

his own land, his wife and boy with van and pony selling the produce from house to house in the neighbouring town or seaside resort. With vegetables there is such a large difference in prices between wholesale and retail that a small holder would probably grow at a loss if he sent his produce by rail to a salesman.

I would like to quote two examples of small fruit-growers near Maidstone sending their produce by rail to a salesman in London. One had old fruit plantations (say, from 30 to 40 years planted), but unfortunately the varieties were old and inferior, though the cultivation was good. He showed me carefully-kept accounts of receipts and expenditure over several years; some years showed a profit, other years a loss, the total showing only a small average profit. This occupier was a foreman of large plantations near, so did not work in his own plantations, though his son worked there regularly.

The other example is that of a man who grabbed an acre of woodland, and afterwards paid £1 rent, planted the land with Apple and Nut trees, Currants, Raspberries, &c. He worked on a farm near, working his fruit land in his spare time, sometimes taking time off, sometimes employing other men. It was rather weedy when I saw it, but it looked as if it had been fairly well treated generally. The result of this man's plantation, he confessed, had been a pleasure to himself and his family; it had occupied his spare time, and perhaps kept him from the public-house, but had not helped him much financially. The difference between the small grower and the large grower is that the large grower is able to hoe, prune and dig at the right time by setting on a sufficient number of men, whilst the small grower has to wait till he has the opportunity, and is consequently usually behindhand, and does little or nothing to protect his fruit from insect and fungus attack.

I agree that these examples are not indicative of brilliant success, but if there were more combination between both small and large growers we should be better off. There are many good examples of small fruit holdings on Lord Mount Edgcumbe's estate on the banks of the river Tamar, which divides Devon from Cornwall. Here the slope of land enables the tenants to grow early Strawberries as well as other fruits. In Hampshire also there are many Strawberry growers with small holdings. In both cases the climate favours them. There are also excellent fruit holdings and excellent holders at Evesham and Pershore in Worcestershire.

I think that a good form of small fruit holding would be for a landlord to plant on suitable land, say, five acres of bush Apples, tend them for five years, then erect an inexpensive though well-built wooden cottage (with brick foundation, such as one sees in Canada), and let to a tenant who would cultivate and tend the holding well.

In the case of men in the neighbourhood of a common having free pasturage, this seems to be a great advantage and gives a man the opportunity of gradually increasing his holding.

It seems desirable that small holders should be near together, if co-operation is to help, and that they to some extent work on the same lines and agree to grow to some extent the same varieties, say, of Potatoes, Apples, &c.

Small holdings should undoubtedly be encouraged, but in order for the men to be successful the land needs to be carefully chosen, and some authority needs to guide them and encourage them to work unitedly for their common good. I conclude by quoting the opinion of Sir John Lawes and Sir Henry Gilbert: "Although to establish a large number of the population of the land in small holdings would not only be very costly, but would only to a limited extent, and under favourable conditions, be attended with success, it is nevertheless very desirable that the sale and purchase of land should be rendered as cheap and easy as possible. Further, it would doubtless be for the benefit of the country that the owner of landed property should be absolute owner, with power to sell, or lease, or will it to whomsoever he pleases, and that his successors should have the same power as himself. It would, in fact, be desirable to remove all restrictions to the transfer of land, and to its acquisition on equitable terms, so that there should be no artificial obstacles in the way of the small holder, who would then succeed if the conditions were suitable, but not otherwise."

NOTICES OF BOOKS.

PLANT LIFE IN SWITZERLAND.*

THE books on Alpines show no signs of a diminished birth rate, and books are rather apt to resemble populations in their conformation to the general rule of averages. There are a few—very few—really good books, a sprinkling of bad ones, and large intermediate classes that, like the Laodiceans, are neither good nor bad. It is, of course, inherently probable that any fresh arrival will be found to belong to the common crowd. We find this expectation verified in the volume before us. Mr. Arber has endeavoured, it is true, to break out into a fresh track, but he does not appear to us to have been very successful. Apparently, he did not set out with the idea of "giving any aid towards ascertaining the names of Alpine plants"; he says so in his preface. His aim is indeed somewhat nebulous, viz., to "draw attention to some points of botanical interest among the better known members of the Alpine flora of Switzerland."

On turning to the letterpress, however, one is continually meeting with passages which, to any body unfamiliar with the flowers, can have but little interest, e.g., in the pages devoted to Androsaceæ, or the Buttercups. There is some information about the mechanism of cross-pollination in many of the plants, but we can hardly imagine that anyone, not already familiar with the plants, could utilise it, while to those who do possess some botanical and floristic knowledge, the treatment will perhaps appear somewhat perfunctory. The excursions into parthenogenesis and such like matters are either not extensive enough or they are superfluous, and we are not impressed by the chapter dealing with the supposed origin and relationship of the flora as a whole.

In fact, we confess to a feeling of disappointment. There is either too much or too little, and opportunities of really interesting the reader are too often missed. Thus a comparison of the different kinds of fruit in the Geums, especially in relation to means of dispersal in their natural habitats, will readily occur to anyone familiar with the Alpine flora as an example of what is here meant.

Nevertheless, the book is by no means wholly without merit. It is even probable that some will find it interesting, and certainly the admirable photographs of the actual plants provide a distinctly attractive feature. But why have the publishers used such thick paper? A book of this kind is most serviceable when it can be taken out on a ramble, but *Plant Life* is too thick for the pocket, and the rucksack is meant for other things.

ALPINE FLOWERS FOR ROCK GARDENS.†

THIS is in some respects a curious book. In the earlier pages an odd prominence is given to De Vries as a supposed authority on what one might call the botanical aspect of Alpines. There are extended references to other authors which, as we think, serve to swell unnecessarily the size of a rather unduly bulky volume. Moreover, Mr. Wright seems sometimes hardly to be speaking from first-hand experience, e.g., in perpetuating the fable about the Edelweiss. It is true he does not write about the inaccessible crags so dear to the heart of the stay-at-home journalist, but one would hardly gather that the plant is perhaps most frequently to be gathered among the grass of the higher levels. The reference to the rich flora of the Glyders of Camarvonshire (p. 61) is rather misleading. The "stone-strown surface" is not the rich side—indeed it is very poor—and the interesting flora is practically confined to a few calcareous rocks which for the most part project northwards from the Glyders themselves.

Sensible remarks are made on the construction

of rockeries and on the choice of stones, but many readers might criticise the chapter on the score of its brevity.

There are considerable lists of plants suitable for the rock garden but if we felt inclined to find fault with the author it would be on account of the omission of many "good" plants, and the inclusion of much "rubbish." Indeed, the whole book might be greatly improved.

A very attractive feature of Mr. Wright's book lies in the illustrations, which consist partly of reproductions of excellent photographs of rock-gardens, natural and artificial, and partly (or rather mainly) of coloured pictures which are unusually successful. Indeed the book is well worth having for the sake of the latter alone. The colours are vivid and reproduce, especially by artificial light, the character of Alpines better than most attempts we have seen. They naturally vary in quality, and sometimes the tint is hardly correct, e.g., that of *Primula farinosa* on p. 100, but this will not surprise anyone who is familiar with the difficulties that stand in the way of adequately reproducing the colours of

finest specimen of this beautiful Noisette I have ever seen was grown under glass by my friend Mr. David A. McClew, Factor on the Logan Estates, at Chapel Rossan, in this parish. It seldom had fewer, during the flowering season, than several hundred contemporaneous blooms. Miss Alice de Rothschild, which has just been distributed by Messrs. A. Dickson & Sons, appears to be a Rose of great beauty, and is manifestly regarded by them as a hardy Marechal Niel, with the colour and delicate aroma of that variety. If so, it can hardly fail to prove itself an important acquisition. *Le Progrès* is one of the finest yellow Roses I have had in my garden for many years. Its complexion is a very rich shade of nankeen yellow, sometimes suffused with apricot. It is one of the finest of the many fine Roses, for which we are indebted to M. Pernet Ducher. Another admirable yellow variety is *Medea*, raised many years ago by Messrs. Wm. Paul & Sons. When cultivated under favourable conditions of soil and atmosphere, this is truly a magnificent Rose. Here it flowers very late in the autumn, and at the present period—the beginning of November—it is

FIG. 154.—KALMIA LATIFOLIA IN THE ARNOLD ARBORETUM.

(See p. 332.)

flowers, as judged by the eye. The publishers are to be congratulated on the excellence with which they have carried out their part of a work which deserves to meet with kindly recognition at the hands of the public. J. B. F.

THE ROSARY.

YELLOW ROSES.

THE number of notable Roses of this special colour entirely suitable for garden cultivation is somewhat confined. It is especially to be regretted that the grandest variety of them all, the incomparable Marechal Niel, is only adapted, by reason of its sensitiveness to atmospheric influences, for conservatory culture. I have several times given it a fair trial in my garden on a sheltered south wall (perhaps not sufficiently warm for its requirements) with indifferent success. The

still in bloom. *Mme. Ravary* (Pernet Ducher, 1900) is a handsome orange-yellow variety of medium size, whose colour is occasionally highly distinctive. Harry Kirk, a very notable Newtownards' introduction, is sulphur-yellow in colour, of almost perfect form, and very effective. I was very much impressed with the beauty of this lovely Irish Rose when I saw it quite recently—towards the end of October—in the new nurseries of Messrs. Dobbie & Co., near Edinburgh. It gave me a new conception of the value of this variety for decorative purposes.

Cloth of Gold now exists for the most part in conservatory catalogues; I fear it is seldom cultivated even in the conservatory. Of infinitely greater value to the ordinary cultivator are *Gloire de Dijon*, and its more refined derivatives, *Mme. Gerard* (supposed to be a hybrid between *Gloire de Dijon* and *General Jacqueminot*), *Reve d'Or*, and *Bouquet d'Or*. *David R. Williamson*.

THE ARNOLD ARBORETUM.*

(Concluded from page 351.)

Such conifers and flowering evergreens as are hardy thrive exceedingly well. One of the great annual displays of the Arnold Arboretum is made by *Kalmia latifolia*. When I landed in Boston, on June 16, this shrub was in its full beauty both here and in the grounds of Professor Sargent's residence at Holm Lea. In the Arnold Arboretum it covers a sloping bank at the northern base of Hemlock Hill, forming an irregularly-disposed mass, perhaps 200 yards in length and 10 to 20 yards wide. There is considerable variety in the size and depth of shade of the blossom, and in the density of the flowers in the truss. With the dark masses of Hemlock in the background, the whole made a

separated from the next by a grass walk. The shrubs are brought together in their respective genera and Natural Orders, and there is only a single row of plants down the centre of the border. This allows each plant to stand on its own ground, without interference from its neighbour, and the convenience of the student is further aided by each specimen having a label on either side. The general idea is somewhat similar to that of the arrangement of the herbaceous plants at Kew. Considered as part of the landscape, this system is not beautiful, especially in the early stages, when the plants are not fully grown, and bare spaces yet await their destined occupants. But for purposes of botanical study, no other arrangement is so convenient.

The collections of trees are, of course, spread over the Arboretum generally, the rather

labour, but, during the course of it, he and his co-workers have been able to introduce to cultivation many new, very distinct, and beautiful species. A number of dwarf, bushy species are of particular interest to planters, because their low, almost shrubby habit makes them suitable for places where the older Thorns, from considerations of space, could not previously be grown. About 15 acres on the eastern slope of Peter's Hill have been devoted to the type collection of American Thorns. The plants have been raised from the type trees of each species, and every plant has its place defined on a plan of the site, so that, in case of loss of label, its identity would be recoverable. From 10 to 20 years must elapse before this collection reaches its best, but it will eventually constitute probably the most remarkable assemblage of members of a single genus in the world.

It was too late in the season to see the flowering of the rich and well-grown collection of garden varieties of Lilac (see fig. 155), but *Syringa japonica*, the noblest of the genus, and a tree here over 30 feet high, was very striking in the profusion of its large, pyramidal panicles of white blossom. Even with us it is a very useful small tree, because of its late flowering, but it is one of the instances already alluded to where North Asiatic deciduous trees thrive much better in places where the summers are hotter than ours.

One of the great annual displays of blossom in the Arboretum is made by *Rhododendron Kampeferi* (see fig. 156), a Japanese ally of *R. indicum*, but very hardy, introduced by Professor Sargent less than 20 years ago. This and most of the other Azaleas were past before my visit, but I was fortunate to find *A. arborescens*—an Azalea native of the Eastern United States—fully in flower. Its flowers are white, with long red stamens, and its charm is heightened by a most gracious perfume. It is curious that it is scarcely known in British gardens.

WHAT THE ARBORETUM HAS DONE.

From what has been said it will have been gathered that the Arnold Arboretum is filling a very important part in the advancement of arboriculture in North America and Europe. Being in one respect part of the park system of Boston, it provides a very beautiful place of resort for the people of that city. It provides also many lessons in landscape art, for there is evidence that every aspect of the grounds has been the subject of careful study in that respect. While the scientific side of the establishment necessarily dominates all others, the natural beauties of the site have not only been preserved but greatly enhanced.

Considered from the practical side, as apart from pure botany, perhaps the most notable work it has done has been the popularisation and dissemination of American trees and shrubs. Before its foundation, American gardens appear to have mainly depended for their ornamentation on plants of European origin. As an instance, I was told that, 30 to 40 years ago, one could not have purchased 150 American Oaks in American nurseries. The flora of the East United States has given an extraordinary number of beautiful trees and shrubs to English gardens, and in the latter half of the 18th century and the beginning of the 19th, their introduction and cultivation was the chief interest of the most ardent horticulturists of the period. Many of the shrubs then introduced disappeared in course of time, and the Arnold Arboretum has done much good work in re-introducing them. Such shrubs as *Vaccinium hirsutum*, *Rhododendron arborescens*, *Gaylussacia brachycera*, *Kalmia cuneata*, and *Fothergilla major*, are a sample of the many delightful plants which have in this way been restored to us. Many quite new species have also been introduced to cultivation, whilst others,

FIG. 155.—GARDEN VARIETIES OF LILAC (*SYRINGA VULGARIS*) IN ARNOLD ARBORETUM.

picture of exceeding beauty (see fig. 154). No European visitor in the neighbourhood of Boston in mid-June should miss the sight of this splendid bank of *Kalmia*. Its beauty, both in Professor Sargent's garden and in the Arnold Arboretum, would seem to show that this shrub, although long introduced and well known, has either been neglected in Britain, or that our climate generally is not so well adapted for it as it is for most evergreens. It would appear, however, that the former is the case, as there are some very fine specimens in the South of England.

The botanical collection of shrubby plants is arranged in a series of long parallel borders, each border being about 8 or 10 feet wide, and

Natural Orders (in the Bentham and Hooker sense) being planted at the eastern portion of the grounds near the Museum. A special consideration is paid to American trees that reach timber-producing size. With these, the system is to plant (first) a number of specimens in a group close enough to develop trunks instead of side branches, and thus show their timber value; and (second) a single specimen at a distance of not less than 100 feet from its companion group. This is to show its value as an isolated tree for gardens and parks.

AMERICAN THORNS.

One of Professor Sargent's great tasks for some years past has been the elucidation of the North American *Crataegi*. It has involved an enormous

* Mr. W. J. Bean, in the *Kew Bulletin*, No. 8, 1910.

long known but rare, have been made more plentiful.

Next to the woody vegetation of his own country, Professor Sargent has given most attention to that of Northern Asia. He himself has enriched American and European gardens with numerous trees and shrubs collected in Japan in the early 'nineties. It would need too much space to enumerate half the things introduced through him and the institution he controls; but amongst them the following are especially noteworthy:—*Syringa japonica* and *S. pekinensis*, *Cercidiphyllum japonicum*, *Phellodendron sachalinense*, *Rhus trichocarpa*, the typical *Prunus triloba*, *P. Sargentii*, and *P. subhirtella*, the Oaks mentioned above, *Picea Glehnii*, *Betula Maximowiczii*, and *Rhododendron Kampeferi*.

the numerous qualities that are needed to make the perfect director of a large public garden, there are three that stand out as peculiarly essential. As a matter of course, he should have great scientific attainments, and in these days he needs also a keen perception of landscape beauty; finally, he must possess the business faculty. To few have these attributes been given in so full a degree as to Professor Sargent. No one has done a tithe as much for the advancement of knowledge in regard to North American trees and shrubs, and, although now in advanced middle age, he still retains an untiring mental and physical energy. A great traveller, he has seen all but a few of the North American trees growing in their natural haunts. He has also introduced many valuable North Asiatic trees to

whose ten volumes are a mine of reliable information, especially in regard to trees and shrubs. In 1894 was published the *Forest Flora of Japan*, the outcome of Professor Sargent's travels in Japan a year or two previously.

His greatest work, however, and the one on which his literary fame will most endure, is the *Silva of North America*, a magnificent work in quarto of 14 volumes, giving one or more portraits, a description, and much historical and other information about every tree of timber-producing size in North America, exclusive of Mexico. A very successful work is the *Manual of the Trees of North America*, to some extent an abridgment of the *Silva*.

At the present time there is being issued at intervals a quarto publication called *Trees and*

FIG. 156. —RHODODENDRON (AZALEA) KAMPEFFERI IN THE ARNOLD ARBORETUM.

On behalf of the institution in its relationship to Harvard University, two collectors, Messrs. Wilson and Purdon, are now travelling in China, and the former had previously spent two or three years there in the same work.

Whilst my object has been to indicate as briefly as possible what the Arnold Arboretum is and what it does, and to show that it is an institution which Harvard University and the City of Boston in particular, and the United States in general, have every reason to cherish and be proud of, I should not conclude without a few words in appreciation of the remarkable man who has made it, to whom it owes its splendid efficiency, and on whom its continued existence as a scientific institution has largely depended. Among

America and thence to Europe. Free from the common craze of the collector for exclusive possession, his desire is that the plants he introduces should become widely diffused in gardens, and the limits of his generosity appear to be set only by the possession of a single plant of a kind.

The literary work of Professor Sargent commenced with the publication of the ninth volume of the *Tenth Census of the United States*, which contained a catalogue of the forest trees of North America, amplified by various particulars in regard to habitat, uses, sizes, &c. From 1888 to 1897 he published a weekly journal devoted to forestry and horticulture—*Garden and Forest*—which was probably too much in advance of its period in America to be a financial success, but

Shrubs, giving illustrations and descriptions of new or little-known ligneous plants. Since the publication of the *Silva*, however, the most laborious undertaking under the auspices of Professor Sargent and the Arnold Arboretum is a complete *Bibliography of the Trees and Shrubs of the World* up to 1900, which is now in the hands of the printer. This work will consist of four quarto volumes, and will run to 4,000 pages. It gives all references to the published literature of any value, in all languages, dealing with the woody plants of the globe. By its means the student will be furnished with a complete guide to all the authoritative printed information about any known tree or shrub up to the beginning of the present century.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

WISLEY TRIALS.—A special Sub-committee of the Fruit Committee of the Royal Horticultural Society visited Wisley on October 13 and recommended Awards of Merit to the following, which were confirmed by the Council at its meeting on Tuesday, October 25:—Apple: Hounslow Wonder, from Messrs. Spooner & Sons, Hounslow; Peach: Salway, from the Duke of Richmond, Goodwood. W. Wilks, Secretary.

R.H.S. FRUIT SHOW (see p. 354).—*F.R.H.S.* has good grounds for his remarks. I am certain that the county classes would be entered more largely if gardeners were certain that the rules would be strictly adhered to. The judges are not to blame, but the Council should instruct them to decide whether the fruits have been grown in the open or under fruit cases, or in orchard houses. It states clearly in the schedule "the fruit must be grown entirely outside." Such judges as are appointed should know that varieties of Pears like Marie Benoist, Beurre Diel, Emile d'Heyst, and Charles Ernest cannot be had entirely from the open by the middle of October to such perfection, except in Southern counties. In such a season as the past, it certainly cannot be achieved in Midland and Northern counties. I noticed in one or two instances in the single dish classes for Pears that the 1st prize was awarded for ripeness more so than for quality. This does not give exhibitors from the more Northern counties a fair chance. If the Society wishes to obtain greater competition from the Northern and Midland counties, they must make examples of those competitors who show fruits from indoors when the schedule requires fruits grown in the open. W. T.

EQUAL PRIZES.—I have read with interest the remarks of the several correspondents on this subject. I have judged at many shows, and on more than one occasion I have agreed with my colleagues to award equal 1st prizes. Where two exhibits are so close in point of merit that there is only one point (or half a point as some put it) between them, the fairest way is to add together the value of the 1st and 2nd prizes and divide the amount equally between the two exhibitors. It should be stated on the two prize cards that the exhibits have been considered of equal merit, and that the 1st and 2nd prizes are given them. A. J. L., Wyfold Court Gardens.

W. S. Gilbert, in one of his humorous plays, speaks of making "the punishment fit the crime." Why not make the reward fit the exhibit? How can there be any degree of fitness in giving a pointed collection of 127½ points 12, and one of 127 points 8? There is no sense of justice in such an arrangement. Were all sums of money offered in classes pooled, that is to say, if £20 were the allotted sum for three or four prizes in a class, and the awards of sums as prizes made in proportion to the numbers of points given to each exhibit in the class, full justice would be done. If two exhibits were found to be equal in number of points each would receive the same sum. It is often said that the high value of the first prize creates competition, but on the contrary, the too-common relative smallness of the other prizes restricts competition. Did exhibitors understand that in all cases of pointed collections their exhibits would obtain prizes in exact accordance with the merits of each exhibit, they would be much more likely to compete. Of course, the number of prizes awarded in each class would be stated, as is now the case. A. D.

SAXIFRAGA FLORULENTA.—I am glad to see that Mr. Milne-Redhead, in your issue of November 5, comments (p. 340) on Mr. Farrer's remarks re *S. florulenta* in the previous issue. It is seven years since the last *Kew Handlist* was published,

and they will doubtless shortly issue another edition. With regard to Mr. Farrer's remarks respecting *S. lingulata* and *S. lantoscana*, the Kew authorities evidently consider *lantoscana* only a variety of *S. lingulata*, and it is a question as to whom we are all to go for an authority on these matters. We may all have private opinions on these vexed questions of nomenclature, but if everyone asserts his own particular opinion as the infallible one, where shall we all be? Even Kew must occasionally (and would be ready to admit it) be ready to alter their opinion, but it seems to me that Kew should be the final authority on these things; otherwise the confusion will be intolerable. We ought surely all to abide by their decision. So far as private opinion goes in this particular case, Mons. Correyon agrees with Kew as opposed to Mr. Farrer in that *S. lantoscana* is only a local variety of *S. lingulata*, and found, as Mr. Farrer says, only in the valley of Lantosque. It is worth noting, however, that the plants which Mons. Correyon and Mr. Sunderman send out under the name *lantoscana* are totally different; that of Mons. Correyon answering the description of the plant Mr. Farrer mentions as having a lot of Aizoon blood in it, and, with all deference to Mons. Correyon's opinion, it always seems to me that his plant must be a natural hybrid of Aizoon and *lingulata*, or, more likely still, Aizoon and cochlearis. The plant that is called *lantoscana* at Kew and Glasnevin is the same as supplied by Mr. Sunderman, and has been grown there under that name for many years. To my knowledge, the true *S. lingulata* has been grown at Kew, and also at St. John's College Gardens, Oxford, for over ten years, but doubtless inferior forms are supplied for it by nurserymen. The true form is so very distinct, as so well described by Mr. Farrer (see *Gardeners' Chronicle*, October 29, p. 311). Now, as to the question of *lantoscana* being only a variety of *lingulata*, the distinctive feature of both is that they flower on one side of the stem only, and this peculiarity is not found, so far as I know, in any other species, and this would rather point to the fact that they are one and the same species. In this connection it is worth noting that Mons. Correyon's *lantoscana* lacks this peculiarity, and this fact, together with the appearance of the rosette, make my theory of its connection with Aizoon as at least a reasonable one. There is a form of *lantoscana* called "superba" (that they have at Kew, and used to have at Glasnevin, but have lost), and it only differs by being still more gloriously beautiful in having rather larger flowers more densely smothering the drooping stems. If any reader wishes to know where these are obtainable, I shall be glad to give the information required. C. B. Robinson.

IVY-LEAVED PELARGONIUMS AS STANDARDS.—Ivy-leaved Pelargoniums grown as standards are by no means so uncommon as the note from your correspondent, *Yorkshire Gardener* (p. 297), would seem to suggest. During the season just ended a sunken garden in Battersea Park which was planted with bedding varieties of *Violas* had the monotony relieved by standard plants of Ivy-leaved Pelargoniums, several varieties being represented. The effect produced was decidedly good, as the plants flowered with great freedom. Again, during a visit paid to Messrs. Veitch's nursery at Feltham in the summer, I noted a considerable number grown in this way, and was told there was now a large demand for standard plants of such things as Pelargoniums, both Ivy-leaved and zonal, Fuchsias, Heliotrope, *Plumbago capensis*, *Salvia splendens*, &c. A selection of these was shown by Messrs. Veitch at the meeting of the Royal Horticultural Society on August 16. In growing Ivy-leaved Pelargoniums as standards, it is by no means necessary to graft them, as the more vigorous kinds form a stem as quickly as the zonal varieties, provided the side branches are removed until the desired height is obtained. For this purpose some of the best are Colonel Baden Powell, Marillo, The King, The Queen, Souvenir de Charles Turner, Mrs. Hawley, Corlen's Glory, Resplendent, and Sabrina. One point to bear particularly in mind is that the leaves from their succulent character are much heavier than those of the zonal section, hence the support must be substantial. I am suggested by your correspondent is very trustworthy, for though the question of expense may be a consideration, yet one has the advantage of feeling that the plants are safe even should storms arise. W.

SENECIO GLASTIFOLIUS.—I have made some experiments as to the hardiness of the variety of *Senecio glastifolius*, which formed the subject of the supplementary illustration in the *Gardeners' Chronicle* for July 16, and it occurred to me that you might like to know the results. Specimens planted in the open border without protection of any kind grew vigorously, and under less severe conditions would probably have flowered about January. Intense cold without frost produced no ill effects, neither was damage apparent after 10° of frost, but when the thermometer fell to 15° the plants perished. Here I think is evidence that the plants will be able to survive the winter in the open in the milder parts of the country, especially if a little protection is given them. It will then prove a valuable acquisition as a border plant, especially as the flowers are very useful as cut blooms, lasting well in water and being of an uncommon colour. Harry Robinson, Welbeck Abbey, Worksop.

A MONŒCIOUS DATE PALM.—Phoenix dactylifera is, I believe, generally known as a dioecious plant, requiring the presence of specimens of both sexes to ensure the production of its valuable and luscious fruit, which forms the chief food of the Bedouin Arabs. An exception to this has, however, occurred this year in the gardens of his Highness the Khedive of Egypt, at Cairo. A fine Palm, measuring 12 metres, or over 39 feet in height, has, to the great astonishment of the French gardener, Mons. Charles Henry, produced large bunches of flowers of both sexes, of which he sent specimens to the Editor of the *Revue Horticole*, who describes them at considerable length in the number of his periodical for November 1, on pp. 192-3-4, and also gives an excellent photograph of one of the bunches in illustration of his remarks. I think this curious occurrence is well worthy of comment, and should be specially interesting to botanists. W. E. Gambleton.

LATE PEAS. It may be interesting to state that from a sowing of Sutton's Invincible Marrowfat Pea, made on June 26, I was able to pick several dishes of fine Peas during the months of October, and the last on November 2, which, I think, is rather unusual in this part of the country. No traces of mildew were to be found on the haulm, which speaks well for it being a useful late variety, as well as a good one for main crop. Vegetable Marrows and Runner Beans were untouched by frost till the night of November 2. A. Hoop, Dehale Hall Gardens, Mansfield, Notts.

POISONOUS PROPERTIES OF THUYA.—I should be obliged if any of your readers can inform me if they know of authentic cases of animals being poisoned through eating *Thuya gigantea*. In recent years, on several occasions, specimens of *Thuya gigantea* have been sent to me for naming, the sender stating that cattle had been poisoned through eating this plant. In one case a storm blew some of the branches of *Thuya gigantea* over a cemetery wall, and these branches were eaten by cattle, and some of the cattle died. E. W. Moore.

FRUIT-TREE STOCKS.—The paper on Fruit-tree Stocks (see p. 325) contains several mistakes in dates. Mascal's *New Art of Planting* dates from 1572, not 1652; Lawson's *New Orchard* 1618, not 1656; Austen's *Observations* 1631, not 1653; Evelyn's *Pomona* 1664, not 1678; Switzer's *Practical Fruit Gardener* 1727, not 1731; Hut's *Paradise* 1755 (the 3rd edition is dated 1763, not 1758). The earliest practical guide to grafting will be found in Fitzgerald's *Book of Husbandry*, in which the matter is treated in a perfectly lucid manner. "A Pear or a warden would be grafted in a pyne stocke, and if thou canst get none than graffe it in a Crabbe tree stocke and it will do well, and some men graffe them in a whyte thorne." "In some manner of Appels the Crab tree stocke is beste." In *The Country Farme* (1600) we gather that Peaches were worked on Praches, Almonds and Plums, and Pears upon Quinces. Parkinson (1629) mentions several stocks, Crabs, tree stocks and Paradise for Apples, of the latter he remarks: "Being a dwarf tree whatsoever fruit shall be grafted on it will keep the graft low like unto itselfe, and yet beare fruit reasonable well. And this is a pretty way to have Pippins Pomegranates,

or any other sort of Apples (as I have had myself, and also sown with others), &c." For Plums he preferred the "White Peare Plumme, because it groweth the goalest and freest," but he had nothing to advance against the black and red Pear Plum nor the white and red Wheat Plum. Some kinds of Nectarines were budded on Apricots, which had previously been worked on a white Pear Plum stock. Peaches were worked on several kinds of Plums. The Creeper Apple was another name for the Dutch Paradise, and grew much stronger than the French Paradise, which was used for pot-grown Apples and dwarfs. For very early noted stocks the list should therefore read thus: 1534, free stock Pear and Apple and White Thorn; 1600, Almonds, Plums, Quinces; 1629, French Paradise, White Pear, Red Wheat, and other large-leaved Plums; 1708, Muske Plum, by Mortimer; 1731, Creeper, by Miller; 1731, Dutch Paradise. But these dates are only to be taken as representing the years in which they were noted by the various authorities. Parkinson, for instance, was well acquainted with the above and other stocks long before 1629. The Creeper or Dutch Paradise must have been well known long previous to 1731, and, as Dutch Carnations superseded all others after the Revolution of 1688, it is natural to suppose that the Dutch Paradise stock would find its way to England about the same period and for the same reason that the supply from France would be stopped. It will be noticed that double working is advanced from 1655 to 1629. Miller notes the Mahaleb as a likely stock for Cherries, and he and other writers state that the Laurel was employed as a Cherry stock. *R. P. Brotherton.*

I am grateful to Mr. Brotherton for his corrections; had I had the benefit of his wide knowledge of old gardening books and his means of consulting them, it would have lightened my labours in preparing the paper. As it was, I had to do the best I could with the R.H.S. Library and that of my grandfather. The books available were not always first editions, and this is not always stated on their title pages. The only accurate dates of origin are those of the broad-leaved and Nonesuch Paradise stocks, the other dates are merely those of the books in which I found the various stocks mentioned. Since, in none of the books is any stock cited as new to horticulture, they must have been in general use some time beforehand. It would be interesting to know if the passages quoted are the same in the earlier editions. I missed Miller's reference to the Mahaleb as a likely stock for Cherries; his statement of the Laurel being used as a Cherry stock is almost as mythical as Leonard Massey's advice, "To have Cherries on many trees good for to cut into Alhallowtide ye shall graffe them upon a Willow or Sallow tree, and they shall endure unto Alhallowtide on the trees." The anonymous author of the *Fruit Gardener* (1768) says of Miller, "He is severe against the ancients, where it is evident that he had either not consulted their works or did not understand them; at the same time we find him retailing their prejudices with all the éclat of new discoveries or maxims of his own." *H. Somer Rivers.*

GENTIANA PNEUMONANTHE.—In your issue of November 5, p. 334, Mr. H. Stuart Thompson records the finding of a specimen of *Gentiana Pneumonanthe* with the white flowers having the usual green stripes, in Dorset. It may be of some interest to record that recently Admiral Carr, of Longress, Chertsey, sent me an exceedingly fine specimen of this plant with white flowers; indeed, so floriferous was it (it bore 18 almost, or quite, open flowers) that at first I could not believe it to be *G. Pneumonanthe* at all. Admiral Carr wrote: "The plant was found in Choldham Common, near this house, about two years ago, and is growing well in my garden. . . . *Gentiana Pneumonanthe* is fairly common here. . . . A plant has been raised from seed of this wild one, also white." A white-flowered form of this plant is mentioned in *De Gentiana libellus*, by Froslich, published in 1765, but I can find no mention of its occurrence in Britain in any of the florae I have been able to consult. If Admiral Carr succeeds in raising a stock of white-flowered plants, we shall be glad to thank him for adding a charming variety to these gardens where *Gentiana* of this type is so good. *Fred. J. Chittenden.*

The Week's Work.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq.,
Bardon Hill, Westwood, Yorkshire.

Plumbago rosea.—This species is one of the most attractive flowering plants to be seen in the houses at this season. It succeeds best when allowed to remain through the flowering season tastefully arranged in an intermediate stove. The atmosphere should be kept somewhat dry, and a little ventilation afforded the plants on all favourable occasions. A very charming effect is obtained if the cut flowers of *Plumbago rosea* are associated with Lily of the Valley or Roman Hyacinths and sprays of Smilax or Asparagus.

Camellia.—During the Chrysanthemum season, Camellias are frequently allowed to suffer for want of water and insufficient feeding at the roots. Give proper attention to these matters, and let the foliage receive a thorough cleansing.

The fernery.—The species of *Adiantum* are always valuable for cutting during the winter months, when their fronds are so useful for associating with cut flowers. Extreme care must be taken to keep the fronds in good condition, by preventing an excessive amount of moisture both in the atmosphere and at the roots. Under favourable conditions, several sorts of *Adiantum* will grow during the winter but the fronds produced at this season seldom possess any lasting properties. The fernery may now be afforded ventilation on favourable occasions and no moisture whatever ought to be applied after noon. Plants which have become unsightly may be cleansed of all the disfigured fronds, and should be placed in a light position in an intermediate house. Keep them somewhat dry at the roots, until the end of the year, at which time they will be ready to start into growth. As soon as growth is discernible apply waterings of soft water occasionally.

The forcing house.—Where cut flowers are in demand throughout the winter, many plants should now be put under the influence of gentle forcing. Lilies in variety are always in request at Christmas time, and these can be brought into bloom for successional flowering by placing a few plants into heat at intervals. Tulips such as *Duc van Thol* in separate colours are extremely useful for winter and early spring. *Proserpine* and *Mon Tresor* are invaluable from January onwards, and may now be brought indoors at intervals for forcing. *Narcissi* in variety are almost indispensable for this class of work; these, however, must not be forced too severely, it being advisable to keep them in a warm green house until the flower buds are in a somewhat advanced state. Care must be exercised with *Narcissi* at almost every stage of their growth or the flowerbuds will turn blind.

THE KITCHEN GARDEN.

By JOHN DESS, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Rhubarb.—Rhubarb may now be forced, with a good chance of profitable returns, provided the roots are in a fit condition when they are introduced to heat. If they are lifted and exposed to the weather for a week beforehand, they will force all the better. The Mushroom house or any covered place, where a temperature of 55° can be maintained, will answer the purpose well. At Windsor, we prefer a sunken pit, with a slight hot bed, to any other position. The hot bed is composed of leaves trodden tightly together, and over the hot bed are placed a few inches of rich soil. The roots are then put as closely together as possible, without causing them injury, and the space between the clumps is filled with finely sifted soil, made moderately firm with the hand. If the soil is moist, very little water will be necessary until growth commences, when a gentle watering may be given. *Daws's Champion* is a good variety for early forcing, and the stems have a fine, rich colour.

Globe Artichokes.—These plants should be protected from frost by placing a quantity of long litter around each clump, but taking care not to cover the plants overhead, or they will soon decay. The ground between the rows should

afterwards be dug, and a good dressing of horse droppings given to it. These plants are more frequently injured by cold, water-logged soil in winter than by frost, and they should not be planted in a low or moist position if it can be avoided.

Asparagus.—Asparagus beds may be divested of all withered stems as soon as possible. The surface of the beds should then be lightly forked over, and a few inches of the loose soil removed in order to make room for a dressing of decayed farmyard manure, after which the alleys may be dug and allowed to remain in a rough state during winter, so that the soil may be fully exposed to the influence of the weather. The preparation of ground for new beds may be taken in hand as soon as possible, and Asparagus being an important crop, a very thorough preparation should be carried out. The situation should be one exposed to the sun, but sheltered, as far as possible, from the wind, which sometimes causes severe injury to the plants in the autumn. If the land is of a light, sandy nature, the trenching need not be more than 2 feet deep; but a very liberal quantity of farmyard manure should be given, and the beds should be made as near the ground level as possible. On the contrary, if the land is stiff and cold, something more must be done before satisfactory results are obtained. The ground should be drained so that no stagnant moisture will remain about the roots, and the whole bed should be trenched 2½ feet deep. If old lime rubble is available, a quantity may be forked into the bottom of each trench as the work proceeds, and a liberal dressing of farmyard manure mixed with the soil. River sand may also be applied with advantage if the land is heavy, and, when planting takes place, the beds should be raised a few inches above the surrounding soil.

Winter salads.—The materials for forming winter salads constitute an important part of the daily supply. Every attention should be given to the blanching and protecting of Endive. The plants having been removed from the open garden to some rainproof pit, may be easily blanched by tying up each plant separately, or by covering them with clean boards 10 days before they are required for use. Lettuces in pits are more liable to suffer from dampness than Endive, and should be ventilated freely by tilting the lights whenever the state of the weather will permit. Sowings of Mustard and Cress should be made each week in boxes, or on the bed of a newly-started Peach house, covering the seeds with sheets of paper until growth commences.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS,
Aldenham House, Hertfordshire.

Lily of the Valley.—The present is a good time to plant crowns of Lily of the Valley. In many places where a border is devoted to this plant the roots are lifted annually, the largest crowns are selected for forcing, whilst the smaller ones are graded for planting, according to their sizes, and thus a good stock is maintained. For forming a plantation, choose a shady position, such as that afforded by a north wall; manure the ground liberally, and apply some decayed leaf-mould, to make the ground as light and rich as possible. The crowns should be planted just deep enough to be shallowly covered, and when this has been done a further covering of 2 inches of leaf soil may be applied.

Christmas Roses.—The beds containing *Helleborus* may now be given a good mulch of decayed farmyard manure, after thoroughly clearing them of weeds and loosening the surface of the soil with a fork. A few plants, if protected with hand-lights, will yield flowers by Christmas or early in the new year, and the quality of these will be much superior to those which flower without protection.

Salomon's Seal.—This plant is of much value for forcing, and the flowers are pretty at any time. The plant is not fastidious as to soil and position, but the roots should be planted in deeply-worked ground and a dressing of manure applied.

The Water Garden.—There is much decaying foliage that may be removed with advantage. These remarks refer to those plants situated at the water's edge, although the tall plumes of

Phragmites communis, and also the Typhas, should be allowed to remain at present, as these retain their decorative value for some considerable time. The water should be kept clear of leaves and other rubbish, and, if it is intended to replant any Nymphaeas or other aquatics, it is well to mark the positions while the growth remains, as afterwards it is often a difficult matter to locate them. Aquatics may be planted or divided at this season during periods of open weather. Plants of an herbaceous character, such as Senecios, Astilbes, Spiraeas, Polygonums, and Helianthus, that grow so luxuriantly may be given a top-dressing of good soil or manure, and any division or replanting may be carried out. The same remarks apply to Irises that thrive well in moist situations, of which *I. Kamperi*, *I. siberica* and *Pseudocacorus* are notable examples. Many other species might with advantage be given a trial, especially in open positions.

General remarks.—Most of the spring bedding arrangements will now be completed, and the beds should have the surface soil raked over. Not only does this improve their appearance but it also encourages the plants. Complete the planting of any bulbs as soon as possible. Frames containing plants of a tender nature should be well protected each evening, and watering should be done sparingly early in the day, carrying out the operation in favourable weather. Abundance of air should be given at every opportunity, but with discretion. Attend to the labelling of plants, and endeavour to label each plant as neatly and durably as possible. Bedding plants in cool houses or frames will need careful watering, and all decaying foliage should be removed. Admit all the light possible by constantly cleansing the glass.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Pruning of wall trees.—This operation being one of great importance, it should be performed by someone who has had considerable experience not only in pruning itself, but in the habits and cropping qualities of the different varieties. Apricots and Plums, but Apricots in particular, are apt to lose some of their branches without any apparent reason for the failures. In such cases the dead branches should be removed before the general pruning is begun, for it will be necessary to re-arrange the whole of the tree in order to furnish the gaps. Both kinds of fruit produce the best specimens principally on shoots formed in the previous year, but they also fruit freely on spurs. Owing to the better specimens being produced on the shoots of the previous season, it is desirable to retain a sufficient number of these growths in the tree, but a desire to save these shoots should never be encouraged to the extent of causing overcrowding of the branches. Shoots of medium strength may be left intact, but the stronger ones should be pruned to half their length. In cases of old-established trees, where the spurs have become long and unsightly, a few of the worst of these may be shortened or thinned out each year at pruning time. All spur growths of the current season should be cut back to two or three buds, and care should be taken to make the cuts very smooth; therefore, a knife with a keen edge should be employed for the purpose. Sweet Cherries require similar treatment to that I have already described.

Apples, Pears and Plums.—When these fruits are grown as bush and pyramidal trees they should have the extension shoots pruned to within 9 or 10 inches of their origin, cutting back all other shoots to within two buds of the base. Allow the main branches plenty of room and avoid overcrowding the smaller shoots. Old-established trees with greatly-expanded and over-numerous spurs may be treated as I have advised for Apricots and Plums, shortening or thinning out a portion of the spurs this season and a few more next year. It must always be remembered that certain varieties of Apples and Pears form their flower-buds at the ends of the shoots. Amongst Apples of this type may be instanced Irish Peach, Mr. Gladstone, Yorkshire Beauty, Bismarck, and Worcester Pearmain. Such varieties should never be subjected to what is known as summer pruning. In the case of orchard trees it is advisable to lock them over every

second year, removing any branches that cross other branches and cutting out any which are weak or useless. Endeavour to keep the centre of each tree open, so that all the shoots will be exposed to the influences of light and air.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Bollea and Zygopetalum.—Plants of the Bollea section of the genus *Zygopetalum*, as *Bollea celestis*, *B. Lalindii*, *Pescatorea Klaboehorum*, *P. cerina*, *P. Lehmannii*, *P. Dayana*, *P. Roezlii*, *Huntleya meleacris*, *H. albida*, *W. Wailesiana*, *Batemanna Burtii*, *B. Colleyi*, the hybrid *Bollea-Chondrorhyncha* *Frebeliana*, *Chondrorhyncha fimbriata* and *C. Chestertoni* are growing freely and pushing forth roots into the compost. As the night temperatures are getting low in the cool intermediate house, the plants should be removed to a cool part of the Cattleya house for the winter. Whilst these plants do not succeed in low temperatures, neither do they thrive if the heat is more than they require, especially in winter. At Burford, they do best in a temperature varying between 55° and 60°, and in a position well up to the roof glass, but where they are not exposed to the least sunshine, even in winter. The atmosphere surrounding them should be kept constantly saturated, and the Sphagnum-moss on the surface of the pots sufficiently moist to keep it fresh and green. The foliage should be sprayed lightly overhead several times a day with tepid rain water. In spite of all this dampness a small species of red spider will often attack the undersides of the leaves, and the pest must be quickly eradicated by the use of the sponge. Any plants in need of fresh rooting material, or larger receptacles, may now be given attention: the pots or pans should be drained to about three parts of their depth, and they should be rather large in comparison to the sizes of the plants. The compost may consist of three-parts Sphagnum-moss to one of *Osmunda* fibre, cut up moderately fine, and plenty of small crocks mixed with them to assist the drainage. In potting, press the materials just sufficiently to make the plants firm, and keep plenty of the living heads of the Sphagnum on the surface. The rare *B. Lindenii*, now in flower, thrives well in the intermediate house the whole year round, in a position under the shade of large *Sobralias* and tall-growing *Epidendrums*. Plants of *Cattleya labiata*, *C. Bowringiana*, *C. Dowiana*, and its variety *aurca*, as they pass out of bloom, should be placed in the coolest and best ventilated part of the Cattleya house for their long period of rest. See that the old flower sheaths are cut off close down to the apex of the pseudo-bulb, as sometimes moisture accumulates at the base of the sheaths, and frequently the plant is lost from this cause. Sometimes disease is caused by affording the plants too much water at the root when the flowers are pushing up through the sheath, the extra water being given with the idea of getting better flowers; but the ill-effects occur soon after flowering; and when the plants are at rest. From the present time water at the root is only necessary at long intervals, sufficient being applied around the edge of the compost to keep the pseudo-bulbs plump, the object being to induce root action, and yet prevent premature growth.

Cattleya and Laelia.—These remarks are also applicable to many of the hybrid *Cattleyas* and *Laelias* which bloom at this season. Plants which require repotting may be seen to as soon as roots are observed pushing from the base of the current season's growth, but if they have produced such roots while in bloom, repotting may be postponed till new growth commences. *C. Lawrenceana* should now be elevated well up to the light, and small plants suspended near to the roof glass at the warm end of the house. Afford water very cautiously, as the young breaks are apt to decay if too much is applied. Plants of *C. Trianae* having completed their growth, should be kept only just moist at the roots, but immediately the flower spikes are seen to be pushing up at the base of the sheaths, a little extra moisture will be necessary. The watering of *Cattleyas* and *Laelias* during winter is often a difficult matter to the beginner in Orchid culture; in many cases the plants are kept far too wet. On a fine, sunny morning the grower is tempted to afford the plants a good watering, and this being done, it often happens, that for many days afterwards the

weather is dull and wet, and the plants, especially specimens in large pots, do not dry in the least, and the roots and pseudo-bulbs take up far more water than they need. It is safer to keep the plants a little on the dry side.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir Ernest Cassel, G.C.B., Moulton Paddocks, Newmarket.

Late Grapes.—Late Grapes still in the vineries will require considerable attention if the fruit is to be preserved in good condition. Examine the bunches about twice each week and remove any sound berries, as a decaying and mouldy berry soon contaminates others with which it comes in contact. Maintain the temperature as near 45° as possible, keeping a gentle warmth in the water pipes to dry the atmosphere. No plants or cutting boxes which require water must be placed in the house, as the moisture thus created would prove injurious to the Grapes at this season of the year. Where lack of space compels the house to be utilised for such purposes, it is preferable to cut and bottle the Grapes, placing the bottles in a cool fruit room. If the border is partly outside, as is often the case with late vineries, some protection from heavy rains must be afforded. A few pieces of corrugated zinc, spare frame lights, or, failing these, a 2 feet thickness of leaves or loose litter will prevent saturation and keep the soil fairly warm and dry.

Early pot vines.—The house containing these may now be closed, and the young vines treated as advised in a previous Calendar. Take care that the night temperature is not allowed to exceed 45° by fire heat; during severe weather it is advisable to allow the temperature to fall a few degrees rather than have a dry, fiery atmosphere before growth has started.

Early permanent vinery.—This structure having been cleaned, and the vines pruned, as already advised, may now be closed, in order to provide a successional crop to that afforded by the pot vines. Even when both houses are started simultaneously, the pot vines will ripen their fruit first, as the roots being more confined, they respond quickly to the action of liquid manures, and the vines being raised from "eyes" every year, it is not necessary to consider the future welfare of the plants when high temperatures are desirable to hasten the ripening of the berries. The fermenting material having been mixed and allowed a short time to "sweeten," may be brought inside and placed, ridge-fashion, along the border. Turn the heap several times each week, so that it gives off a gentle heat, adding a little fresh material, and removing part of the old, as necessary, until growth is fairly advanced on the vines. When a bed of such material in a house is continually giving off a slight steam or vapour, but little syringing of the roots is required to induce the shoots to break kindly into growth, and the warmth generated renders the use of fire heat seldom necessary, therefore, much of daily damping of floors and borders is saved. Admit air freely on fine days, closing the ventilators at about midday in order to raise the temperature about 10°. Whenever mild weather prevails outdoors, a "chink" of air may be left at the top of the house over night.

Late vineries.—The vines in these houses may be pruned as soon as the wood is mature. Those houses which are to be started at the New Year ought to be pruned and cleaned without delay, cleaning and airing the houses freely for a few weeks before starting the vines in the same way as advised for Peaches in last week's Calendar. When pruning, select such shoots as are required for use in grafting or for rooting as "eyes" next season, picking out well-ripened shoots with good plump buds. Label the shoots, tie them in bundles and "heel" them in on the north side of a wall until required.

Outside borders.—Any early vineries which have the roots partly outside must be given adequate protection before the soil gets cold and soddened through heavy rains. This work ought to be done at once. A coating of leaves and fresh litter from the stables in equal proportions should be placed on the border to a depth of 18 inches or 2 feet and covered with boards or zinc to expel the rains.

Errata.—In the list of Plums given on p. 354, a comma should be placed between Kirke's and Transparent Gage.

EDITORIAL NOTICE

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Illustrations. The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, NOVEMBER 22—
Royal Hort. Soc. Coms. meet. (Lecture at 3 p.m. by Mr. Jas. Hudson, on "Plants in Congenial Positions.")
Horticultural Club Meeting.

FRIDAY, NOVEMBER 25—Aberdeen City, Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—42.6°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 16 (6 P.M.): Max. 48°; Min. 31°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, November 17 (10 A.M.): Bar. 30.1; Temp. 39°. Weather—Slight mist.

PROVINCES.—Wednesday, November 16: Max. 46 Cornwall; Min. 26 England E. coast.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—
F Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

TUESDAY—
Clearance Sale of Nursery Stock, at Lees Nursery, Feltham, by Protheroe & Morris, at 12.

WEDNESDAY—
Roses, &c., at 12.30; Palms and Plants, at 5, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.
Annual Sale of Fruit Trees, &c., at Plant Nurseries, Borough Green, Kent, by order of Mr. J. Tisdman, by Protheroe & Morris, at 11.30.

FRIDAY—
Orchids, in variety, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

All botanists will unite in congratulating Professor F. O. Bower on his award of one of the two Royal Medals conferred during the present year. The Royal Medals are awarded annually by the Sovereign, upon the recommendation of the Committee of the Royal Society, "for the two most important contributions to the advancement of natural knowledge published originally in his Majesty's dominions within a period of not more than 10 years and not less than one year within the date of the award."

Professor Bower, who was born in 1855, is the son of A. Bower, Esq., of Elmerofts, Ripon, Yorkshire, and has, as his portrait suggests, all the sturdiness and geniality of the typical Yorkshireman. After distinguishing himself at Cambridge, Bower proceeded, like many of his botanical contemporaries, to complete his scientific education under those distinguished botanists, Sachs, of Würzburg, and De Bary, the great pioneer in the scientific investigation of plant diseases, of Strassburg.

On his return to England, Bower acted first as assistant to Professor Oliver at the University College, London, and in 1882 became lecturer in botany in South Kensington, in which position he had the great advantage of serving under Huxley. Three years later, in 1885, Bower was appointed by the Crown to the Chair of Botany in Glasgow, which post he still holds. By no means an armchair or mere laboratory botanist, Professor Bower has travelled widely in America, in Ceylon, and more recently in Jamaica. As is natural with a strenuous and able a man, he has been the

recipient of many marks of distinction. Elected a Fellow of the Royal Society in 1892, he became an honorary member of the German Botanical Gesellschaft in 1907, and a corresponding member of the Bayerisch Academy in 1907.

Professor Bower's contributions to botanical science have consisted in a long series of important memoirs, all bearing upon the processes of evolution, whereby the higher plants of the present day have arisen from simple ancestors. These researches he summarised recently in a volume, reviewed in our columns (May 3, 1908), entitled *The Origin of a Land Flora*. In addition to his own contributions to botanical science, Professor Bower has rendered signal service in training men, including

subjected. One plant of this Bramble was discovered in 1898, "growing on the floor of the Taxad forest (Dacrydium forest, probably) at Inchbonny, near Lake Brunner, Westland." Some rooted pieces were brought away and cultivated under ordinary conditions at first, and then under different conditions of dryness and exposure, in order to bring it to flower, but hitherto without success. *Rubus Barkeri* is a small trailing shrub allied to *R. parvus*, but differing from this species in the possession of mostly trifoliate leaves and in certain other respects. Dr. Cockayne is unable to decide whether it is a genuine species; a hybrid—perhaps between *R. australis* and *R. parvus*—or, as seems most likely, a juvenile stage

PROFESSOR F. O. BOWER.

them with his own energy and enthusiasm, and so making sure provision for the further advancement of the science to which he has devoted his life.

A
Non-flowering
Species of
Rubus.

The common Ivy (*Hedera Helix*) and *Ficus pumila* (*F. stipulata*) are familiar instances of plants that never flower under certain conditions: but, if the conditions alter, the same individuals may flower freely. Dr. L. Cockayne describes a New Zealand Bramble (*Rubus Barkeri*) in the *Transactions of the New Zealand Institute*, vol. xlii., p. 325, which fails to produce flowers under the most diverse conditions to which it has been

of the latter. Whatever its origin may be, it is a very ornamental plant for the rock-garden, on account of the colouring of its elegant leaves, and, as it is easily propagated vegetatively, it will probably soon reach this country. This Bramble is all the more a puzzle on account of the singular and somewhat contradictory physiological phenomena presented by other New Zealand species, as observed and recorded by Dr. Cockayne. Four native species are recognised by Mr. Cheeseman in his *Handbook*. *R. australis* has polymorphic leaves and climbs to the top of the loftiest trees, whilst *R. parvus* is a trailer with branches less than 2 feet long. Concerning the other two species, indigenous to New Zealand, Dr. Cockayne says that they

behave abnormally. *R. schmidelioides* has a juvenile form, distinct from the adult, and the former, though attaining great dimensions, never flowers, whereas the juvenile form is a plant of the forest floor, the adult form of *R. schmidelioides* grows as a liane, that is, a climber over trees, and, having gained a more advantageous position with regard to the illumination, flowers abundantly. Here then the shade form is the non-flowering, and in this respect resembles *R. Barkeri*.

LÆLIO-CATTLEYA WALTER GOTT (C. BICOLOR × L.-C. BLETCHLEYENSIS).—Our illustration (fig. 158) represents this new hybrid, which is named by Messrs. SANDER & SONS after their Orchid hybridist, Mr. WALTER GOTT, who, for a considerable time, has had charge of their Orchid hybrids in the St. Albans nursery. The batch of seedlings raised from this cross showed very great variation in the size, form and colour of the flowers, one section partaking most of *C. bicolor*, with its labellum pro-

ROYAL HORTICULTURAL SOCIETY.—The fortnightly meeting of the committees will be held on Tuesday next, the 22nd inst. At the afternoon meeting, Mr. JAMES HUDSON, V.M.H., will give a lecture on "Plants in Congenial Positions."

THE KEW GUILD.—We are informed that Mr. H. COWLEY, assistant editor of *The Garden*, has been appointed secretary to the Kew Guild and editor of the *Journal* until the next annual meeting. Past Kewites are earnestly invited to assist.

FIG. 158.—LÆLIO-CATTLEYA "WALTER GOTT": SEPALS AND PETALS, APRICOT-YELLOW; LIP, REDDISH-VIOLET.

In the case of *R. cissoides* var. *cruperatus*, the opposite occurs. This plant, when growing as a shrub in the open, its leaves reduced to midribs, rarely, or probably never, flowers; but when sheltered, or when a liane in the forest, its leafy shoots bloom abundantly. That the leafy and leafless forms are one and the same species Dr. Cockayne's culture experiments have fully proved.

jected on a more or less narrow isthmus. The variety illustrated was shown by Messrs. SANDER & SONS at a meeting of the Royal Horticultural Society on November 8 last. The sepals and petals are of a clear, apricot-yellow tint, shaded with rose-pink; the front of the lip is deep reddish-violet, the light, rose-tinted side lobes being marked with purple. In this variety there is a decided suggestion of *C. Warszewiczii*, which, with *L. tenebrosa*, produced *L. C. Bletchleyensis*.

in making the *Journal* as interesting as possible by contributing short notes. All communications should be addressed to Mr. COWLEY, South Side, Kew Green, Kew.

NURSERYMAN AS MAYOR.—At the annual meeting of the Colchester Town Council, Mr. FRANK CANT, the well-known Rosarian, of the firm of Messrs. FRANK CANT & Co., was elected Mayor for the ensuing year.

NATIONAL VEGETABLE SOCIETY.—We learn that, owing to representations from many of the smaller country competitors, the National Vegetable Society has arranged to hold its next exhibition at a rather earlier date than was the case this year. It will, therefore, take place at the Royal Horticultural Hall, on August 30. The accounts ending September 30 have been audited, and a report is being prepared upon the work done by the Society during the past year. Copies of the report will be furnished to the members before the annual general meeting takes place on December 6 next. The accounts show a satisfactory balance. In regard to next year's trials, seeds have been sown at Sutton Green, and the liberal manner in which these have been supplied by the trade is much appreciated by the committee.

NATIONAL CHRYSANTHEMUM SOCIETY.—We may remind readers that the annual dinner will be held on Tuesday, November 29, in the Holborn Restaurant. The President, Sir ALBERT ROLLIT, will occupy the chair. The Secretary, Mr. RICHARD A. WITTY, 72, Savernake Road, Gospel Oak, London, will be pleased to hear from those intending to be present.

CHRYSANTHEMUM CONFERENCE.—The National Chrysanthemum Society will hold a conference at Essex Hall, on December 5. The conference will be divided into two sessions, afternoon and evening, when the following papers will be delivered:—Afternoon Session: Chairman, Sir ALBERT ROLLIT, LL.D., D.C.L. (President of the Society); 3 p.m., paper by Mr. NORMAN DAVIS entitled, "The Culture of Japanese Chrysanthemums for Exhibition"; 4 p.m., paper by Mr. W. HIGGS entitled, "The Culture of Incurved Chrysanthemums for Exhibition." Evening Session: Chairman, Mr. THOMAS BEVAN (Chairman of the Executive Committee); 6.30 p.m., two short papers by Mr. H. J. JONES and Mr. R. F. FELTON on the "Methods of Exhibiting Japanese and Incurved Chrysanthemums," and "The Use of Large Blooms in Floral Decoration," respectively; 7.30 p.m., paper by Mr. THOS. STEVENSON entitled, "Late Struck Japanese Chrysanthemums for Exhibition." From 3 p.m. to 9 p.m. an exhibition will be held in the large hall. The proceedings of the conference will be concluded about 8.30 p.m., so there will be an opportunity for members who may arrive late to inspect the exhibits between 8.30 p.m. and 9 p.m.

BIRMINGHAM CHRYSANTHEMUM SHOW.—Amongst awards made to non-competitive displays at this exhibition were large and small gold medals. Messrs. THOMSON & Co., 20, High Street, Birmingham, inform us that they were awarded one of the large gold medals for their display of vegetables, referred to on p. 363.

MR. JOHN LAMBERT.—The many friends of Mr. LAMBERT, gardener at Powis Castle, will be sorry to learn of an accident that befel him. Owing to the slipping of a ladder, on which he was standing, Mr. LAMBERT fell a distance of several feet, fracturing four ribs. It is reassuring to know he is progressing favourably towards recovery from his injuries.

GARDENER'S GOLDEN WEDDING.—Mr. and Mrs. JAMES SMITH, Ramockburn Road, St. Ninian's, Stirling, recently celebrated their golden wedding. Mr. SMITH, who is in his 76th year, is a native of Perth. He began his gardening career at Abercainey, Grief, and after various appointments was, in 1860, appointed head gardener at Lazony Hall, near Carlisle. Mr. SMITH has also held the post of gardener at Craigton, Finty, Stirlingshire (for 25 years), at Tullibewan Castle, Dumbartonshire, and at Randolphfield, Stirling.

SCOPE OF A PUBLIC PARKS DEPARTMENT.—The next meeting of the members of the Horticultural Club should be of especial interest at the present time. Mr. W. W. PETTIGREW, Superintendent of the City Public Parks Department (Cardiff), will deliver a lecture on "The Aims and Scope of a Public Parks Department." The lecture is to take place on Tuesday, the 22nd inst., at the Hotel Windsor, and the subject will be illustrated with lantern slides.

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

NOVEMBER 8.—*Present*: Mr. E. A. BOWLES, M.A., F.L.S. (in the Chair), Dr. A. B. RENDLE, Messrs. A. W. HILL, J. FRASER, C. E. SHEA, E. M. HELMES, C. H. HOOPER, W. C. WORSDELL, and E. J. CHITTENDEN (hon. sec.).

Fruit of Musa cativosa.—Mr. W. C. WORSDELL showed a fruit of a species of *Musa*, probably *M. ventricosa*, which he had collected in the northern Transvaal, the plants growing in a grove on the edge of the forest just where it joins the high veldt.

Pollen of Apples, &c.—Mr. C. H. HOOPER showed photographs of the pollen of several kinds of fruit trees and bushes.

Malformed Pears.—Mr. E. A. BOWLES showed on behalf of Mr. HOOPER PEARSON some so-called proliferous Pears (see figs. in *Gard. Chron.*, October 8, p. 272). This malformation is not uncommon, and is explained by the fact that the fleshy part of the Pear is an axial structure, not a part of the ovary. The fruits are merely extensions of the axis without the formation of carpels.

Triple flower of Dendrobium formosum.—Mr. L. CRAWSHAY made the following report on the flower referred to him from the last meeting:—This flower was developed near the apex of an inflorescence bearing normal ones; it is about half as large again in all its parts. The normal flowers consist of six perianth segments, the petals much broader than the sepals, two of the latter, together with the labellum and column, being prolonged backwards to form a spur. The spur is complete posteriorly by the cohesion of the posterior margins of the lateral sepals, but is split almost to the apex anteriorly, on account of the corresponding margins of the lateral sepals being free. The abnormal flower showed five sepals and three petals, a double labellum and triple column, the middle third of which being the smallest. It is formed of three flowers, the laterals being set nearly at right angles to the median one. Each lateral flower consisted of two complete sepals, two petals (one on the labellum), and a well-developed spur. Each also accounted for one third of the column, and bore a normal pollen apparatus. The posterior petal (dotted), showed traces of a dividing line, and represented the two contiguous petals of the lateral flowers, whilst the anterior sepal (lined), similarly represented two lateral sepals. The only evidence of the median flower was in the ovary, and the middle third of the column, which was barren. Instead of the characteristic triangle, the ovary showed an oblong section, and only five placental areas had been differentiated.

LECTURE ON THE BLOSSOMING OF FRUIT TREES.

At the afternoon meeting on November 8 Mr. Hooper delivered an address entitled "Observations on the Blossoming of Hardy Cultivated Fruits." The lecturer stated that he compiled notes during three seasons on the blossoming of fruit trees, with the object of ascertaining the critical stage in the flowering period, when the blossoms were most susceptible to injury by frost. He stated that during the last two years (1909 and 1910), and more particularly this year, the shortage of Plums, Pears and Apples would seem to be due to dull, cold and rainy weather whilst these trees were in flower. In 1908 the weather at the flowering time was generally sunny and dry, although there was slight frost on two or more nights, but the flowers being dry, little or no

injury seemed to follow, as there was a good crop of all fruits.

The importance of insects in the transference of pollen from one flower to another has for long been known to be advantageous, being in some cases essential for the production of fruit, but it has been more recently noticed that in the case of Apples and Pears cross-pollination is, with some varieties, absolutely necessary.

In some fruits the stamens are mature and shed their pollen before the stigma or stigmas of the same flower are mature, in others, including the Apple and Pear, the stigmas are mature and ready to receive the pollen before the stamens shed their pollen.

Red Currants have a longer flowering period than Gooseberries. In 1909 they commenced to flower about April 19, were in full flower by April 29, and had all set fruit by May 21. Picking began on July 12. The pollen of Red Currant is almost spherical; it is adhesive, and seems to be shed only during a short period compared to the long time the flower is open. The stamens and pistil come to maturity simultaneously.

In 1909 Black Currants commenced to flower about April 19, were in full bloom by May 7, and the flowers set by May 21; picking began on July 14. The pollen of the Black Currant is plentiful, spherical in shape, very adhesive, clinging together in a mass; the flowers are visited by hive and bumble bees. The stamens and pistil come to maturity simultaneously. The leaves are fully expanded before flowering commences. In 1909 berries had coloured by the commencement of July.

The Gooseberry is usually the next fruit to open its flowers after the Cob; they are in flower about four weeks on an average, and the fruit is ready to pick green about a month after being in full flower. In Gooseberries the flowers and leaves open about the same time. The flowers at the tips of the branches open last. The Gooseberry is protandrous, i.e., the stamens shed their pollen before the stigmas are in a suitable condition to receive it. The Gooseberry flower is said to have lost the power of self fertilisation.

The Red Currant is generally the next fruit to blossom after the Gooseberry, but it is not so uniform in its flowering as the latter; thus one bush may be in flower earlier than another, and the same way with the branches.

In Plums the stamens and stigma mature very nearly at the same time. Taking an average from records of several years, in different parts of England, the following appears to be the approximate order of flowering: In 1903, average 10 different varieties, in flower 17 days (11 to 24); full 8½ (7 to 10).

In 1909, average 7 different varieties, in flower 13 days (15 to 24); full, 7 (6 to 8).

In 1910, average 8 different varieties, in flower 23 days (20 to 26); full, 7½ (6 to 10).

The period of duration of an individual Plum flower is about six days.

It has been observed that Rivers's Early Prolific is self-fertilised with the greatest difficulty, only setting nine Plums out of as many thousand of flowers, whereas Victoria is completely self-fertile. The Histon Apricot Plum, the Blue Bullace, and the Sloe are self-fertile.

As the total flowering period of the different varieties of Plums is about 25 days at Wye, and probably about the same in other parts of England, both the earliest and latest-flowering varieties have a considerable portion of their flowering period in blossom at the same time, which assists in pollination. Practice teaches that a mixture of two or more varieties in a plantation is advantageous for cross pollination, and that bees in the vicinity of a plantation are helpful, especially in a wet season, as they come out during the fine intervals and assist in the work of cross-fertilisation.

At Wye in 1909 the flowering of the Raspberry commenced on May 24; the plants were in full flower on June 3, and finished flowering about the July 6; picking began on July 14.

In 1910 the first flowers opened on May 24.

Mr. Hooper stated that this year he placed paper bags over three bunches of Raspberry flowers, before any of the blooms had opened, and was surprised on untying them later to find fruits were almost as plentiful as on those bunches open to insects.

In Pears generally the varieties keep to a definite order of flowering, though some varieties are more constant to an order than others.

In 1909 the different varieties of Pears were in flower at Wye from April 26 to May 18; the crop was moderate. The average duration of flowering of 15 varieties was about 14½ days, in 1908 it was 17 days. The trees were in full bloom about the seventh day after commencing to flower. The following varieties of Pear appear to be specially good pollen producers: *Beurré Clairgeau*, *Pitmaston Duchess*, *Catillac*, *Marie Louise d'Uccle*, *Clapp's Favourite*, and *Doyenné du Comice*. When the Pear flower opens the stamens are curled inwards and are immature, while the stigmas are ripe and ready for pollination.

The time of flowering in the Apples, said Mr. Hooper, is not appreciably influenced by the stock, although there is probably a slight advantage in earliness in the case of those grafted on the *Paradise* stock. Apple flowers that have been fertilised are more capable of resisting damage by frost. In America the average time of the duration of blossoming is nine days, whereas in this country the trees are in bloom about 20 days. It has been found that when single trees of Apple and Pear are isolated from other trees they bear little or no fruits.

PARIS INTERNATIONAL SHOW.

(Concluded from page 362.)

Miscellaneous groups of flowers were probably not so numerous as we have seen at some of the autumn shows in Paris. Part of the central design of the ground plan consisted of a hollow square with rectangular corners and several beds in the middle. There were paths intervening to allow visitors to walk all round the beds inside the square and outside. At the corners Messrs. *CAYEUX & LECLERC* staged collections of *Cactus Dahlias* in great variety, all the specimens being arranged in large, loose bunches of one variety.

Close to this exhibit were several displays of *Carnations* shown by Messrs. *LEVÉQUE & SOX*, but the groups were not arranged with such artistic taste as was adopted by Mr. Engelmann, of *Saffron Walden*, at the Brussels and Paris Exhibitions in April and May last.

Messrs. *W. WELLS & Co.* staged a vase of their new *Carnation White House*. *Carnations*, mostly French-raised varieties, were also set up by "*OUILLETS COTTAGE*," but by far the most attractive exhibit was shown by Mr. *ENGELMANN*, who had a beautiful group lightly arranged in huge bouquets in tall vases of varying heights. This collection was in every respect well worthy of British horticulture, and received a high award, and a Special Silver Medal was awarded for the variety *Carola*. Other varieties included *Beacon*, *Winsor*, *Regina*, *May Day*, *Defiance*, *Lucille*, *Harlequin*, *Enchantress*, *Victory*, and *Britannia*. Mr. *GEO. BUCHER*, a well-known grower of *Clematis*, exhibited fine specimens of *La France*, *Modesta*, *Proteus*, *Ville de Lyon*, *Venosa*, *Nerxes*, *Marcel Moser*, and other varieties set up with great taste in a long border on the outer side of the hollow square previously referred to.

Messrs. *G. & A. CLARK, LTD.*, Dover, were the only other English exhibitors. They staged a miscellaneous collection of cut flowers, comprising single *Chrysanthemums*, *Pompon Dahlias*, and two large vases of decorative *Chrysanthemums*. Several pretty groups were shown by Mr. *FÉRAND*, consisting of *Cyclamen* and *Astilbe* (*Spiræa japonica*), with a neat, narrow edging of *Primula obconica*. The same flower was shown also by Mr. *J. B. CALAIS*. Mr. *AUBERT-MAILLE* had a prettily-arranged group of *Cyclamen*, *Begonia Gloire de Lorraine*, *B. Turnford Hall* and *B. Patrie*. A choice collection of Japanese *Lilics* in pots was shown by Mr. *LEON FONTENAU*.

Two of the most dazzling exhibits came from Messrs. *VALLERAND* and *BILLARD*, both specialists. Their groups extended across the hall in a straight line, and had a semi-circular front in the middle. Huge blooms of tuberous-rooted *Begonias* formed the major part of these two exhibits. Foliage *Begonias* of the *Rex* type were exhibited by Mr. *CHASSET* in a nice little collection close by. Mr. *DÉSIRÉ RAMELET* put up a pretty bank of *Bouvardias* in variety and ferns.

The principal feature of the show in the floral classes consisted of *Chrysanthemums*. By far the grandest contribution in the exhibition was that made up by Messrs. *VILMORIN, ANDRIEUX & Co.* It occupied almost the central position and

covered an area of, approximately, 8,000 square feet. It was one of the grandest and most comprehensive exhibits of *Chrysanthemums* we have ever seen displayed by a single firm, and consisted of pretty, freely-flowered bush plants bearing large blooms and trained specimen plants of pyramid form. The latter varied from the round pyramid to those having four sides in the Japanese fashion, with rows of flowers one above the other. There must have been several hundreds of blooms on some of these plants, and the whole exhibit, broken up here and there by pathways, was shaped and designed in a most effective manner. The collection was relieved on one side by a fine bank of *Gerbera Jamesonii* raised by Mr. *ADNET*, of Cap d'Antibes, a delightful piece of floral decorative art. The *Chrysanthemums* must have numbered several hundred varieties, and the whole collection was edged with a narrow border of the *Pompon* variety *Gerbe d'or*. We have only space to name a few of the best varieties. Among the bush plants were *E. J. Brooks*, *Chenon de Leché*, *Mme. Ed. Roger*, *Merstham Yellow*, *Leslie Morrison*, *Mlle. Anna Debono*, *W. Duckham*, *R. Hooper Pearson*, *W. Mease*, *Pockett's Crimson*, *Alec. Payne*. Trained specimens included *Ch. Schwarz*, *Banquise*, *Loisseau Rousseau*, *M. Pechou*, *Congrès de Caen*, *Mara*, *Ville de Phenice* and other varieties not known to English growers.

Mr. *AUG. NOXIN* filled a long border with pot plants staged along the side of the show hall. In front were some decorative sorts, including *Eldorado*, a new yellow variety; *Figaro*, a new bronze; and *Purpurine*. New exhibition Japanese varieties were seen in *Mme. Jules Rossi*, *Secrétaire A. Gillard*, *Mme. Rose Jaimond*, *Mme. Cecile Bultel*, and *Mme. Leon Grosjean*. A goodly representative collection of standard sorts was also staged, besides a number of singles.

Other plant exhibits came from Mr. *GASTON CLEMENT*, who had a fine corner group of *Berthe Lachaux*, a new Japanese variety of a pretty blue-mauve colour; and from Mr. *PINON*, who sent a most original collection of specimens trained in all kinds of fantastic forms.

THE *ECOLE HORTICOLE DE PLESSIS-PIQUET*, Mr. *ZIMMERMANN*, Mr. *MABELAIN* and Mr. *MASCAUZ* also showed in the plant classes.

In the cut-bloom section there were numerous exhibits. Some of them contained very excellent blooms; they were not set up in vases or on boards placed on tables, but were arranged in beds of varying shapes on the ground level and edged with turf.

The section for new seedlings was largely filled, the best collection being shown by *Mme. CALVAT*, who had some very large blooms, five of each variety, and for which a *Prix d'Honneur* was awarded. Other exhibitors of seedlings were Messrs. *DOLBOIS*, *Marquis de Pins*, *PAUL RAILLON*, *LIGER-LIGNEAU*, *NONIN*, *ROZAIN*, *CHANTRIÉ*, *MONTIGNY*, *CLEMENT*, *TRAINSEL*, *VILMOGIN & Co.*, *DECAULT*, *HERAUD*, *BACQUE*, and *MARTIN*. A special prize of £4 was awarded to *Mme. CALVAT* for the best novelty in the show. It was a Japanese variety named *Petite Helene de Tiaré*. The other cut-bloom classes were well filled, and some were of very large extent. The principal exhibitors were Messrs. *LEVÉQUE*, *VERNIER FRÈRES*, *MARTIN*, *DUBUISSON-FOUBERT*, who had some enormous blooms of *F. S. Vallis*; *FÉRAND*, who had two large groups of singles; *MONTIGNY*, who staged novelties of 1909-10 in a border of great length; *RAGOT*, *BACHET*, and others. Mr. *PAUL FERON* put up some grand flowers in stands resembling stumps of trees placed at intervals on a square bed. He had in fine form *Mme. G. Rivol*, *F. S. Vallis*, *W. R. Church*, *W. Mease*, *Mary Mason*, and others. Of special merit was a beautifully-arranged circular group set up by Mr. *DURAND*, of *Brévannes*. Vases contained grand flowers with smaller vases around the outer edge judiciously intermingled with autumn foliage. Solid Japanese blooms of the greatest size and substance demonstrated the fact that Mr. *DURAND* is a grower of no ordinary skill. His chief flowers were *W. Mease*, *Mme. G. Rivol*, *Pockett's Crimson*, *Mme. Paolo Radaelli*, *Polyphème*, *F. S. Vallis*, *Ferd. de Bièvre* (grand), and others of the same type.

On a circular bed, with blooms in short vases, was a collection of yellow Japanese varieties, chiefly *F. S. Vallis*, set up in fine style by Mr. *GEO. TRUFFAUT*. In the centre there arose a huge monument 15 feet high built up of *F. S. Vallis* blooms intermingled with autumn foliage. It was a superb work of floral art and one of the most striking features of the show.

Mr. *H. CRÉPIN* arranged a somewhat similar group rather different in form. The ground plan was a square; at each of the four corners was a huge trained pyramid plant, and from the centre a peculiar form of trained plant of considerable height. Around the base was a large number of blooms of *Mme. Ed. Roger* encircled with a row of *Rose Polvine* and an edging of *Baronne de Vinols*, certainly a most original conception.

We must pass on towards the end of the show, and what remains can be but briefly described. *Chrysanthemum* exhibits that attracted our attention were those of the *ASILE DE VILFÉ*, *ÉVARAD*, *HÔPITAL ST. ANTOINE*, *ALP. COURBERON*, who staged an unusual lot of the *Caprice du Printemps Sports*; *ALP. SIMON*, *LECLERC*, *CARNAT*, *LANDEROUIN*, and *ECOLE ST. NICOLAS*.

Some groups in which extra fine show flowers were shown were staged by Mr. *CHARVET*, Mr. *ROSETTE*, Mr. *MARCEL FÉQUEUX*, and Mr. *PAUL LABBE*. A gigantic, circular, pyramid-trained plant 7 feet in diameter, and about the same in height, was shown by Mr. *H. CRÉPIN*; it carried several hundred medium-sized blooms, being a prominent feature.

The exhibition may well be described as international, for, beside the English exhibitors, the jury was composed of representative horticulturists from England, Belgium, Italy, Holland and Germany. The English members were Mr. *Harman Payne*, president of the first section and president of the Floral Committee; Mr. *Thomas Bevan*, president of the third section; Sir *Albert Rollit*, president of the fourth section; Col. *Prain*, president of the seventh section; and Mr. *Geo. Schneider*, president of the eighth section. On the evening of the second day of the Show the whole of the jury was entertained by the National Horticultural Society of France at a reception in the hall of the Society, when Mr. *Viger* presided.

On Sunday the members of the congress and the jury went to an enjoyable excursion. Carriages were provided, and visits were made to the Luxembourg Gardens and to the Natural History Museum. A lunch was given to the party at the *Palais d'Orsay*. Mr. *Viger* presided, and repeated his welcome expressed the previous evening. Other speeches and replies were made by Messrs. *Geo. Truffaut*, *Ph. Rivoire* and *Harman Payne*. The party then left for a drive in the Bois de Boulogne and a visit to the City of Paris horticultural establishment, where the numerous greenhouses were inspected. The following is a list of a few of the most important prizes awarded:—

The Premier Grand Prix d'Honneur offered by the President of the French Republic was won by *VILMORIN, ANDRIEUX & Co.* for *Chrysanthemums*. The second Grand Prix d'Honneur was awarded to Mr. *CROUX* for fruit and fruit trees. Prizes of Honour were also awarded by the jury to *SOLOMON & SOX* for Grapes, to Mr. *PINON* for *Chrysanthemums*, to *Mme. CALVAT* for *Chrysanthemums*, to Mr. *BILLARD* for *Begonias*, to Mr. *RIBET* for fruit, to Mr. *PAUL LABBE* for cut flowers of *Chrysanthemums*, to the *ECOLE HORTICOLE DE PLESSIS-PIQUET* for *Chrysanthemums*, and to Mr. *NOBLOT-BRUNEAU* for fruit and fruit trees. In some of the classes there was a large number of entries, and the exhibitors were rewarded with works of art. Gold, Silver-gilt, Silver and Bronze Medals of the National Horticultural Society of France, money prizes being quite unknown at such shows on the Continent.

SCOTTISH HORTICULTURAL.

NOVEMBER 1.—The monthly meeting of this association was held in the Gold Hall, 5, St. Andrew Square, Edinburgh, on this date. Mr. *Whytock*, the president, was in the chair, and there was an attendance of 110 members.

Mr. *George P. Berry*, lecturer in horticulture at the Edinburgh and East of Scotland College of Agriculture, gave a lecture on "The Working and Management of Garden Soils." Mr. *Berry* pointed out that the surface layer was the most fertile one, and maintained that, while it was sound practice to dig at least two spades deep, it was mistaken policy to bring the sub-soil to the surface. Whether the working be two or more spits deep, each spit should be left in its original position. By turning the top spit into the bottom of the trench the bacteria, which were nearly all present

in this, were suffocated, and the soil brought to the surface was, for the time being, practically sterile. The principal advantages of deep working were: free admission of air to a greater depth (thus increasing the depth of the fertile layer), and allowing a free ascent of moisture to the surface in dry weather in summer. Speaking of surface working, he advocated the free use of both the hoe and rake during the growing season, thereby assisting in the free admission of air, the conservation of moisture, and in checking sudden falls in temperature through evaporation from the surface. Drainage was also dealt with, and the necessity for frequent applications of lime in small quantities in order to keep the soil in a healthy state.

Fifteen new members were elected.

The lecture for the meeting on December 6 will be delivered by Mr. M. Todd, Edinburgh, the subject being "The Scottish Horticultural Association: A Retrospect."

CARDIFF CHRYSANTHEMUM.

NOVEMBER 2, 5.—The 24th annual exhibition held in connection with this society took place in the Park Hall, Cardiff, on the foregoing dates.

Mr. GEO. DRAKE, Nurseryman, Cardiff, exhibited eight vases of specimen Japanese blooms (each vase containing three blooms of one variety), for which he was awarded a 1st prize and a challenge cup offered by the society. The blooms were exceptionally fine examples, and one of the Lady Talbot variety received the N.C.S. award offered for the best bloom in the show. In addition to this, the collection contained excellent blooms of Walter Jinks, F. S. Vallis, Hon. Mrs. Lopes, Reginald Vallis, and Lady Letchworth. Mrs. F. S. WILLIAMS, Bryn Glas, Newport (gr. Mr. J. Duff), was a close 2nd, having among other varieties, good blooms of F. S. Vallis, President Viger, Miss B. Rowley, and Lady Talbot. 3rd, The Marquis of BUTE, Cardiff (gr. Mr. H. Farmer, Lord NINIAN STUART, Falkland, N.B. (gr. Mr. W. Young), received an extra prize.

Mr. DRAKE was also placed 1st for 12 blooms of Japanese varieties, distinct. Notable varieties in his exhibit were Hon. Mrs. Lopes, Leslie Morrison, Rose Pockett, and Reginald Vallis. 2nd, Mrs. A. Joy, Comtyrall, near Cardiff. 3rd, L. E. TREHARNE, Esq., Coedriglan, near Cardiff (gr. Mr. G. H. Brown).

The Marquis of BUTE won the 1st prize, together with a challenge cup, in the class for a stand of 24 Japanese blooms of not fewer than 18 varieties. Among these F. S. Vallis, A. T. Miller, Pockett's Crimson, Marquis of Northampton, and F. Payne were well represented. H. CORNELIUS, Esq., Weston (gr. Mr. Cook), won the 2nd prize in this class.

Mr. GEO. DRAKE secured the premier award, which included a challenge cup, in the class for 24 incurved blooms in not fewer than 12 varieties. Godfrey's Eclipse, Lady Isabel, Pantia Ralli, and Boccace were some of his best blooms. The Marquis of BUTE was placed 2nd, and the EXORS. of the late Prince HATZFELD, Chippenham (gr. Mr. F. Bible), 3rd. In the premier collection some of the most striking blooms were Buttercup, Duchess of Fife, Frank Trestian, and Lady Isabel.

The Marquis of BUTE also won the 1st prize for a stand of 12 incurved blooms in not fewer than six varieties. As this exhibit was the best in two classes it was awarded the National Chrysanthemum Society's Silver Medal. The varieties shown were Buttercup, Duchess of Fife, Mrs. G. Denyer, Clara Wells, Topaz Orientale, and H. W. Thorp. The same competitor won the leading prize and a silver challenge bowl for a stand containing blooms of 12 Japanese and 12 incurved Chrysanthemums, each of a distinct variety. Among the best of the Japanese sorts were F. S. Vallis, W. A. Etherington, Hon. Mrs. Lopes, Maud Jefferies, and F. Payne, while Romance, Duchess of Fife, Miss Threlfall, and Buttercup were conspicuous among the incurved flowers. 2nd Prince HATZFELD (gr. Mr. F. Bible).

Messrs. S. WILLIAMS & SONS, Nurserymen, Cardiff, secured the 1st prize, including a challenge cup, in the class for a group of single and large-flowering Chrysanthemums arranged on foliage plants in a space of 60 square feet. Mr. W. TRESIDDER, Nurseryman, Cardiff, was placed 2nd. In addition to these, there was a very fair display of groups in other classes, the

majority of these being arranged by amateurs and cottagers.

At the luncheon one of the judges referred to the appearance of these groups, suggesting that exhibitors should arrange them less formally.

Fruit was fairly well represented in the 14 classes provided by the schedule. Sir J. GUNN, St. Melons, near Cardiff (gr. Mr. Dobbs), won the 1st prize and a challenge cup for a collection of six bunches of Grapes in not fewer than two varieties. The same exhibitor was equally successful in winning the 1st prize and a challenge cup for a collection of hardy fruits.

TRADE EXHIBITS.

Mr. J. BASHAM, Bassaleg, near Newport, showed a splendid collection of hardy fruits as at former shows, being awarded a Gold Medal.

Mr. W. TRESIDDER was also awarded a Gold Medal for a collection of Dahlias. A similar award was made to Messrs. J. CYPHER & SONS, Cheltenham, for a collection of Orchids. Messrs. CLIBRANS, Altrincham, showed a miscellaneous collection of Chrysanthemums and other flowers. (Silver Medal.)

SOUTHEND-ON-SEA HORTICULTURAL.

NOVEMBER 2, 5.—This Society held its annual autumn exhibition of Chrysanthemums, fruits, and vegetables in the Marlborough Hall on the above-mentioned dates. The attendance of the public on both days was satisfactory, as also was the number and quality of the exhibits. Five excellent groups of Chrysanthemums in pots were arranged in competition for the challenge cup presented by J. Tabor, Esq., The Lawn, Rochford. It was won by that gentleman's gardener, Mr. J. BURLS, with a group consisting of well-grown plants of popular varieties surmounted with flowers of uniform size. 2nd, Mr. BOOSEY, Nurseryman, Rochford. Mr. A. REEVES, Queen's Hotel, Westcliff-on-Sea, was a close 3rd. In the corresponding class for a group of miscellaneous plants arranged for effect, Mr. J. BURLS was again successful with a capital exhibit consisting of brightly coloured Codieums, Abutilons, Salvia splendens, profusely-flowered plants of Begonia Agatha, Carnations, Bouvardia, &c.; 2nd Mrs. MULLAR, Leigh House, Leigh-on-Sea (gr. Mr. A. Epps); and the Rev. R. STUART KING, Leigh-on-Sea, was 3rd.

CUT BLOOMS.—In the open class for 24 blooms (Japanese), distinct varieties, Mr. J. BURLS was placed 1st, staging grand blooms of Mr. F. S. Vallis, Reginald Vallis, Mrs. W. Knox, Mrs. A. T. Miller, Mary Mason, Bessie Godfrey, Mrs. R. Hooper Pearson, Miss G. Moore and (among other good varieties) a grand bloom of Lady Talbot, of great depth and diameter and which was awarded the silver medal presented by Dr. G. F. Jones, J.P., for the best Japanese bloom in the show. Mr. A. EPPS was a fair 2nd. In the class for 12 Japanese blooms distinct, Mr. F. E. BELCHER, Stanford-le-Hope, was a good 1st, staging, among others, fine blooms of Mrs. A. T. Miller, F. Penfold, Lady Talbot, W. A. Church, A. Byron, Henry Parkins, Mme. Paolo Radacchi, and Guy Paget; Mr. P. E. WISEMAN, Maldon, was a close 2nd. The best exhibit of six blooms of Japanese varieties was shown by Mr. F. E. BELCHER, Mr. BURLS being placed 2nd and Mr. WISEMAN 3rd, all showing well. In the class for 12 incurved varieties Mr. P. E. WISEMAN was a good 1st. Mr. BELCHER was 1st in the class for six blooms of one variety of a Japanese Chrysanthemum, showing blooms of Guy Paget of great substance; Mr. A. DAVEY was 2nd, and Mr. J. BURLS 3rd. In the class for six vases of Japanese blooms, distinct varieties, three blooms in each vase, there were only two entries. Mr. BURLS was placed 1st, thus winning the silver medal offered, and Mr. A. EPPS 2nd.

In the amateur classes (open) Messrs. CAMPION and W. THURLEY were the most successful exhibitors, the former taking five 1st and the latter five 1st and seven 2nd prizes. In the class provided for nurserymen and florists residing within a radius of 10 miles of Southend Post office for one wreath, one cross, one bouquet, and one lady's spray and three buttonholes displayed on a table 6 feet by 3 feet, the 1st prize was won easily by Mr. PILGRIM, Leigh Road, Southend; Miss MILES, Hamlet Court Road, Westcliff-on-Sea, was 2nd. Mr. H. BLAKELEY, Evan's Farm, Rochford, was placed 1st for table decoration,

with a light arrangement of pink thread-like Chrysanthemums in glass vases of different sizes and Asparagus tenuissimus.

FRUIT CLASSES.—There were four entries in the class for two bunches of Black Grapes. Alderman INGRAM, Westcliff-on-Sea, was placed 1st for an excellent exhibit having medium-sized bunches of Gros Colman, consisting of large, even, and beautifully-coloured berries carrying a fine bloom; 2nd, Mr. BOOSEY. Apples and Pears were shown fairly well. Mr. A. EPPS was 1st for six dishes of dessert Apples, showing good fruits of Cocker's Pippin, Cox's Orange Pippin, Adam's Pearmain, Ribston Pippin, Lord Lennox, and Ellerton Pippin; Mr. H. B. HERBERT, Eastwood, Rochford, was a good 2nd. Mr. LANGSTON, Barling, was a good 1st in the corresponding class for six dishes of culinary Apples. Mr. W. A. VOSS, Rayleigh, won the 1st prize easily in the class for three dishes of desert Apples.

NATIONAL CHRYSANTHEMUM.

TRIAL OF SINGLE CHRYSANTHEMUMS.

NOVEMBER 12.—A trial of single varieties of Chrysanthemums, under the auspices of the National Chrysanthemum Society has been conducted during the past season at Messrs. H. J. Jones, Ltd.'s nursery, Keston, Kent. About 250 varieties were received from various sources.

On Saturday, 12th inst., members of the Floral Committee journeyed to Keston to inspect the varieties.

The Committee, under the chairmanship of Mr. D. B. Crane, drew up a list of synonymous varieties and judged the best varieties in their respective colours.

Instead of certificates, three crosses were given for those of the greatest merit.

Mrs. Buckingham, a fine pink variety, which received a First class Certificate last year, was approved.

The following were selected for the distinction of receiving three marks:—Narcissus, deep yellow (Robert Milner was equally good, but the two varieties were considered to be too much alike); Sir G. Bullough, a later variety, was good. Of white varieties, Meusa was very fine, with large flowers; Mrs. J. Carlile is also of fine form, but smaller; Mrs. Buckingham is a pretty pink sort, with a salmon shade; other pink varieties gaining the three marks were Florrie King, Pictor (pale shade), Pink Edith Pagram, Silver Slade, Lady Blanch Conyngham (bronze), Pyrethrum (bright chestnut red), Lillian Collett, Adelaide (white base, shading to mauve), J. B. Lowe (fine crimson), Swinburne (pale blush), and Sandown Radiance (bright chestnut-red). Other good varieties, but which failed to gain the maximum number of marks, were: Peter Pan, Maggie McLeod, Bronze Pagram, F. A. Collett, Lyra, Winnie Wells (this is a pretty dwarf-flowered yellow variety), Netta (pink), and Gaiety (a pretty bronze semi-double variety).

The plants were grown in pots, and were mostly of neat, compact habit, with good foliage. All those enumerated may be recommended for pot culture. A. H.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.

ANNUAL MEETING.

The annual meeting of the members of this society was held in the Music Hall Buildings, Aberdeen. There was a large attendance, and Mr. J. G. Burnett, of Powis, chairman of directors, occupied the chair. Mr. J. B. Rennet, advocate, Aberdeen, secretary of the society, submitted the annual report and accounts. In moving their adoption, the Chairman said they might be considered to be very satisfactory. Their annual show was a particularly good one, and, as the report stated, was one of the best ever held under the auspices of the society. They began the year with debt, but now they were possessed of a small credit balance.

The Chairman having expressed his desire to retire, Mr. Gill was unanimously elected to the vacancy.

Ex Councillor Milne was elected vice chairman; Messrs. W. Reid and W. Wylie were re-elected auditors; while Mr. J. B. Rennet was re-elected secretary and treasurer. Twenty directors were also elected.

CHELTENHAM ROOT, FRUIT, AND CHRYSANTHEMUM.

NOVEMBER 2, 3.—The 40th annual show of this association was held in the Town Hall, Cheltenham, on these dates. The Chrysanthemums were exceptionally fine, for although the specimen plants were not so numerous, the quality was excellent. Cyclamens were well represented, winter-flowering Begonias made an artistic table, Primulas were fair, and Salvias were very effective.

The silver cup presented by the Mayor and Corporation of Cheltenham for six distinct varieties of Japanese Chrysanthemums, was won for the second time by Mr. G. J. MAYO, Cheltenham.

Major SELWYN PAYNE won the cup offered by Mr. H. N. SIMMONS for the best dish of dessert Apples shown by an exhibitor living within six miles of Cheltenham.

The special prize given by Ald. W. N. SKILLICOME for the best specimen Chrysanthemum plant in the show was won by Mr. G. J. MAYO with a beautiful example of Nellie Pockett.

Mr. H. O. LORD, Col. FAIRLAX RHODES, Mr. G. J. RESTALL, Mr. H. J. TILLEY, Mr. H. T. YOUNG, and Mrs. GREAVES (table decorations) were 1st prize winners in the classes for Chrysanthemums; Messrs. H. ANDREWS and E. T. LEIGHTON showed best in the Carnation classes; whilst Mr. H. ANDREWS, Mrs. RAICLIFFE, Mr. J. HORLICK and Mrs. ROBINSON were prominent exhibitors of other kinds of plants.

Certificates of the National Chrysanthemum Society were awarded to Mr. G. MAYO for a choice specimen of Nellie Pockett, and J. R. TOOLEY, Esq. (gr. Mr. H. Andrews), for 36 blooms of Japanese varieties.

There was a magnificent display of fruit; the chief prizewinners were Messrs. W. S. R. COX, ROSS; E. W. CADDICK, H. NEWMAN, Hetherly, A. H. TAYLOR, J. BOLT, Major SELWYN PAYNE, J. HITCH & SONS, Mr. C. M. FITCHER, and Mrs. ROBINSON.

TORQUAY AND DISTRICT GARDENERS'.

NOVEMBER 3.—The annual Chrysanthemum show, under the auspices of this association, was held in the Bath Saloons, Torquay, on this date, and proved a very successful exhibition, competition being extremely keen, especially in the cut bloom classes, while the groups of single and double Chrysanthemums were especially bright and meritorious. The table decorations, of which there were several, were light and graceful in design. The class for epergnes of cut Chrysanthemums, arranged with autumn foliage and berries, brought out some exceedingly artistic exhibits, the 1st prize basket being a marvel of bright and graceful arrangement. Among the honorary exhibitors were Mr. R. P. KITSON, who showed some fine specimens of Nerine Bowdenii; Mr. C. COLES, who exhibited the curious *Hemantus puniceus* in berry, and Col. CARY, who staged a fine collection of winter-flowering Carnations. Mrs. J. LYON won, for the third time, the Silver Cup offered for the best group of single Chrysanthemums, with a superb collection of brightly coloured and fresh flowers. The cup now becomes her absolute property. A very fine group of large-flowered Japanese Chrysanthemums was contributed by Mrs. RICHARDSON, and awarded a 1st prize. The large class for cut blooms was for 24 varieties of Japanese, the 1st prize being won by Dr. SKARDON, with an excellent stand of large, brightly coloured flowers. Among the best varieties were the brilliant yellow A. Davis, Lady Talbot (of immense size), Elsie Fulton, and J. H. Silsbury. The 1st prize exhibit of twelve incurved Japanese Chrysanthemums, shown by Mrs. LYON, was especially good. The special prize for six vases of cut Chrysanthemums was won by Mrs. LYON. Considerable interest attached to the competition between artisans and cottagers, and in this section some very creditable exhibits were staged. Attractive as were the flowers and plants shown in the competitive classes, the display afforded by the nurserymen's exhibits contributed greatly to the success of the show. THE DEVON ROSERY, Torquay, had a very excellent stand, containing Lapagerias, Tuberoses, Palms, with the new *Phoenix Roebelii*, *Lilium Harrisii*, *Cypripediums*, *Salvia splendens*, *Ericas*, *Solanum capsicastrum*, *Ceanothus Gloire de Versailles*, Orange trees and Hydrangeas. Messrs. ROBERT YEITCH & SON, Exeter, showed *Nerine Bowdenii*, *N. Fothergillii*

major, *N. flexuosa alba*, the brilliant, scarlet-flowered *Alberta magna* (which has been tried in the open in the south-west, but has not succeeded), *Kadsura japonica* (new, with red foliage and small white flowers, a fine collection of winter-flowering Carnations, including *Rose Doré*, *Mikado*, *Lady Audley Neeld*, *Fair Maid*, *Carola*, *Aristocrat*, *Victory*, *Vinca*, *Afterglow*, *May Day* and *Beacon*; *Grevillea sulphurea*, *G. Preissii*, *G. alpina*, *Cryptomeria elegans* (with bronzed foliage), *Thibaudia acuminata*, *Chrysanthemums* and *Apples*. Mr. W. B. SMALE, Torquay, had a new *Abutilon* named *Devonshire Cream*, also *Dracena de Grootii* (with variegated foliage), *Acadlypha hispida*, *Anthuriums*, *Antholyzas*, *Cyclamens*, Chinese *Primulas*, and a new strain of *Primula obovata*. The DEVON FRUIT FARM staged a splendid collection of 74 varieties of Apples. Messrs. BURRIDGE & SONS, Paignton, showed some superb plants of Chrysanthemums, *Codiaeums* (Crotons), finely coloured *Dracenas*, and a varied assortment of *Ericas*. Mr. HEATH, Kingskerswell, whose beautiful *Viola*s were always so admired by the public at this show, was an absentee, as he has started fruit growing in British Columbia.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 3.—Committee, Messrs. E. Ashworth (Chairman), R. Ashworth, Arthur Ashton, Bolton, Holmes, Keeling, Parker, Sander, Thorp, Ward and Weathers (hon. sec.).

G. SHORLAND BALL, Esq., Burton, Westmoreland (gr. Mr. Herdman), exhibited a good collection of plants, in which were some very good *Cypripediums*, *C. × Earl of Tankerville*, *C. insigne* var. *Sandera*, *C. × Hitchcote* in variety, and a choice plant of *Lycaste Skinneri* var. *alba* (Silver-gilt Medal).

Col. J. RUTHERFORD, Blackburn (gr. Mr. Lupton), a competitor for the "R. Ashworth" Cup, staged a group of *Cypripediums*.

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), made a fine display of bright and rare plants. Awards of Merit were granted to *Odontoglossum × Ashworth* var. *Fire King*, *Cattleya × Cooksonii* var. *Queen Amelia*, *C. × Princess Royal* and *C. labiata* var. *Leona*.

H. J. BROMLOW, Esq., Rainhill (gr. Mr. Morgan), received an Award of Merit for *Cypripedium × Reginald Young*.

J. J. HOLDEN, Esq., Southport (gr. Mr. Johnson), exhibited two forms of *Cattleya × Folia*; one named *C. × Folia* var. *splendens* received an Award of Merit.

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), was awarded a Silver Medal for a splendidly-grown collection of *Cypripediums*, in which were many specimens of the yellow forms of *C. insigne*.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Gillett), had the distinction of gaining the only First-class Certificate awarded at the meeting. It was granted to *Odontoglossum crispum* var. *R. Ashworth*, of which *O. c.* var. *Granitium* was one of the parents.

J. H. CRAVEN, Esq., Keighley (gr. Mr. Corney), staged a group of *Epidendrum vitellinum* var. *autumnalis*, which added brightness to the show, and for which a Silver Medal and Cultural Certificate was awarded. *Cattleya × Folia alba* Craven's var. received an Award of Merit.

F. A. HINDLEY, Esq., Great Horton, Bradford (gr. Mr. Fox), was awarded a Silver Medal for a mixed group of Orchids.

Mr. A. A. McBEAN, Cooksbridge, exhibited the rare and distinct *Odontoglossum crispum* var. *Solum*.

MESSRS. KEELING & SONS, Bradford, staged, amongst other things, a fine plant of *Cattleya labiata* var. *King George V.* The plant received an Award of Merit.

O. O. WRIGLEY, Esq., Bury (gr. Mr. Rogers), staged a good group of *Cypripediums*, in which was noted the pretty *C. × Boltonii*.

Mr. H. A. INNES, Croft Spa, Yorks., was awarded a Silver Medal for a display of miscellaneous Orchids, including many *Cattleyas* and *Cypripediums*.

W. THOMPSON, Esq., Stone (gr. Mr. Stevens), exhibited *Odontoglossum × exultans* var. *Minerva*, and *Cypripedium × Ed. Guest*.

A. HANMER, Esq., Marple, exhibited a peculiar form of *Cypripedium × Hitchcote*.

Mr. P. WEATHERS, Manchester, received an Award of Merit for *Cattleya Bowringiana* var. *concolor*. Other exhibitors were THE LIVERPOOL ORCHID & NURSERY CO.; Messrs. MANSELL & HATCHER, Rawdon; Mr. W. SHARPLETON, Bradford; and Mr. J. BIRCHENALL, Alderley Edge.

COVENTRY CHRYSANTHEMUM.

NOVEMBER 3, 4, 5.—The sixteenth annual exhibition of the Coventry and District Chrysanthemum and Horticultural Society was held on these dates. The quality of the exhibits was of a very high standard throughout, and in point of view of the number of entries the show was a success. The Mayor presided and Colonel Wyley performed the opening ceremony. Honorary exhibits were staged by Messrs. CLIBRANS, Altrincham; the Executors of Thomas Webb, Esq., Coventry; Messrs. KIMBERLEY & SON, Kenilworth; Mr. PARSONS, Worcester; Messrs. HEWITT & CO., Solihull; and others. In the open class, Division A, 1st prizes for plants were gained by Messrs. W. FINCH, R. H. BRADNICK, HUGH ROTHERHAM, F. TWIST, and Captain STARKEY, whilst 2nd prizes were won by Mrs. W. I. LITTLE, Messrs. HUGH ROTHERHAM, W. FINCH, and F. FOSTER. In the classes for cut blooms, Miss MELLODY won three 1st prizes, the other premier awards being secured by the Countess of CRAVEN and Mr. R. H. BRADNICK; the 2nd prizes were awarded to the Countess of CRAVEN, Mr. W. FINCH, Miss MELLODY, and Mr. J. RAVEN. In the class open to private gentlemen or their gardeners for six vases of single Chrysanthemums, Mr. HUGH ROTHERHAM won the 1st prize. In the miscellaneous section of this division, the Countess of CRAVEN, Captain STARKEY, Messrs. FOSTER, and H. MITCHELL were successful exhibitors. Messrs. F. E. FOSTER, L. LISTER KAYE, and H. MITCHELL showed successfully in Division B, open to gentlemen not employing more than two gardeners regularly and residing within a radius of 12 miles of Coventry. The amateurs and cottagers gaining awards were Messrs. W. BIRKETT and A. H. MOORE. In the open classes for vegetables, Captain STARKEY, Messrs. H. MITCHELL, E. FORD, and J. KNIGHT won 1st prizes, whilst others who showed well were Messrs. H. MITCHELL, J. KNIGHT, T. NICHOLS, C. V. FROB, Captain STARKEY, and Mr. E. FORD. A gold medal was offered for a group of foliage and flowering plants, and this was won by HUGH ROTHERHAM, Esq. (gr. Mr. G. Griffin). The medal for the best bloom in Division B went to Mr. L. LISTER KAYE (gr. Mr. Watson). A medal was awarded to Mr. A. H. MOORE, as the winner of the greatest number of points in the amateur classes.

RAYLEIGH AND DISTRICT HORTICULTURAL.

NOVEMBER 4, 5.—The Rayleigh and District Horticultural Society held its second autumn exhibition of flowers, fruit, and vegetables in the Council School, Rayleigh, on these dates. The most noticeable features of the show were the non-competitive exhibits of fruit, &c., staged by Mr. W. A. VOSS, Eastwood Road, Rayleigh; Mr. T. H. WEBSTER, nurseryman, Stock; Mr. S. TAYLOR, Alpha Nursery, Rayleigh; and others. The most prominent of these exhibits was exhibited by Mr. VOSS and consisted of 15 varieties of Apples, two of Pears, and one fine dish of Quinces. These were shown to the best advantage in shallow, oblong market baskets, each containing from 12 to 24 perfect fruits of the respective varieties. The varieties consisted of (dessert) Duke of Devonshire, Scarlet Pearmain, Worcester Pearmain, Borsdorfer (Garret Pippin), and Court Pendu Plat, (culinary). The Queen (grand examples and beautifully coloured), Annie Elizabeth, Warner's King, Lord Grosvenor, Lord Derby, New Hawthornden, Mère de Ménage, and Emperor Alexander; Pears, Doyenne Boussoch (of great size and fine colour), and Aston Town. In addition to a good exhibit of Apples and Pears of leading varieties, Mr. TAYLOR had an attractive exhibit of floral arrangements. Mr. EPPS, Leigh House, Leigh-on-Sea, was a successful exhibitor in the competitive classes. E. B. FRANCIS, Esq. (who offered several special prizes), contributed a basket of well-coloured Black Alicante Grapes, not for competition.

BURY ST. EDMUNDS AND WEST SUFFOLK CHRYSANTHEMUM, FRUIT AND VEGETABLE.

NOVEMBER 3, 4.—This society held its annual show in the Corn Exchange on these dates. Notwithstanding the unfavourable fruit season in East Anglia, the numerous classes were well filled with produce of excellent quality. The open classes for 36, 24 and 12 cut blooms of Chrysanthemums were all well filled with blooms of good quality, the most successful exhibitors being Sir CARL MYERS, Bart., and Lord HOWARD DE WALDEN. The decorative and members' classes showed an increase in exhibits, table decorations being a feature of the show; these were judged by ballot of the visitors. Some well-flowered Begonias and Cyclamens were shown from Saxham Hall Gardens, and some handsome Exotic Ferns, Calanthe Veitchii and Cattleya labiata from Cavenham Park Gardens; a collection of fruit from the latter place included fine bunches of Muscat of Alexandria Grapes. Some very fine Apples and Pears were shown from the gardens at Ampton Hall, Cumpsea Ashe and Farnham Park. Vegetables were well shown from Cavenham Park, Livermere, and Farnham Park. In Messrs. Sutton and Sons' class for a collection, there were seven exhibits, all of excellent quality.

DERBY CHRYSANTHEMUM.

NOVEMBER 4, 5.—The show of the Derbyshire Gardeners' Chrysanthemum Association was held at the Drill Hall, Derby, on these dates. The entries were numerous and the quality of the exhibits equal to the average.

CUT BLOOMS.—In the class for 24 blooms of Japanese varieties there were six competitors. Sir W. BASS (gr. Mr. E. Nesbit) won the 1st prize; his stand consisted of Mr. F. S. VALLIS, Reginald VALLIS, Mr. R. H. B. MARSHAM, President Viger, Francis Jolliffe, W. Gee, White Queen, Mr. L. THORN, J. W. MOLYNEUX, Mrs. A. T. MILLER, G. BOMMINGS, Hon. Mrs. LOPES, Mr. E. LUXFORD, Marquise Venosta, Dennis Kirby, Evangeline, and Lady Conyers; the bloom of J. W. MOLYNEUX was of the most striking colour. Mr. A. CHANDLER, Rugby, followed closely, his specimen of F. S. VALLIS being the largest bloom in the show; 3rd, Mr. J. WOOD, Alvaston. For 24 blooms of incurved varieties four competed. Mr. NESBIT led with Romance, R. TRISTAN, H. W. THORPE, Pania Halli, Marjorie Shields, Buttercup, Mrs. Hygate, W. J. HIGGS, Lady Isabel, Boccaccio, Mme. Vrembley, Mrs. G. DENYER, Daisy Southern and Calypso; 2nd, Mr. A. CHANDLER; 3rd, Mr. WOOD. These exhibitors also won in the same order for six vases of Japanese varieties. There were six exhibits of decorated tables, Mrs. F. OTTOS, Longford, being awarded the 1st prize, and Mrs. WARWICK the 2nd prize. The best group of Chrysanthemums was arranged by Mr. F. MEAKIN, Mr. C. T. CHADWICK being placed 2nd. In a smaller group class the 1st prize was won by Mr. C. S. BECK. There was keen competition in the less important classes.

VEGETABLES.—There were 20 entries in the class for a collection of vegetables, the winner being Mr. H. C. SMITH, Alvaston.

NON-COMPETITIVE EXHIBITS.—These were a great feature of the show. Capt. W. DRURY LOWE, Locko Park (gr. Mr. F. Sherwin), staged a superb exhibit of Begonias, and the Rev. BUCKSTON (gr. Mr. Sharnbrook) a collection of Begonias, Orchids, Cyclamens and Chrysanthemums. Mr. COREY, The Outwoods, Duffield, showed three fine seedling single Chrysanthemums, which attracted much attention; they were named respectively Elsie Robinson (a bright pink flower with a white eye), C. Knifton (white, flushed with orange), and J. H. Coley (waxy white).

WORTHING CHRYSANTHEMUM.

NOVEMBER 3, 9.—The annual exhibition took place on these dates, in the St. James's Hall, which was quite inadequate for the arrangement of the large number of exhibits. Chrysanthemums surpassed the usual standard, whilst fruits and vegetables were of fine quality.

A Silver Challenge Cup, to be won three times in succession, or five in the aggregate, was offered for a group of Chrysanthemums. The class attracted four competitors, and the successful exhibitor was H. S. JOHNSON, Esq., Seldenville,

Worthing (gr. Mr. Geo. Best). Mr. G. PILGRIM, Worthing (gr. Mr. F. Green), was placed 2nd, and Mr. W. PARSONS 3rd.

In the cut bloom classes, for 12 Japanese varieties, distinct, Mr. HARRY WEST, Broadwater, was awarded the premier prize. This exhibit included choice blooms of Mrs. C. Penford, Mrs. A. T. MILLER, Pockett's Crimson, Mrs. L. THORN, and Master David. 2nd, H. S. JOHNSON, Esq.

The 1st prize for six Japanese, distinct, was won by Mr. W. PARSONS, Mr. H. S. JOHNSON being placed 2nd. The last-named exhibitor secured the premier award in the class for six incurved varieties, distinct.

Dr. ROUSE, Worthing, led in the class for six Japanese blooms of one variety with fine blooms of Mrs. W. KNOX; 2nd, Mr. H. S. JOHNSON, with Mrs. Geo. Mileham.

Mr. H. S. JOHNSON excelled in the class for four vases of single Chrysanthemums, showing excellent blooms of Sandown Radiance, Eureka, Bronze Pagram, and Edith Pagram; 2nd Mr. W. P. PELLY, Worthing.

NON-COMPETITIVE EXHIBITS.—Amongst these was an especially fine display of cut blooms of Chrysanthemums, exhibited by Mr. H. W. THORP, Durrington, conspicuous varieties being Ethel Thorpe, Pockett's Crimson, Bessie Godfrey, Geo. Mileham '08, Mrs. J. W. Cole, Splendour, Evangeline, and Maritana, a new incurved variety of creamy-yellow colour. Mr. ROBERT PIPER, Worthing, was the exhibitor of a group of Chrysanthemums; whilst the BARNHAM NURSERIES, LTD., Barnham, exhibited a display of fruit.

SOUTHAMPTON ROYAL HORTICULTURAL.

NOVEMBER 8, 9.—The annual autumn show was held in the Artillery Drill Hall on these dates. The exhibition was attended with success; the entries far exceeded those of recent years, whilst the quality of the exhibits was of a high standard.

Cut blooms of Chrysanthemums, Vegetables, Apples, and Grapes were the outstanding features of the show. Mr. FUDGE, as usual, discharged the secretarial duties with ability.

CUT BLOOMS.

The principal class for Chrysanthemums was for 12 varieties of Japanese sorts, three of each, arranged in vases. Substantial prizes were offered, and the class brought six competitors, their collections making a bold display. The 1st prize was won by Captain F. G. DALGETY, Lockerley Hall, Romsey (gr. Mr. W. BENTON), for a meritorious display of such varieties as Lady Talbot, Mme. P. Raduelli, Mme. G. Rivol, Master James, Purity, Reginald Vallis, the Hon. Mrs. LOPES, and F. S. VALLIS. E. G. MOCATTA, Esq., Wolcott Place, Adlestone (gr. Mr. T. Stevenson), was a close second. This exhibitor showed some remarkably fine blooms of Lady Talbot, F. S. VALLIS, Valerie Greenham and Bessie Godfrey.

In the class for six blooms of any two white varieties of Japanese Chrysanthemums there was a keen competition. Mr. CHANDLER, Shirley Road, Southampton, was placed 1st, having the varieties Annie Nichol and Purity; 2nd, Major CHICHESTER, Embley Park, Romsey (gr. Mr. W. Hall), with fine examples of F. Payne and F. S. VALLIS. Mr. CHANDLER was awarded the 1st prize for six Japanese blooms of any variety not white; Captain DALGETY followed with good examples.

Captain DALGETY excelled in the class for two dozen Japanese Chrysanthemums, in not fewer than 16 varieties, the blooms to be arranged on boards. E. G. MOCATTA, Esq., was 2nd, his blooms being close in point of merit to those in the premier exhibit. There were six displays in this class, all the blooms being of remarkably high quality.

Incurved varieties were numerous and good. In the class for 18 blooms, in not fewer than 12 varieties, there was a spirited competition. After much deliberation the judges awarded the premier place to MATTHEW BODGSON, Esq., Moreton House, Kingsworthy (gr. Mr. Marsh), for large and coarse blooms, none too well finished. A. TATE, Esq., Downside, Leatherhead (gr. Mr. W. Mease), was placed 2nd, with much neater and fresher examples. Although a trifle smaller in size, a bloom of Clara Wells in this stand was

adjudged the premier Incurved Chrysanthemum in the show, whilst Lady Talbot in Mr. MOCATTA's 2nd prize exhibit in the vase class was selected as the premier Japanese bloom.

Single-flowered varieties are always shown well at Southampton, and this year proved no exception. For six vases of singles, distinct, disbudded, and unlimited in numbers, nine growers entered, making a fine display. Mr. MOCATTA secured the 1st award quite easily, with extremely fine blooms, well arranged, of Mensa (white), Pictor (soft pink), Bronze Pagram, Metta (red), Forbes (pink), and the richly-coloured Framfield Beauty. Mr. C. DYMOTT, Freemantle Nurseries, was a good 2nd. For the same number of varieties, not disbudded, nine entered. Mr. DYMOTT, with extremely freely-flowered bunches of Peter Pan, Mary Richardson, Laura Heaver, Lily Beer, Merstham Beauty, and Edith Pagram, was successful in winning the 1st prize; E. G. MOCATTA, Esq., being awarded the 2nd prize.

Chrysanthemums of the decorative type were well displayed. The schedule requires amending with regard to this class, as it reads thus: "Four vases of Chrysanthemums suitable for decoration, singles excluded," enabling the more astute exhibitor to include large Japanese blooms as was done on the present occasion, whilst all other exhibitors staged smaller varieties of a truly decorative character. The 1st prize-winner was Mr. CHANDLER, who showed Lady Talbot, O. H. Browhead, Alice Byron, and W. Gee; 2nd, Mr. DYMOTT, with attractive bunches of Market Red, Hortus Lolosanus, Mille, Dorey, and the Rev. W. Wright.

Plants were not numerous or good; three moderate groups of Chrysanthemums, intermixed with foliage plants, were arranged. Lord SWAYTHLING, South Stoneham House (gr. Mr. T. Hall), was placed 1st, and Mr. F. G. BEALING, Bassett Nurseries, 2nd. J. C. D. ESTERRE, Esq., Elmfield, Southampton (gr. Mr. C. Hosey), had the best specimens of four freely-flowered decorative varieties, as well as the finest six plants carrying not fewer than six blooms on each.

Table plants were shown finely, W. H. MYERS, Esq., Swanmore House, Bishop's Waltham (gr. Mr. Kilwood), was placed 1st of eight competitors. Grapes, Apples, and Vegetables were all well shown. Major CHICHESTER won the chief prizes for Grapes; Mr. MOCATTA for dessert Apples; Mr. MYERS for vegetables, the last-named excelling in Messrs. Toogood's and Messrs. Sutton's classes for six varieties of vegetables.

There were several non-competitive displays. The BRITISH COLUMBIAN FRUIT CO. had an imposing exhibit of Apples in three dozen varieties and an interesting display of bottled fruit. Messrs. OAKLEY & WATLING and Mr. WILLS exhibited floral devices. Mr. B. LADHAMS showed Alpines and other hardy plants. Mr. E. HULLER, Winchester Nurseries, had a fine array of Apples.

WESTON-SUPER-MARE AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 10.—The 24th exhibition was held on this date in the Knightstone Pavilion. The number of entries was about the same as last year. There were three classes for groups of Chrysanthemums; in the largest one, the 1st prize was awarded to H. CORNELIUS, Esq. (gr. Mr. C. Cook), and the 2nd to F. DOVE, Esq. (gr. Mr. C. Henley), both local exhibitors. Mr. C. J. ELLIS won the 1st prize for a group of single Chrysanthemums arranged with foliage plants, being followed by Mrs. J. R. BRAMBLE (gr. Mr. G. Daffurn). Mr. ELLIS was also successful in the class for a group of miscellaneous plants arranged for effect. There was a keen competition in the cut-bloom classes. Mr. CORNELIUS had the best exhibit of 24 Japanese Chrysanthemums in 18 varieties, showing especially good blooms of Hon. Mrs. LOPES, Rose Pockett and Splendour; 2nd, Mr. W. IGGULDEN, Frome. The best exhibit of 12 Japanese blooms was shown by Mr. J. W. SPINNER, Worle, whilst for six Japanese blooms the 1st prize was awarded to Mr. DOVE. The best bloom in the cut-bloom classes was a specimen of Lady Talbot, shown by Mrs. J. R. BRAMBLE. The vase classes were exceptionally good, and displays by amateurs about the average for this exhibition. The decorative and other classes were well filled. There were many classes for fruit and vegetables, Apples being especially numerous.

LIVERPOOL HORTICULTURAL.

NOVEMBER 9, 10.—The autumn exhibition, which constituted the 31st show, was held for the first time in the Corn Exchange. The glass roof of the building admitted an abundance of light, but after dusk the electric light was too limited for the showing of the exhibits to advantage. The position is good for suiting the convenience of business men, but the interior lacks the charms of St. George's Hall. The entries, with the exception of hardy fruits, were well up to the average, and the quality throughout was satisfactory. A considerable falling off is noticed in respect to the large trained plants, a smaller type of plants taking their place.

CHRYSANTHEMUMS IN POTS.—These were somewhat fewer than usual. A. EARLE, Esq. (gr. Mr. T. Hitchman), showed very successfully, securing the leading award in the following classes: (1) three large-flowering specimens (2) one large-flowering specimen (3) three trained plants (4) three staked plants, and (5) one staked plant. The three trained plants were charming examples.

JOSEPH SMITH, Esq. (gr. Mr. J. H. Kefford), was placed 1st in the class for a Pompon variety, with a well-bloomed specimen. W. J. LOCKETT, Esq. (gr. Mr. E. R. Finch), proved the winner in the class for six staked plants. Mr. J. H. KEFFORD excelled with plants of single varieties, with a bright combination of colours. W. CUNNINGHAM, Esq. (gr. Mr. W. Wilson), Mr. G. OSBORNE, and T. W. WRIGHT, Esq. (gr. Mr. T. Atken), were winners of 2nd prizes in the plant classes.

CUT FLOWERS.—For 36 blooms, 18 incurved and the same number of Japanese sorts, in not fewer than 12 varieties. Sir W. H. TATE, Bart. (gr. Mr. G. Haigh), was adjudged the winner, with large, fresh blooms. Especially fine were (*Japanese*) Hon. Mrs. Lopes, Master James, Master Daniels, Lady Talbot, and Sir Frank Crisp; (*Incurved*) Buttercup, Romance, and Lady Isabel. The other prize-winners in this class were Lieut. Col. J. B. GASKELL (gr. Mr. J. Stoney), Sir GILBERT GREENALL, Bart. (gr. Mr. C. Goves), and Mr. H. OSBORNE in this order.

Eighteen Incurveds.—Miss ROBINSON (gr. Mr. J. Nesbit) won the 1st prize with good blooms, including Romance, Buttercup, and Mrs. B. Hankey; 2nd, A. COOK, Esq. (gr. Mr. C. Osborne); and 3rd, T. HENSHAW, Esq. (gr. Mr. J. George). Mr. J. GEORGE excelled in the class for 18 Japanese Chrysanthemums, the blooms of F. T. Vallis and Master James being very noteworthy. Mr. G. HAIGH and C. GOVES, Esq., were placed 2nd and 3rd respectively.

Twelve Incurveds.—T. CLARKÉ, Esq. (gr. Mr. J. Clarke), led in this class with choice flowers, and the same exhibitor won the 1st prize for 12 Japanese blooms.

For six vases of singles C. J. PROCTER, Esq. (gr. Mr. J. Williams), led with excellent flowers in a very strong competition, whilst for three vases of singles Mr. L. THOMPSON was well ahead. In the smaller classes the 1st prize winners were Messrs. E. WHARTON, J. TAYLOR, A. WILLACEY, W. AINDOW, and J. FINDLAY.

MISCELLANEOUS PLANTS.—J. FINDLAY, Esq. (gr. Mr. E. Wharton), showed the best four plants of Begonias in a strong competition. Mr. F. C. KEIGHTLEY showed the best three Ferns, and Mr. E. R. FINCH proved the 1st prize-winner in the class for one specimen Fern. Mr. J. GEORGE led in the class for three Orchids, and JAMES SMITH, Esq. (gr. Mr. D. Little), won the 1st prize for one Orchid with a plant of *Odontoglossum grande*, carrying 30 flowers. Mr. G. OSBORNE was placed 1st for two Palms, whilst for three Palms in 8-inch pots Mr. T. HITCHMAN proved the 1st prize winner.

In the other plant classes 1st prizes were won by Messrs. J. H. KEFFORD (Primulas); T. HITCHMAN (Cyclamen); E. R. FINCH (table plants); T. HITCHMAN (Poinsettias); T. HITCHMAN (Hyacinths); and J. GEORGE (Lily of the Valley).

FRUIT CLASSES.—In the class for a collection of six dishes W. L. GLADSTONE, Esq. (gr. Mr. T. Elsworth), proved the 1st prize winner, staging Grapes Black Alicante and Golden Queen, Melon Sutton's Best of All, Apples and Pears.

Grapes.—The best two bunches of Black Alicante were shown by E. LOND, Esq. (gr. Mr. J. Wright); any other Black Grape by Mrs. KENDALL (gr. Mr. R. Anderson) large bunches of Barbarossa; Muscat of Alexandria by Mr. J.

STONEY; and any other white Grape by Mr. W. WILSON, who showed Golden Queen.

For six dishes of dessert Pears F. BIEBY, Esq., Shrewsbury (gr. Mr. J. Taylor), was placed 1st with fine fruits of *Bonré Ballet Pere*, *Doyenné du Comice*, and others. Mr. J. LEE had the best single dish of Pears, the variety being *Doyenné du Comice*. Mr. J. LEE excelled for six dishes of dessert Apples, with Charles Ross, King of the Pippins, &c., one dish of a dessert variety, with Cox's Orange Pippin, six dishes of culinary Apples, and one dish of a cooking Apple.

The 1st prize-winner in the class for three dishes of dessert Apples was Mr. C. HACKLING, whilst Mr. J. CLARK showed the best four dishes of culinary Apples.

NON-COMPETITIVE EXHIBITS.

As usual at this exhibition trade growers exhibited important displays, and the following awards were made:

Gold Medals to Mr. J. LEE, Bebington, for a collection of Apples and Pears; Messrs. CLIBRANS, Altrincham, for Vegetables; Messrs. MANSELL & HATCHER, Rawdon, for a collection of Orchids; Mr. NORMAN DAVIS, Framfield, for Chrysanthemums; Messrs. W. WELLS & Co., Merstham, for Chrysanthemums; and Messrs. R. P. KER & SONS for Cyclamen.

Silver Medals to Mr. H. MIDDELHURST for Chrysanthemums and Potatoes; Mr. W. ROWLANDS for Begonias and Palms; Messrs. THOS. DAVIES & Co. for Potatoes; Messrs. DICKSONS, Chester, for Chrysanthemums, Carnations and fruit; the LIVERPOOL ORCHID COMPANY, Gateacre, for Orchids; the GOVERNMENT OF BRITISH COLUMBIA for Apples.

GLOUCESTERSHIRE ROOT, FRUIT AND CHRYSANTHEMUM.

NOVEMBER 9.—The 47th annual exhibition was held at the Shire Hall, Gloucester, on this date. The competitive entries numbered 685, being about the same as last year, and in every respect the show was held to be equal to any previous one. The excellence of the fruit classes exceeded all previous exhibitions in connection with the society.

The chief prize winners in the Apple classes were: Mr. W. GORDON CANNING, Hartpury; Sir WILLIAM WEDDERBURN, Meredith; Mr. J. W. BENNETT; G. DAVIS, Barnwood; Sir WM. MARTINE, Stroud; Mr. W. S. R. COX, Ashle Leigh; Mr. W. REED; Mr. MARTIN CHART, Huccote; E. PICKFORD & SON, Gloucester, and Mrs. KNOWLES, whilst successful exhibitors of Pears were Mr. W. GORDON CANNING, Sir WILLIAM MARLING, and Mr. G. DAVIS.

The feature of the Chrysanthemum exhibits was the number of new single varieties shown. Indeed, the majority of the flowers were singles of the market type, suitable for table decoration, as the society wish to encourage the development of the decorative sorts rather than the large exhibition varieties. The most charming variety exhibited was Mary Richardson, a single, of a beautiful soft orange-bronze shade of colour. Sir WILLIAM WEDDERBURN, Mr. W. GORDON CANNING, Sir HUBERT PARRY, and Mr. MEATH BAKER were the principal prize winners in the Chrysanthemum classes.

The championship cup offered by Mr. Henry Terrell, K.C., for the competitor gaining the highest number of points, was won by Mr. W. GORDON CANNING, of Hartpury House, who secured 46½ points. Mr. H. J. PHILLIPS, Tibberton, being 2nd with 39, and Mr. H. DENT BROOKLEHURST, Sudeley Castle, 3rd, with 36 points.

PUTNEY, WANDSWORTH, & DISTRICT CHRYSANTHEMUM.

NOVEMBER 10, 11.—The 33rd annual exhibition of this society was opened by Alderman A. D. Dawney, the Mayor of Wandsworth, in the Wandsworth Public Baths, on the 10th inst. The entries were more numerous than usual, the competition in many classes being very keen. An outstanding feature of the show was the magnificent group of Chrysanthemums and foliage plants arranged by E. H. BROWN, Esq., Highwood, Roehampton (gr. Mr. R. Bradford), which won the silver cup presented by the tradesmen of Wandsworth. The 1st prize for

a miscellaneous group was won by J. D. CHAMKINGTON, Esq., Gifford House, Roehampton (gr. Mr. J. Prentice), with a very tastefully-arranged group, in which Orchids predominated.

In the cut bloom classes, Mme. STUART, The Convent, Roehampton (gr. Mr. A. Smith), was well to the fore, being the winner in the classes for 24 and 12 Japanese blooms and for six white blooms shown on boards. The same exhibitor also won a silver cup presented by the Mayor for eight vases of Japanese blooms, each containing three blooms of one variety, this being a particularly fine exhibit.

Winter-flowering Begonias were well shown by M. S. NAPIER, Esq., Putney Heath (gr. Mr. S. Mynett), this being a very strongly-contested class. Two classes for collections of vegetables were well filled, the Dowager Countess of KINTORE (gr. Mr. D. Anderson), being the winner in one class, H. W. HOFFMANN, Esq. (gr. Mr. Dolley), winning the prize offered by Messrs. Jas. Veitch & Sons.

The fruit classes were not so well filled as usual. Mr. A. SMITH won the principal prizes for both kitchen and dessert Apples, and Mr. C. ALEXANDER for Pears. Grapes were shown well by Mr. W. GILL and Sir W. J. LANCASTER (gr. Mr. F. H. Goddard). Sir W. J. LANCASTER also obtained the 1st prize for table plants.

Amongst the non-competitive exhibits was a splendid group of foliage and flowering plants, including many choice Orchids, from Messrs. JAS. VEITCH & SONS, Chelsea. Mr. L. R. RUSSELL, of the Richmond Nursery, contributed a group of hardy ornamental foliage and hermal plants. Handsome floral designs were sent by Messrs. MAHOOD & SON, WALBORN & SONS, and W. R. MANN, Putney, and Mr. R. NEAL, nurseryman, Wandsworth.

BURTON AND SHOBNALL CHRYSANTHEMUM.

NOVEMBER 12. The annual show of this society was held in the Town Hall, Bradford, on this date. The Society has been in existence for 25 years, the President being Sir William Bass, Bart. The general effect of the show was excellent, and was much enhanced by several non-competitive exhibits. In the open class for 18 varieties of Japanese Chrysanthemums shown as cut blooms, the 1st prize was won by the President, Sir WILLIAM BASS (gr. Mr. R. Nesbit), Mr. JOSEPH WOOD being placed 2nd. Sir WILLIAM BASS also excelled in the class for 12 incurved blooms and for 12 Japanese blooms. Other successful exhibitors were J. B. MORRIS, Esq. (gr. Mr. J. Hazlehurst), R. B. WRAGG, Esq. (gr. Mr. G. F. Mehl), Messrs. GEORGE GRETON, E. CAUSER, J. MITCHELL, W. OLIVER, W. L. CLIFF, and S. GARRETT.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

NOVEMBER 14.—The usual monthly meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on the above date. Mr. C. H. Curtis occupied the chair. Seven new members were elected, and one nominated. The death certificate of Mr. A. Miles was produced, and the amount standing to his credit, viz., £8 15s. 3d., was granted to his nominee. The sum of £66 5s. has been paid for sick claims since the last meeting.

DEVON AND EXETER GARDENERS'.

At the annual meeting, held recently, a report of the year's work was given by Mr. Charley, the secretary, while the treasurer, Mr. Mackay, was able to state that the association would begin the session of 1910-11 with a balance in hand of £8.

The President expressed the wish to retire from office, and on the motion of Mr. Hope, Trehawke Kekowich, Esq., of Peamore, was elected president for the ensuing year. Mr. Mackay was again chosen as treasurer and Mr. Charley as secretary; the committee also was re-elected.

The opening paper of the session was one entitled "Rockeries: How to Make Them and What to Grow on Them," by Mr. R. S. Seabome, of Lascombe Castle Gardens, near Dawlish. Mr. J. Wilson, of Killerton Gardens, presided.

SCOTTISH HORTICULTURAL.

NOVEMBER 16, 17, 18.—The Chrysanthemum show of this association was held in the Waverley Market, Edinburgh, on these dates. Compared with last year's show, there was a falling off in the number of entries, but this was chiefly in the vegetable classes. The cut flower and decorative classes were practically equal to last year. The following table shows the comparative numbers for the two years.

	1909.	1910.
Cut flowers	166	162
Bouquets, &c.	112	104
Plants	194	79
Chrysanthemums	53	31
Fruit	106	84
Vegetables	314	237
	855	697

There was thus a net deficiency of 158.

The quality of the exhibits was, however, excellent, and some of the large blooms were never, perhaps, shown better.

The non-competitive exhibits were not quite so large as usual, and, with the exception of Messrs. Dobbie & Co., the local nurserymen were not in evidence.

In the class for 15 vases of Japanese Chrysanthemums, in 15 varieties, 3 blooms in each vase, the City of Edinburgh Queen Victoria Memorial Prizes, presented by the Lord Provost, Magistrates and Town Council, there were four entries, and the 1st prize, including the City of Edinburgh Cup (to be won three times before it becomes the property of the competitor) and £12, was won by Messrs. BELL, Rossie, Forgandenny, (gr. Mr. D. Nicoll); Captain STIRLING, of Keir, Dunblane (gr. Mr. T. Lunt), was placed 2nd; the Dowager Countess of SEAFIELD, Cullen House, Banff (gr. Mr. A. Morton), 3rd; and Col. E. STEWART RICHARDSON, Ballathie, Stanley, Perth (gr. Mr. J. E. Davis), 4th. Mr. NICOLL'S flowers, with the number of points awarded, were as follows:

Name of variety shown,	Maximum points,	Points awarded.
Hon. Mrs. Lopes	12	10
Lady Conyers	12	8½
Mrs. L. Thorn	12	8½
Purity	12	10
Lady Talbot	12	9½
Mme. Paolo Radaelli	12	9
Bessie Godfrey	12	8
J. H. Silsbury	12	8½
Edith Jameson	12	10
Mme. G. Rivol	12	9½
Victoria and Albert	12	9
Mrs. C. Beckett	12	9
F. S. Vallis	12	9
Mrs. F. W. Vallis	12	10
Mrs. A. T. Miller	12	9½
	180	138

Messrs. BELL were followed closely by Captain STIRLING, as the following table shows:—

Name of variety shown,	Maximum points,	Points awarded.
Bessie Godfrey	12	8½
R. Vallis	12	9½
F. S. Vallis	12	9½
White Queen	12	10½
Frances Jolliffe	12	8½
Mrs. F. W. Vallis	12	9
White Venosta	12	9
Edith Jameson	12	8½
Melchet Beauty	12	9½
Purity	12	9½
Mrs. L. Thorn	12	8
Superb	12	8½
Lady E. Letchworth	12	7½
E. J. Brooks	12	10½
Mrs. G. Mileham, 1908	12	10½
	180	137

The Countess of SEAFIELD'S varieties were, Mrs. Thorn, Mrs. A. T. Miller, Reginald Davis, Lady Conyers, Lady Talbot, White Queen, President Viger, Frances Jolliffe, Elsie Fulton, Wm. Beadle, Mrs. G. Mileham, Mme. G. Rivol, Master James, Edith Jameson, and Melchet Beauty, a total of 119½ points being awarded. Col. STEWART RICHARDSON scored 76 points.

In the Scottish Cup class, which is confined to Scottish gardeners and amateurs, and to

which eight vases of Japanese Chrysanthemums in eight varieties, three blooms of each, have to be staged, the cup (which is held by the winner for one year) and £6 was won by Lord NINIAN CRICHTON STEWART, Falkland Palace, Fife (gr. Mr. Wm. Young). The varieties were as follows: Mrs. L. Thorn, Mrs. A. T. Miller, Lady Talbot, Master David, J. H. Silsbury, F. S. Vallis, Mme. Cadbury, and Hon. Mrs. Lopes, receiving 61 points out of a possible 96. The 2nd prize was awarded to the Right Hon. R. C. MUNRO FERGUSON, Raith, Kirkcaldy (gr. Mr. D. McLean), with 58½ points. The varieties were Mrs. L. Thorn, Reginald Vallis, Hon. Mrs. Lopes, Mrs. F. W. Vallis, Mrs. A. T. Miller, Lady Talbot, Mrs. G. Mileham, and Bessie Godfrey. A. R. BROWN, Esq., Summerhill, Shandon, was placed 3rd with 5½ points, his finest variety being Master David; 4th, Lady ARMISTEAD, Castle Huntly, Longforgan, with 57 points, Melchet Beauty being the best example in the exhibit.

In the class for six vases of Japanese Chrysanthemums in six varieties, three blooms in each vase, the 1st prize of £4 was awarded to Wm. RAMSAY, Esq., Bowland House, Stow, Midlothian (gr. Mr. R. Honeyman), who showed Mme. Paolo Radaelli, Mme. G. Rivol, Algernon Davis, Mrs. G. Mileham, Hon. Mrs. Lopes, and Mrs. A. T. Miller, receiving 51½ points out of a possible 72, the best specimens being Hon. Mrs. Lopes, which gained 10½ points out of a maximum of 12. W. T. MACLELLAN, Esq., Auchanault, Helensburgh (gr. Mr. H. MacSkimming), was placed 2nd with 38 points, having Reginald Vallis, Mrs. A. T. Miller, Hon. Mrs. Lopes, Valerie Greenham, Olive Miller, and J. H. Silsbury; 3rd, H. E. GORDON, Esq., Aitkenhead, Cathcart (gr. Mr. John Boucher), with Lady Talbot, Reginald Vallis, J. H. Silsbury, Mrs. A. T. Miller, Mrs. G. Mileham, and Victoria and Albert, receiving 37½ points, the first-named variety receiving the highest number of points, namely, seven.

In the class for blooms shown on boards there were nine entries, the same as last year, although the number of flowers had been reduced from 24 to 12, and for which Mr. J. W. McHattie this year offered prizes amounting to £5. Messrs. BELL (gr. Mr. D. Nicoll) were placed 1st, the Dowager Countess of SEAFIELD (gr. Mr. A. Morton) 2nd, and Messrs. GEO. WILLIAMS & SONS, nurserymen, Cardiff, 3rd.

PLANTS.

For a group of six plants of Chrysanthemums, distinct (single and Pompon excluded), the 1st prize was won by Lady STEEL, Edinburgh (gr. Mr. W. Michie); 2nd, D. HINE, Esq., Colinton (gr. Mr. W. Pulman); 3rd, Mrs. SIMSON, Colinton (gr. Mr. Jas. Fraser); and for four plants of Japanese Chrysanthemums (distinct) by D. HINE, Esq.; 2nd, Lady STEEL; 3rd, Mrs. SIMSON, whilst the best two plants of Chrysanthemums (distinct) were staged by D. HINE, Esq.; 2nd, Lady STEEL; 3rd, Mrs. SIMSON. The best large flowered Chrysanthemum was shown by D. HINE, Esq.; 2nd, Lady STEEL; 3rd, Mrs. SIMSON; and the best specimen of a single Chrysanthemum by Lady STEEL; 2nd, D. HINE, Esq.

There was a fairly good display in the class for a group of plants, the specimens consisting principally of specimen Palms, Dracenas, and Ferns. For six Dracenas the 1st prize was awarded to the Earl of HOME. The Hon. Mrs. BAILLIE HAMILTON, Duns (gr. Mr. G. Kerr), showed the best six plants of *Primula sinensis*, *Salvia splendens* was shown best by Colonel NISBET, Gilmerton (gr. Mr. R. W. Lannell), and *Cyclamen* by Mrs. BOASE, Dundee. There was a good display of Lily of the Valley and Roman Hyacinths, Leti STRAIBEN and CAMPBELL, and Major THORNBURN, Peebles (gr. Mr. J. McNeill) being the respective 1st prize winners; for eight decorative foliage plants Sir WALTER LAWSON was placed 1st, followed by the Earl of HOME.

CUT BLOOMS (Open Classes).

In the class for two vases of Japanese Chrysanthemums, one variety, three blooms in each vase, the 1st prize was awarded to Colonel R. G. ATKIN, Cansdowne Park, Helensburgh (gr. Mr. Alex. Campbell); 2nd, Mr. DAVID NICOLL.

For four vases of Japanese Chrysanthemums, 12 distinct varieties, three blooms in each vase, the 1st prize was awarded to the Dowager

Countess of SEAFIELD, Cullen (gr. Mr. Alex. Morton); 2nd, Captain A. STIRLING; 3rd, Mr. DAVID NICOLL.

The best exhibit of four vases of Japanese Chrysanthemums in four varieties, three blooms in each vase, was shown by W. H. DOBIE, Esq., Dollarbeg, Dollar (gr. Mr. John Waldie); 2nd, JAMES SIM, Esq., Newtyle (gr. Mr. James Sword).

For three vases of Chrysanthemums in three varieties arranged for quality and decorative effect, not more than 12 sprays in each vase, any foliage to be used, A. S. HENDERSON, Esq., Dundee (gr. Mr. Geo. Scott), was placed 1st; 2nd, Dr. SCOTT, Musselburgh (gr. Mr. Wm. Armstrong).

The medal offered for the best bloom in the show was awarded to A. STIRLING, Esq., Keir (gr. Mr. Thos. Lunt), for the variety White Queen.

SINGLE CHRYSANTHEMUMS.

There was a class for six vases of single Chrysanthemums in six varieties, the 1st prize, a gold medal, being won by the Earl of WEMYSS, Gosford (gr. Mr. W. Galloway); 2nd, Mr. JAMES BRUCE, Springfield Nursery, Davidson's Mains (Silver-gilt Medal).

The Earl of WEMYSS showed the best three vases of single Chrysanthemums in three varieties, staged for quality and decorative effect, with any foliage; 2nd, C. W. COWAN, Esq., Dalhousie Castle (gr. Mr. W. G. Pirie).

Two vases of winter-flowering Carnations, six flowers in each vase, were best shown by J. H. HOPLDsworth, Esq., Hamilton (gr. Mr. A. McKinley).

A silver medal was offered for the best new Chrysanthemum not in commerce. It was won by W. WELLS & Co., Merstham, Surrey, for Harry E. Converse, a bronze, Japanese, Recurved variety; the 2nd prize, a bronze medal, was also won by Messrs. WELLS for William Turner, a pure-white, Japanese, Recurved variety.

AMATEUR CLASSES.

For four vases of Japanese Chrysanthemums, in not fewer than four varieties, three blooms in each vase, the 1st prize was awarded to Mrs. JAS. STEWART, Alloa; 2nd, Mr. JAS. JENKINS, Aberdeen.

Mr. R. JENNER, Stirling, excelled in the class for two vases of Japanese Chrysanthemums, six distinct varieties, three blooms in each vase; the 2nd prize being won by Mr. JAS. JENKINS.

FRUIT CLASSES.

For a collection of fruit, to consist of eight dishes in eight distinct kinds and not to include more than two dishes of Grapes, the 1st prize was awarded to the Earl of WEMYSS. He showed fine specimens of Apples, the dish of Gascoyne's Scarlet Seedling being notable. The dishes of Charles Ross, King of Tompkins' County and Emperor Alexander were also remarkable; of Pears this exhibitor showed Duchess d'Angoulême very well. The Grapes were also good, and it was a splendid collection of fruit generally; 2nd, Lord ELPHINSTONE.

GRAPE.—The Grape classes were poorly represented. C. W. COWAN, Esq., Dalhousie Castle, was placed 1st for four bunches of distinct varieties, with Lord ELPHINSTONE a good 2nd. For two bunches, one black and one white variety, C. W. COWAN, Esq., was again placed 1st. Lord ELPHINSTONE secured 1st place for two bunches of Lady Downe's, and also 1st for two bunches of any other variety of Grape.

APPLES.—A prize was offered for 18 varieties of Apples, grown in Scotland, six of each sort, ripe or unripe. There was a good competition, and the specimens staged were very creditable. The 1st prize was won by Colonel GORDON, Castle Douglas (gr. Mr. Jas. Duff), who showed fine, ripe fruits of Golden Spice, Gascoyne's Scarlet Seedling, Stirling Castle and others; 2nd, Mr. R. G. SINCLAIR, Drem, who showed a fine dish of Allington Pippin.

In an open class for 18 varieties of Apples, ripe or unripe, Mr. E. W. CARADOC, Ross, Herefordshire, was awarded the 1st prize. He showed remarkable specimens of Lord Derby and Mère de Menage. 2nd, His Excellency The AMERICAN AMBASSADOR, West Park, Bedfordshire (gr. Mr. G. McKinley). For six varieties of Pears, the Earl of WEMYSS again secured the 1st prize.

In a class for three baskets of dessert Apples, in three varieties, 12 fruits in each basket, ripe

or unripe, open to market-growers, the 1st prize was won by Mr. E. W. CARADOC, Ross, Herefordshire; 2nd, Mr. R. G. SINCLAIR.

VEGETABLES.

There was a very small entry in these classes, but the produce was again of a very high quality. In the principal class in this section, for a collection of vegetables only four exhibits were staged, and Lord LAUDERDALE, Thirlestane Castle, Lauder (gr. Mr. R. Stuart), was awarded the 1st prize. He staged fine examples of Sutton's Exhibition Brussels Sprouts, Lyon Leeks, and Ailsa Craig Onions; the 2nd prize was won by JAMES MOIR, Esq., Dollar (gr. Mr. D. McMichen), and the 3rd by The Earl of HOME.

A silver medal was offered to Edinburgh market-growers for the best 12 bunches of Leeks (14 to the bunch) as grown for market. Mr. WILLIAM DOUGLAS secured the prize with splendid produce grown from seed of his own saving and selecting. The 12 bunches weighed 274 lbs.

NON-COMPETITIVE EXHIBITS.

Messrs. DOBRIE & Co., Edinburgh, put up a large stand of selected varieties of Chrysanthemums. They also staged about 60 varieties of Potatoes. (Silver-gilt Medal.)

His Grace the Duke of Buccleuch, Dalkeith Palace (gr. Mr. James Whytock), exhibited a large collection of fruit grown under ordinary culture in Dalkeith Palace Gardens. (Gold Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, exhibited a large stand of Chrysanthemums. The singles, Sylvia Slade, Altrincham Yellow, C. J. Ellis, Mensa, a very fine white variety, and Mrs. Chamberlain, being shown in splendid condition. (Gold Medal.)

Messrs. STORRIE & STORRIE, Glencarse, had one of their characteristic exhibits of fruit, Celosias and Streptocarpuses. (Silver-gilt Medal.)

Messrs. YOUNG & Co., Cheltenham, exhibited a table of Perpetual-flowering Carnations. (Gold Medal.)

Mr. H. N. ELLISON, West Bromwich, staged a collection of Ferns and Gerberas. (Silver-gilt Medal.)

Mr. W. POUPART, Twickenham, exhibited a table of bottled fruits. (Gold Medal.)

The GOVERNMENT OF BRITISH COLUMBIA put up a semi-circular exhibit of Apples shown as packed for export in boxes. (Gold Medal.)

Messrs. R. SANKEY & SON, Nottingham, exhibited their specialities in garden ware, including pots, pans and boxes. (Gold Medal.)

Mr. JAMES W. SCARLETT, Inveresk, showed Potatoes and other culinary produce as grown for market. (Silver Medal.)

Messrs. TILLIE, WHITE & Co., Edinburgh, exhibited a collection of vegetables. (Silver Medal.)

Messrs. JOHN FORBES, LTD., Hawick, had a small collection of winter-flowering Carnations, Begonias and other flowers. (Silver Medal.)

Messrs. WILLIAMS & SONS, Cardiff, staged an effective display of all sections of Chrysanthemums. (Silver-gilt Medal.)

Messrs. WM. BROWN & Co., Edinburgh, staged a collection of Canadian Apples, being shown in the original cases as exported. (Gold Medal.)

Mr. C. DICKSON, Blairgowrie, exhibited some Apples, examples of culture on Muir of Blair.

The PATENT SAFETY LADDER Co., Peterborough, put up specimens of their patent ladders and steps. (Bronze Medal.)

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending November 16.

Another cold week.—Since the present month began there have occurred only two unseasonably warm days and but three warm nights. The nights, however, have been much more unseasonably cold than the days, and on five of them the exposed thermometer showed 10 or more degrees of frost. At 2 feet deep the ground is now 2° colder, and at 1 foot deep 4° colder, than is seasonable. Rain fell on five days to the total depth of about half an inch. Moderate quantities of rain water have again come through both percolation gauges on each day during the week. The sun shone on an average for 2 hours 21 minutes a day, which is 20 minutes a day longer than is usual in the second week in November. The winds were as a rule rather high, and in the windiest hour the mean velocity amounted to 20 miles—direction W. For the third week in succession there was a seasonable amount of moisture in the air at 3 p.m. E. M., Berkhamsted, November 16, 1910.

MARKETS.

COVENT GARDEN, November 16.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally by several times in one day.—Eus.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Azaleas, Bouvardias, Carnations, Chrysanthemums, Gardenias, Hyacinths, Lilies, and Marigolds.

Table listing various cut flowers and their prices, including Marigolds, Narcissus, Mimosa, Orchids, Pelargoniums, Roses, and Tuberoses.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Adiantum, Asparagus, Croton, Ferns, and Ivy.

Table listing various cut foliage and their prices, including Hardy foliage, Ivy, Moss, Myrtle, and Smilax.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Aralia, Ferns, Asparagus, Begonia, Chrysanthemums, Crotons, and Cyperus.

Table listing various plants in pots and their prices, including Ferns, Ficus, Funkia, Grevilleas, Isoplepis, Kenia, Liatana, Lillium, Marguerites, Selaginellas, Solanums, and Spinas.

Fruit: Average Wholesale Prices—continued.

Table listing various fruits and their prices, including Apples, Bananas, Dates, Figs, Grapes, Lemons, and Melons.

Table listing various fruits and their prices, including Medlars, Nuts, Chestnuts, Peaches, Pears, and Quinces.

Christmas Fruits and Preserves.

Table listing various Christmas fruits and their prices, including Figs, Nuts, Dates, and Raisins.

Table listing various Christmas fruits and their prices, including Nuts, Dates, Raisins, and Mixed Fruits.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Aubergines, Asparagus, Beans, Cabbages, Carrots, Cauliflowers, Celery, Chicory, and Corn.

Table listing various vegetables and their prices, including Mushroom broilers, Mustard and Cress, Onions, Peas, Potatoes, and Turnips.

Remarks.—Apples: Foreign Apples are still plentiful and meeting with a moderate demand. Good samples of English Apples are selling well. Pears: Larger consignments have been received from France, and the high prices are maintained. Grapes: English supplies are still plentiful with a slight rise in value generally. Foreign supplies are shortening. Tomatoes: There are some fine samples of English Tomatoes on the market and they are selling readily. Supplies from the Canary Islands are limited, the consignments selling freely. Oranges are arriving in larger consignments; good samples are scarce. Nuts of all varieties show an increase in value. The Vegetable market is busy, all kinds of produce being in demand. E. H. B. Covent Garden, November 16, 1910.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples (American), Greenings, Baldwin, York Imperial, Albemarle, and Kings.

Table listing various fruits and their prices, including Apples (Oregon), Newtown Pippin, English, Lord Derby, Warner's King, Cox's, and Bismarcks.

REMARKS.—Trade very steady and arrivals plentiful. Prices about same as last week. Edward J. Newborn, Covent Garden and St. Pancras, November 17, 1910.

COVENT GARDEN FLOWER MARKET.

Trade has been very quiet during the past week. Country buyers may find it an advantage to procure supplies of plants, especially foliage plants, before the busy time begins. Chrysanthemums and Ericas are subjects that may be purchased some time before they are wanted, but there is a risk with some of the other subjects. At present the market is well supplied with all the pot plants usually seen at this time of the year.

Chrysanthemums are remarkably good, and several growers have small, well-flowered plants in pots of the type shown so well by Messrs. Butler Bros. at the last exhibition of the National Chrysanthemum Society. Ericas are well flowered. Begonia Gloire de Lorraine, including the Turnford Hall (white) variety, is now in the best of condition. The white variety is not so much in demand as the pink sorts. Extra large plants of both varieties are worth about 2s. 6d. to 3s. 6d. each. Cyclamen are fairly good. Pelargoniums are over for the season. A few plants are seen, but they are not of much value. Liliams are fairly good. White Marguerites from several growers are well flowered. Solanums are seen in well-berried plants, but the quality varies very much; some of the specimens are remarkably good. All the usual foliage plants are well supplied.

CUT FLOWERS.

It is difficult to estimate the value of any flowers at the present time, but in most instances supplies more than equal the demands. Prices may advance from day to day, especially as those that will keep are being held over for the Christmas trade. Chrysanthemums are the leading feature, and may be had in various qualities. The specimen blooms are not much in demand. This morning I was offered fine flowers of a large curved white variety very cheaply. The medium-sized flowers of good quality are most appreciated. Liliams are plentiful, and their prices are rather below the average for the time of year. Roses are plentiful, very fine blooms being seen. Carnations are well supplied. Roman Hyacinth is procurable, and there is plenty of Lily of the Valley to be had. All cut foliage may be procured at the ordinary prices. A. H., Covent Garden, November 16, 1910.

LAW NOTE.

CLAIM FOR COMPENSATION FOR THE DEATH OF A GARDENER.

A CLAIM has been entered in the Sheriff Court at Hawick, N.B., on account of the death of Mr. Robert Reid, gardener to Mr. Charles J. Wilson, manufacturer, Deanfield, Hawick. It is made by his widow, for herself and two children, and the amount sued for is £193 5s., being three years' wages of the deceased, the claim being made under the Workmen's Compensation Act. The grounds of the claim are that the deceased on August 21 last, had been working in Mr. Wilson's garden and greenhouse for about two hours, and that, on going home he had been brushing the garden soil from his boots when he injured his thumb. Either then, or afterwards when working in the garden, he contracted blood poisoning—from which he died, and that it is known that the tetanus bacillus is frequently found in garden soil. The insurance company with whom Mr. Wilson was insured resists the claim, upon the plea that the cause of death was not an injury by accident in the course of the deceased's employment.

Obituary.

W. R. FISHER.—We regret to announce the death of Mr. Wm. Rogers Fisher, which occurred on Sunday last, after an operation. Mr. Fisher, who was born in Sidney in 1846, was a professor in the School of Forestry attached to Oxford University, and he is the author of volumes 4 and 5 of Schlich's *Manual of Forestry*.

TRADE NOTICE.

The seed and nursery business of Messrs. James Service & Sons, Maxwellton, Dumfries, has been purchased by Mr. David Barr and Mr. David Hunter, who will continue to carry on the business under the name of James Service & Sons. Mr. David Barr has for the last 29 years occupied the position of manager to Messrs. Thomas Kennedy & Co., nursery and seedsmen, Dumfries, and Mr. David Hunter has been manager for the firm of Messrs. Wm Learmonth & Son, nurserymen, Lathfield, Dumfries.

ANSWERS TO CORRESPONDENTS.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

BEGONIA GLOIRE DE LORRAINE: S. Walker. The plants are badly infested with a clamor. Both the plants and the soil in which they are growing should be burned.

COLOUR BORDER: *Hibernicus*. We do not know of any scarlet-flowering herbaceous plants growing 5 feet or 6 feet high, other than those you mention. While there are plenty of white, yellow, and blue-flowering herbaceous plants growing to this height, the number of reds and scarlets are exceedingly few. We fear it will be necessary to modify your plan of arrangement to get the desired colour effect.

CREOSOTE FOR PRESERVING FRAMES: *Axious*. Creosoted frames have not been found injurious to the plants that are growing therein. The creosoted timber should, however, be quite dry, and exposed to the weather for some time before being made into frames.

CREOSOTED STAKE: E. F. C. Creosoted stakes have not been found injurious to fruit or other trees. See, however, the above note.

CYPRIPEDIUM: F. H. There is nothing in the specimen received to account for the failure. At the same time, if the material the plant was growing in is similar to that enclosed with the specimen, it is too light and porous for such strong-growing species. Some cultivators put these in a compost containing one-half its bulk of fibrous loam, and others use loam fibre almost exclusively. In such retentive material we have not seen any examples of decay such as that exhibited by your plant.

FELLOWSHIP OF R.H.S.: J. M. S. No examination is necessary. Write to the Secretary, Horticultural Hall, Vincent Square, Westminster, enclosing an entrance fee of one guinea, whereupon you will be proposed for election at the next meeting. If you are a professional gardener you will not be called upon to pay the entrance fee, but must contribute an annual subscription of one guinea.

FORESTERS' TERMS: H. R. Heartshake is prevalent in almost every kind of timber, and may best be described as clefts or splits that follow the medullary rays from the centre outwards. Starshakes radiate from the centre towards the outside, the clefts being widest at the sapwood, the opposite being the case in heartshake. Cupshakes, perhaps, worst of all, and renders the timber valueless for constructive purposes. The shake takes the form of curved splits, which sometimes wholly separate the annual rings. Spanish Chestnut, Oak, and Elm suffer much. These defects occur most commonly in trees that are growing on sandy soil, and may be caused by frost or wind, the latter particularly when of large size. The damage, unfortunately, can rarely be detected until the tree is felled. You would find *Webster's Foresters' Diary* useful in these and other matters. It is published every year, price 2s. 6d.

GAS LIME: T. W. You may with safety apply from 1 to 1½ ton per acre of gas lime to your ground. It will assist in getting rid of the gall-weevil and also help in bringing the plant food present in the soil into an available condition for the vegetables and fruit trees. The gas lime should be spread over the surface of the ground early in winter in order to allow the injurious gases to evaporate. After three or four weeks exposure dig it deeply into the soil, which will then be ready for planting in the spring.

GRAPE CULTIVATION OUT OF DOORS: X. Y. Z. In the Marquis of Bute's vineyards, near Cardiff, in South Wales, greater success has been achieved with black than white Grapes. The variety which has been most satisfactory is known as Gammy Noir, and you will do well to try this one with several others. There is a variety known as Reine Olga, which was given an Award of Merit by the Royal Horticultural Society on October 24, 1899, to mark its suitability for outdoor cultivation.

HORTICULTURAL SCHOOLS IN FRANCE: E. M. S.

We do not know of any public gardens or horticultural schools in France where women students are admitted, and there are but few women in France who have taken to horticulture as a profession. In many market gardens women are workers, especially in vegetable gardens, but we do not think there would be any chance of a stranger being admitted among them. However, you might write to Mons. Abel Chatenay, Secretary of the Société Nationale d'Horticulture de France, 84, Rue de Grenelle, Paris, who would be in a position to give you every information on the subject.

NAMES OF PLANTS: J. H. R. 1. *Bouvardia elegans*; 2. *Ophiopogon Jaburan variegatus*; 3. *Codiaum grande maculatum*; 4. *Codiaum Queen Victoria*; 5. *Codiaum angustifolium*; 6. *Codiaum Evansianum*. The foliage of these plants, called Crotons in gardens, varies very considerably in the different stages, which renders positive identification difficult.—R. F. *Cælogyne* (*Pleione*) *præcox Wallichiana*.—E. B. *Begonia Scharffii*, figured in the *Botanical Magazine*, t. 7023 (B. Haageana). (See *Gardeners' Chronicle*, Oct. 5, 1889, p. 388.)—W. E. *Arbutus Unedo*.

NECTARINE WITH "BROWN ROT": W. E. The best plan is to adopt your suggestion to remove the tree and burn it, for there is always a danger of the disease spreading to other trees in the same house. Remove every particle of the roots, and dig out the soil, replacing it with fresh compost.

PARADISE STOCK: *Constant Reader*. Some prefer the Nonnisch stock, which is recognised by its slightly woolly foliage; others the broad-leaved variety. Stocks may be raised from seeds, but they are more usually produced from layers, suckers and cuttings. Seedlings, as a rule, grow more vigorously than stocks propagated by other methods, and that is another good reason why a dwarfing stock, unlike a Crab or a free stock, should not be raised from seed. The French Paradise is worthless, as it lacks vigour and is short-lived.

PEAR FRUITS WITH SPOTS: G. B. The spots are caused by Pear scab. Spray the trees with the Bordeaux mixture next spring, first, just when the leaves are expanding, then again when the fruits have set.

PEAR PITMASTON DUCHESS: *Fr. Capp*. The fruits you send are exceedingly fine specimens, and the quality is unusually good for this variety. We have a case in our record book in which six fruits weighed together 7 lbs. 9 ounces, which is scarcely so good as the specimens you mention, as being only just under 1½ lb. each. However, we are informed that a single fruit of this variety, weighing 2 lbs., was sold recently in Covent Garden Market. At the R.H.S. recent fruit Show a specimen of Pitmaston Duchess was exhibited from Colonel Harbord's garden, Gunton Park, Norwich (gr. Mr. W. Allen), which weighed 2 lbs. 1 ounce.

PLANTING SHRUBS: R. R., *Birkdale*. You will be perfectly safe in proceeding according to your letter. At the same time, we may point out that it would be better for the shrubs if some clay could be mixed with the road sweepings and sand, as the road sweepings in themselves are usually of such a character as to lighten and render more porous any soils to which they are added. The buried turf will not in any way injure the shrubs, but the presence of water is quite another matter. Unless you can devise means of getting rid of the water, some of the deeper-rooting shrubs will be sure to exhibit injury when once their roots get into the water-logged soil.

RUST ON CARNATIONS: W. W. Rub the affected leaves with a sponge soaked in a solution of permanganate of potash of a rose-red colour. All the plants should be sprayed once a week with this same solution.

ROSES IN AUTUMN.

MANY of the species of Rose are very beautiful in autumn, their fruits lending a bright blaze of colour to the surroundings. Apart from their tortured and pampered sisters, all too common in many gardens, these species of Roses are more at home in the wild garden, where they ramble, creep, climb, or form large handsome bushes and trees. In a somewhat unorthodox garden in Mid-Lothian, on a sloping piece of ground bordered by a wooded policy, many species of Roses have been introduced into a scheme of wild gardening with pleasing results. The majority of the occupants are single-flowered Roses, but many of these are of intrinsic beauty in summer, and in autumn are very valuable for their brilliance of fruit and foliage. Yews and Firs are used as subjects for the climbing varieties, and the bright hips of the Roses form a striking contrast to the dark foliage of the trees to which the Roses cling. In late October, several of the Roses were still in flower, enabling one to form an opinion of the glorious display they make in summer, when they are in full profusion of blossom. *Rosa sancta*, the Holy Rose of the Abyssinian cloisters, was still yielding a few of its delicate pink blossoms, and seemed to thrive exceptionally well among some of the other dwarf growers. A variety of *R. rugosa*, named *acicularis*, also in flower, bore large crimson flowers and showed itself to be quite distinct from the others in habit and foliage. The dwarf

Roses were all planted near the path, and such tiny things as *R. pimpinellifolia* var. Brightness and *R. nitida* were noted. The former has bronzy-coloured foliage and jet-black hips, while the latter was very gay in its autumn dress of scarlet foliage and coral-red fruit and spines. Other charming little Roses were: the old Rose of Burgundy, just a few inches high; *R. pyrenaica*, very prettily covered with curious, scarlet hips; *R. venosa*, with brilliant red berries; and *R. Lawrenceana*, a very dwarf China with bright, glaucous foliage. Some of the most conspicuous Roses for richly-tinted foliage were of the *rugosa* section, the leaves of these assuming, in many cases, a light golden-yellow, all, of course, bearing many large "apples." Conrad F. Meyer plays an important part in this garden in summer, where it forms enormous bushes laden with delightfully fragrant blossoms, but, beyond retaining its dark green foliage well into winter, it is not particularly noticeable as an autumnal Rose. It is a gem in the wild garden, and is a superb variety for this situation. *Rosa lucida* bears many brilliant scarlet hips, and its foliage turns a striking purple colour, while *R. alpina* has leaves of a deep glowing red. Other strikingly tinted varieties are *R. venosa*, with many red fruits; *R. Sayi*, very bright leaves; *R. complicata*, with very small foliage of a rich colour; and *R. carolina*, pretty alike in leaves and bark.

Mention must also be made of the native variety *R. altaica*, with its bronzy-red foliage and jet-black hips. The Penzance Briars were all represented, but Anne of Gierstein is the most valuable of these for autumn effect, and here it produces an enormous crop of hips. Some of the sorts notable for their fruits are *R. pisocarpa*, with very small pea-shaped hips and a very strong grower; *R. pomitera*, the Apple-fruited Rose, having its branches weighed down with large, handsome fruits; *R. alba*, the old, single, garden Rose, laden with hips of a glowing colour, and *R. parviflora*, having fruits resembling Cherries. Some natural hybrids raised here from the *Rugosas* were laden with huge hips of brilliant hues, and are of value for this purpose, but in flower they are not of particular merit. Strong growers, climbing up through the trees, were *R. cameliiflora*, an evergreen variety; *R. bracteata*, better known as the Macartney Rose; *R. lavigata*, also an evergreen; and *R. polyantha* and *Wichuraiana*, both well known and popular types. Nearly every Rose species known is grown here, so far as they are known to stand the climate of Scotland, and, with one or two exceptions, all do well. *R. Eow*, the single yellow Abyssinian Rose, refuses to be established, as also does *R. Moyesii*, a recent introduction from China and a very desirable acquisition. Contrary to general experience, *R. bracteata* does well, and is quite hardy, two or three vigorous specimens being at home on Yew trees. The district is suitable for Roses, and in the immediate neighbourhood, the native varieties attain a great size in the woods and hedgerows. With fruit and foliage the Rose is a valuable plant for autumn effect, and this wild garden is now much enhanced by its brilliance. Passing on through the formal Rose garden, with its climbers on poles and chains, the scene was in marked contrast with that of the wild garden. Beautiful as the latter was

in summer, it was still beautiful in the autumn, whilst the formal Rose garden was by that time devoid of interest. *Geo. M. Taylor, Mid-Lothian.*

ALPINE VALLEYS.

(Continued from page 365.)

THE VÉSUBIE.

THE descent from the Boreon towards St. Martin leads through land of increasing fertility and luxuriance. The glen of the Boreon widens and the wood recedes. And so, through meadows starred with lovely forms of *Campanula persicifolia*, one comes down at last upon the little pleasure town of St. Martin Vésubie (St. Martin Lantosque). Not only must the name-place of *Saxifraga lantoscana* always be a place of pious pilgrimage to the gardener, but St. Martin is, in itself, a corner of the world so charming and set amid surroundings so beautiful as to deserve far more celebrity than it has yet achieved. It is true that the French inhabitants of the Riviera know its delights, and have their summer-villas there, but by the tourist, by the English, not only are the Maritime Alps themselves almost as little known as Thiber, but even this little town, lovely, easy of attainment, warm, delicious and cheap to live in, is almost unvisited.

But it is not the picturesque old houses gathered on a hill between two rivers, it is not the new town bosomed among Chestnuts that will draw the gardener. For here begins a yet more potent attraction, the mountain limestone that always promises a good harvest. Nor is the promise belied. One strolls out of St. Martin and along the high road which leads round the other side of the valley towards Venanson; in ten minutes the road is skirted by banks of limestone, from which *Campanula macrohriza* hangs in curtains of lilac-violet. Another dozen paces, and the rocks, the slopes, the very road-side gutters are golden with the starry showers of *Hypericum Coris*. High above, rise wooded slopes towards grey limestone crags, and soon their lowest bastions impend over the highway. And there, always on the shady side, one first sees the essential celebrity of St. Martin Lantosque.

Saxifraga lantoscana here grows and seeds exactly as it does on the great cliff at Ingleborough, showing itself more profuse in reproduction than any other of its kin, until, at least, you have seen *S. lingulata* on the rocks above the Val de Roja. On the high ledges hang its wide, great cushions of silver-grey, and every little cranny and wad of Moss below has its seedling or young plant. As one leaves the road and climbs up through the cove at the feet of the cliffs, the *Saxifrage* becomes more and more abundant and its cushions wider and wider. It does not, however, seem to vary very much in habit—to nothing like the same extent as other *Aizoon* or *Cochlearis*. In fact, the only variations that I noticed were one form of great size and profuseness of spike, and another, etiolate and spidery, under a bush. The plant is rigid in its preference for the damp and shady side of the rocks, which, of course, is the reason why it has taken as warmly to my cliff as to its own chosen home. Very rare and very puny are the pieces you will find on the sunny side of the rocks. But on the shady side it hangs in wide masses among *Primula marginata*, which seems quite indifferent as to whether it grows on granite or limestone. Another thing one can note about the *Saxifrage*, is that in its native place it is not nearly so free-flowering as it fortunately is in cultivation. A cushion a foot wide or more will only be responsible for a couple of flower-spikes. The same, as we shall see at Tenda, if we ever get there, applies to *S. cochlearis*.

The Vannion road is ideal for the tired collector, who now finds himself able to pluck half a dozen first-class plants without stirring from the highway. For, a few yards further on, where the slopes turn the hillside and come out into the sun, they are starred with the pearl-white cups of lovely *Linum salsoloides* in abundance; *Hypericum Coris* does not diminish; white and gold cover the hillside in the richest profusion, among bushes of Wild Lavender, and all the grey, odorous vegetation of the Mediterranean coast. The *Linum* is woodier-rooted than the *Hypericum*, which comes up in a neat, sandy tuft at one dig of the trowel, but quite as well worth the taking. I think it by far the most beautiful of its race, as I know it, and have long found it as easy and comfortable in damp West Yorkshire as though it had never heard of the grilling smbanks that are its home on the torrid Riviera. A little further on, at a turn in the

often that *Lilium pomponium* comes as high and as far as this from the blazing places above the Mediterranean which it loves.

To reach Nice from St. Martin one descends by tram or carriage through the long gorge of the Vésubie to a little uninteresting place of the same name, where one takes train for the coast. The drive occupies some four to five hours, and is a gradual descent towards the arid dustiness of the sea-board. Below St. Martin, *Campanula medium* is very splendid, making high spires of violet on almost every bank, and *Catananche bicolor* is brilliant too. Then there follows a fertile valley, where, in July, there is little to see though in autumn I remember that the *Colchicum* is abundant. After this, though, the road passes into the tremendous Gorge of the Vésubie, a cañon of some miles in length, between cliffs of limestone that sometimes almost meet overhead. The walls are

ORCHID NOTES AND GLEANINGS.

CATTLEYA PORTIA "LARKIN'S VARIETY"

(*C. LABIATA* × *C. BOWRINGIANA*.)

THE accompanying illustration represents this pretty *Cattleya*, which was shown at the Royal Horticultural Society's meeting on November 8 last, in a small group of hybrids, by Samuel Larkin, Esq., The Ridgeways, Haslemere (gr. Mr. Hale). It is of a clear, rosy-mauve tint, the front of the labellum being light reddish-purple, and the disc tinged with yellow. The variety is remarkable for the unusual width of the petals and the attractive form of the flower generally.

Cattleya Portia was originally flowered by Messrs. Jas. Veitch & Sons, in 1897, and since that time other raisers have been successful in flowering plants from crosses made both ways, and consequently varying in character.

The crosses of *Cattleya Bowringiana* are very useful, as they generally display their flowers in the early winter, when blossom is not plentiful.

LELIO-CATTLEYA × ETONA

(*C. SUPERBA* × *L. CINNABROSA*.)

A FLOWER of the brightly coloured hybrid raised by Eustace F. Clark, Esq., Chamoux, Teignmouth, from seeds sown in June, 1902, has been sent us. The flower, which is very brightly coloured, is over 4 inches across; the narrow, lanceolate sepals have a distinct tinge of yellow at the back traceable to *L. cinnabarina*, the surface being closely set with finely-spotted mauve lines. The rather broader petals are tinged and veined with mauve colour. The lip displays the influence of *L. tenebrosa*, especially in its deep reddish-claret colour and the dark lines from the base on a yellowish ground. *Cattleya superba* shows most in the firm texture of the flower.

ORCHIDS AT BARONSHALT, TWICKENHAM.

THE collection at Baronshalt, the residence of Henry Little, Esq. (gr. Mr. Howard), is one of the oldest in the country, and famous for its fine selection of *Laelia purpurata* and good *Cattleyas*, *Laelias*, and *Laelio-Cattleyas* generally, some section of which gives a fine display of flowers at all seasons.

On the occasion of a recent visit, the hybrids of *Cattleya Bowringiana*, which are special favourites, were making a grand display in the long, lean-to house of about 125 feet in length. *Cattleya Montini* (*C. Bowringiana* × *C. Dowiana aurea*) and its varieties *nobilior* and *colorata* were represented by very fine specimens, one plant being about 4 feet across and furnished with many large heads of rich purplish-crimson flowers, the larger spikes being each a perfect bouquet. *C. Mrs. J. W. Whiteley* (*C. Bowringiana* × *C. Hardyana*) was equally fine, one spike having 13 large handsome blooms. *Cattleya Wendlandiana* (*C. Warszewiczii* × *C. Bowringiana*), one of the early Veitchian hybrids, was a fine colour, and *C. Brownie* Veitch's variety (*C. Bowringiana* × *C. Harrisoniana*), when grown as it is at Baronshalt, shows itself to be a really pretty hybrid, some of the plants having spikes bearing 8 to 14 pink flowers with violet veining on the lip. *C. Portia* (*C. Bowringiana* × *C. labiata*) had fine heads of bloom of the colour of *C. labiata* and varied much in size and form; those nearest to *C. labiata* being the larger, while those which partake most of *C. Bowringiana* have the most flowers on a spike. Other varieties of *C. Bowringiana* crosses (the value of which cannot be over-estimated, as they give their bright flowers late in the year) which were in bloom were *Laelio-Cattleya Parysatis* (*L. pumila* × *C. Bowringiana*), *L. C. Tenes* (*C. Bowringiana* × *L. C. Nysa*), and *L. C. Tirsias*, and with them the fine varieties of *C.*

FIG. 159.—CATTLEYA PORTIA "LARKIN'S VARIETY": COLOUR ROSEY-MAUVE, WITH REDDISH-PURPLE FRONT TO THE LIP.

road, I clambered up among rock-ledges white as our own sea-limestone, clothed in scrub and coated with strange *Sempervivums*; and there, on a shoulder of cliff, I came upon a rare plant of whose existence in these regions I knew, but upon whose habitat I had never dreamed that I should have the luck to stray thus accidentally. On the hottest limestone rock, in stony ground, in crevices filled with dense, dwarf shrubs, towered here and there the stems of *Lilium pomponium*—not the stinking, yellow horror of our gardens, which is really *L. pyrenaicum*, but the genuine Mediterranean plant, vermilion flowered and gorgeous, cousin german to *Heldreichii*, *Carmolinum* and *Chalcidonicum*. Though St. Martin lies comparatively low (some 3,000 feet), and though the rocks on which I found the Lily were very hot and sun-baked, I fancy it is not

hung with cushions of a little *Potentilla*, which is probably *P. saxifraga*, and annoys one by looking as if it ought to be something so much better than it is. And then *Saxifraga lanata* cana takes possession. In sheets, and beds, and cushions and masses, at one particular bay in the road, it seems to clothe every inch of space from top to bottom of the huge precipice. In flower-time that rock-wall must be a splendid sight. It has the further advantage of being impregnable. But, after the road emerges from the Forge, there is nothing more to see in mid-July. We are now near the level of the Mediterranean; everything is dust-dry and dust-grey; only a rare flower here and there of pink Rock Rose, or *Coris monspeliensis*, remains to remind one that there is any such thing as a flower in these torrid regions. *Reginald Farrer.*

Bowringiana itself. *Laelio-Cattleya Violetta*, L. C. *Blethleyensis*, L. C. *luminosa*, L. C. *Gottoiana*, L. C. *Schilleriana*, and other *Laelio-Cattleyas* were finely in bloom, and among hybrid *Cattleyas* noted were *C. Carmen* (*C. Lüdemanniana* and *C. Warszewiczii*), of a very pretty tint, several *C. Minucia*, *C. Miss Williams*, *C. Thayeriana*, *C. Fabia*, *C. Iris* and other showy *Cattleyas*. At the end of the house, one side was taken up with the grand specimens of *Laelia purpurata*, which have been cultivated by Mr. Little for many years with such great success that many of the plants are now sending up 6 to 10 sheaths, which promise a great show next summer. *L. purpurata Littleiana*, for which a First class Certificate was given a good many years ago, and *L. purpurata Baronshalt* variety, which received an Award of Merit, are among the best, and show great improvement over their early form. These *Cattleyas* and *Lælias* are grown in a comfortably warm intermediate house; the *L. purpurata* are making up their new growths and are kept tolerably moist at the root. Indeed, Mr. Little keeps his *Lælias* rather warmer and more moist in winter than they are kept in some collections, and evidently with the best results. *Osmunda* fibre and *Sphagnum* moss are used as potting material, and leaves are carefully avoided, as Mr. Little had a sad experience in the use of them as a potting material for Orchids when they first came into use. His plants lived, but they made little root, and Mr. Little believes that the collection would have been ruined if the use of leaves had not been abandoned. A distinct yellow variety of *Brasso-Lælia* Mrs. Gratrix and other *Brasso-Lælias* and *Brasso-Cattleyas* thrive admirably under the same treatment. A selection rather than a collection of *Cypripediums* is grown, and this includes the clear yellow and white *C. insigne* *Sanderæ* (the handsome *insigne* *Harefield Hall* and other good varieties, many of which were in bloom, together with the distinct, greenish yellow *C. Roseth* and *C. Harrisianum viride*. Among others in flower were the old but not common *C. purpuratum*, *C. Littleanum*, the rare natural hybrid of *C. Lawrenceanum* and *C. Dayanum*; *C. Curtisii*, *C. callosum Sanderæ*, *C. Charlesworthii*, and many others.

TREES AND SHRUBS.

SOME SPINDLE TREES.

SEVERAL species of *Euonymus* are noteworthy for their highly-coloured fruits and, when laden with these in autumn, they produce very charming effects in the pleasure grounds, park, or woodland. The leaves also assume brilliant autumnal tints.

The British Spindle Tree (*Euonymus europæus*) is also a good subject for a lawn, as it attains the size of a small tree 12 feet to 20 feet in height. In autumn, the trees are usually loaded with the bright rose-coloured fruits which, during October, burst open and disclose the orange-coloured seeds. There are several varieties differing slightly from the type; the most noteworthy are *fructu albo* with white fruits, and *pallidus*. The large-leaved Spindle Tree, *E. latifolius* is a native of Europe and Asia. It differs from our British species in having much larger fruits and foliage. The habit of the tree is also distinctly looser in character. A Japanese species, *E. yedoensis* is distinguished from *E. latifolius* in having shorter pedicels and smaller wings to the fruits. Compared with *E. latifolius*, a fourth species, *E. plampis*, has fruits which are much darker in colour and round in shape.

E. oxyphyllus, a native of China and Japan, is also noteworthy for the highly-coloured fruits. The fruits of this species mature earlier than those previously mentioned, bursting open in September.

In the matter of soil and position, the Spindle Trees are not fastidious, thriving in most situations and ordinary garden soils. Seeds form a ready means of propagation.

The flowering season is May, but, being small, the flowers do not attract attention. A watch, however, must be kept about this time for the caterpillars of the small ermine moth, which, if neglected, quickly clear the plants of the young leaves and flowers. An effective remedy is to spray with Paris Green or some other arsenical compound. *A. O.*

FOCKEA CAPENSIS.

FOCKEA is a small genus of *Asclepiadaceæ* not far removed from *Stephanotis*. All the species are African perennials with large, fleshy root-stocks, thin, twining stems, opposite leaves and axillary cymes of small flowers. They have no economic value except in the rootstock, which is said to be boiled and eaten by natives. Horticulturally they have no value whatever, but the plant of which an illustration is here given has

FIG. 100.—FOCKEA CAPENSIS, AS GROWN IN THE IMPERIAL GARDENS AT SCHÖNBRUNN, NEAR VIENNA.

an interest on account of its having been in the Imperial Gardens at Schönbrunn, near Vienna, more than 100 years. This plant until quite recently was supposed to be the only survivor of an extinct species, but Dr. R. Marloth found it wild in 1906 in the neighbourhood of Prince Albert, South Africa. There it occurs in considerable patches among the shrubs on the slopes of the Sandriver Mountains, and the tubers, which are irregular in shape, brown, and warty skinned, are sometimes very large, weighing 50 lbs. or more. Two other species, *E. angustifolia* and *E. undulata*, have Turnip-shaped tubers, which are edible either in a raw state or after being boiled with sugar and made into a kind of jam. Another closely related species, *F. glabra*, has been in cultivation at Kew for at least 30 years. Formerly there were two plants of it, named *F. capensis*, one with a flat tuber like a cobbler's lapstone, the other Pear-shaped, and it was thought that *F. glabra* and *F. capensis* were synonymous, but Mr. N. E. Brown, in a recently-published volume of the *Floca Capensis*, states: "I have maintained the plant (*F. capensis*) as a distinct species from *F. glabra*, leaving future discoveries to prove or disprove the correctness of the view." The Kew plants are,

therefore, *F. glabra*, and, so far as we know, the Schönbrunn specimen is still the only living example of *F. capensis* in cultivation.

The growth of *F. capensis*, as shown by the behaviour of the Schönbrunn plant, is exceedingly slow. In 1800 (about) the tuber, according to Jacquin (*Fragments*, p. 31), was 1 foot long and 6 inches in diameter, and it is almost the same sizes now. Mr. Brown suggests that either the tuber attains its maximum development in a comparatively short period, and then remains stationary, or else the rate of growth must be excessively slow, in which case a tuber weighing 50 lbs. would be of very great age. We are indebted to Herr S. Sávoly, Budapest, for the drawing of the Schönbrunn plant here reproduced. *H. H.*

NOTICES OF BOOKS.

HEREDITY.*

THIS volume on heredity will certainly not be the least popular of the new series of shilling manuals published by the Cambridge University Press.

The subject is of such exceptional interest and increasing importance that no one can afford to remain in ignorance of the results achieved in this branch of science during the last few years; while for those concerned in any way with the breeding of the domestic races of plants and animals, or for those interested in social problems and the betterment of the human race, a knowledge of this subject is not merely of interest but a necessity.

In a subject of such complexity, it is no light task to present, within the narrow limits of some 140 pages, an account that shall be at all adequate on the one hand, and readily intelligible to the varied classes of readers to whom it will appeal on the other. Mr. Doncaster is to be congratulated on his achievement.

The kind of questions to which this science endeavours to supply answers is dealt with in the first, introductory chapter; and although the answers are, in the present state of knowledge, in many cases incomplete or altogether wanting, yet the number

of problems to which confident replies can now be given encourages the hope that the remainder will be found to be capable of solution.

Mr. Doncaster rightly warns us that, when we have determined a given character to be inherited according to certain rules in one species of organism, we must not assume that the inheritance of this same character follows similar rules in another species—that conclusions arrived at concerning the transmission of, say, tallness in Sweet Peas cannot be applied directly to tallness in man.

The part of the book that the majority of readers will no doubt find of greatest interest is the concluding chapter dealing with inheritance in man, and it is especially in this part of the subject that the above warning is most required. The second and third chapters contain a clear account of the phenomena of variation; the significance of continuous and discontinuous variation is explained and the part probably played by each in the production of new species and varieties is discussed. The possible

* *Heredity in the Light of Recent Research*, by L. Doncaster. The Cambridge Manual of Science and Literature, 1s. net. (Cambridge: The University Press.)

causes leading to the appearance of new variations are also examined in some detail.

As explained in Chapters IV.-VI., there are two methods of studying the phenomena of heredity, each of which has its own special advantages and drawbacks. The Mendelian method is for the most part only fully applicable where experimental breeding is possible and where the character, the inheritance of which is under investigation, is clearly marked off from other characters without intermediate connecting forms, i.e., in cases of discontinuous variation.

It is concerned with the way the characters of any one individual are handed on to the immediate offspring.

In the case of man, this method has only a limited applicability, and the second, known as the biometrical method, is often the only one that can be used. But this second method, being a statistical one, only provides information as to how any given character is inherited in the race considered as a whole, and whilst serving to demonstrate that offspring resemble parents, with respect to any quality, to a certain degree *on the average*, can provide no definite information with regard to any given individual.

Readers with non-mathematical minds will be grateful to the author for his lucid treatment of this mathematical subject.

Seeing that the average man's interest in himself is greater than his interest in the race, the cases of Mendelian inheritance will probably be of greater interest to the majority of readers. For, though the number of instances in which the mode of inheritance of a given character has been determined by experiment is not overwhelmingly great; yet the results which have been obtained have an impressive certainty which does not appear to attach to the more general statistical results obtained by the biometricians.

There is no doubt that the author is well advised to discuss thoroughly the cases he selects, rather than try to introduce others at the cost of over-compression and possible loss of clearness. This consideration was no doubt the reason for not including some discussion of such phenomena as "dominant whiteness," "coupling," &c., that would have rendered the book more complete. It seems a pity, too, that room could not be found, in an appendix perhaps, for the inclusion of a method of determining the constitutions and relative numbers of the offspring from parents of known constitution, such as the graphical method used by Bateson and Punnett. But where so much has been included it would be ungenerous to complain because the author has not given us more.

The book is to be welcomed, not only on account of the interest of its subject, but as an example of the scientific method as applied to biology. There is sometimes a tendency, in biological literature, to rather unduly mingle hypothesis with fact, with the result that the subordinate position of the former as compared with the latter is somewhat obscured. Nowhere is the temptation to such treatment so great as in a popular or semi-popular work. The author, naturally desirous of connecting together his more or less isolated facts on a continuous thread of hypothesis, is apt to commit the scientific sin—comparable with jury-packing—of selecting his facts to fit his hypothesis.

The investigation of heredity is peculiarly liable to suffer from such treatment, though, as a matter of fact, the text books written in English, for example, those by Bateson and also by Professor Punnett, are admirably free from this defect.

The acceptance or rejection of evidence cannot help being, to some extent, a personal matter, and unless the writer keeps a careful watch on himself he is unconsciously inclined to accept more readily evidence which confirms

his hypothesis rather than that which does not. Mr. Doncaster has done well to keep the "possibly true," for which the evidence is not absolutely conclusive, subordinate to "certainty," and also to relegate mere hypothesis, for the most part, to an appendix.

THE FLORA OF NEW GUINEA.

In the *Gardeners' Chronicle* of February 26, 1910, p. 136, there is a notice of the first part of the botany of Dr. H. A. Lorentz's expedition in Dutch New Guinea, containing, among other families, the Orchidaceæ and Palmaceæ. The second part has now been issued, continuing the pagination to p. 426 and the plates to n. 68. Between 40 and 50 families, or natural orders, are dealt with in this part, of which about half are represented by only one to three species each, 16 by only one each. Indeed, it seems probable that more attention was given to Orchids and some other groups than to the vegetation generally. Euphorbiaceæ are rather numerous, but include no novelties of special interest. Of the two Hippocrateaceæ, one is described as a new genus under the name of *Salacia*

(Photograph by Sir Robert Maxwell.)

FIG. 161.—*CAMPANULA BARBATA* AT MONKEITH: FLOWERS PALE BLUE.

crataea, differing from *Salacia* in having a globose, indehiscent fruit, and globose, wingless seeds. The Proteaceæ are limited to *Banksia dentata*, an Australian species, and a new *Helicia*. Among the few Rutaceæ is a new *Citrus*, *C. grandiflora*, described as having petals 35 millimetres long, which, assuming the petals spread horizontally, would give a flower nearly 3 inches in diameter, and much larger than those of any previously-known species. The Dilleniaceæ are represented by a *Dillenia* and four species of *Saurauia*, a genus now usually referred to this family. Of *Barringtonia*, which seems to find its greatest concentration in New Guinea, three species are described as new. The Myrtaceæ proper are few, and those belonging to characteristic Australian genera five in number. Of these two, *Melaleuca leucadendron* and *Beckea frutescens* are widely dispersed in Malaya, the latter extending northwards to China. Two others are also Australian, and the fifth, *Leptospermum parviflorum*, has hitherto only been observed in the mountains of Northern New Guinea. More interesting are

the Gesneraceæ of the tribe *Cyrtandreeæ*. Fourteen species are enumerated, all of them endemic. There is one species each of *Æschynanthus*, *Dichrotrichum* and *Monophyllia*, and 10 of *Cyrtandra* itself, some of them quite ornamental plants. *C. Wentiana*, especially, must be a very fine species. It is a shrub 12 to 15 feet high, with oblanceolate leaves 1½ to 2 feet long, and clothed with a pale-yellow tomentum on the under surface. The wholly yellow flowers are in axillary clusters and about 2 inches long, the calyx as large, and almost enclosing the corolla. *Cyrtandropsis* is the name of a new genus of one species, remarkable for its unisexual, inconspicuous flowers. The Acanthaceæ are represented by only two species, and the Compositaceæ by 17, more than half of which are widely-dispersed weeds, and mostly introduced in New Guinea. Of three species of *Nepenthes* one, *N. neoguineensis*, is new and nearly related to *N. Reinwardtiana*, a species apparently not in cultivation. Both species bear green pitchers of moderate size and elegant shape, though devoid of brilliant colouring. The Cycladaceæ, Gnetaceæ, and Casuarinaceæ number one species each, all familiar plants. *Nymphaea Lotus*, *N. stellata* and *N. gigantea*, and the Bornean *Barclaya Mottleyi* are the only showy aquatics. Notable Mimosaceæ are three new species of the pluricarpellary *Archidendron*. *Verbenaceæ* are relatively numerous, and include the handsome *Clerodendron magnificum*. A small collection was made of fresh-water algae, of which an interesting account is given.

CAMPANULA BARBATA.

EVER since I first brought home this plant 40 years ago from the Albula Pass, I have found it difficult to keep—apt to damp off in winter—until last year when it took to seeding itself profusely over the wall garden. Seedlings sprang up in all directions, indifferent, apparently, to whether the soil was loam, sandy, lime rubbish or peat, and they flowered with a liberality never manifested by their carefully-tinted parents. I enclose a photograph of one of them (see fig. 161). There was no variety of colour or habit among them; all were of the typical palest blue with white hairs. *Herbert Maxwell, Monkeith.*

AMERICAN NOTES.

CORNUS SLAVINII.

In the June number of *Rhodora*, the monthly journal of the New England Botanical Club, Alfred Rehder, of the Arnold Arboretum, Harvard University, describes a new hybrid Dogwood under the above name. A group of the type plant grows in Seneca Park, Rochester, N.Y., where my attention was first called to it by B. H. Slavin, the foreman of the park, in 1905. Flowering and fruiting specimens were sent to the Arnold Arboretum in the same year for observation in the herbarium, and living plants were also sent. After careful investigation, Mr. Rehder came to the conclusion that it was a hybrid between *Cornus circinata* and *C. stolonifera*.

As known hybrids in the genus are extremely rare, and only two natural hybrids have been described (the other one also by Mr. Rehder, in the first volume of *Trees and Shrubs*, and described under the name of *C. Arnoldiana*, a hybrid between *Cornus paniculata* and *C. Purpusii*), the addition to this interesting and ornamental genus is highly important. Only three stations are at present known for *Cornus Slavinii*. One is mentioned above, another is in Durand-Eastman Park, Rochester, N.Y., and the third in Piscataquis County, Maine.

Cornus Slavinii grows from 5 feet to 7 feet high, with upright branches. The young branchlets are at first greenish, but late in the season they

assume the purplish end appearance of *Cornus stolonifera*. The oval to ovate leaves, acuminate at the apex, and rounded at the base, are glaucous beneath, and covered with villous pubescence. In this respect it is markedly different from *Cornus stolonifera*, which, on the under side of the leaves, is whitish, with slight pubescence. The general outlines and characters of the leaves much resemble *C. circinata*. The flowers appear about the first week in June, and are intermediate in flowering between the parents. *Cornus stolonifera* usually comes in flower about the middle of May, and *C. circinata* from June 20 to 25; *C. stolonifera* has the habit of flowering intermittently throughout the season. The sub-globose, pale-blue fruits ripen about the end of July, and are very attractive.

One character of *C. Slavini*, to which Mr. Rehder does not call attention, is its distinctly stoloniferous character; that is, it sends out subterranean shoots, and forms gregarious clumps, whereas, in *Cornus stolonifera*, so far as we have seen, the shoots or branches are sent out or disposed on the surface of the ground like layers, and are not really stoloniferous in the true sense.

A large percentage of the seeds are fertile, and germinate easily, and, as might be expected, the seminal off-spring show considerable divergence of characters from those of the parents.

Cornus Slavini is a most interesting and useful shrub for the decoration of parks and gardens. *John Dunbar, Rochester, N.Y.*

FOREIGN CORRESPONDENCE.

TRIAL OF ROSES AT BAGATELLE.

I AM directed to remind you that, during the years 1911-12, as in previous seasons, a competition will be held for new Roses, which will be open to any who care to send its specimens, with the name of the Rose and of the grower.

I beg to give you below the directions which I am requested to give those who wish to take part in the competition:—

(a) The plants must have been cultivated, where possible, in pots, and several specimens—at least five—are to be submitted to the Bagatelle Rosery (L.), before April 15. They must be accompanied by a note on their origin, parentage, and, where possible, the particular treatment they should receive.

(b) The new Roses exhibited will be placed in the open ground immediately on their arrival at Bagatelle, and will remain in the same place until the month of October in the second year, in order that the judges may have the opportunity of studying, during two seasons, their flowering properties, and the quality of their growth.

The address to which the Rose trees are to be sent is as follows:—Curator des Promenades, Roseraie de Bagatelle, Bois-de-Boulogne, par Neuilly-sur-Seine, en gare de Neuilly, Porte Maillet. *J. C. N. Forestier.*

FORGOTTEN FORAGE PLANTS.

We know from the classics that in the agriculture of the past a *Cytisus*, about which there is a veil of mystery, rendered great service in the feeding of cattle, and especially of goats. In the *Memoires d'Agriculture de Paris*, for 1787, M. Amoureux argued that the plant in question was the Tree Lucerne (*Medicago arborea*), or *Cytisus* of Virgil, celebrated by him for causing cows and goats to yield abundance of milk, while its flowers were grateful to bees. This shrub was a native of Greece and the Archipelago. There are other *Cytisi* which are known to occur in the flora of Greece. They, unlike the *Labur-*

num, are non-poisonous, and so may also have been forage plants. In the East, a leguminous plant known as *Cajanus judicus* has afforded food for animals from time immemorial, and has been imported into and naturalised in the West Indies.

The fact of the matter is, that the *Cytisi* of warm countries, and especially the many species native of the Canary Islands, are non-poisonous, differing in this respect from *Cytisus Laburnum* and three or four other species from north-west Europe, which are always poisonous.

Amongst Canary Island plants, mention may be made of the *Tagasaste* (*Cytisus proliferus* var.

has afforded the needy farmers invaluable food for their cattle; hence this Alpine Broom might render similar services in the high plateaus of South Africa. When it flowers, it is an excellent, probably unsurpassed food for bees. In these days when so much is talked about re-afforestation, all these leguminous shrubs have a very great value, as, owing to the property their roots possess of fixing atmospheric nitrogen and thus manuring the soil, they would be most suitable precursors of forest plantations. It was with *Ulex europæus* (Furze) that the famous Pine forests in the Landes district, south of Bordeaux, were started, and thousands of acres of desert

FIG. 162.—DESSERT APPLE "HARD CAIRN RUSSET": RECEIVED R.H.S. AWARD OF MERIT ON NOVEMBER 5. (See p. 361 ante)

palmensis) and *Yacia* (*C. steudotanus*), and the beautiful *Genista splendens*, all of which are used as valuable fodder plants in the Island of Palma, of which they are natives. In northern countries, where rains abound and where food for cattle is seldom scarce, these plants would not thrive, but in many countries subject to droughts, such as the Cape, Australia and California, and where there is no irrigation, all the *Cytisi*, being capable of withstanding severe droughts, would supply a great want.

During a recent prolonged drought in Tenerife, the remarkable native White Broom, called *Spartocytisus supranubius*, which grows on the highest mountains at an altitude of 9,000 feet,

country were converted into valuable forests through the genius of a man (Bremontier) who foresaw the opportunity, and who was generously supported by the great Napoleon.

Even the Spanish Broom (*Spartium junceum*), if not used to excess, is a useful fodder plant, and was at one time a very serviceable textile plant, but its qualities have long since been forgotten: so much so, that it once cost the authorities at Kew a long and interesting correspondence to confirm its past merits. This Broom will grow in unfertile lands where nothing else prospers, and would be very useful for re-afforestation purposes. *George V. Perez, Puerto Orotava, Tenerife.*

NEW GARDEN WORMS.

WHILE on a visit to Cambridge some time ago, I took the opportunity to explore the Botanic Gardens for Annelids, and had the good fortune to come across a species which is new to Britain. As it has not yet been found elsewhere, it might be assumed that the worm is of foreign origin, though it seems to be perfectly at home on the fringes of the pools. It will, in all probability, be found at Kew in similar situations when the lakes come to be explored. The name of the worm is *Allolobophora Hermannii*, Mich., but the generic name will have to be altered when the affinities of the species have been more fully determined. It was first described by Prof. Michaelsen, of Hamburg, in 1890, from specimens found in a morass in the Harz Mountains. The *Monograph of the Oligochaeta*, by Beddard, devotes only a few lines to it, which are as follows:—

Length 40 mm., breadth 2 mm.; number of segments, 100. Tubercula pubertatis on xxix.,

The form of the worm is very graceful, similar to that of a *Phreocytes*, and it is cylindrical both in front and behind. The mean length in alcohol is 60 mm., or 2 to 2½ inches, and the diameter 1½ to 2 mm. In a few cases the animal attains a length of 70 to 75 mm. The diameter, which is usually under 2 mm., reaches a maximum in the region of the tubercula pubertatis, which are large and prominent. The number of segments is ordinarily 110 to 115, but it may be found anywhere between 93 and 150. The worm is greyish in alcohol, the colour being clearer among the young than among the old, but it is never deep. The prostomium cuts about three-fourths of the first segment or peristomium. On the 15th segment, as usual, one finds the male pores, which are, however, not easily seen till the creature is adult or nearly so. The openings are then situated on large, white papillae, which extend over part of the adjoining segments. One is reminded of *Allurus* and of the pretty little *Allo. mammalis* by this appearance. One also finds prominent

ments, to the number of two pairs, and open on the line of the third seta.

The worms were found in association with *Lumbricus Michaelseni* and *Lumbriculus* by Dr. de Ribaucourt, and in Cambridge with *Allurus*. Its form and manner of life suggest that it is a transition form between the earth and fresh water species, and is related to *Allurus* and *Helodrilus*. The two latter are British, and it would not, therefore, be surprising to find that the new species is indigenous. A species of *Helodrilus*, which, I think, is new to science, has this year been found in Cornwall, and this encourages us to hope for yet further discoveries. I venture to repeat my appeal to gardeners and others to send rare specimens to me for description in the *Monograph* which I am preparing for the Ray Society. *Hilberic Friend, Swadlincoate, Burton-on-Trent.*

BROMELIACEÆ OUT-OF-DOORS AT CAMBRIDGE.

THE tender plants that are grown out-of-doors in the shelter of the Plant Houses at Cambridge have been a feature for many years. The Cacti have been illustrated and described a number of times, but there are other groups to which attention has not been drawn. One of these is the group of Bromeliaceæ. The accompanying illustration (fig. 163) shows a fine plant of *Puya chilensis*, which is 6 feet high and 6 feet through. It has been in this position for a number of years, and this year I hoped it would flower, but it is branching, and, I believe, therefore, that it is intending to spread laterally and not to flower. It grew from quite a small plant, and has long been a fine specimen. In winter it has the protection of a glass light overhead, and in severe weather mats are hung in front of it.

The Bromeliad next in height is *Greigia sphacelata*, half of which is shown in the picture on the left. It is about 3 feet high and as much through. It does not flower, but the mass of bright green foliage is distinct and attractive. One of the finest masses is formed by *Rhodostachy. pitcairniifolia*, which measures 3 feet through and is 2 feet 6 inches high. It flowers indoors sometimes, and has close heads of small, blue flowers seated in a rosette of bright red leaves; here it has not flowered, but the dark green, novel-looking foliage does not fail to attract attention. Two other kinds of *Rhodostachy*s are quite distinct from the last, but resemble one another. One is *R. littoralis*, which has leaves that are distinctly silvery below, and form a mass 4 feet through and 2 feet 6 inches high. Still more silvery is *R. andina*, which forms a mass of leaves 4 feet through and 2 feet high. All the fore-mentioned plants are natives of Chili. Native of Brazil, and quite hardy under the conditions provided, is *Dyckia rautiflora*, which has leaves spreading in rosettes on the ground and giving the idea of green, narrow-rayed star fish. It produces spikes of orange flowers which have been very ornamental during the summer and flowers are still trying to open. The species does perfectly well. *D. brevifolia*, also from Brazil, is more tender, but quite easily cultivated. All these Bromeliads have spiny-margined leaves which save them from any undue handling by the curious; all are sharp, and those of *Puya chilensis* are quite strong in character. One or two other kinds are being tried, and any other suitable kinds that can be obtained would have a trial in this position, the most important species for the purpose that occurs to me being *Puya Whytei*.

Another group of considerable interest is that of the Zingiberaceæ. *Zingiber mioga*, a native of Japan, does well, but it has not yet flowered; *Roscoea purpurea*, in two forms, also native of the Himalayas, has succeeded well for many years, and several species

FIG. 163. PUYA CHILENSIS GROWING OUT-OF-DOORS IN CAMBRIDGE BOTANICAL GARDEN.

xxx. First dorsal pore iv.-v. The setae are paired, though the two setae of each pair are more widely separated in the anterior segments; these setae are larger than those which follow. This species seems to be without integumental pigment."

The first authority to add anything to our scanty stores of knowledge was Dr. de Ribaucourt, who gives a very full description of this interesting creature in the *Dissertation on Sarc. Worms* which he prepared for his doctor's degree in 1896. As my Cambridge specimens exactly agree, in their adult condition, with his very accurate diagnosis, I shall follow very closely that author's description.

Dr. de Ribaucourt commences by saying that he collected numerous specimens in the humid earth found by the pools in the forest of Brengarten, near Bern, and he extends the account given by Michaelsen by adding new details.

papillae on the 11th segment similar to those often seen on *Lumbricus castaneus* and some other annelids.

The girdle, which is always an important organ in diagnosis, extends from the 22nd to the 32nd segment, and when young the dorsal pores can easily be seen here. The first three rings of the girdle seem not to be a part of the clitellum until the worm is adult, and its characters are attentively studied. The tubercula pubertatis are on segments 29 and 30, and these two segments are greatly enlarged ventrally. Sometimes the two adjoining segments, 28 and 31, are affected thereby; but there are no other papillae or glands on the girdle. The dorsal pores commence between the fourth and fifth segments.

The chief internal characteristic is found in the position of the spermatheca. These are very small, and are, therefore, difficult to discover. They occur, however, in the 10th and 11th seg-

of *Hedychium* are perfectly at home. They grow into fine masses, and among them are *H. flavescens*, *H. angustifolium*, *H. Gardnerianum*, and the hybrid *H. Sadlerianum*. Unlike the Bromeliaceae, these Zingiberaceae flower freely, are always ornamental, and in some cases strikingly handsome. Four genera are thus represented in this out-door culture. Others might succeed, but it is impossible to carry these experiments beyond a certain limit. *R. Irwin Lynch, F.M.H.*

WATERSIDE PLANTS AND WATER PLANTS.

NOTHING is more suitable for planting by the side of a large lake than *Gunnera manicata*. The handsome, gigantic leaves, some 8 feet or 9 feet across, are very attractive, and their reflection in the water is always beautiful. There

edge. The common *Calla* has been in flower from July up to the present time, but it produced the greatest show of blossom in July. The plants rivalling many of those grown in pots. *Nymphæas* are also indispensable subjects for planting in the water; some of the best are *N. Robinsoniana*, a vigorous-growing variety, producing large, violet-purple flowers shaded red, with orange-red stamens. *N. W. Doogue*, one of the choicest of Water Lilies, having cup-shaped deep pink flowers 5 in. to 6 in. in diameter. *N. sanguinea*, a bright crimson-flowered variety changing to deep red, very free in blooming; *N. James Brydon*, pink; *N. Ellisiana*, a brilliant shade of carnation-purple, very free and sweetly scented; *N. Marhaeca chromatella*, canary yellow; and *N. purpurata*, a sweetly-scented variety and free in flowering.

the Water Violet, is showy when in bloom, as also *Ranunculus lingua*. This plant grows rapidly, and soon requires thinning. *Vallisneria spiralis* is a suitable plant for covering large areas of water; it can be kept in check by thinning. The peltate leaves and yellow flowers float on the surface of the water. The Rice plant (*Zizania aquatica*) is also very effective; *Caltha polypetalata* is charming in the spring, and quantities should be grown to make a bold display in the water. Logs of wood or blocks of stones may be covered with *Primula rosea*, *P. japonica*, and *Caltha palustris*. *Carex longifolia*, *C. japonica*, *C. Grayi*, and *Cyperus longus* all grow well either in the water or on the bank; in either position they are effective. The species of *Pinguicula* grow in damp, boggy places. *Acorus calamus* (Sweet Flag) has aromatic foliage, and will grow either in water or on the banks where it can reach the water. *Funkias* are at home on the banks of streams, where they grow luxuriantly. *Lysimachia clethroides*, with its pretty white flowers, is an attractive subject during August and September. *Osmunda regalis* and its many varieties do well in the water garden and make stately plants. *Rodgersia podophylla* is an attractive plant, producing large, peltate leaves. *Lythrum roseum superbum*, with its bright rosy flowers, is very showy in August and September. *Gentiana asclepiadea*, with its arched branches of deep blue flowers, are attractive, and the beautiful *Gunnera scabra* is also imposing, especially when the red leaf stalks are prominent. *Gunnera magellanica* and *G. monoica* are small growing species. *Primula sikkimensis* is also well adapted for a cool, damp spot; when in flower the plants are very conspicuous. *Sarracenia purpurea* and its varieties are elegant types for the bog garden or waterside, as also are the Cobra-headed *Darlingtonias*, these being attractive all the year round. *Drosera longifolia* and *D. rotundifolia* are effective when planted in clumps between the *Darlingtonias*. Other elegant plants are *Saxifraga peltata*, which will grow to large dimensions, and various species of *Bambusa*, such as *B. Veitchii*, *B. Metake*, *B. palmata*, and *B. flexuosa*. *W. A. Cook, Leonardlee Gardens, Horsham, Sussex.*

RHEUM INOPINATUM.

This attractive little species from the Himalayas is quite distinct from most members of the Rhubarb family, which are all more or less of a coarse-growing and vigorous nature. While species like *R. palmatum* and others often attain a height of 8 feet or more, the maximum height of *R. inopinatum* is seldom more than 2 feet. It also belongs to that section of the genus, some species of which have few or no leaves on the stem. The grey-green, wrinkled leaves are from 6 inches to 9 inches long, and nearly as wide, borne on red-purple coloured petioles, about 6 inches long. They form a tuft of foliage, from amongst which the bright-red or crimson inflorescence is produced. Quite a succession of stems is produced, and the plant remains attractive for the whole of the summer months, the fruits being equally highly coloured. It is perfectly hardy in the open border, and seeds are freely produced. Seeds of *R. inopinatum* were collected by Capt. H. J. Walton, at Gyantse, in Tibet, in September, 1904. Some were received at Kew, and plants flowered for the first time in July, 1905. The illustration (fig. 164) shows a two year old plant grown from seed ripened here. Another dwarf-growing species from the same region is *R. acuminatum*, which is said to be the common Rhubarb of the Sikhs in Himalaya. Like the above species it is found at high elevations, and seldom exceeds 3 feet in height, with deep red-purple stems and inflorescence. Both of these make interesting border plants, but while *R. inopinatum* is perennial the other usually dies after flowering. *R. inopinatum* is figured in the *Botanical Magazine*, tab. 8189. *H. L.*

FIG. 164.—RHEUM INOPINATUM AT KEW.

[Photograph by W. Irving.]

plants are at home on the water's edge, and they are best grouped several crowns together, say a few yards apart. They will attain their maximum size about three or four years after planting. *Primula rosea* and *P. japonica*, if planted in masses between the *Gunneras*, provide a display of flowers in the spring. One of the prettiest sights in the water garden at Leonardlee has been afforded by *Spiraea arifolia* as a background with a broad batch of *S. palmata* in front. Other *Spiræas* suitable for the water garden are *S. japonica*, *S. astilboïdes*, *S. gigantea*, *S. compacta*, *S. multiflora*, and *S. Davidii*. These all do remarkably well on the water edge. *Liliums* are effective, and such species as *L. Ansonii*, *L. superbum*, *L. pardalinum*, and *L. croceum* do well on the water

Aponogeton distachyon is a perfect gem as a water plant, the white flowers being set off with purple anthers and scented like Hawthorn.

Calla palustris, the Water Arum, has pretty white flowers, which grow about 6 inches or 7 inches above the water. *Menyanthes trifoliata*, the Bog Bean, is a free-growing plant, the pink fringed flowers resembling those of the Horse Chestnut. *Myriophyllum proserpinacoides* (Green feather) has very pretty cut leaves. *Butomus umbellatus*, the Flowering Rush, has stately inflorescences of pink heads, set off by the Rush-like foliage. *Sagittaria japonica* produces large, white flowers, which rise about 18 inches above the water. There is a double form called *S. japonica fl. pl.*; this is wonderfully attractive and easy to grow. *Hottonia palustris*,

COLONIAL NOTES.

ADANSONIA DIGITATA (BAOBAB TREE).

I HAVE just read in the *Kew Bulletin*, No. 3, 1910, p. 98, an interesting article entitled "Baobab Trees Used for Storage of Water," and, as I did so, it occurred to me that a note from Tobago on this same tree may be of interest to some readers of the *Gardeners' Chronicle*. In the neighbourhood of Scarborough (the capital of the island) there are a few large specimens which flower and fruit regularly and freely. The shell of the fruit is hard and gourd-like in form. In the island of Grenada—and, so far as I know, in Trinidad too—the fruits never mature. Here they ripen, and are known as "Guinea Tamarind." I am informed that the ripe fruits are sent to Trinidad for sale, the dry, pulpy substance in which the seeds are embedded being eaten.

CASSIA JAVANICA.

For several weeks past two trees of this magnificent member of the Leguminosae have been flowering in the Botanic Gardens of Tobago. Here it is known as the "Apple-blossom Cassia," reminding those of us who remember the Apple orchards of England of Blossoming time. The upper parts of the branches, for many feet in length, are clothed with beautiful and fragrant flowers. A small plant of this same Cassia was planted on Arbor Day (November 9) last year at the foot of Burnett Hill, Scarborough, where it has thriven in a satisfactory manner. One or two of our chief planters are placing dozens of it around the outskirts of their Cocoa estates. I am indebted to the kindness of the Director of the Royal Botanic Gardens, Kew, for identifying the plant under the name *Cassia javanica*; it is known here as *C. marginata*. *W. E. Broadway, Tobago.*

The Week's Work.

THE ORCHID HOUSE.

By W. H. WHITE, Orchard Grower to Sir Frevor Lawrence, Bart., Birtford, Surrey.

Schomburgkia.—Plants of the warm-growing section of this genus which have cylindrical pseudo-bulbs as *S. tibetica*, *S. Humboldtii*, *S. Sanderiana*, *S. Thomsoniana*, *S. Kimballiana*, *S. Chionodoxa*, and its variety *rosea*, should be raised well up to the roof glass of the hottest house. When growth is completed, light sprinklings of water on the surface of the soil will be all that is required for several months to come. Those of the fastum section as *S. Lyonsii*, *S. undulata*, *S. rosea*, and the winter-flowering *S. crispata* do not require nearly so much heat, the Cattleya house and Cattleya treatment being alike suitable for them. *S. Humboldtii*, owing to its scanty habit, does best when fixed to a block of wood, or teak raft. Whilst making its growth, the plant should be well syringed overhead several times a day, but when at rest one watering a day is sufficient. The other species enumerated thrive well when potted very firmly in well-drained *Osmunda* fibre. The best time of repotting is soon after growth commences, or just when new roots are making their appearance.

Cypripedium.—The warmth-loving *Cypripediums* are now growing very freely, and may still be lightly sprayed overhead two or three times a day when the weather is bright, and the temperature sufficiently high, but the long, flat-leaved species as *C. Stonei*, *C. laevigatum*, *C. Parishii*, *C. Lowii*, and *C. Rothschildianum*, though requiring plenty of water at the root, should not be damped overhead in winter, as water is apt to settle in the growths and cause decay. Any of these *Cypripediums* on the shady side of the East Indian house which have become pot-bound may be repotted at this season. They grow vigorously in well-drained pots, and in a mixture of equal parts of fibrous loam, *Osmunda* fibre, and sphagnum moss. Care must be taken to mix beds of small crocks with the material, as the plants when in full growth require an abundant supply of water. Many of the cooler-growing species and hybrids are now in bloom or developing their flowers; in the case of large specimens,

see that spikes are not being bent down by the heavy foliage. Afford the plants plenty of water at the root till the flowers open, when the quantity should be considerably reduced.

Intermediate house.—Plants of *Masdevallia tovaensis* are now sending up their pure white flowers, which appear well above the dark green foliage. Keep the plants in the coolest and shadiest part of the house, and the flowers will last in good condition for many weeks. When vaporising the house with the XI-All compound, it is advisable to remove the plants to another house, as the fumes often turn the tails of the flowers to a pinkish hue. At this season every care should be taken in watering this *Masdevallia*, as too much water at the root, if only for a short time, will cause many of the leaves to decay at their base and fall off. Plants of *Odontoglossum pulchellum*, *O. platycheilum*, and *O. Londesboroughianum*, having finished their growth, should be placed in a somewhat dry, light position in this house, affording them only just sufficient water at the root to keep the pseudo-bulbs plump. Any plants of *Zygopetalum maxillare* and its variety *Gautieri* that have started to grow and need fresh material, should now be given attention. This plant is invariably imported upon pieces of Tree Fern, and when the new growths are likely to exceed the length of the Fern block, we simply wire another piece of Tree Fern on the top of the old one, and the plant, if vigorous, soon takes hold of the added portion. Suspend the plant in a shady part of the house, keeping each growth perfectly clear of small yellow thrips, and never let the block get in the least dry.

Cool house.—Now that plants of *Odontoglossum Uro-Skimmeri*, *O. biconense*, and *O. B. album* are growing fast, they may be potted if necessary, and it is essential to their well-being that the potting material of *Osmunda* and sphagnum-moss be made thoroughly porous. These species should be placed at the drier and warmer end of the house.

THE HARDY FRUIT GARDEN.

By A. K. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

The Fig.—In gardens where severe frosts are usually experienced, the branches of the trees should be unfastened from the wall and tied together in bundles of a convenient size. This will allow them to be readily protected with Bracken Fern, straw or mats. See that each bundle is fastened securely to the wall, otherwise the wind may cause them to be chafed in rubbing against each other.

Bush Fruits.—Bush fruits are easily propagated from cuttings, and it is a good plan to insert a few shoots of the best varieties each season. By doing so a supply of young bushes will be always available for filling any gaps caused by dead trees or to replace old and worn-out specimens. It must be remembered that young bushes produce much the finest fruit, and it is not advisable to retain old specimens that are deteriorating. In the case of Red and White Currants and Gooseberries, select as cuttings young shoots of medium strength, making them about 12 inches in length. Remove with a sharp knife all the buds, with the exception of three or four at the upper end. This will cause the plant to make a "head" on a clear stem, and prevent the formation of ground suckers. In planting the cuttings, make a trench about 8 inches deep, placing some old potting soil at the bottom. Plant the base of the shoots in the added mould, and then fill in with the ordinary soil, making it firm as the work proceeds. Black Currants may be propagated in a similar manner except that no buds are to be removed, as it is desirable to encourage the development of as many basal growths as possible, so as to permit of a certain quantity of the old wood being removed annually, as the Black Currant fruits on the young wood. If it is desired for any special purpose to train the Black Currant with a stem, adopt exactly the same system as advised for the other sorts.

General work.—When the ground is hard with frost, take advantage of the time to wheel manure to the fruit quarters, placing it in convenient heaps ready for spreading beneath the trees when pruning is finished, and the ground cleared of the rubbish. Newly-planted trees should have the permanent labels attached before the writing on the paper labels is obliterated by rain. Fresh

labels may, where they are needed, also be attached to the other trees. The work of preparing the labels may be done indoors when the weather is too inclement for outside operations. Metallic labels, with raised letters, are the best for the purpose, as they are practically indestructible.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Cauliflowers.—Cauliflower plants potted a month ago, standing in cold pits, should be allowed all the ventilation possible. The lights may be removed during the day and replaced again at night, leaving them open a few inches at the top in order to promote a sturdy growth. Afford water carefully, or the plants will become too succulent to withstand the cold of winter. There is yet time to pot up young seedling Cauliflowers for planting in April. If they are potted moderately firmly in good, rich loam they will fill the pots with roots, and provide a valuable successional batch to those potted a month ago.

Broad Beans.—If an early supply of this vegetable is desired a small sowing may, provided the ground is in a fit condition, be made without delay. This sowing should be made in a sheltered part of the garden, where the soil is not too heavy; for, although the Broad Bean succeeds best in a somewhat heavy soil in summer, it would not be advisable to sow them in such a medium now. If the ground has been trenched and manured in readiness, the seed may be sown in rows 3 feet apart, and covered with 3 inches of soil. Some seeds should be sown in a box at the same time, and placed in a cold frame for the purpose of providing plants for filling any gaps in the rows.

Chicory.—The crowns may be lifted now and placed in the forcing pit or Mushroom house, where it is perfectly dark. A temperature of 55° is sufficient to force Chicory. A damp, stagnant atmosphere must be avoided or the young growths will soon decay. If a small quantity only is required, Chicory may be grown in pots in the same manner as Seakale. Six good crowns will be sufficient for each 8 inch pot. Make the soil moderately firm, leaving about 1 inch of the crown uncovered. When growth commences a pot of the same size may be placed over the crowns in an inverted position. If the soil is in a moist condition at the time of potting little or no water will be necessary, but if the soil is dry, a good watering should be given as soon as the potting is finished. Dandelion may be lifted and forced in the same manner as advised for Chicory.

Lettuce.—Young Lettuce plants growing in cold pits, and intended for planting out in the spring, should be afforded fresh air freely to keep them from damping. All decaying leaves should be removed, and the soil amongst the plants stirred with a small hoe, when a sprinkling of lime or dry ashes should be applied as a precaution against damping and a deterrent to slugs.

Early Carrots in pits.—Where pits are available, a sowing of Carrots should be made in the early part of December. No fire heat is necessary for this crop, however severe the weather may be, provided a bed of fermenting material is placed in the pit. Leaves make the best hot-bed for this purpose, the heat from them being more lasting and of a milder nature than when manure is employed. When the leaves have been collected and allowed to remain for ten days, they may be turned, placed in the pit, and trodden tightly together, leaving the surface as even as possible. Place a 9 inch layer of soil over the bed; loam which has been removed from a Melon house is suitable. The soil should be made moderately firm and level with a wooden rake previous to sowing the seed, which may be done either in drills, made 4 inches apart, or broadcast. Some growers sow Lettuce and Radish with this crop, but this is not advisable. During periods of severe frost, a covering of Fern or some other protective material should be placed over the pit in sufficient quantity to exclude the frost. Early Scarlet Horn is still one of the best varieties for this sowing. Other good sorts of Carrot for frame culture are Parisian Forcing and Early Gem. As soon as the young plants appear slugs must be guarded against, and, if necessary, a sprinkling of lime applied.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Bougardia.—The earliest batch of Bouvardias will soon have passed their best flowering stage; the flowering shoots may be shortened somewhat and the plants transferred to a moist, warm atmosphere. Let them be given alternate waterings of liquid manure from the farmyard and some approved chemical fertiliser, and they will flower freely again early in spring. If the plants have been attacked by aphids or red spider, these pests may be thoroughly eradicated by syringing occasionally with insecticide, and fumigations with a nicotine compound.

Anthurium Scherzerianum.—The brilliant, scarlet spathes of *A. Scherzerianum* are exceedingly decorative in the short, winter days, and are useful for mixing in cut flower arrangements, as they are capable of lasting in good condition for a considerable period after being cut. In order to get the best plants for flowering in winter, the cultivator should either propagate them by cuttings early in spring, or seedlings should be raised in the previous autumn. The plants require considerable heat and a moist atmosphere throughout the growing season, and such spathes as show themselves should be removed early until about the month of September. In that month, the plants should be transferred to a house in which the conditions are somewhat drier, and ventilation should be afforded on all favourable occasions in order to keep the spathes dry.

Anthuriums with ornamental foliage.—Fine, foliage species and varieties of *Anthurium* should be given a season of rest by slightly reducing the atmospheric temperature, but not lower than 60°. The roots may also be kept somewhat drier during the winter.

Euphorbia (Poinsettia) pulcherrima.—The plants of this species have almost completed the development of their brilliantly coloured bracts. The grower must take great pains not to apply more water than the plants require, as any excessive moisture at the roots at this season will cause loss of foliage. The use of artificial manures should be discontinued, but occasional waterings with clear soft water will be beneficial. The growths of *Poinsettia pulcherrima* are sometimes cut for use with other cut flowers for table decoration. In such cases the plants must not suffer neglect afterwards, but, on the contrary, they should be placed near to the glass in full light, and the water supply lessened gradually in order that the plants may mature. Later the stems may be shortened, and when this has been done the plants should be stored in a dry position, where the temperature will not fall below 55°.

Propagating Chrysanthemums.—In gardens where numbers of *Chrysanthemums* are cultivated for exhibition purposes it is time to commence to propagate the late-flowering varieties. Speaking more particularly for the northern districts, there is great difficulty in securing second crown buds from plants which are rooted later than the first fortnight in December. For propagating, a shallow box should be placed in a cool greenhouse or frame, where frost can be excluded. Loose pieces of glass should be placed over the top of the box to prevent drooping until the cuttings have formed roots. The pieces of glass should be reversed each day, placing the dry side next to the cuttings. Cuttings should be selected from the free-growing shoots at the base, say, shoots 5 or 6 inches in length, and utilising the first 3 inches for forming the cutting. Stem cuttings are not advisable, as they flower prematurely. If they are available, thumb pots should be used, keeping the cuttings singly in the pots close to the edge, and taking care that the base of the cutting rests firmly upon the soil in the pot. As soon as the cuttings are seen to be making growth they should be accustomed gradually to increased ventilation and light before they are removed from the case. They should be kept growing steadily through the winter until it is safe to transfer them to cooler pits or frames. It is desirable to examine the cutting pots at intervals of a week or so in order to repot any of the stronger-growing varieties before the general repotting into large 60-sized pots is carried out. The cuttings and plants generally must be kept free from Aphides by frequent syringing with a weak insecticide.

FRUITS UNDER GLASS.

By E. GOODACRE, Gardener to Sir ERNEST CASSELL, G.C.B., Monlton Paddocks, Newmarket.

Forcing of Strawberry.—To obtain ripe Strawberries early in the new year, a batch of plants may now be started, preferably such plants as are in 5 in. pots. Select strong, well-rooted plants, with prominent crowns, and give the roots a good soaking with lime water. When they have drained, prick up the surface soil, and lightly top-dress the plants with a little fresh compost. About a week before selecting the plants, a hot-bed should be made up. Mix two parts leaves to one of horse-mannure, and after allowing time to sweeten, tread the mixture into a frame to a depth of 2½ or 3 feet. Plunge the plants to the pot-rims in the hot-bed, keeping them within 6 inches of the glass. Care must be taken that the bottom heat does not become excessive, otherwise the roots will suffer. The atmospheric temperature of the frame may range from 50° to 60°, admitting air whenever the conditions are favourable. It will be necessary to admit air at the higher end of the lights for some time when the bed is new, to allow the ammonia fumes to escape. On bright days, a gentle spraying with tepid water will be beneficial, but regular syringings are unnecessary, and they do more harm than good when the weather is dull and cold. Under the influence of the bottom heat, new leaves will develop, and when the flower spikes can be seen the frame may be kept at about 55° to 60° at night, covering the glass with a mat during severe weather. When the inflorescence is well up, remove the plants to a shelf in some of the early fruit houses where there is an atmospheric temperature of 60 to 65 at night, but do not place them where they are exposed to the draught from the ventilators, this very often being the cause of flowers falling to set.

Tomatoes.—Winter fruiting plants must be kept fairly dry at the root, giving them water only when the soil is dry, but not in such a state as to cause the plant to flag. The atmosphere should also be kept reasonably dry and freely ventilated, the temperature ranging from 55 at night to 65° or 70° by day with sun heat. Endeavour to set the flowers as they open by gently tapping the trellis during the middle of the day, in order to liberate the pollen. Light top-dressings of loam mixed with a little bone-meal may be given occasionally as the roots appear on the surface. See that the glass is kept thoroughly clean, so as to admit light. Keep superfluous growth in check, and expose the fruits fully to the sunshine.

Cucumbers.—During frosty weather, a covering of mats, canvas, or even long litter, placed on the roof-glass will be of great assistance in maintaining the required temperature with a minimum amount of fire-heat.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Lawns.—Nothing tends so much towards the general good appearance of an establishment as well-kept grass lawns, occupying, as they do, such prominent positions in the near precincts of the mansion. At this season, the grass will be much stimulated by frequent brushings and rollings, the latter when the sward is not too soft. A liberal dressing of either horse-droppings, leaf-mould, or soil, such as old putting material, may also be applied, together with a sprinkling of bone-meal, which will act as a stimulant to the grass during the winter and spring months. Avoid the use of any quick-acting manure at this season, as extra activity at the present time is not needed. If it is necessary to re-level any portion, or lay new turf in places where it has become much worn, such as frequently happens underneath the shade of large trees and where there has been much traffic, this work should now be taken in hand. Before placing the new turves in position, spread a little new earth on the ground, raking it to a fine tilth. Many people think that fine, grassy turf is absolutely necessary, but such is not the case. Good strong-growing turf, as cut from a pasture meadow, will serve well enough, and though this may look unsightly for a time, upon the eradication of the weeds in spring, it will make an excellent seed-bed. It should then be treated with finely-sifted soil, and some good lawn mixture sown. Make

the new material thoroughly firm, and place some protection to prevent persons from walking over it. Where there are glass borders to paths and drives, it frequently happens that, owing to the use of the edging tool, these lose their shape. In such cases the proper width should be measured, and pegs inserted, and the verge brought out so far as, when trimmed off, to be of the proper width. Fresh turf is laid in the intervening space, and made thoroughly firm, after trimming off the rough grass with a pair of hand shears.

Trees and shrubs.—The weather has been fairly favourable for the work of planting. For the removal of good-sized specimens, a trench should be worked round, and an attempt made to secure the roots intact with a good ball of earth. Take the greatest care of fibrous roots that project beyond the ball, by tying these back. For removing the tree, we use a strong wooden trolley on rollers. When the roots are sufficiently undermined, the edge of the trolley is placed underneath the ball and the edges supported with stout planks until the roots are free, when they are matted up and hauled on with ropes, and tied secure. Planks are placed under the rollers in a slanting position, for the whole thing to be hauled out; the tree can then be removed to any distance with absolute ease. Should the soil be so light and dry that a ball cannot be secured, I would suggest that the wood be pruned severely, as, when the sap rises, it will cause increased activity at the base. Make all specimens thoroughly secure by staking or supporting them by wires, securing these to the stem over some soft material such as sacking, and to stout pegs in the ground. Always plant the heaviest side of the tree to the west, as from this quarter we usually get the strongest winds. The present affords a good time for overhauling stakes and ties on all shrubs and trees. The new form of tree ties that I introduced have much to recommend them. Before, we used to lose or spoil many promising young trees, owing to their leaders becoming cut into, by tying with string, but these newer ties, owing to their width, hold securely and effectively, until, in the course of time, they become rotten.

THE APIARY.

By CULTORIS.

The Isle of Wight disease.—This disease has made its appearance in England, and as its symptoms are not well known, it will be well to describe it in some detail. The disease destroyed nearly all the bees in the Isle of Wight in 1906, hence its name in this country. On the Continent it is known as the "May Pest," because it often makes its appearance during the month of May. About 60 years ago, following the cold and wet springs, this epidemic attacked nearly all the apiaries of west-central Europe, leaving probably less than 20 per cent. unimpaired. From this it will be seen it is not an unknown disease. The bees, on being attacked, run about the alighting board in a very unnatural manner. They do not attempt to fly, and may often be seen falling to the ground, there to creep about until they come to blades of grass, up which they creep, and from thence attempt to fly, only to fail. The number of bees on the ground increases as time goes on, and every blade of grass within a square yard of the hive has one or more bees on it. When evening comes, they form clusters for warmth. If the nights are cold, they die. Some who have studied the epidemic very closely say that the pollen has been injured by the frosts occurring at this time of the year, and this, together with fermented feed made from poor sugar, has brought about the disease. If the abdomen of the infected bees is carefully examined, it will be noticed that it is slightly enlarged, and in it will be found, at the end of the large intestine, a small ball of imperfectly-digested pollen.

How to treat it.—Generally speaking, it will be well to destroy all colonies that are suffering from the epidemic, and then cut out all combs and burn them, too. The frames and hives should then be thoroughly washed in boiling water, using carbolic soap. When dry, and after standing in the fresh air, the whole should be painted with a solution of Calvert's No. 5 carbolic, using one-half the quantity of disinfectant as water. The hives and frames may then be safely used for swarms or stocks purchased.

EDITORIAL NOTICE

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR DECEMBER.

THURSDAY, DECEMBER 1—
R.H.S. Colonial Fruit and Vegetable Exhibition (3 day).
SATURDAY, DECEMBER 3—
Soc. Franç. d'Hort. de Londres meet.
TUESDAY, DECEMBER 6—
Roy. Hort. Soc. Coms. meet. Scottish Hort. Assoc. meet. British Gard. Assoc. Ex. Council meet. National Vegetable Society Annual Meeting.
MONDAY, DECEMBER 12—
United Hort. Ben. & Prov. Soc. Com. meet.
WEDNESDAY, DECEMBER 14—
Nat. Chrys. Soc. Conference & Lsh. at 4-sex Hall, Strand.
SUNDAY, DECEMBER 25—
Christmas Day. Quarter Day.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—41°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, November 23 (6 P.M.): Max. 41°; Min. 27°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London. Thursday, November 23 (10 A.M.): Bar. 30.1; Temp. 42°; Weather—Dull.

PROVINCES.—Wednesday, November 23: Max. 53 Cornwall; Min. 32° Hull.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.
TUESDAY—
Special Sale of Roses, &c., at 12.30; Palms and Plants at 5, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.
WEDNESDAY—
Miscellaneous Bulbs, &c., at 12; 2,247 cases Japanese Lilioms, at 2.30, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.
FRIDAY—
Established Orchids from the late Mr. Drewitt O'Drewitt's collection, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Our Public Parks.

The lecture by Mr. Pettigrew at the Horticultural Club on Tuesday last called attention to the many and varied directions in which the public parks of this country are made to serve the interests of those who dwell in densely-populated districts. Notwithstanding all that has been written on the subject, it may well be doubted if the important part which the parks play in the social welfare of large towns and cities is realised perfectly by those for whose benefit they exist. That they do, in some vague and indirect way, contribute to the general health of the localities immediately surrounding them is admitted, while the demand for dwellings in their vicinity is, in itself, a striking testimony to their popularity as residential neighbourhoods. Beyond this general appreciation, however, the average householder seldom goes: contenting himself with numbering public parks among the amenities of town life.

With the definite knowledge that fresh air and sunlight are potent antidotes to certain forms of disease, the public park is shown to be an institution of a definite and high value. In the future, a public park sys-

tem will be considered as necessary in town development as a proper scheme of drainage.

In addition, moreover, to their special value in the direction indicated, the parks provide means of out-door recreation which may be enjoyed by the community at large, and Mr. Pettigrew laid emphasis on this branch of the subject. At the present day, most towns provide facilities, according to their several powers, for bowling, tennis, cricket, golf, football, boating, fishing and swimming.

This fact does not make the parks any the less horticultural in their main character. On the contrary, it may be said that in many towns the extended provision for games in the parks has been accompanied by a corresponding increase in their horticultural attractions. We recognise, in common with all intelligent people, that a public parks department is primarily a horticultural institution, and we have frequently devoted space in these columns to articles dealing with the special work which superintendents are called upon to carry out in parks, believing, as we do, that the narration of the experiences of those charged with responsibilities in some of the principal towns is a means of encouraging others to put forth their best efforts for the development of the proper ideals over the whole country. In this connection, we are pleased to note that Mr. Pettigrew made it perfectly plain that the major portion of the work carried on by a public parks department is of a purely horticultural character, and, that the most attractive features of a park in the appreciation of the general public are just those things which are the recognized work of a trained horticulturist. It is the flowers, the green sward, the trees and shrubs, the arrangement of colours, and the wild woodland which constitute the irresistible attractions of public parks.

There is, however, much to be done before the full possibilities are realised. The superintendents require greater experience with trees and shrubs in order that other species may be added to the number in general cultivation. We are not satisfied that the parks in London and elsewhere present that variety which recent introductions have rendered possible. There is often too much repetition of the commoner shrubs and too little diversity in the flower garden. Like most other people, gardeners are apt to become copyists in the sense that they imitate one from another certain features which have commended themselves to their taste, with the result that one park is too nearly like another. In London, for instance, where numerous parks are under the control of one authority

for example, the London County Council it should be possible to so develop particular features in different parks as to give to each a special value and distinction. But this result cannot be obtained if the several superintendents work entirely independent of each other and unaided by informed initiative from headquarters. It requires a scheme, drawn up with great care, by a chief officer possessed of horticultural knowledge and experience. In this scheme, each park would form a unit related to and depending upon all the other units constituting the park system. In some of these respects London, if it would, might learn much from Glasgow, where Mr. Whitton is doing such excellent work. Moreover, in relation to the de-

velopment of the parks it is important to devise means of raising the standard of the gardeners employed in them. The art of cultivation is a progressive art, and one which requires all the abilities of the best men obtainable. Much experience and considerable study are essential for the production of such men, and the rewards offered the gardeners in the shape of salaries and opportunities for advancement ought to be such as will compensate them for the time and labour expended in the acquisition of these qualities. At present, in London, and also in certain provincial towns, few or none of the conditions which we have laid down are fulfilled. The chief officer is only too often appointed by reason of qualities of secondary importance. The superintendents are isolated instead of being united, and the gardeners are, in not a few instances, but ill paid. Mr. Pettigrew deserves the thanks, not only of gardeners, but of the whole community, for drawing attention to the great and as yet inadequately realised possibilities for improvement and extended usefulness which our public parks present.

OUR SUPPLEMENTARY ILLUSTRATION.—Our issue for August 13 last contained a descriptive note, with illustrations, of the Earl of Onslow's charming gardens at Clendon Park, Surrey. Reference was then made to the water-garden and Lily pool, and the choice perennial plants which ornament the banks of the water. In the present Supplementary Illustration is shown a view of the Lily pool with most of the plants in flower. Between the pool and the Maori Council House can be seen a fine specimen of *Gunnera manicata*. The picture is one that should inspire others to obtain for their own gardens the beautiful effects that peculiarly belong to aquatic flowering plants.

FLOWERS IN SEASON.—MESSRS. H. CANNELL & SONS, Swanley have forwarded some pretty varieties of single Chrysanthemums, a selection of "collarette" Dahlias and blooms of their salmon-coloured sport of Paul Crampel Pelargonium. The Chrysanthemums include the varieties Red Start (red), Honeysuckle (white), Golden Pagram (yellow), Miss Janet Curtis (rose-pink), and Mrs. F. A. Collet (bright terra-cotta).

ROYAL AGRICULTURAL.—A horticultural exhibition will be held in conjunction with the society's meeting at Norwich next year. The dates are fixed for June 27 to June 30. The schedule includes some 25 classes, of which half the number are open to all comers. The most important class is for a group of miscellaneous plants arranged on a space of 350 square feet. Three prizes, of the value of £30, £25, and £20, are offered. There are also classes for Orchids, Carnations, Begonias, herbaceous flowers, Roses, Sweet Peas, vegetables, and fruit. The arrangements of the horticultural section are under the management of Mr. PETER BLAIR, Trentham Gardens, Stoke on Trent.

LINNEAN SOCIETY.—The next general meeting of the Society will be held on Thursday, December 1, at 8 p.m. Exhibitions:—1, Mr. G. C. DROCE, *Utricularia ochroleuca* and *U. Bremii*, from Ireland, and *Charophyllum aureum* and *Arabis alpina* from Scotland. 2, Miss IDA M. HAYWARD, aliens introduced into Tweedside with foreign wool. Papers:—1, Capt. C. F. U. MEEK, "Spermatogenesis in *Stenobothrus*." 2, Dr. OTTO STAFÉ and others, "Reports on the International Congress of Botanists held at Brussels in May, 1910."

SOUTHAMPTON CHRYSANTHEMUM SHOW.—

In addition to the non-competitive groups mentioned in our report of this show on p. 380, a group of stove and greenhouse plants was exhibited by the Hon. Mrs. ELIOT YORKE, of Hamble Cliff (gr. Mr. G. T. Turner), and received the society's Gold Medal. A collection of Palms and other decorative plants was shown by the President, Lord SWAYTHING (gr. Mr. T. Hall), the group being awarded a Silver Medal.

WOLVERHAMPTON HORTICULTURAL CLUB.—

Mr. J. F. SIMPSON having resigned the position of honorary secretary of this Club, Mr. ALFRED DOBBS (Messrs. Tom B. Dobbs & Co.) has undertaken the duties till the end of the year, at the unanimous wish of the members.

MR. T. E. HENWOOD.—

The honorary secretary and treasurer of the National Carnation and Anemone Societies, Mr. T. E. HENWOOD, having reached his twentieth year of office, it is proposed to present him with a suitable testimonial at the joint annual meeting of these societies. The preliminary list of subscribers includes Mrs. Martin R. Smith, Sir John T. D. Ewellyn, and Messrs. Leopold de Rothschild, H. R. Taylor, Robt. Morton, G. H. Lawrence, F. W. Price, Walter Shipman, J. J. Sheldon, W. Lightbody, J. Sargeant, J. Douglas, Senr., J. Douglas, Junr., and William Smith. Subscriptions may be forwarded to Mr. JAMES DONALD, Junr., Ednam, Great Bookham, Surrey.

PRESENTATION.—

Mr. G. BRISTOL has been appointed farm bailiff to Mrs. LAMBERT, of the Manor House, Effingham, Surrey, after serving for many years as gardener to the late Mr. CHARLES E. LAMBERT. To mark the 20th anniversary of his service with the family Mrs. LAMBERT has made him a suitable presentation. Mr. BRISTOL is a member of the Effingham Parish Council, and takes an active interest in the men's club.

PRESENTATION TO MR. J. UDALE.

On Saturday, the 19th inst., Mr. UDALE, horticultural instructor for the county of Worcestershire, was presented with a silver epaulette by school teachers who have attended his courses of instruction in horticulture during the past three years. During 1910, 40 teachers have attended the course of instruction provided by the county council at the County Experimental Gardens, Droitwich. At the end of the season an informal examination is held and certificates of proficiency granted, according to merit.

THE BOTANICAL MAGAZINE.

The issue for November contains illustrations and descriptions of the following plants:—

XERONEMA MOORII, tab. 8542. This member of Liliaceae develops a striking inflorescence of red-dish-purple flowers, the flower-bearing portion assuming a sub-horizontal direction. All the flowers are borne erect on the upper surface of the rachis. The long ensiform leaves have a character like those of some lilies. The plant is a native of the mountains of New Caledonia, growing at elevations of from 3,000 to 5,000 feet. The flowering season is June.

PLEIOCARPA MUTICA, tab. 8545.—This stove plant bears axillary, many-flowered globose clusters of blooms; and opposite, elliptic or oblong leaves. It forms a shrub about 5 feet high. The species is found wild in the Cameroons, where it was discovered by Mr. G. MANN. It is also met with in Old Calabar, from whence it was introduced to European gardens. The plant needs a similar treatment to that afforded *Ixoras*: it makes a handsome subject when in flower, the beautiful white blossoms being produced in profusion.

COLUMNEA OERSTEDIANA, tab. 8544.—In common with most Gesnerads, this species of Columnea bears strikingly handsome flowers. According to the description in the text they are pink-coloured, but the illustration shows them a full red. The species is a native of Costa Rica,

the same region in which the beautiful *C. magnifica* was discovered. A plant of *C. Oerstediana* flowered in Colonel BEDDOE'S garden at Putney, and supplied the material from which the plate was prepared.

PYRACANTHA ANGUSTIFOLIA, tab. 8545.—*Pyracantha angustifolia* was introduced to cultivation by Mr. M. L. DE VILMORIN, seeds having been sent to that gentleman by SOLIÉ from Eastern Tibet, in 1895. The species is apparently best suited for gardens in favoured districts as, although plants at Kew have survived the winter, they require a long spell of sunny weather to perfect their crop of bright orange-coloured berries. It would probably succeed on a sunny wall, but is hardly likely to be of such value as some of the species of *Crataegus* and *Cotoneaster* as a wall plant. In Mr. DE VILMORIN'S garden on Les Barres the original plant develops a plentiful crop of berries, which colour well in the autumn. A specimen in the garden of Torquay, Torquay, supplied the materials from which the illustration in the *Botanical Magazine* was prepared. The flowers are whitish and produced in corymbs.

HOULETTIA SANDERII, tab. 8546.—This species was described by Mr. ROLIE in *Gardener's Chronicle*, 1910, vol. xlvii, p. 206, and it is nearly allied to *H. Lowiana*. The species was imported from Peru by Messrs. SANDERS & SONS, St. Albans.

THE ORCHID WORLD.—The November number, the second issue of this new Orchid periodical, edited by Mr. GURNEY WILSON, is to hand. One of its attractions is a note on Walton Graze and its Orchids, with a fine portrait of their owner, Mr. WILLIAM THOMPSON. A well illustrated article on *Phaleopsis*, illustrations of Sir GEORGE L. HOLFORD'S fine *Cypripedium Shogun* and of Mr. E. V. Low's *Cypripedium King George V.* are also given, together with other interesting subjects.

PUBLICATIONS RECEIVED.—*Carnations, Picotees, and Pinks*, by T. W. Sanders, F.L.S. (London: W. H. and L. Collingridge.) Price 2s. 6d. net.—*Monmouthshire Education Committee: Report of the Director of Agricultural Education*, July 13 and October 19. *The Charm of Gardens*, by Dion Clayton Calthrop (London: Adam and Charles Black.) Price 7s. 6d. net.—*The Estote Magazine*, November, 1910. (London: Spottiswoode & Co., Ltd.) Price 6d.—*Royal Botanic Gardens, Kew: Bulletin of Miscellaneous Informaticn, 1910.* (London: Darling & Son.) Price 1d.—*Plant Animals: A Study in Symbiosis*, by Frederick Keeble, Sc.D. (Cambridge: University Press.) Price 1s.—*Weather Instruments and How to Use Them*, by D. W. Horner. (London: Witherby & Co., High Holborn.) Price 6d.—*The Journal of the Board of Agriculture*, November, 1910. (London: R. Clay & Sons, Ltd.) Monthly. Price 1d.—*The British Fern Gazette*, edited by Charles T. Drury. December. (Kendal, Westmorland: The British Pteridological Society.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

FLOWER SHEATHS OF LELIAS AND CATTLEYAS.—Mr. White, in his notes upon Orchids (see p. 375), recommends growers to "see that the old flower-sheaths are cut off close down to the apex of the pseudo-bulb." May I venture to suggest a little dodge, which here we find most effective, and, I think, simpler than cutting? When about to pluck a *Laelia* or *Cattleya*, take the tips of the sheaths between the finger and thumb of either hand, pull them sharply apart, and rather downwards; they will come away quite readily right at the very root of the stalk, where it issues from the bulb. That one of our very largest Orchid growers expressed himself as very much struck with this method when he happened to see me do it one day emboldens me to make the suggestion to the renowned experience of Burford, *John Edwards-Moss, Roby Hall, Torquay.*

LATE PEAS.—In reference to Mr. A. Hough's note (see page 371), I may say that we have gathered several good dishes of Peas during October and up to the middle of November for several years past, from sowings made in the latter part of June. The latest date on which we have picked Peas here being November 19. The varieties on which we rely for late supplies are Latest of All and Autocrat. Although situated in the south, this locality is a cold one. *Wilmot H. Yates, Rotherfield Park Gardens, Allon, Hants.*

ONION CROP.—I have weighed my crop of Onions sown in the open on March 4, and from 4 perch 20 square yards I have 987 lbs. weight of bulbs of average size. The varieties were Long Keeping, Sutton's M1, and Improved Reading. For the above crop 1½ ounces of seed was sown, and the thinning cost sixpence. *G. H. H. F.*

SILVER-LEAF DISEASE.—In reference to the interesting article on this disease, which appeared in the *Gardener's Chronicle* of November 12, mention may perhaps be made of a paper on the same subject, which was read at the recent meeting of the British Association at Sheffield. During the last two years the writer has made observations and experiments in Cambridgeshire with respect to silver-leaf disease, which is particularly frequent in Plum trees, especially Victorias, in this district. The results of inoculation experiments with pieces of sporophore of *Stereum purpureum*, confirm the statements of Professor Percival and Mr. Spencer Pickering, but so far no silvering has been induced by the inoculation of a healthy tree with the spores alone. So far as I am aware, no previous worker has made inoculations with the pure spores of this fungus. In reference to these apparently negative results, it should be stated that silvering may possibly ensue the next year, by which time the mycelium derived from the spores may have developed vigorously. It has been found possible to grow *Stereum purpureum* in pure culture in artificial conditions; by this means all possibility of contamination by the mycelium will be avoided. Inoculation experiments have already been performed, using mycelium obtained in this way, and the results will be awaited with interest. With regard to the incidence of the disease, one is struck by the large number of regrafted trees which become silvered. A few Gooseberry and Red Currant bushes have been found to be silvered in this district, and of considerable interest is the fact that a fortnight ago I came across a Sycamore, a part of whose foliage was silvered. This tree, present in the midst of a mixed wood, had been cut down, and some of the new shoots arising from the base bore silvered foliage. It is significant that *Stereum purpureum* was found to be growing in abundance on the part of the stump in the neighbourhood of which the affected shoots arose. *F. T. Brooks, Botany School, Cambridge.*

I read with interest the article on Silver-leaf disease on page 356, which stated that Mr. Pickering considers that Silver-leaf is not an incurable malady. In the issue for September 28, 1901, p. 247, you published an account of how I cured this disease in a tree of Lord Napier Nectarine, growing in a glass-house, one side of the tree only being affected. I will repeat from memory my treatment. I obtained some liquid manure water from the cow sheds, and I diluted it with water. In each gallon of the manure-water I dissolved half an ounce of sulphate of iron. I saturated the soil in which the tree was growing with this liquid. This I did three times during the summer, giving also a dressing of air-slaked lime. The next season I was greatly disappointed to find the disease appeared again to about the same extent, but I noticed that the foliage on the healthy portion of the tree appeared finer and of a darker colour than usual. So I repeated the treatment during the second summer by giving the tree three heavy waterings at intervals with the solution. The following spring I was delighted to see only a few leaves affected with the malady. I believe I gave three more waterings with the liquid the third summer, making three years' treatment. I never saw any more disease after that year. The tree was a very old one, being planted about 35 years. It began, this summer, to show signs of decay, so I have replaced it this autumn by planting a younger specimen. *J. Easter, Nustell Proery Gardens.*

APPLE SCAB.—I read with interest the lecture delivered by Mr. Salmon (see p. 358) on "Diseases of Fruit Caused by Fungi." I suppose there is no gardener who is not acquainted more or less with the pest known as the Apple scab or black spot, and who would gladly welcome some cure for it. Professor Salmon has advocated spraying Apple trees with Bordeaux mixture for some time past, and it would be interesting to hear from gardeners who have followed his treatment as to whether they have been successful in combating scab with this specific. In my case I have been unsuccessful; why, I do not know. I sprayed twice, but the fungus is still present, and on some trees as bad as ever. What I cannot understand is that one tree may have its fruit badly infected, whilst the fruit on a neighbouring tree may be free from disease. I notice that the fruits on trees with abundant and healthy foliage are attacked with scab, thus exploding the statement that the disease proceeds from leaf to fruit. I have also observed that the weaker-growing varieties seem more susceptible to an attack of scab. I gathered (to all appearances) some clean and well-grown fruits, and though they were isolated, they have developed the fungus badly in the fruit-room. *P. E. Cornish, Downs House Gardens, Yalding, Kent.*

CHRYSANTHEMUMS IN SOUTHWARK PARK.—The display of Chrysanthemums in this park is very fine this season, and certainly no other park in London can show such uniform quality and excellence of bloom. The Incurred varieties call for special mention, and it may be said without exaggeration that the collection is made up of exhibition blooms. The splendid results that have been achieved are all the more remarkable, seeing that the plants have been cultivated under the least favourable conditions in the neighbourhood of factories. That this phase of gardening is appreciated by the public is shown by the large numbers of people who have inspected the flowers. *Walter H. Appell, Superintendent, Bermondsey Public Gardens.*

ARUNDINARIA NITIDA.—This very graceful, light, and most distinct Bamboo does not appear to have received the attention that its merits deserve. As a specimen plant, it is one of the handsomest of Bamboos, and it is also one of the hardiest of the race. At Gunnersbury House, for 10 years past, plants have withstood the cold of winter and spring. It is more nearly deciduous than any other Bamboo in these gardens, and I have noticed that it starts into fresh growth sooner than any other sort, yet not soon enough for the young growths to be harmed by frost. It grows freely, but does not spread nearly so much as some other Bamboos. I recommend *Arundinaria nitida* to all who have not yet planted it. *Jas. Hudson, Gunnersbury House Gardens.*

CHRISTMAS ROSES.—It is with the utmost diffidence that I venture to criticise the instruction given by an authority of so much experience as Mr. E. Beckett; but surely one should hesitate before following his advice in the *Chronicle* for November 19 "to give a good mulch of decayed farmyard manure" to Christmas Roses at the present time. Such treatment would utterly mar the chief ornament of the garden at this season. The early *Helleborus niger abfolius*, the finest of all, has been in full flower for a month past, a mass of the hue of Apple blossom. *H. niger* and the later varieties are just about to flower, the buds being closely set above ground, and mulching would be a sad disfigurement. Given deep cultivation when they are planted, Christmas Roses seem quite indifferent to subsequent treatment; the only thing they demand imperatively is to be let alone. Few flowering plants resent disturbance more obstinately. *Herbert Maxwell, Monroth.*

RURAL EDUCATION.—The following letter has been sent to the County Councils Association:—*Sir, I am instructed to inform you that this association, while acknowledging the usefulness of the suggestions made by the Rural Education Committee of the County Councils Association with respect to agricultural education in the counties, as reported in the daily papers of October 27, regrets the little prominence given to horticultural education. This association feels that the general disposition to regard horticulture as a side issue of agriculture is to be deprecated. Horticulture, as embracing market gardening,*

*fruit-growing, school-gardening, and gardening in private establishments, is a highly-specialised subject, and one of great importance; and the association is of opinion that it cannot be dealt with adequately by an agricultural adviser, but requires the supervision of a trained horticulturist. The special needs of the small holder and of the cottager and allotment gardener (in the amelioration of whose lot horticulture plays an important part) call for similar special treatment. This association fears that unless horticulture is under the direction of a horticultural instructor who has direct access to the Rural Education Committee in each county, through an organising secretary who is not a purely agricultural instructor, its importance will not be realised, and its requirements may be overlooked. In a word, this association considers that horticulture is sufficiently important and distinctive to demand separate treatment from agriculture. *Walter P. Wright, Hon. Secretary, Horticultural Education Association.**

TREE PLANTING.—I notice a paragraph in an article by "A Southern Grower," which may cause some misapprehension as to the results of ramming trees on planting. He says, "The results of last season's planting are not favourable to the Woburn method of puddling trees in. The land was so extremely wet during nearly the whole of that season that a great number of the Apple trees were practically puddled, and never before has there been such a large proportion of dead trees after a planting as there is in my young plantation made under the conditions indicated." When the soil is in a wet and sticky condition, it is certainly unsuitable for planting in the ordinary way, for the earth cannot be shaken between the roots, and contact between it and them is very imperfect. This is well known, and has been fully illustrated by definite experiments at Woburn. But if the ground is rammed, contact between the roots and soil is insured, and, as this ramming results, under all ordinary conditions, in puddling the soil, it does not matter whether the soil is in a puddled condition to start with or not. In fact, the more puddled and sticky the soil is, the better will be the results obtained by ramming as compared with those obtained by planting in the ordinary way. In many of our experiments on the subject, the soil at the time of planting was in a very wet and sticky condition, and in some cases it was purposely made so, whilst an excellent illustration of the way in which tree planting becomes independent of the condition of the soil where ramming is adopted, was given by our planting last season; the condition of the soil at the farm during the autumn and winter months may be judged by the fact that we were never able to lift our Potatoes, and had to leave more than an acre of them undug for another season, yet in spite of this we planted 523 Apple trees, ramming them well, and of these only one died. *Spencer Pickering.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 22.—The fortnightly meeting was held on Tuesday last, and the exhibition provided an excellent floral display, the Hall being well filled with exhibits. Exhibits of Orchids were numerous, there being important groups as well as a considerable number of novelties. The ORCHID COMMITTEE granted three First-class Certificates and three Awards of Merit. Many showy groups of flowering plants were brought to the notice of the FLORAL COMMITTEE, the principal subjects being Begonias, Carnations, Chrysanthemums, Pelargoniums, Ferns and ornamental-leaved and berried plants. This Committee granted ten Awards of Merit to varieties of Chrysanthemums. The FRUIT AND VEGETABLE COMMITTEE made no award to a novelty, and beyond a group of Apples and varieties of Endive grown under trial at Wisley, had little to inspect. At the afternoon meeting in the Lecture Room, Mr. James Hudson gave an address on "Plants in Congenial Positions."

Floral Committee.

Present: W. Marshall, Esq. (Chairman), and Messrs. H. B. May, Jas. Walker, W. J. Bean, C. T. Drury, G. Renche, J. Douglas, J. F. McLeod, H. J. Cutbush, Jno. Green, R. C.

Noteutt, W. Howe, Chas. Dixon, H. J. Jones, C. E. Shen, Chas. E. Pearson, F. Page Roberts, E. H. Jenkins, W. J. James, Chas. Turner, R. C. Reginald Nevill, C. R. Fielder, R. Hooper Pearson, W. B. Cranfield, and E. A. Bowles.

E. H. BROWN, Esq., Highwood, Roehampton, Surrey (gr. Mr. R. Bradford), staged a large floor group of stove and greenhouse plants, after the style adopted at competitive flower shows. It included such flowering plants as *Calanthes*, *Celcias*, *Begonias*, *Poinsettias*, *Richardias*, *Lily of the Valley*, *Ericas*, *Primulas*, *Cyclamen*, *Bouvardias* and *Carnations*. *Dracenas* were interspersed with *Codiaeums* (*Crotons*), *Palms* and *Humea elegans*, and a well-grown specimen of *Aralia Veitchii* was placed in the centre. (Silver-gilt Flora Medal.)

Lord HILLINGDON, Uxbridge (gr. Mr. A. R. Allan), staged a large number of well-grown plants of the beautiful rose-flowered *Begonia Ensign*. The exhibit was made attractive with small *Palms*, *Ferns* and other greenery. (Silver-gilt Flora Medal.)

GURNEY FOWLER, Esq., Glebelands, South Woodford, showed pink and white-flowered *Begonias* of the *Gloire de Lorraine* type. The plants were admirable specimens, very freely flowered and they made a showy group. (Silver Flora Medal.)

Another showy exhibit of *Begonia Gloire de Lorraine* was staged by Mr. R. FOSTER, Summer Hill, Lindfield, Sussex, the plants being extra large, well-flowered specimens. (Silver Banksian Medal.)

The Earl of STANHOPE, Chevening Park, Sevenoaks (gr. Mr. Charles Sutton), staged half-a-dozen well-flowered plants of *Plumbago rosea*. (Bronze Banksian Medal.)

MESSRS. JAMES VEITCH & SONS, LTD., Chelsea, again made an attractive exhibit with *Begonias*, the plants and the method of staging them being both admirable. On the opposite table the firm made an attractive display of *Bouvardias*, admirable plants for greenhouse and conservatory decoration at this season. A large floor-group of Chrysanthemums was also exhibited by Messrs. VEITCH, the plants being compact specimens in 5½-inch pots. They were mainly decorative and single sorts; a selection includes (*single*) *Cinnamon*, *Falcon* (pale orange), *Charming* (rich chestnut); (*decorative*) *Phœbus* (yellow), *Niveus* (white), *Rose Poitevin* (rose), *Mrs. Buckbee* (white), and *Dazzler* (crimson). (Silver-gilt Flora Medal.)

MESSRS. W. CUTBUSH & SON, Highgate, London, filled two long tables with greenhouse plants and Carnations, as at the last meeting. *Ericas*, *Liliums*, *Spiræas*, *Palms*, *Aralias*, *Dracenas*, and other decorative subjects were all shown finely as pot plants. (Silver Flora Medal.)

MESSRS. STUART LOW & CO., Enfield, exhibited varieties of perpetual-blooming Carnations; the beautiful *Lady Arlington* variety was shown splendidly; the colour is salmon-pink. This firm also showed *Cyclamens*.

Messrs. H. B. MAY & SONS, Edmonton, showed a large bank of Ferns having about 60 species and varieties. The plumose sorts of *Nephrolepis exaltata* predominated, and of these none was more beautiful than *N. e. Marshallii*, which originated as a sport from *N. e. Amerpohlilii*. One of the smallest Ferns in the exhibit was also one of the most beautiful. This was *N. cordifolia crispata congesta*, quite distinct from the type. Amongst the largest plants were *N. exaltata* var. *multiceps*, *N. cordifolia tessellata*, *N. Festeri* (a sport from *N. exaltata*), *N. exaltata* (type), and *N. pectinata*. (Silver-gilt Banksian Medal.)

Mr. L. R. RUSSELL, Richmond, again filled a large table with ornamental-leaved plants, such as *Ivy*, *Enonymus*, *Elaeagnus*, *Aucubas*, *Pernettias*, and *Veronicas*, some of the specimens being covered with brilliantly-coloured berries. (Silver Banksian Medal.)

Mr. H. BURNETT, St. Margarets, Guernsey, set up a showy group of Carnations, the blooms being of extra fine quality. Those following were specially good:—*Scarlet Glow*, *Mrs. C. F. Raphael* (cherry-red), *R. F. Felton* (rose-pink), *White Chief*, *Snow Queen*, and *Countess of March* (salmon-pink). (Silver Banksian Medal.)

Mr. VINCENT SLADE, Staplegrave Nurseries, Taunton, exhibited bunches of Zonal *Pelargoniums*. There was a large assortment of varieties, some of the more notable sorts being *Clivedon* (orange yellow), *Lady Folkestone* (blush-pink), *Claremont* (white), *Mrs. J. A. Bell* (white and pink, a very pretty combination), *Chas. H.*

Cartis (scarlet), Dublin (cerise), and London (crimson), the two last-named being new varieties.

Mr. W. H. PAGE, Tangley Nursery, Hampton, staged large plants of his new scarlet-flowered Pelargonium His Majesty, which received an Award of Merit on November 23, 1909. (Silver Banksian Medal.)

Messrs. H. J. JONES, Ltd., Hither Green, Lewisham, staged an imposing group of Chrysanthemums, including numerous large Japanese blooms in epergnes at the back of the display. Edith Jameson, a large Japanese variety of pink colour, has given rise to two fine sports in Mrs. Faulkner (white) and Ernest G. Mocatta (yellow). Mrs. J. Hygate is a handsome incurved variety, the florets being pure white. A handsome white single is seen in Mensa, which was displayed in numerous vases in this exhibit. Other varieties of note were F. S. Vallis (yellow Japanese), Lady Francis Ryder (white Japanese), R. F. Fulton (yellow decorative); R. Hooper Pearson (deep yellow decorative), Golden Nugget (decorative), Sandown Radiance (rich red), Bessie Brown and Buttercup. (Silver-gilt Flora Medal.)

Mr. FRANK LILLEY, Les Hôchs, Guernsey, showed varieties of single Chrysanthemums, including the new variety Strawberry.

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited large-flowered, single Chrysanthemums: Cannell's Crimson, Yellow Gem, Mrs. R. Cannell (crimson), Merstham Jewel (bronze), Honey-suckle (white), Dr. F. A. Collet (terra cotta), and Mrs. Bruce (white) are a selection. This firm also made a brilliant display with bunches of Zonal Pelargoniums. The following varieties were the best in their colours:—(Scarlet) The Sirdar, New York, Naples, Arabic, Kingswood, Jupiter, Berlin; (salmon) Barbara Hope, Mary Pelton, Taurus, Ceres, Carmania; (crimson) Aldenham, Sir T. Hanbury, London, Capt. Halford; (rose) Dublin, Mrs. Williams, Caronia; (pink) Caledonia, Henry Compton, Lady Curzon, Paris; (white) Venus, Mary Beaton, Snowstorm, Snowdrop and Claremont. (Silver Flora Medal.)

Messrs. W. WELLS & CO., LTD., Merstham, Surrey, showed Chrysanthemums, including varieties of all the types, but singles mainly. We noticed Mrs. G. C. Kelly (Japanese), Amaranth (with a splash of chestnut and a silver reverse), Mensa (a fine white single), Arcturus (crimson, striped with yellow), Cannell's Crimson, Rose Ellis (pink), Crimson Jewel (a seedling from Merstham Jewel), Miss Hilda Wells (this pretty single Chrysanthemum is best not disbudded; the colour is a bright orange-red), White Baby (a miniature-flowered Pompon), and Antique (old rose; a decorative, being a sport from Decour Enguehard). (Silver Flora Medal.)

Mr. JAMES BOX, Lindfield, Baywards Heath, Sussex, showed Chrysanthemums, including some pretty single varieties, Mrs. W. Buckingham (pink) being prominent. The variety Golden Spray has clusters of small yellow blooms like a spray of Cineraria.

Messrs. G. WILLIAMS & CO., Cardiff, staged varieties of Chrysanthemums, amongst them being many pretty single flowers.

AWARDS OF MERIT.

Awards of Merit were recommended to the following varieties of Chrysanthemums:—

Chrysanthemum Brightness. This is a very large single variety, and the colour a bright red than we have seen in single Chrysanthemums. The orange-coloured disc is surrounded by a yellow ring. The florets are too thin to keep the flower perfectly regular in form. Shown by Messrs. GEO. WILLIAMS & CO., Cardiff.

C. Crimson Jewel.—This is a decorative variety, with an open centre like that of a single flower. Its attractiveness lies in its gold-tinted florets, which, in themselves, are rich orange-red. Shown by Messrs. WELLS & CO.

C. D. B. Cran.—This is a first class exhibition flower of the Japanese type. The florets are moderately broad, very long, and they form a deep flower of great width. The colour approaches to buttercup yellow, but some of the flowers, evidently from later buds, develop a brownish-red, which streaks the yellow to a considerable extent. The bloom exhibits much refinement. Shown by Mr. MARTIN SILSBURY, Shanklin.

C. Ernest G. Mocatta.—This is a yellow sport from the well-known, pale-mauve, Japanese Edith Jameson. The flowers are a rich canary-

yellow shade. Shown by Mr. THOMAS STEVENSON, Woburn Place Gardens, Addlestone.

C. Ethel Thorp.—A very large, mauve-tinted incurved flower, suitable for exhibition purposes. Shown by Mr. H. A. THORP, Durrington, Worthing.

C. Mrs. Foot.—A large single variety, with crimson flowers having a white ring round the yellow disc. It has stiff stems, which hold the flowers erect. Shown by Mr. L. L. LAWRENCE, Shoreham.

C. Peter Plant.—This single variety obtained its award for the rich mauve pink colour of the flowers, which are fairly erect as shown. Exhibited by Mr. L. L. LAWRENCE, Shoreham.

C. Sandown Radiance.—A rich crimson single flower, 5½ inches in diameter, borne on stiff erect stems. An excellent variety for providing "colour." Shown by Messrs. WELLS.

C. Strawberry.—A distinct single variety, which exhibits a soft, pale-red tint which is not common. Shown by Mr. FRANK LILLEY, Guernsey.

C. William Turner.—A white Japanese flower of the largest size, possessing broad florets incurving a little at the tips. This will be amongst the best exhibition "whites." Shown by Messrs. WELLS.

Orchid Committee.

Present, Harry J. Veitch, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), J. Charlesworth, J. Cypher, W. P. Bound, W. H. Hatcher, H. G. Alexander, H. Ballantine, Gimney Wilson, J. Wilson Potter, W. Bolton, H. Little, W. Thompson, F. Sander, F. M. Ogilvie, Stuart Low, A. A. McBean, C. H. Curtis, and W. Cobb.

There was a fine show of Orchids, chiefly Cypripediums, including a fine hybrid shown by Lieut. Col. Sir GEORGE L. HOLFORD, K.C.V.O., and a noble variety of *C. Charlesworthii* named *Temeraire*, shown by Messrs. SANDER & SONS.

H. S. GOODSON, Esq. Fairlawn, Putney, was awarded a Silver-gilt Flora Medal for a fine group in which most of the best Cypripediums of the season were well represented. These included very fine forms of *C. insigne* Sandera and other varieties of *C. insigne*; *C. Lecanum Chinkaberryanum* with seven flowers, also other types of *C. Lecanum*. *Odontoglossum* were arranged at the back of the group, and amongst *Laelio-Cattleyas* we observed the new *L. C. Myrtha* (*C. Dowiana Rosli* × *L. C. Gottaiana*), a fine flower of an uncommon tint of yellowish-rose; also *Cattleya Venus Fairlawn* variety, and a distinct *C. Iris*. Beside the group was a remarkable display of about 150 coloured drawings of Orchids in Mr. Goodson's collection.

J. GURNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), was awarded a Silver Flora Medal for a representative group of good Cypripediums, with which were arranged *Odontoglossum crispum* and other Orchids. Specially fine were the large and very darkly-coloured *C. gigas* Glebelands variety, *C. triumphans*, *C. Titus superbum*, *C. Baron Schroder*, varieties of *C. Thalia*, some of the best yellow varieties of *C. insigne* Sandera, and good forms of *C. Lecanum*.

Messrs. JAS. VEITCH & SONS, LTD., King's Road, Chelsea, were awarded a Silver Flora Medal for a fine group of Cypripediums, which included several new hybrids. The chief novelty was *C. Islandia* (see Awards). Another pretty new hybrid was *C. illustre* (*Lecanum* × *Euryades*), a distinct and pleasing flower. Others noted were *C. Milo superbum*, *C. Maudie*, *C. Baron Schroder*, fine specimens of *C. insigne* Sandera, and other forms of *C. insigne*; also good specimens of *C. Lecanum*. The plants were finely grown and well flowered, and the hybrids showed interesting variety.

Messrs. JAS. CYPHER & SONS, Cheltenham, were awarded a Silver Flora Medal for an extensive group of Cypripediums, in the centre of which were some well-flowered plants of *Vanda cerulea*, *Calanthe Veitchii*, *Odontoglossum crispum*, and several hybrids, one being a specially dark variety. Of the Cypripediums noted were some very dark-flowered *C. Fairieannum*, *C. Prospero majus*, *C. Lecanum giganteum*, *C. L. corona* and other forms of *C. Lecanum*; *C. Rolfeae*, *C. Vipinii*, a selection of forms of *C. insigne*, and some attractive unnamed hybrids. In front, were several plants of the pure white *Masdevallia tovaensis*, the scarlet *Sophranitis grandiflora*, and *Lycaste lasioglossa*.

PANTIA RALLI, Esq., Ashted Park (gr. Mr. Hunt), was awarded a Silver Banksian Medal for an effective group of splendidly-grown and well-flowered plants of *Calanthe Bryan* and *C. Wm. Murray*.

SAMUEL LARKIN, Esq., The Ridgeways, Haslemere (gr. Mr. Hale), was awarded a Silver Banksian Medal for a neat group, in the centre of which was a grand plant of *Cattleya laevis* (see Awards). Others of interest were two plants of *Cymbidium Tracyanum*, a pretty hybrid between *Laelia pumila* and *Cattleya Hardyana*, and other *Laelio-Cattleyas*; *Cypripediums*, and *Oncidium incurvum*.

Messrs. J. & A. A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a fine group of Cypripedium *insigne* Sandera, which included about 30 specimens, one having 12 fine yellow and white flowers. With these were several specimens of *C. insigne* "Harefield Hall variety."

Messrs. STUART LOW & CO., Bush Hill Park, Enfield, secured a Silver Banksian Medal for an effective group, at the back of which was a selection of brightly-coloured *Dendrobium Phalaenopsis Schroderianum*. In front of the display were good varieties of *Cattleya Fabia* and other hybrids, Cypripedium *insigne* Sandera, *C. Fulshawense*, and other Cypripediums, an elegant plant of *Liparis longipes* with about 20 flower-spikes, various *Oncidiums*, including the entirely yellow-flowered *O. varicosum luteum*, and some pretty *Odontoglossums*.

M. FURMIN LAMBEAU, Brussels, exhibited *Cattleya Maggie Raphael* "Lambeau's variety" (*Triane* × *Dowiana aurea*), a finely formed, pink-tinted flower, with ruby crimson front to the lip; and *Cattleya Drapsana* (Mrs. Pitt × *Dowiana aurea*), with greenish, primrose-yellow sepals and petals, the rose-coloured lip being veined with orange.

Messrs. SANDER & SONS, St. Albans, showed two fine novelties (see Awards), also *Chondropetalum Fletcheri*, a dark coloured, unnamed *Eulophyllum*, and a *Lycaste*, from Peru, with ivory-white flower.

Mr. E. V. LOW, Vale Bridge, Haywards Heath, staged a small group of rare Orchids, including *Cattleya Maggie Raphael alba*, *C. Clarkei*, *C. Lambcaniana*, Cypripedium *Thalia Westfield* variety, *C. Germaine Opoix Westfield* variety, *C. Pium*, *Cymbidium erythostylum*, and *Brasso-Cattleya Mrs. J. Lemiam*.

Messrs. CHARLESWORTH & CO., Haywards Heath, staged an effective group, in which were noted many interesting Orchids, including a fine, red-flowered *Odontocidium Devossiana*, Cypripedium *Thalia*, *C. Lecanum giganteum*, and other Cypripediums, *Calanthe Butcherdensis*, and some hybrid *Cattleyas*.

HENRY LITTLE, Esq., Baronscliff, Twickenham (gr. Mr. Howard), showed Cypripedium *insigne* Baronscliff variety, a distinct form, in which the olive-brown spotting on the dorsal sepal is partially suppressed.

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham, showed an interesting selection of hybrids, including the large and handsome *Laelio-Cattleya Rubens* (*C. Hardyana* × *L. pumila*), *Odontoglossum Blackii* (*Pescatorei* × *Rossii*), a very neat and pretty hybrid, with pure-white flowers, the sepals being dotted with dark purple, as in *O. Rossii*, and the petals having a few purple marks at the base; *Sophranitis Thwaitesii* (*C. Mendelii* × *S. grandiflora*), formed like *S. C. Denis*, but with rose-tinted sepals and petals, and mauve tip to the labellum; four white-petalled *Cattleya Maggie Raphael*; and a very rich scarlet *Odontocidium Charlesworthii*.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cypripedium Miniatur (*Euryades* × *Minnie*), from Lieut. Col. Sir GEORGE L. HOLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—This is one of the best of the many superb Cypripediums shown from Westonbirt. Having regard to the size of the flowers, its thick, wax-like substance and distinct markings, it is in advance of any yet shown. The very broad dorsal sepal is pure white, with a small, yellowish-green base, all but the margin being evenly blotched by a deep claret purple colour. The massive petals and lip are yellow at the margins, the inner parts being tinged with purplish-brown. The parentage of the hybrid is interesting, *C. Euryades* being *C. Boxallii*; *C. Lecanum*, and

C. Minnie (intens. \times Lecanum). Thus the hybrid is of three parts insignie, two of Spicerianum, one of villosum, and one of Boxallii.

Cypripedium Charlesworthii Temeraire, from Messrs. SANDER & SONS, St. Albans.—A unique variety, resembling nothing which has yet appeared out of the many thousands of the species imported. The petals and lip are formed and coloured similar to a large form of typical C. Charlesworthii. The very remarkable dorsal sepal is more than 3 inches in height, and nearly 4 inches in width, broadly ovate. The apex is carried up to a point, the sides being wavy at the margin. The ground is white, closely veined with a delicate tracery of a rosy-lilac colour.

Pandaevaria Sanderi, from Messrs. SANDER & SONS, St. Albans.—A beautiful variety, and the first of its colour. The well-formed, white flowers, instead of being tinged with blue, as in other forms, have the tips and margins of the sepals tinged with magenta-pink, the petals being flushed with the same colour, and the lip of a deep-magenta shade.

AWARDS OF MERIT.

Cypripedium Iolanthe (Eucypides \times insignie Sanderi), from Messrs. JAS. VEITCH & SONS.—A flower of fine form, the dorsal sepal being unusually broad and of a clear white, spotted with purple. The broad petals are tinged and slightly veined with purple, the margins being yellow. The lip is yellow, tinged with purple.

Cattleya lucida (Borringiana \times Schilleriana), from SAMUEL LARKIN, Esq., The Ridgeways, Baslemere (gr. Mr. Hale).—A charming winter-flowering hybrid, the inflorescences of 10 to 12 flowers forming bouquets. The sepals and petals are rose-purple, the tube of the lip, which folds over the column, blush-white, the rounded front lobe being purple, with a white margin. The finely-growing specimen carried three flower-spikes.

Saphro-Lalio-Cattleya Althana (C. Percivaliana \times S. J. Gravata), from H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day).—A pretty hybrid, of good size and unusual tinting, the rosy sepals and petals having a light golden tone, and the ruby-crimson labellum an attractive veining of deep yellow.

CULTURAL COMMENDATION

to Mr. Spowage (gr. to Col. CARY BATTEN, Abbots Leigh, Clifton) for a plant of *Oncidium tigrinum*, with 55 fine flowers on a single spike.

Fruit and Vegetable Committee.

Present. G. BUNYARD, Esq. (in the Chair); and Messrs. J. CHEAL, W. BATES, A. DEAN, G. KELL, A. R. ALLAN, J. JAMES, O. THOMAS, W. POUPART, W. JEFFRIES, E. BECKETT, J. DAVIS, G. REYNOLDS, J. HARRISON and H. J. T. HOOPER.

The finest exhibit before the Committee was a collection of 40 dishes and baskets of superb Apples shown by Lieut.-Col. BORRON, Hinton, Maidstone (gr. Mr. Whittle). Not a single fruit of this fine collection had been grown on walls, but all were from bush or cordon trees trained on trellises in the open. Of Codlin varieties, very fine specimens were found in Lane's Prince Albert, Belle Pontoise, Belle du Bois, Bramley's Seedling, Cox's Pomona, Bismarck, Gascoyne's Scarlet Seedling, Warner's King, Mère de Ménage, Hambling's Seedling, Emperor Alexander, Lord Derby, Newton Wonder, Peasgood's Nonesuch and Sandringham. Superb dessert Apples were seen in Brownlee's Russet, Vicar of Eighton, Rival, Barnack Beauty, Melon Apple, Ribston and Cox's Orange Pippins. (Silver-gilt Hogg Medal.)

Mr. W. POUPART, Jun., Twickenham, showed a collection of nearly 100 bottles of preserved fruits. These included Plums, Raspberries, Red Currants, Loganberries, Blackberries and Gooseberries. (Silver-gilt Knightian Medal.)

Mrs. MILLER, Moylen, Marlow, showed a collection of preserves and chutneys.

Lord LANGATOCK, The Henke, Monmouth (gr. Mr. T. Coomber), sent two very fine and handsome smooth Cayenne Pines with small crowns. One of the fruits weighed 9 lbs. (Silver Knightian Medal.)

Sir WALDOLE GREENWELL, Maiden Park, Surrey (gr. Mr. Lutott), showed 15 bunches of Grapes, comprising three each of Muscat of Alexandria, Black Alicante, Appley Towers Gros Maroc and Gros Colmar.

A collection of blanched Endives, comprising 24 varieties, but not all of them distinct, was shown from the Wisley gardens. After a careful scrutiny of the whole, three marks were awarded to (7) moss-curl; (10) green-curl; (51) white-curl; (55) white-curl; and (57) Winter Giant. Similar awards were made to broad-leaved varieties: (4) Broad-leaved Batavian; (26, 27 and 28) all Round-leaved Batavian. Some heads showed great solidity and all were well blanched.

THE LECTURE.

At the afternoon meeting of Fellows Mr. J. HUDSON gave a lecture on "Plants in Congnial Positions." Mr. Hudson illustrated his remarks with about two dozen lantern slides from photographs of plants growing under his care in the gardens at Gumpersbury House, Acton. He said that he attached great importance to providing shelter, especially from cold winds. Moisture-loving plants need an abundance of water, and he instanced both Palms and Bamboos as cases in point. With respect to Bamboos, he recommended the use of bonemeal or some other phosphatic manure, rather than a too free application of nitrogenous fertilisers, as it is better to build up growth of an enduring character than to encourage the formation of large but sappy shoots.

HORTICULTURAL CLUB.

THE WORK OF A PUBLIC PARKS DEPARTMENT.

ON the occasion of the usual house dinner of the members of this club, on Tuesday evening last, at the Hotel Windsor, Westminster, Mr. Harry J. Veitch presiding, Mr. W. W. Pettigrew, superintendent of the city of Cardiff public parks, gave a lecture on "The Aim and Scope of a Public Parks Department." Quoting John Stuart Mill, he said that "the multiplication of happiness is, according to utilitarian ethics, the object of virtue." This being so, a parks department, organised on proper lines, is one of the most important, as it is one of the most virtuous, in the utilitarian sense, of our public institutions. Its aim or design is to secure the happiness of every individual.

This is done in a variety of ways, each of which, however, runs into the other:—

(a) By promoting directly and indirectly the health, both morally and physically, of the inhabitants of towns.

(b) By providing healthy amusement of every possible kind in the open air.

(c) By providing a wider interest in life by (1) giving opportunities of getting into closer touch with natural objects; (2) by the development of aesthetic tastes—natural scenery and music.

Whilst the aim is as already described, the various parks departments have not the same scope in fulfilling them. Scope largely depends on wealth, and on purely accidental circumstances connected with the character and formation of the grounds belonging to the department concerned.

The lecture, which was much appreciated, was illustrated by a large number of lantern slides depicting characteristic park scenery and amusements. The subject is referred to in our leading article.

ULSTER HORTICULTURAL.

NOVEMBER 8, 9.—The annual Chrysanthemum show under the auspices of the Ulster Horticultural Society was held on these dates in St. George's Market. Fine weather favoured the inaugural proceedings, the opening ceremony being performed by the Countess of Aberdeen. The show was in every way worthy of the high traditions of the society, and both as regards quantity and quality the exhibits were well up to the standard of former years. The groups of Chrysanthemums made a fine display, the principal prize winners in this section being Mr. JOHN ROGERS, J.P., who had an attractive exhibit interspersed with foliage plants; Mr. CHARLES DUFFIN, Mr. JAMES BRADLEY, and Mrs. FORSTER GREEN. Mr. HUGH DICKSON scored meritorious successes in the section devoted to stove and greenhouse plants, table plants, and Coniferae, while Mr. FRANK WORKMAN and Mr. CHARLES DUFFIN were

successful in the department for stove and greenhouse of forced plants arranged for effect. Mr. JOHN ROGERS, J.P., won the 1st prize in the class for Ferns, while in the classes for Palms, Cycads, Codiaums, and Dracænas premier awards went to Mr. CHARLES DUFFIN, Mr. FRANK WORKMAN, and Lady CLANMORRIS. The last-named excelled in the class for six plants, dissimilar, suitable for table decoration, whilst in the Begonia classes Mr. H. E. RICHARDSON, Lisburn, and Lord O'NEILL were prominent exhibitors. The class for cut blooms of Japanese Chrysanthemums shown in vases made a fine colour scheme. The 1st prize for 15 vases was won by Mr. JOHN JAMESON, D.L., who shows year after year, and other winners included the Countess of CALEDON, Lord O'NEILL, Mrs. E. ROBERTSON, Mr. JOHN ROGERS, J.P., and Lady PALMER. There has seldom, if ever, been a better show of single Chrysanthemums at this exhibition. Prizes were gained by Colonel R. G. SHARMAN-CRAWFORD, D.L., Mr. EDWIN HUGHES, J.P., Mr. VINCENT CRAIG, Mr. W. H. M'LAUGHLIN, Mr. J. BRADLEY, Lady CLANMORRIS, Mr. CHARLES DUFFIN, Lord O'NEILL, Mr. GEORGE J. PRESTON, and Mrs. FORSTER GREEN. Lord O'NEILL was placed 1st for a table of dessert fruits, Mr. CHARLES DUFFIN being a good 2nd.

ABERYSTWYTH CHRYSANTHEMUM.

NOVEMBER 9.—The 13th annual show of the Aberystwyth Chrysanthemum Society was held on this date in the Pier Pavilion. The entries numbered 136, there being an increase in the open and amateur classes, but exhibits in the cottagers' class were fewer than last year. The Silver Cup given by the tradesmen of Aberystwyth for the best group of Chrysanthemums in pots was won by Mr. R. WELLER, Jun., who has been successful four times, and has thus won two cups outright. He was also awarded a Certificate of Merit for the best Chrysanthemum plant in the show. The cup given by Mr. Rufus Williams for 24 cut blooms of Chrysanthemums was also won outright by Sir C. E. G. PHILLIPS. There was keen competition throughout the several classes, and the single blooms, as well as the table plants, were of exceptionally fine quality. Certificates of Merit were awarded to Mr. J. H. PHELPS, Carmarthen, for the premier bloom in the amateur classes; to Sir C. E. G. PHILLIPS for the best bloom in the show; and to Mr. J. WEBBELL for the best plant selected from the entire exhibition.

STIRLING CHRYSANTHEMUM.

NOVEMBER 10, 11.—The 21st annual show was held on these dates in the Albert Halls, Stirling. Compared with former years, the entries were fewer in number, but the exhibits were of superior quality.

The principal class for cut blooms was for six vases of Japanese Chrysanthemums, distinct, three blooms of each variety. Mr. McLEAN, Greenfield, Alloa, secured the premier award (the Hon. President's Cup) with clean, well-finished blooms of good size, Mrs. A. T. MILLER, Edith Jameson, Mrs. A. G. Pirie, and Mary McLean being prominent varieties. The last-named is a primrose-coloured sport from Mrs. C. Beckett, obtained by Mr. McLEAN three years ago.

Mr. J. SMALL, Norwood, Alloa, was placed 1st for 12 blooms of Japanese varieties shown on boards, his best examples being Pessie Godfrey, Master James, Lady Talbot, Geo. Mileham '08, and Mrs. A. T. Miller.

The specimen plants of Japanese varieties showed an advance on exhibits of former years. Plants in 6-inch pots were again a feature, while the single-flowered sorts were the best that have been staged at any previous exhibition in Stirling. Messrs. JAS. WOOD, Dummore; R. JENNER, Newhouse; J. K. MESTON, Stirling; and H. GRAY, 26 Park Terrace Stirling, all won 1st prizes in this section.

The usual supplementary classes consisting of Primulas, Ferns, Zonal Pelargoniums, Roman Hyacinths, and other greenhouse plants were all well filled.

Excellent Grapes were displayed by Messrs. J. MITCHELL, Arthury Castle; C. PALMER, Alloa; and J. SMALL, Norwood. Excellent Peas were shown by Mr. MITCHELL; and fine Apples by Mr. BLACKLOCK, Blairdrummond.

Vegetables made a meritorious display. Messrs. C. SHAW, Boquhan, and Geo. WATSON,

Kippen, led in the classes for collections, and the same exhibitors were successful in the other vegetable classes.

Honorary exhibits.—Messrs. DRUMMOND & SONS, Stirling, exhibited a collection of 70 dishes of Apples; Messrs. GEORGE BUNYARD & Co., Maidstone, also staged a fine collection of Apples; Mrs. TASKER, Stirling, showed vases of early-flowering Chrysanthemums in 50 varieties, also a basket of Roses; Mr. R. MORRISON, Stirling, displayed a number of Chrysanthemum plants in flower.

BAKEWELL CHRYSANTHEMUM.

NOVEMBER 9, 10.—The 14th exhibition was held in the Town Hall on these dates. Mr. H. E. Springs discharged the duties of secretary, and is to be congratulated on the results.

The semi-circular groups arranged around the hall made a fine display. These were divided in two classes. Mrs. McCREAGH THORNHILL (gr. Mr. G. Harvey) gained the 1st prize, which included a Silver Challenge Cup (given by R. Armitage, Esq.) for a splendid group of specimen blooms; 2nd, Mrs. ARMITAGE (gr. Mr. Kirkby). Mrs. McCREAGH also won the 1st prize for a group of single and decorative Chrysanthemums interspersed with other foliage, winning another Silver Challenge Cup; 2nd, S. ORME, Esq. A special feature in the cut bloom classes was the exhibits of 12 Japanese blooms, distinct, arranged with foliage on long stems, for effect. Mr. McINNES carried off the premier award with fine blooms; the variety "Lady Talbot" in his collection was adjudged to be the best bloom in the show. This exhibitor was also placed 1st in the class for 12 Japanese blooms, distinct; six Japanese blooms, distinct; and for six Japanese blooms of one variety. The single-vase class open only to lady competitors brought six entries; Miss DUNN won the 1st prize, being followed closely by Mrs. MAUDSLEY. In the amateurs' classes, both for Chrysanthemums and vegetables, Mr. W. SAUNDERS was the most successful exhibitor.

DEVON AND EXETER HORTICULTURAL.

NOVEMBER 10, 11.—The autumn exhibition, the 210th show of the society, was held in the new Queen's Hall, Exeter, a handsome and commodious structure, this being the first time it has been used for a public function. So far as Chrysanthemums were concerned, the show was an unqualified success, both the cut blooms and the groups being remarkably good. Competition was keen, and the display generally showed an advance on those of recent years. The chief prize in the cut bloom classes was a cup of the value of £30, offered by Messrs. Saunders & Biss, horticultural builders. The cup must be won by the same exhibitor three times before it becomes his property. Money prizes were added. The Rev. T. SHEEPSHANKS, Chudleigh (gr. Mr. A. Dunkley), who had won the cup twice previously, was once again the best exhibitor. Competitors were required to stage in this class 12 vases of Japanese varieties, distinct, three blooms of each; four vases of incurved varieties, distinct, not more than three blooms of each sort, and eight vases of single Chrysanthemums, distinct, not more than 20 blooms of each variety. Among his choice Japanese varieties were Mrs. J. Hygate (awarded the N.C.S. Medal), Clara Wells, Lady Talbot, Hon. Mrs. Lopes, J. W. Molyneux, Superb, President Viger, and P. Radalli. The 2nd prize in the cup class was awarded to Major C. H. CHICHESTER, and the 3rd to Mrs. GIDLEY, both of whom staged fine blooms. The Rev. SHEEPSHANKS was also placed 1st in the class for the best 24 Japanese Chrysanthemums in not fewer than 18 varieties, being followed by Mr. W. BROCK. The Rev. SHEEPSHANKS's best blooms were Master David, Mrs. A. T. Miller, F. S. Vallis, Shanklin, Florence Penfold and Algernon Davis. E. C. NORRISH, Esq., Barnstaple, was placed 1st in the class for 12 Japanese blooms, distinct, whilst for six white varieties of Japanese sorts Mrs. GIDLEY, Hoopern House (gr. Mr. W. R. Baker), was awarded the 1st prize. Mrs. GIDLEY was also 1st in the similar class for six yellow varieties, her best specimens being Lady Talbot and F. S. Vallis, and for six of any other colour. The

best illustrative collection of cut blooms arranged on a table 8 feet by 4 feet was shown by Mr. C. M. COLLINGWOOD, who won the 1st prize. The N.C.S. Medal for the best bloom of a Japanese variety (not incurved) was awarded to Mr. W. NIX, Exeter, for President Viger.

Competition in the class for a group of Chrysanthemums was very keen; the 1st prize was won by a new competitor, Mr. W. J. PRING, Exeter (gr. Mr. Webber), whose group scored in lightness of arrangement, variety, and general effect. Mr. W. BROCK, Exeter (gr. Mr. W. Rowland), was a close 2nd, his blooms being superior but the arrangement heavier and less effective. The 1st prize carried with it a silver cup presented by Mr. Duke, K.C., M.P.; the cup must be won three times before becoming the absolute property of the winner. This is Mr. PRING's first time of winning it.

APPLES.—For a collection of 24 varieties, distinct, 12 dessert and 12 culinary sorts, the 1st prize was won by the Countess of EGDMONT (gr. Mr. Thos. Ley); Mr. W. ORROCK was placed 2nd. In the class for six dessert Apples, Dr. SAMWAYS (gr. Mr. A. C. Williams) was placed 1st, having choice fruits of Cox's Orange Pippin, King of the Pippins, Allington Pippin, Redribbed Greening, Ribston Pippin, and Blenheim Pippin. H. S. THOMAS, Esq. (gr. Mr. E. Leach), was 1st for six culinary varieties. Dr. SAMWAYS was the principal winner in the single-dish classes, in which Mrs. C. HEARN (gr. Mr. Auning) and T. H. KIRKWOOD, Esq. (gr. Mr. Abrams), also won prizes.

PEARS were of rather poor quality. For a collection of six dessert and three culinary sorts, the 2nd prize was awarded. For three dessert varieties the 1st prize was awarded to Mrs. HEARN; whilst Dr. SAMWAYS excelled in the class for three culinary varieties.

VEGETABLES were extra fine in quality, and the competition was keen in almost all the classes. The seed-men's classes (special prizes were offered by Messrs. Robert Veitch & Son, Exeter, Sutton & Sons, and James Carter & Co) were keenly contested. In the society's class for a collection of eight distinct kinds, Mrs. GIDLEY, Hoopern House, was placed 1st, and J. H. LEY, Esq., Trehill, 2nd.

Trade exhibits were displayed by Messrs. ROBERT VEITCH & SON, Exeter; JARMAN & Co., Chard; and SAUNDERS & BISS, horticultural builders, Exeter. The arrangements were efficiently carried out by the hon. secretary, Mr. T. A. Andrews.

DUNFERMLINE CHRYSANTHEMUM.

NOVEMBER 11, 12.—This show was held in St. Margaret's Hall, Dunfermline, on these dates. The entries were in excess of last year by 65, the increase being chiefly in the cut bloom classes. A Challenge Cup was offered this year for the first time for eight vases of Chrysanthemums in as many varieties, three blooms of each. Mr. WALTER DOLLARBEY, won the trophy easily. Mr. T. D. FREELIS, Stirling, won the premier place in the amateur's section.

Plants are always shown well at this Dunfermline exhibition, and the high quality was maintained this year both in the professional and amateur classes.

Vegetables formed a feature. Mr. J. WALTER was awarded the 1st prize in the class for a collection, the produce being set up in fine style. Leeks, Carrots, and Onions were shown well.

Fruit is provided for in two classes only. Mr. J. MITCHELL, Broomhall, led with good quality Grapes and fine Apples; fruits of Ribston Pippin were remarkable for their colour.

Messrs. JAS. FAIRLEY & Co., Cairneyhill, exhibited 50 varieties of outdoor Chrysanthemums, also floral designs. Mr. R. FERGUSON, South Nursery, Brucefield, Dunfermline, showed a number of Roses cut from plants out of doors.

BRADFORD CHRYSANTHEMUM.

NOVEMBER 11, 12.—The 24th annual exhibition was held on these dates in the St. George's Hall. The number of exhibitors was sixty, which is well up to the average number for this show. In the principal class for cut blooms, that for 24 Japanese Chrysanthemums in not fewer than 18 varieties, the 1st prize was won

by A. JAMES, Esq., Rugby (gr. Mr. A. Chandler), who showed especially good flowers of George Hennings and Master James. The 2nd prize was won by E. G. MOCATTA, Esq., Adlestone (gr. Mr. T. Stevenson), whose exhibit contained a fine flower of Lady Talbot, which was adjudged the best bloom in the show of its type. Mr. MOCATTA was placed 1st for 12 Japanese varieties, dissimilar, followed by Mr. JAMES, whilst Mr. G. W. DRAKE, Cardiff, excelled in the class for 24 incurved varieties, and A. TATE, Esq., Leatherhead (gr. Mr. W. Mease), showed best in the class for 12 blooms of incurved varieties. The premier bloom of an incurved was G. F. EVANS, shown by Mr. DRAKE. Other prize-winners in the Chrysanthemum classes were Messrs. H. CLARK & SON, Rodley; Mr. W. IGULDEN, Frome; Mr. J. THORNTON, Driehlington; and Mr. CHAS. JONES, Abergele. A new local class for 18 blooms arranged in vases with Ferns and foliage produced eight entries, of which Mr. L. SHEARMAN's collection, containing a good show of blooms, was adjudged the best.

WEST OF ENGLAND CHRYSANTHEMUM.

NOVEMBER 15.—The annual show was held on this date in the Guildhall, Plymouth, and a very creditable exhibition was provided, though it is evident that the fashion for showing large blooms has greatly declined, at all events in the south west of England, as, in place of the numerous competitors who formerly exhibited in these classes, there was this year but a single entrant for the open prizes. The staging in the hall was admirable, and the groups of single Chrysanthemums were very effective and graceful. The 1st prize for 48 Japanese blooms was won by Rev. F. SHEEPSHANKS, in whose stand Lady Talbot, Hon. Mrs. Lopes, J. H. Silsbury, and General Hutton were very fine. The same exhibitor won 1st prizes for 12 Japanese, 12 Japanese incurved, and 18 Japanese blooms displayed in vases. For 12 vases of single Chrysanthemums, three sprays of each, the 1st prize was won by Mr. J. WEBBER. The 1st prize for a group of Orchids was won with a fine collection of Lycastes, Odontoglossums, Cattleyas, Cypripediums and other species by Mr. J. WEBBER, and the 1st prize for a group of stove and greenhouse plants by the same exhibitor with an exhibit containing Lilium Harrisii, Carnations, Cyclamen, Chrysanthemums, Codium (Frotons), Asparagus Ferns, and Palms. One of the prettiest features in the show was the 1st prize stand of salads, exhibited by Mrs. BAINBRIDGE. The exhibit contained 42 varieties, and was brilliant in colouring, with scarlet and golden Capsicums, Chis, red and white Radishes, large yellow and red Tomatoes, and small Currant Tomatoes of the same colours, variegated Chicory with yellow and crimson leaves, pillars of Cress, Endives, Corn salad, Cheval, and Borage. The majority of the classes were open only to residents within 15 miles of Plymouth, and the competition in these classes was very keen, fine cut blooms being shown and good plants of many varieties. There were also classes open to amateurs, cottagers and artisans which were well filled. An excellent display of fruit was staged, and the show of vegetables was also of high merit. The 1st prize for a collection of 24 dishes of fruit was won by Mr. F. R. ROBB with a very perfect selection of high-class specimens, while the Earl of MORLEY won the 1st prize for 20 dishes of Apples.

The attractions of the show were greatly enhanced by the exhibits of nurserymen. Messrs. R. VEITCH & SON, Exeter, who were awarded a Silver Medal and a Certificate of Merit, had a fine exhibit, in which were Vaccinium Vitis-idea, Pernettya mucronata, Skimmia japonica, Cotoneaster frigidus, Acaecia platyptera, Grevillea Preissii, G. alpina, Quercus coccinea, Paneratum macrostephana, Nerine Bowdenii, N. Fothergillii major, and a fine collection of winter-flowering Carnations. Messrs. SUTTON & SONS, Reading, exhibited a superb collection of vegetables, for which they were awarded the Society's Gold Medal and Certificate of Merit. The DEVON ROSERY, Torquay, showed a fine collection of Apples. Mr. W. J. GODFREY, Exmouth, staged a quantity of Chrysanthemums and a collection of Zonal Pelargoniums, as well as many hybrid Gerberas.

WINCHESTER CHRYSANTHEMUM.

NOVEMBER 15, 16.—As usual the annual autumn show was held in the Guildhall, and, although exhibits were not quite so numerous as last year in the classes for cut blooms, the deficiency was fully made up in the decorative section. Nowhere is a finer display of incurved blooms to be seen than at the Winchester Shows, as the prizes offered attract most of the leading Chrysanthemum exhibitors.

PLANTS.

In the class for a collection of Chrysanthemum plants arranged for effect, the judges to take into consideration the quality of the blooms, there were only two entrants, MATTHEW HODGSON, Esq., Moreton House, Winchester (gr. Mr. A. J. Marsh), being distinctly 1st, with plants carrying handsome blossoms, none too well arranged; 2nd, JAMES HARRIS, Esq., Barton Mark, Winchester (gr. Mr. J. Knight).

Dwarf plants and high quality blooms with good foliage, suitable for conservatory decoration, receive every encouragement in the schedule. In the class for nine specimens Col. DICKINS, Edge Hall, Winchester (gr. Mr. G. Adams), was easily 1st, with plants carrying exhibition blooms, of such varieties as the following: Mme. G. Rivol, F. S. Vallis, Emblème Poitevine, J. Feed, and Mme. R. Oberthur; J. A. FORT, Esq., 69, Kingsgate Street, Winchester (gr. Mr. G. Cousins), was placed 2nd. In a similar class, but for white and yellow varieties only, Col. DICKINS again won the 1st prize, with grand blooms, having excellent plants of Godfrey's Eclipse, C. H. Curtis, and Mrs. F. Judson; Mr. FORT was again 2nd. Mr. A. TAYLOR, Hillside Terrace, Winchester—an amateur—had much the best naturally-grown specimens, and received the 1st prize. In the single specimen class without any restrictions, Col. DICKINS won the premier award with a magnificent plant of J. H. Silsbury.

6

CUT BLOOMS.

Although cut blooms are a great feature at this exhibition, the vase classes are not popular; only two being provided, and neither was well contested. There were three exhibits in the class for 36 blooms of Japanese varieties in not fewer than 24 sorts. Mrs. CLARK, Frensham Place, Frensham, Surrey (gr. Mr. C. Moore), won the 1st prize with high-quality blooms of the following as the leading sorts: Mrs. A. T. Miller, Maud Jofferies, Master James, Pickett's Crimson, Bessie Godfrey, Lady Talbot, F. S. Vallis, Hon. Mrs. Lopes, W. Mease, J. H. Doyle, Purity, and Leslie Morrison; MATTHEW HODGSON, Esq., was placed 2nd; and BERNARD HANKEY, Esq., Feteham Park, Leatherhead (gr. Mr. Higgs), was a good 3rd.

In the class for 24 Japanese blooms five competed, the premier award being won by Captain F. J. DALGETY, Lockerley Hall, Romsey (gr. Mr. W. Baxter), for full-sized, even, fresh examples of popular varieties well staged; Mrs. CHRISTIE, Ribblesden, Windlesham (gr. Mr. W. Wilson), was awarded the 2nd prize, her display being quite close in point of merit to the 1st prize exhibit. For 12 Japanese blooms of distinct sorts, W. GARTON, Esq., Satisbury Court, Southampton (gr. Mr. D. Edwards), excelled with desirable specimens of well-known sorts; 2nd, J. RIDLEY SHIELD, Esq., Carden, Alesford (gr. Mr. Rose).

Incurved varieties were, as usual, extremely well represented. For the premier prize of £5 for 36 blooms in not fewer than 24 varieties, J. B. HANKEY, Esq., led with typical blooms of Clara Wells, Emblème Poitevine, Lady Isabel, Amber Beauty, Buttercup, Daisy Southam, Duchess of Fife, Frank Trestian, and Frank Hammond, staged in the best manner by Mr. Higgs, who is one of the ablest growers of incurved Chrysanthemums; Mrs. CHRISTIE was placed 2nd with a less even set, although many of the blooms were unusually large and all were well arranged; PANTIA RALLI, Esq., Ashted Park, Epsom, (gr. Mr. J. Hunt), followed closely and secured the 3rd prize.

The Comtesse of NORTHBROOK, Stratton Park, Micheldever (gr. Mr. A. J. Henderson), won the 1st prize for five blooms of any white variety shown in a vase, with remarkable examples of Mrs. W. Judson, of purest white and of faultless form; JOHN LIDDELL, Esq., Sheffield Manor, Basing-toke (gr. Mr. R. Learmouth), was 2nd, with Mme. C. Nagelmackers.

Single Chrysanthemums arranged in vases are

always a feature at Winchester. For six vases seven competed, A. P. RALLI, Esq., Twyford, Winchester (gr. Mr. J. Hughes), winning the 1st prize with choice examples of Sylvia Slade, Roupell Beauty, White Pagiam, and Mrs. Kitson; A. H. EVANS, Esq., Harris Hill, Newbury (gr. Mr. C. Smith), was a close 2nd.

Classes open only to ladies were numerous and keenly contested. Mrs. ARTHUR BIDE, Alma Nurseries, Farnham, showed the best dinner table decoration. Mrs. LADHAMS, Shirley, Southampton, also won a 1st prize for a dinner table decoration.

Vegetables were shown unusually well. W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood), secured the premier award with high-class produce in both Messrs. Sutton's and Messrs. Toogood's classes for six dishes.

NON-COMPETITIVE EXHIBITS.

Messrs. E. HILLIER & SON, Winchester, showed Apples of superb quality, backed up with Carnations, Begonias, and Shrubs, (Gold Medal.)

Mr. MYERS received a Silver Medal for an attractive display of Apples, the fruits being remarkably well coloured. Messrs. TOOGOOD & SOX, Southampton, exhibited vegetables. Mr. FAY showed Carnations. Mrs. FLIGHT, Cornstiles, Twyford, Winchester (gr. Mr. Neville), showed Japanese and Incurved Chrysanthemums of excellent quality. Mr. E. J. WOOTTEN, Knowle Lodge, Fair Oak, Eastleigh, exhibited a collection of Carnations.

CHESTER CHRYSANTHEMUM.

NOVEMBER 16, 17.—The Chester Paxton Society holds an interesting and instructive display of Chrysanthemums and other flowers annually in the magnificent rooms of the Town Hall. The cut flowers are arranged chiefly in vases stood on white cloths. There are also beautifully-arranged dinner tables, and this year a new feature was seen in an imposing display of Japanese Chrysanthemum blooms, standing well apart, interspersed with dried grasses, berries, and highly coloured vine leaves. The exhibitor was the Duke of WESTMINSTER (gr. Mr. N. F. Barnes). The display was awarded the large Gold Medal. Messrs. DICKSONS, Chester, also received a Gold Medal for a tastefully-arranged bank of Chrysanthemums in many forms, relieved with Bamboos and Palms.

In the competitive section 60 classes are devoted to hardy fruits.

For six varieties of dessert Apples, the Rev. L. GARNETT was awarded the 1st prize, having well-coloured fruits.

In the class for 12 varieties of kitchen Apples, Col. THOS. GEE (gr. Mr. P. Greene), was awarded the 1st prize.

The best exhibit of 24 varieties of Apples and Pears was displayed by PHILIP YERKE, Esq. (gr. Mr. G. Aitken). Rev. L. GARNETT won in the class for six dishes of dessert Pears.

CUT BLOOMS.—The only class for Chrysanthemums shown on boards is for 12 Japanese blooms in not fewer than nine varieties. W. DRENSFIELD (gr. Mr. W. May), won the 1st prize, having extra choice blooms of J. H. Silsbury and Hon. Mrs. Lopes.

Sir GILBERT GREENALL, Esq. (gr. Mr. C. Goves), excelled in the class for 18 blooms of Japanese Chrysanthemums in six varieties shown in six vases, for 12 Japanese blooms shown in two vases, and for five incurved varieties. For five blooms of one variety, Mrs. THOMPSON (gr. Mr. J. Fleet) was well ahead with extra fine blooms of F. S. Vallis.

For six vases of naturally-grown trusses and for six vases of single varieties, A. PETAIRN CAMPBELL, Esq., led in each class. The 1st prize exhibit in the class for a group of single varieties was worthy of much admiration, and reflected great credit on the exhibitor, Major MACGILLICUDDY (gr. Mr. E. Stubbs). In the class for a representative group, T. GIBBONS FROST, Esq. (gr. Mr. T. Gilbert), also had a noteworthy combination.

In addition to the non-competitive groups already mentioned, Messrs. CIBBANS received a small Gold Medal for Chrysanthemums; Mr. J. FRANCIS a Bronze Medal for a group of Cactaceous plants; The BRITISH GOLFMAN GOVERNMENT exhibited Apples; and Messrs. McHATTIE showed Palms, fruit, and Chrysanthemums.

LINNEAN SOCIETY.

NOVEMBER 17.—Mr. W. C. Worsdell exhibited specimens of Maize showing androgynous inflorescences, from Pretoria, South Africa; Dr. Stapf spoke on the probable derivation of Zea Mays from a species of Euchlena.

Prof. J. W. H. Trail, F.R.S., exhibited specimens and a lantern-slide of a remarkable form of *Rubus Ideus*, distributed over a considerable district in Aberdeenshire, in which the normal number of leaflets was increased by an extra basal pair, approaching the leaf of the Suberecti group of fruticose Rubi.

The general secretary showed a monstrous Pear similar to those figured by Dr. Masters in his *Vegetable Teratology*, which had been picked up under a Pear tree in a Holloway garden by Mr. A. H. Williams.

Prof. G. Henslow read a paper on "A Theoretical Origin of *Plantago maritima*, L. and *P. alpina*, L. from *P. Coronopus*, L. Vars.," of which the following is an abstract:—

This suggestion arose from the presence of *P. maritima* around the erection of faggots for condensing the brine of the Salt-spring of Bad Nauheim, which is some 240 miles from the nearest coast. For M. Lesage proved that fleshiness of maritime plants was the direct result of the presence of salt. *P. Coronopus* has many varieties, and all the characters upon which they are based are very variable; forms approximating the above species are already named. Lastly, Hoffmann proved by experiment that *P. alpina* is identical with *P. maritima*.

Prof. Henslow then spoke on the subject of his second paper: "A Theoretical Origin of Monocotyledons from Aquatic Dicotyledons, through Self-adaptation to an Aquatic Habit—being supplementary observations to a previous paper (*Journ. Linn. Soc., Bot.* xxix, (1892), p. 485)."

He stated that the general belief now prevalent is that Monocotyledons were descended from Dicotyledons, but no other writer appears to trace them to an aquatic habit. He drew attention to a large number of coincidences, in addition to those in his former paper. "They collectively illustrate the general degeneracy of the Class Monocotyledons. With regard to roots, the arrest of the primary root, and dissociation of the germinal tissue of the root-cap, is shown by experiment to be due to water; as is also the production of lacuna and reduction of strengthening tissues. Recent studies in the anatomy of the stem show a close agreement with aquatic Dicotyledons; while experiments prove the degenerating effect of even a moist atmosphere. The dissected type of foliage of submerged leaves of aquatic Dicotyledons has been proved experimentally to be directly caused by water, and explains the dissected type of foliage seen in Palms and certain Aroids. Embryological investigations have educed many coincidences in the minutest anatomical structure of the nucleus and embryo-sac. The conclusions arrived at are: (1) Coincidences are innumerable in all parts of Monocotyledonous plants with aquatic Dicotyledons. (2) Experimental verification now covers and explains a large proportion of these coincidences. (3) Terrestrial Monocotyledons retain by heredity many of the aquatic characters acquired by their ancestors when living a hydrophytic life; but they are now readapted to a life in air."

NEWCASTLE-ON-TYNE AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 16, 17.—The annual exhibition was held in the Town Hall and Corn Exchange, Newcastle, on these dates. The classes for cut blooms were well filled, and the flowers generally were of a better quality than at last year's exhibition. Plants were again a great feature, and the vegetable classes brought the pitmen into keen competition.

A. E. BALNEBRIDGE, Esq., Lynwood, Jesmond (gr. Mr. T. Bell), won the cup for the third time in succession offered for a group of Chrysanthemums and foliage plants arranged for effect. The cup thus becomes his property.

Another cup was also won outright by A. B. COLLINGWOOD, Esq., Lilburn Towers, Wooler (gr. Mr. Lovell), for table decorations.

Amongst non-competitive exhibits was a fine group consisting principally of well-flowered plants of *Vanda cerulea*, *Epidendrum vitellinum*, *Oncidium tigrinum*, well-flowered *Calanthe Veitchii*, *Cattleyas* in variety, and ornamental

foliage and other flowering plants, shown by Lord RIDLEY, Blagdon Hall (gr. Mr. Perry).

Mrs. CLAYTON, The Chesters (gr. Mr. Cocker), showed a large group of Cyclamen and small plants of winter-flowering Begonias.

In the competitive class the 1st prize for 12 vases of Japanese Chrysanthemums in not fewer than 12 varieties, three blooms in each vase, was won by Capt. LAYCOCK, Wiston, Bawtry, Notts (gr. Mr. G. W. Musk), thus winning the cup for the second year in succession. He showed good blooms of Reginald Vallis, Mrs. A. T. Miller, Marquis of Northampton, F. S. Vallis, Mrs. W. Knott, and others. 2nd, F. W. JAMESON, North Ferriby (gr. Mr. G. Jennings).

The best exhibit of six vases of Chrysanthemums in not fewer than six varieties was shown by C. LACY THOMSON, Esq., F. W. JAMESON, Esq., being placed 2nd; and the best four vases of Japanese Chrysanthemums by F. W. JAMESON, Esq.; 2nd, Captain LAYCOCK.

H. F. BULMAN, Esq., Lintz Green (gr. Mr. T. Gliddon), won the 1st prize in the class for three blooms of a white variety of Japanese Chrysanthemums with finely-finished blooms of Mrs. A. T. Miller.

In the similar class for three blooms of a yellow variety Capt. LAYCOCK was placed 1st, and this exhibitor also excelled for three Japanese blooms other than white or yellow. Capt. LAYCOCK was also successful in the classes for four vases of Incurved Chrysanthemums in not fewer than four varieties and for two vases of Incurved varieties.

The single-flowered classes for plants not disbudded was keenly contested, and they made an attractive display. Capt. LAYCOCK again leading.

For a group of Chrysanthemums and other flowering and foliage plants A. E. BAINBRIDGE, Esq. (gr. Mr. T. Bell), was placed 1st, and Messrs. CARNAGE & Co., Newcastle, 2nd.

Certain classes were restricted to the exhibitors in the counties of Northumberland and Durham. For four vases of Japanese Chrysanthemums in not fewer than four varieties, J. B. SIMPSON, Esq. was 1st and C. D. DOXFORD, Esq., 2nd.

The best four vases of Japanese Chrysanthemums grown within four miles of the Central Station were shown by A. E. BAINBRIDGE, Esq., and A. H. HIGGINBOTTOM, Esq., Newcastle (gr. Mr. J. E. Fairlie), was 2nd.

In the class for 10 kinds of vegetables, Mr. R. SHIELD, Swalwell, won the 1st prize; 2nd, Mr. W. BROWN, Blyden. Leeks and white and red Celery made a grand display. Each class was keenly contested by the local miners.

In the class for Grapes, Mr. T. BELL scored with Muscat of Alexandria, and Mr. G. W. MUSK was 1st for a black variety finely finished.

WINDSOR CHRYSANTHEMUM.

NOVEMBER 17.—The 19th annual autumn show, held in the Albert Institute on this date, was of average merit. The great attraction is the King's Challenge Cup, a handsome trophy. Strange to say, on this occasion, there were but two entrants, and, according to the stipulations governing the competitions, there must be three competitors. The cup was therefore not awarded, but the cash prize that accompanied it was given. It is offered for six vases of five blooms each of any section of Chrysanthemums. Presumably it was the five blooms of one variety that caused the sparsity of entries. Next year it is suggested there shall be an alteration in the conditions, so that a keener competition may be expected. The hon. secretary, Mr. G. E. Kerr, works hard to make the society successful, and he is ably assisted by Mr. Arthur Turner (the chairman), and the committee.

Cut blooms were numerous and good. In the champion class, alluded to already, J. B. FORTESCUE, Esq., Dropmore, Maidenhead (gr. Mr. C. Page), staged very fine blooms of Lady Talbot, Purity, Hon. Mrs. Lopes (rich in colour), F. S. Vallis, R. Vallis, and Maud Jefferies; W. A. OWSTON, Esq., Langley House, Langley (gr. Mr. G. Spong), was placed 2nd with smaller blooms.

An interesting class was that for 18 Japanese blooms, distinct, arranged in a space of 5 feet by 3 feet, with the addition of foliage plants or cut foliage, the aim being to illustrate the value of large Chrysanthemum blooms in conjunction

with other subjects for decoration. Four entered, making an interesting and effective display. E. G. MOCATTA, Esq., Woburn Place, Addlestone, Surrey (gr. Mr. T. Stevenson), was placed 1st with exceedingly fine blooms of Lady Talbot, Mme. G. Rivol, Hon. Mrs. Lopes, Purity, and J. H. Silsbury, well displayed on a base of Ferns with the addition amongst the blooms of Spiraea Thunbergii, and Osmunda regalis; 2nd, Mrs. GERALD GOODLAKE, Hawthorn Hill (gr. Mr. W. H. Hearn), with good blossoms, but not effectively disposed.

Another interesting class which evokes a keen competition, and is certainly a desirable one, is that for 12 blooms arranged in one vase along with any kind of foliage. Eight competed, making a fine display. Mr. MOCATTA won the premier prize with a grand exhibit of the Japanese variety Purity, effectively arranged with suitable foliage. Mrs. GERALD GOODLAKE exhibited extra large blooms, a trifle stale, of F. S. Vallis, and secured the 2nd place; 3rd, Miss L. OPPENHEIM, Hawthorn Hill (gr. Mr. G. L. Crowsley).

Mr. FORTESCUE was placed 1st for 12 Incurved and the same number of Japanese varieties, distinct, having desirable specimens of the following varieties: (*Incurved*) Romance, Duchess of Fife, W. Pascoe, Emblème Boitevine, Fred, Palmer, and Clara Wells; (*Japanese*) Lady Talbot, Edith Jameson, Pockett's Crimson, Mr. C. Penfold, Hon. Mrs. Lopes, and Mrs. J. C. Neil; E. IYERSON, Esq., Charter's Towers, Ascot (gr. Mr. F. Cupp), was placed 2nd with smaller blooms.

Eight competed in the class for 12 Japanese blooms, distinct, Sir ROBERT HARVEY, Langley Park (gr. Mr. H. Bowyer), was awarded the 1st prize.

For six single-flowered varieties, arranged in vases, eight competed. Mrs. E. B. FOSTER, Clewer Manor (gr. Mr. W. Coles), was placed 1st with effective sorts, nicely displayed. In a similar class for decorative varieties, except singles, Mr. STEWARD SMITH, Englefield Green, won the 1st prize.

For a group of decorative Chrysanthemum plants, arranged in a semi-circle 8 feet by 4 feet, a Challenge Cup with a cash prize is offered as the 1st prize. Five competitors took part. Mr. F. RICARDO secured the trophy, with well-grown plants so arranged as to display their blooms perfectly; 2nd, P. NELKE, Esq., Woodlee, Virginia Water (gr. Mr. G. Baskett).

Carnations in pots and vases were an added attraction to the Chrysanthemums. Mr. RIVIRO secured several of the premier awards with attractive blossoms.

Exhibits of fruits and vegetables were good and numerous.

LEEDS PAXTON.

NOVEMBER 18, 19.—The annual exhibition held on these dates in the Victoria Hall, resulted in a good floral display, the entries numbering 154 more than at last year's exhibition. The opening ceremony was performed by the Lord Mayor (Mr. W. Middlebrook, M.P.), and there was a good attendance of the public. In the group classes the best exhibit arranged on a space of about 70 square feet was shown by F. H. FULFORD, Esq., Headingley Castle (gr. Mr. J. Harrison), whilst E. H. FORSTER, Esq., Horsforth (gr. Mr. H. Winterburn), was awarded the 1st prize for a group occupying 60 square feet, Mr. FULFORD being placed 2nd. There were several challenge cups offered in the cut bloom classes. One was presented by Ald. W. Penrose Green, for 36 blooms of Chrysanthemums, including 18 Incurved and 18 Japanese varieties. It was won by A. JAMES, Esq., Rugby (gr. Mr. A. Chandler); 2nd, G. H. DRAKE, Esq., Cardiff. Mr. JAMES also excelled in the class for 12 Japanese blooms in not fewer than six varieties, but he was 2nd to Mr. DRAKE in the class for 12 Incurved Chrysanthemums in not fewer than six varieties. Other prize winners in the cut bloom classes included the Marquis of RIXON (gr. Mr. G. E. Thomas), C. WATSON, Esq. (gr. Mr. H. Carter), W. D. CLIFF, Esq. (gr. Mr. W. N. Hague), and T. ARTON RAWDON, Esq. (gr. Mr. F. Howland). The local classes were well contested; the silver challenge cup offered by Mr. T. G. Mylchreest for the best collection of 24 blooms being won by Mr. PENROSE GREEN; Mr. W. D. CLIFF, Meadow Towers, was another successful exhibitor in the local classes.

LAW NOTES.

FAILURE TO NOTIFY DISEASE.

AT the Farnham Petty Sessions on Thursday, a firm of nurserymen were summoned for failing to notify an all-god outbreak of American Gooseberry-mildew on their premises as required by the American Gooseberry-mildew Order, 1909. The evidence showed that in May or June last Mr. G. C. Hough, an inspector of the Board of Agriculture, visited the defendants' nurseries, but found no sign of American Gooseberry-mildew. On August 30 he paid another visit, and in the Gooseberry plantation he found that the shoots of a number of bushes in an area of about five rods had been cut back, and also that they appeared to have been sprayed with sulphur. In the remainder of the plantation he found that the disease existed over an area involving thousands of Gooseberry bushes. As no notification of the outbreak had been served, the Board of Agriculture wrote for an explanation, and the reply given was that the defendants thought the bushes were affected only by common mildew. The Board were unable to accept that explanation, and felt compelled to institute proceedings. A member of the defendant firm stated that they had no idea that there was any American mildew on their premises. The cutting back was done upon expert advice as a preventive. Spraying with Hop sulphur was also adopted, and it was believed that the treatment was successful. The Chairman said that the justices recognised that the offence was a serious one, but the case was the first one of the kind that had been brought before them, and they imposed a fine of £1 and costs.

CLAIM FOR COMPENSATION.

AT the Croydon County Court, on Thursday, before his Honour Judge Harrington, Arthur Horton, of 59, Maberley Road, Upper Norwood, brought an action under the Workmen's Compensation Act against the Crystal Palace Company. The applicant was a gardener's labourer, and, on February 19, he was engaged in felling an Oak tree in the Crystal Palace grounds, when a bough fell and injured him. He was paid compensation at the rate of 11s. 9d. a week until July, when the injury was supposed to be cured. It was contended that he was still suffering from heart trouble, which it was suggested was traumatic, due to the accident.

His Honour, having heard counsel on both sides, said the case was one which ought to have gone to a medical referee, who could have examined the applicant and formed an independent opinion as to his condition. He came to the conclusion that the applicant had failed to make out a case that he was suffering from neurasthenia, or that, if he was suffering from it, it was due to the accident. Judgment was given for the defendants, with costs.

Obituary.

KAREL VAN GEERT.—We regret to announce the death on the 12th inst., at Antwerp, Belgium, of Mr. Karel van Geert, the well-known nurseryman of Antwerp and Calmpthout, aged 61. He succeeded his father, who founded the business, in the management of this fine nursery, which adjoined the Calmpthout station on the railway leading from Antwerp to Rotterdam. Hardy trees and shrubs were the leading features of the firm. The older nursery at Antwerp is now built over, but the memory of it is retained in the name of the street which occupies the site, viz., Rue van Geert. The late Mr. van Geert was one of the best judges of hardy deciduous trees, Conifers and evergreen shrubs in Europe, while his quiet, courteous and kindly manner endeared him to his many friends.

DAVID PEARCE PENHALLOW.—From our American contemporary *Horticulture*, we learn of the death, on October 26, of Professor David Pearce Penhallow, Professor of Botany at McGill University, Montreal, since 1885. Deceased was born at Kittery Point, Me., May 25, 1854.

WILLIAM ROGERS FISHER.—The many friends of Professor Fisher learned with deep regret of his somewhat sudden death on the morning of Sunday, the 13th inst., as recorded in the last issue of the *Gardeners' Chronicle*. For the past two years, his health had been the cause of some anxiety to his friends, but by the observance of a rigorous diet he seemed to be getting stronger, and probably few knew how bravely he was battling with a dangerous complaint. On the 16th, he was laid to rest in the churchyard of Wolvercote, near Oxford, whither his remains were followed by many colleagues and students. The Royal English Arboricultural Society, of which he was a past president, was represented by Professor Somerville. Born in 1846 in New South Wales, Mr. Fisher early in life came to England, and joined St. John's College in the University of Cambridge, where he applied himself to the study of mathematics with so much success that in 1867 he secured a good place in the pass list. Graduating B.A. in the same year, he held for a short time a mathematical mastership at Repton, but in 1869 his interests were so attracted by the subject of Forestry that he competed in the examination for entrance to the Indian Forest Service, and came out an equal first. His period of probation was first passed at the Forest School of Nancy, but on the outbreak of the Franco-German war, he was, with other English students, transferred to Edinburgh, where he applied himself more particularly to the study of Botany, a subject in which he always continued to take much interest. Proceeding to India in 1872 he was first stationed in Bengal, being subsequently transferred to Assam, where, from 1874 to 1878, he worked with much advantage to the State. In the latter year, his exceptional merits were recognised by his receiving the appointment of Deputy Director of the Forest School at Dehra Dun, of which important technical college he subsequently became Director. In 1890, when the Government of India determined to add a department of Forestry to the Royal Indian Engineering College at Cooper's Hill, Mr. Fisher was attached to the teaching staff of that institution, and there he remained till 1905, when, with the students in residence, he was transferred to the new School of Forestry in the University of Oxford. Brasenose College offered him the privilege of membership, and the University conferred upon him the degree of M.A. Mr. Fisher as a teacher, a writer, and a technical adviser, has left an enduring mark on the progress of scientific Forestry. He gave of his best to the relays of young men who came under his influence in the class-room and the forest, and he must have been an indifferent student who was not soon infected with some of the enthusiasm of his stimulating teacher. Every year he conducted a party of students through selected forest districts of France, and these educational excursions never failed to make a deep impression on those who were privileged to join them. Primarily arranged for the probationers for the Indian Forest Service, these French tours were not infrequently taken part in by landowners and others, and some of our most enthusiastic advocates of advanced Forestry can date their realisation of the true meaning of Forestry to one or other of these delightful trips. Scarcely less interesting were the pleasant outings under Mr. Fisher's guidance to Oxshot, Bagshot, Woburn, and other places within reach of Cooper's Hill or Oxford. In his spare time Mr. Fisher was much employed by private landowners, who desired to put their woods under improved management, and many thousands of acres of woodland in England and Scotland are now being advantageously worked in conformity with plans which he prepared. He also gave much assistance to municipal corporations, such as Leeds, Manchester, and Liverpool, that were interesting themselves in the afforestation of the catchment areas of their water supplies. A matter in which he took much interest of recent years was the Arboretum of the Royal English Arboricultural Society at Tubney on an estate belonging to Magdalen College. This collection of trees had its origin in a gift of seedlings exhibited by the Hon. Mark Rolls at Park Royal, and afterwards handed over to the Society. Mr. Fisher gave the plants accommodation for a year or two in his nursery at Cooper's Hill, and it was he who subsequently arranged with Magdalen College for the establishment of the Arboretum for their reception. Mr. Fisher's services to the

cause of Forestry have received many marks of public recognition. For two years, 1904-5, he filled the office of President of the Royal English Arboricultural Society, in whose welfare, till the last, he took the deepest interest. In 1907 he served on the Departmental Committee on Irish Forestry, and at the time of his death he was a member of the Rural Education Conference. Outside of his work at the School of Forestry nothing absorbed his attention so much as the *Quarterly Journal of Forestry*, which he was largely instrumental in founding in 1907, and of which he was, ever since its inception, joint or sole editor. Mr. Fisher's contributions to the literature of forestry have been numerous and valuable. His two largest works are volumes iv. and v. of Schlich's *Manual of Forestry*, the one dealing with Protection, and the other with Utilization. Earlier in life he wrote an excellent text book on *Forest Botany*, designed primarily for use in the school at Dehra Dun, but well worthy of the larger circulation which it gained. His intimate acquaintance with Continental languages enabled him to undertake the task of bringing out an English edition of the *Vocabulaire Forestier*, which, however, has not yet been published. He also translated Schimper's great work on *Plant Geography*. Few men suc-

THE LATE PROFESSOR FISHER.

ceeded, as Mr. Fisher succeeded, in attracting so many friends and making so few enemies. Of him, in fact, it may be truly said that he had not one. Few also have given so whole-heartedly of their best to young men who were entering the profession that Mr. Fisher loved so dearly. His place will be hard to fill, but his memory will long remain green in the hearts of all who knew him. *Wm. Somerville.*

DR. THEODORE COOKE.—The death of Dr. Theodore Cooke, C.I.E., formerly a member of the Bombay Educational Department, occurred on November 5. In 1865 Dr. Cooke was appointed Principal of the Civil Engineering College at Poona. In 1891 the Botanical Survey of India was organised, and Dr. Cooke was placed in charge of the Survey operations in Western India. Encouraged—states *Nature*—by Sir George King, then Director of the Survey, Dr. Cooke made preparations for the production of the "Flora of the Presidency of Bombay." Unexpected difficulties, however, prevented the realisation of the scheme, and when Dr. Cooke retired in 1893 his energies found an outlet in a post to which he was appointed at the Imperial Institute. Some years later he settled at Kew, and commenced working in the Herbarium on the preparation of the local flora of Bombay. The first part was published in 1901, and the 7th and concluding part appeared about two years ago. On its completion, Dr. Cooke continued to work in the Herbarium, assisting as a volunteer in the preparation of the *Flora Capensis*, edited by Sir W. T. Thiselton Dyer.

A. WEBSTER.—We regret to record the death of Mr. Webster, Superintendent of the West Park, Wolverhampton, after a long illness. Mr. Webster was foreman for Mr. Verdegans, of the Chad Valley Nurseries, Edgbaston, who laid out the West Park. The late Mr. William Thomas was the first superintendent, and, on the completion of the park, Mr. Webster was appointed Mr. Thomas's assistant. On the death of Mr. Thomas in 1895, Mr. Webster was appointed Superintendent of the West and East Parks, this latter having been laid out by himself. Deceased always contributed exhibits to the Wolverhampton Flora Fêtes, which are held in the West Park, and he possessed several gold medals awarded for these exhibits.

HENRY ALFRED STRATTON.—We regret to record the death of Mr. H. A. Stratton, which occurred at his residence in Mackenzie Road, Beckenham, on the 21st inst., from heart failure following pneumonia. Mr. Stratton, who was born on October 31, 1860, entered the service of the *Gardeners' Chronicle* in 1880, and until his retirement, through ill-health, in July, 1899, he was principal book-keeper, and on more than one occasion took charge of the publishing department. He had several serious illnesses, and his life was despaired of more than once, but his fine constitution served him in good stead. In 1901 he recovered from a dangerous malady sufficiently to undertake a post at the *Athenaeum*, and he was in the service of that paper at the time of his death. He was a good and trustworthy man, and his friends will miss a genial and pleasant companion.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending November 19, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The *weather* was extremely unsettled in the earlier half of the week, with heavy rain in nearly all districts. Later on a decided improvement took place in the southern parts of the Kingdom, while frequent showers of sleet, snow, and hail occurred in the north and east. Continuous snow occurred on the Kentish coast on Thursday, but melted on reaching the ground. Thunderstorms prevailed at Valencia on Sunday, at some southern stations on Monday and Tuesday, and at Hillington and Morphett on Friday.

The *temperature* was below the average, the deficit being nearly 6° in Scotland N. and Ireland S., about 5° in several other districts, and about 4° in the English Channel and over northern and central England. The highest of the maxima, which were mostly recorded either on the 13th or 14th, ranged from 58° in England E. to 51° in Ireland N. and to 47° in Scotland N. and E. The lowest of the minima occurred on the 17th generally, but on the 19th in the north and north-west, and ranged from 18° in England S.E., 19° in the Midland Counties, and 20° in Ireland S., to 28° in England N.E. and to 37° in the English Channel. The lowest grass readings were 10° at Llangunmarch Wells, 14° at Kew, and 15° at West Linton, Tunbridge Wells, and Aspatria. In several other localities the readings were below 20°.

The *mean temperature of the sea*.—On our southern and south-western coasts, as well as off the north-east of England, the water was warmer than during the corresponding week of last year, elsewhere it was rather colder. The means for the week ranged from 54° at Plymouth to 41° at Penman Bay and Kirkwall.

The *rainfall* was more than the normal except in Ireland and in Scotland W., the excess being large in most districts. Falls of more than an inch were experienced in places over a large area on the 13th, as much as 1.70 inch at Dumfries, and 1.22 inch at Brighton. At Guernsey 1.23 inch accompanied a severe thunderstorm on the 15th.

The *bright sunshine* exceeded the average generally, but was only equal to it in Scotland W., and below it in Scotland N. and E., and the English Channel. The percentage of the possible duration ranged from 38 in England S.E. and 85 in England E. and the Midland Counties to 22 in England N.W., and to between 19 and 12 in Scotland.

THE WEATHER IN WEST HERTS.

Week ending November 23.

The *coldest weather since January*.—This was the third cold week in succession, and the coldest of the three. In fact, there has been no such cold weather since the fourth week in January, due to persistent low readings throughout the whole week. On the two coldest nights the exposed thermometer registered 16° of frost. The ground is now as much as 6° colder at 2 feet deep, and 8° colder at 1 foot deep, than is reasonable. The temperature at 1 foot deep is at the present time lower than any previously recorded here in November during the last 25 years. The moisture measurement from rain, snow, and fog during the week only amounted to about one-tenth of an inch. There has been some slight percolation through both soil gauges each day. The sun shone on an average for 4 hours 28 minutes a day, which is nearly three times the mean duration for the middle of November. The winds were rather light at the beginning of the week, but the last four days have been very calm. The mean amount of moisture in the air at 3 p.m. fell short of a reasonable quantity for that hour by 6 per cent. *E. M., Berkhausted, November 23, 1910.*

MARKETS.

COVENT GARDEN, November 23.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Azaleas, Bouvardia, Carnations, Chrysanthemums, Gardenias, Hyacinths, Lapageria, Lilium, and Marguerites.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and plants, including Adiantum, Asparagus plumosus, Croton leaves, Ferns, and Hardy foliage.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants and their prices, including Aralia Sieboldii, Begonia Gloire de Lorraine, Cereus Weddelliana, and others.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples (American, Greening, Baldwin, etc.), Pears, and others.

Fruit: Average Wholesale Prices (continued).

Table listing various fruits and their prices, including Apples (Blenheim, Pippin, etc.), Nuts, Almonds, Peaches, and others.

Christmas Fruits and Preserves.

Table listing various Christmas fruits and preserves, including Figs, Nuts, Dates, and others.

Vegetable: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, Broccoli, and others.

REMARKS.—Apples: Both home-grown and imported Apples show a slight increase in value. Varieties packed in barrels are in better demand. Pears: The market is well supplied with both French and American varieties of Pears. Grapes: Prices for the best Grapes are firmer as supplies are decreasing. Tomatoes: English Tomatoes are unusually plentiful for this late period of the year and are selling freely. Tomatoes are arriving from the Canary Islands in larger quantities—these are selling slowly. Oranges: Fruits of the best quality are exceedingly scarce. Cobnuts: The supply is equal to the demand with a slight decrease in prices. Foreign Nuts show an increase in value which is likely to continue. Vegetables: Supplies have increased and the prices are lower. E. H. R., Covent Garden, November 23, 1910.

New Potatoes.

Table listing various new potato varieties and their prices, including Kents, Lincolns, Bedfords, and others.

REMARKS.—Trade is not quite so good, and prices remain about the same. The stocks in London show an increase during the past week. Edward J. Newbourn, Covent Garden and St. Pancras, November 23, 1910.

DEBATING SOCIETIES.

STIRLING & DISTRICT HORTICULTURAL.—A good attendance, under the chairmanship of Mr. G. Petrie, assembled on November 8, to hear Mr. H. Arnold, Carlton Hall, lecture on "How to keep a Greenhouse Gay all the Year Round." Mr. Arnold offered his remarks in a brief and interesting manner, and the presence of those from a long distance was a compliment to his ability as a speaker, his lecture before the Association some years ago on "Wild Gardening" being still remembered with pleasure.

REDHILL AND REIGATE GARDENERS.—The usual fortnightly meeting was held on November 8, at the Penthyon Hall. The lecturer for the evening was Mr. A. E. Buigess, his subject being "Experimental Gardening." James I. of Scotland was probably the first to introduce a pleasure garden in Great Britain, but probably the first pleasure garden of modern times was established by Henry VIII, this at Sutton, Surrey. The lecturer gave the dates of introduction of some of the different fruits and vegetables. The Potato, he said, was first grown by the Spaniards in the sixteenth century, but not until the eighteenth century was it grown for food. The introduction of green vegetables helped largely to stamp out scurvy, which was so prevalent at one time. The lecturer concluded his remarks by dealing with the great improvements that had taken place in fruits and vegetables.

BRISTOL AND DISTRICT GARDENERS.—The usual fortnightly meeting was held on November 10, at St. John's Parish Rooms. Mr. Garaway presided over a good attendance. Mr. Potter, of the Bath Society, gave a paper on "The Heilacoon-Border." He recommended a situation with a background formed by shrubs or a wall, preferably the former, with a south or west aspect. He said a soil of a light nature is best, and previous to trenching leaf-mould and well-decayed manure should be incorporated with it. The lecturer gave a list of varieties suitable for planting, including tall, medium, and dwarf-growing sorts. Included amongst the former were Boccacia, Rudbeckia, Aconitum, Lyngium, Verbascum, Artemisia, Delphinium, Anemone, and Kniphofia, of those of medium height he enumerated Anemone, Campanula, Cimicifuga, Thalictrum, Helleborus, Phlox, and Asters; whilst of dwarf flowers he mentioned Dicotyledon, Sylvia, Funkia, Montbretia, Isatis, and Ostrow-skia are a selection.

CHELMSFORD AND DISTRICT GARDENERS.—The usual weekly meeting was held at the County Laboratories, Chelmsford, on November 18, about 70 members being present. The chair was taken by Mr. Curry, a local farmer. Mr. F. W. Shrivell, of the Agricultural and Horticultural Experimental Station, gave an address on "The Manuring of Kitchen Garden Crops."

PLYMOUTH GARDENERS.—A meeting and exhibition was held on the 12th inst. at Mutley Grammar School, Plymouth. Mr. I. Andrews presided. There was a display of Chrysanthemums, also a competition for exhibitions restricted to under gardeners. Mr. K. W. Swan, gardener at Torr Hill, Ivybridge, read a paper on "Chrysanthemums." The lecturer dealt with the history and various types of this flower, and also gave some practical hints on its cultivation. Mr. W. Bennett gave some hints on the Chrysanthemum as a decorative flower.

CROYDND & DISTRICT HORTICULTURAL.—At this society's meeting on the 1st inst. Mr. J. Heald, of Messrs. Veitch's Nurseries, Chelsea, delivered a lecture on "Hybrids of Amaryllis." The lecturer brought under notice the whole family of Amaryllis, but dealt principally with the species of Hippeastrum. He said that in the early part of the last century the hybridising of these flowers first received attention, and what was considered a great achievement about 1824 was the successful crossings by Dean Herbert, who claimed to have 35 different crossings. Skipping a period of 50 years, during which time nothing eventful took place, Mr. Heald said that other cultivators specialised with them, especially Dutch horticulturists. It was at the establishment of one of these growers that the lecturer first acquired his enthusiasm, for on a business visit for Messrs. Veitch he observed several plants quite superior to any he had previously seen, and coming back with a few bulbs he set to work hybridising and selecting.

At the meeting of this society, on Tuesday, the 15th inst., the hon. treasurer, Mr. P. F. Bunyard, gave a lecture on "New-time Boxes on the Baron Berle, ch. System," or "How to Attract and Protect Wild Birds." The system which he promulgated is one used in Germany, with good effects, and Baron Berle, the author of this system, has for some years scientifically catered for the birds' requirements in the whole of his estate of some 2,000 acres. The result of his experiments has been to attract insectivorous birds only, and these in return have preyed upon insect life in their surroundings that his trees are growing in sound, healthy condition.

ENQUIRIES AND REPLIES.

HOCKBERRY. Can any reader kindly tell me what species of plant is known as the Hockberry? J. H. L.

THE POISONOUS PROPERTIES OF THUYA (see p. 374). For many years I supplied from the Pen-carrow grounds bundles of Evergreens to the Wadebridge Foresters' Fête Committee for the purpose of decorating the town on the occasion of their annual sports. Four or five years ago, a racing donkey was taken suddenly ill soon after winning a race. As it was a valuable animal, its owner immediately sent for a veterinary surgeon, who diagnosed poisoning, and administered an emetic, which brought to light pieces of *Thuya gigantea*. The donkey soon afterwards completely recovered, but the veterinary surgeon was strongly of the opinion that it would have died had the *Thuya* been allowed to remain in the stomach. A. C. Bartlett, Bookham Grove Gardens.

Editors and Publisher.—Our Correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the *Publisher*; and that all communications intended for publication, or referring to the Literary department, and all plants to be named, should be directed to the *Editors*. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

AGAPANTHUS: Omega. *Agapanthus umbellatus* is a somewhat greedy plant, and we suspect that your specimen, though being confined for a long period in the same pot, has become too weak to flower. This is the more likely, because the species is one of the most free-flowering when it is treated liberally at the roots and given full exposure to sunshine during the summer months of the year, either out-of-doors or in a very freely-ventilated conservatory. Your best plan would be to give the plant a shift either by removing it to a larger receptacle or by dividing it into two specimens. It may not be convenient to re-pot such a plant frequently; therefore, it is desirable to make the compost as lasting in good qualities as possible. One of the most floriferous plants we remember to have seen was a very large specimen in a wooden tub, which measured about 2 feet square and 2 to 2½ feet deep. This plant was potted in good loam with a quantity of sand mixed with it, but in addition to these materials such a quantity of quarter-inch bones was added as to make the compost appear white, and a little chemical manure was mixed in. This was done more as an experiment than anything else, as the quantity of bones seemed excessive. But it was successful, for the plant continued to grow and to flower most satisfactorily for years afterwards without any further stimulant. During the growing season the specimen was soaked frequently and thoroughly with clear water, but in December and January the roots were reduced to a condition of dryness approaching drought.

ARFVARIA IMBRICATA: T. W. The male and female inflorescences are usually borne on different trees, but not always. The well-known case of a tree at Exton, in Devonshire, which bore cones of both kinds, may be cited. From the seeds developed by this tree many young trees were obtained. See Veitch's *Manual of the Coniferae*, p. 183.

ERICA CUTTINGS: W. E. If the cuttings are not overcrowded in the pots, they may be allowed to remain until early in the new year. If more convenient, they may be potted as soon as they are well rooted, for when they are left for too long a period in cutting pots the roots get matted together, and it becomes difficult to divide them. If done at this season, three or four rooted cuttings may be put into each pot, potting them singly early in the spring. It is usual to stop the leading shoot once, and allow

the plants to make a new start before disturbing them. When first potted they may be kept rather close, and given a little warmth, but after they are established, the hot-water system should only be employed to keep out frost, and fresh air should be admitted on all favourable occasions. Watering must be carefully attended to, especially if the plants are placed on a stage with hot-water pipes beneath it; for the soil in the pots will be liable to get dry beneath whilst the top appears moist. If the plants are allowed plenty of light and air, growth may be encouraged by keeping the house extra warm, but in dull, dark weather the cooler the house is kept the better. For potting soil, use clean, fibrous peat, with a liberal addition of sand. The compost should be pressed down firmly, taking care that it is equally firm beneath as on the surface. To prevent mildew making its appearance, a little sulphur may be dusted about the plants. *E. hyemalis* is most susceptible to mildew, which proves very destructive if not checked on its first appearance. When potting into large pots, a little soot may be added to the compost, and if the peat is very light the addition of some light fibrous loam will be beneficial. After *Ericas* are well established, they should have plenty of room, so that the light and air may circulate about them. During the summer months they should be placed in the open, fully exposed to the sun. To form bushy plants they may require stopping once after they have made a good start, but this must not be done later than April, or the flower-stems will be short. After the plants are well rooted, soot-water may be used, but it should be made some time before it is required, so that it can be given in a clear state. When the blooms are setting, stimulants should be withheld, but feeding may be continued again when the plants are coming into flower.

HYBRIDISING CHRYSANTHEMUMS: A. H. You do not state which types of *Chrysanthemums* you wish to cross. In the case of singles, which are the easiest to raise from seeds, it is not necessary to remove any part of the flower, but with early-flowering and Japanese varieties, it will facilitate matters if you cut back the florets. In the case of large-flowered varieties, it will be found that the florets each possess ovary, style and stigma, but do not bear pollen, whereas the central florets have, as a rule, the stigmas covered with pollen. It does not follow, however, that any given variety produces both potent pistil and stamen, for in many cases the stamens, though present, are bare of pollen. In cases of this sort, the varieties seed very badly, and sometimes not at all, appearing to be more or less sterile. Varieties which seed easily, usually produce a large quantity of pollen. In common with some other flowers, the stigmas are, as a rule, unexpanded until the pollen has been shed, and comparatively few *Chrysanthemums* are self-fertilised.

IRON IN THE SOIL: C. B. Your soil is evidently suffering from an excess of oxide of iron, which is very injurious to plants when present in large quantities. The best method of counteracting the evil is to apply about one ton of quicklime per acre during the winter, dig in, and leave the soil rough until the spring. In the case of hard water to be used for plants, keep a supply in a large tank, to which add quicklime and soot, half and half; the quantity to be used will depend upon the size of tank. When the water is very slightly alkaline to the taste, enough lime has been added. Give an occasional stir with a stick, allow the solid matters to settle, and water the plants with the clear liquid.

MILDOW ON GRAPES: Nil Desperandum. One of the most common causes of mildew on Grapes is a badly-drained Vine border. Excessive dryness is also a fertile source of this pest. Examine the border, and should there be evidence of stagnation lift the whole of the roots inside the house and replant them in a new border. Should the subsoil be unsuitable for Vines, place a thin layer of concrete over it to keep the roots from going down, and over the concrete provide thorough drainage. Mildew usually makes its appearance soon after the berries have set; at that stage a little sulphur should be dusted over the foliage once a week, and occasionally a little may be dusted on the hot-water pipes. Now the Vines are dormant they

may be fumigated by burning sulphur in the house on a still night. Scrub the rods with a strong mixture of soft soap and sulphur.

NAMES OF FRUITS: G. B. Belle Pontoise.—C. H. Reineite Frauche.—Velvin. Soldat Labourer.—Parslor. The Apple is of very nice appearance; but, compared with other varieties in season, it is of poor quality.—W. D. & S. Présent de Van Mons.—J. D. C. 1. Scarlet Golden Pippin; 2. Newtown Spitzenberg; 3. Brabant Bellefleur; 4. Lord Burghley; 5. Leathercoat; 6, not recognised.

NAME OF PLANTS: G. P. "Cape." *Ornithogalum lacteum*.—M. M. 1. *Cochlosa sanguinea*; 2. *Liparis longipes*; 3. *Bulbophyllum pavimentatum*.—G. H. *Abelia rupestris*.—O. B. 1. *Chelidanthus lendigera*; 2. *Pteris quadriaurita*; 3. *Adiantum formosum*; 4. *Blechnum occidentale*.—R. P. 1. *Cypripedium Leeaanum*; 2. *Laelio-Cattleya Bletchleyensis*; 3. *Selaginella Willdenovii*; 4. *Acalypha macrophylla*.—Cheuton. *Ruscus racemosus*.—A. C. *Jasminum grandiflorum*, native of North-western Himalaya.

POISONOUS CREEPER: G. H. B. *Sidcup*. The plant sent is the Poison Ivy (*Rhus Toxicodendron*), and it is the cause of the eczematous eruptions. This tree should never be pruned without gloves, as very serious skin troubles are otherwise started. The remedy for the poisoning is sugar of lead dissolved in alcohol. The only other subject in your list not above suspicion is *Clematis Flammula*. The say of this also causes skin trouble, but usually only when the skin is broken. The following information respecting *Rhus Toxicodendron* is reproduced from the *Kew Bulletin*:—" *Rhus Toxicodendron* (which is now taken to include also the *R. radicans* of Linnaeus) is widely spread over the eastern portions of North America, and is found in certain parts on the western side. It occurs also in Japan. Sometimes it takes the form of a loose, wide-spreading shrub; sometimes it is a climber. Not only is it variable in mode of growth, but also it exhibits a great diversity in the size and shape of its leaves. Although these are said to be occasionally quinquefoliate, they are almost always trifoliate. The three leaflets of a particular leaf are sometimes similar in size and shape, but usually the middle one is larger than the other two, and it has, invariably, a longer stalk. The margins are either entire or coarsely toothed, the coarse toothing being apparently more characteristic of young plants. In the autumn tints of its foliage this shrub is one of the most handsome we possess, dying off as it does into various rich shades of red. Some years ago the climbing form was distributed from a nursery as *Ampelopsis Hoggii*, a name which has, of course, no justification, but which was no doubt suggested by its similarity in leaf and colouring to *Ampelopsis Veitchii*. This is an instance in which the propensity of some plant dealers to give new names to old plants without troubling to have their identity established has been attended by a certain danger to the public, in addition to the inconvenience and confusion this practice always entails.

TOMATOS: Inquisitive. Four tons of horse manure will be none too much for a house measuring 220 feet by 29 feet. The manure will be better if it is fairly decomposed and dry. Do not dig in artificial manures of any kind, as these can be better applied to the plants when they have set two or three trusses of fruit, but burnt garden refuse or wood-ashes might be mixed with your heavy soil with advantage. The essential point is to provide a rooting medium which will encourage free root action without causing the plants to grow excessively strong. From 12 to 15 bushels of air slaked lime will be sufficient for each house.

CLASSIFICATION OF DAFFODILS.*

THIS publication, issued under the authority of the Royal Horticultural Society, contains more than the title implies. It is, in fact, a readjustment, for horticultural purposes, of previous classifications of the genus *Narcissus*, with a full classified list of all species and garden varieties which have been named up to date. It will be noticed in the title and general letterpress that the term "daffodil" is used for all forms of the genus regarded as garden flowers. It is certainly as convenient as it has now become popular to drop the older distinction between trumpet "daffodils" and the shorter-crowned "Narcissis," and henceforth it will be unnecessary to speak of daffodils and Narcissis.

There is a legend that Haworth, who made a close study of the genus, and in 1831 contributed his *Narcissus* monograph to Sweet's *Flower Garden*, lost his reason in the attempt to systematize the daffodils and daffodil-names existing in his time. Recent proposals

and experiments in the direction of rearrangement for modern needs have produced, if not such dire results, at least sharp criticism and dissension, to which it is hoped the present publication will give pause. So many minds are bent upon the characteristics of this extraordinarily and deservedly popular flower that there must be differences of opinion as to its grouping in the garden and the showroom. But an appeal is here made to sink such differences, at all events until the present scheme has been fairly tried. It is not put forward as necessarily final, but as open to modification when, from time to time, the necessity may arise, in view of the unceasing production of new interbred forms. The scheme is the outcome of a second endeavour, within two years, by a special *ad hoc* sub-committee of the *Narcissus* Committee of the Royal Horticultural Society, and the present writer can testify to the extreme pains taken and the careful consideration given to all alternative schemes and suggestions communicated to the sub-committee.

Broadly speaking, the several classifications used or proposed hitherto have been natural, artificial, or a mean between these two. A natural classification arranges its groups according to the botanical structure or obvious characteristics of the entire plant. Thus it would not put cyclamineus into the same division with trumpet daffodils, although both may show the same relative dimensions of perianth and corona. Nor would it associate *Jonquilla* with *triandrus*, although both carry several flowers on one stem. An artificial system founds its divisions arbitrarily, e.g., on the relative measurements of perianth and corona, without reference to botanical affinities. To find permanent acceptance, a system must probably be a compromise between the two. Length or shortness of crown as compared with the perianth segments will always be a main criterion of grouping on the show-stage. But, at the same time, the man with a true instinct for the individuality of a plant will resent the "lumping together," say, of trumpet *maximus* and *Bulbocodium*, of *Tazetta* and *triandrus*, or of pure poeticus with its hybrids. For this reason the tentative arrangement drawn up very ably on such quite arbitrary lines of division by the Royal Horticultural Society in 1908, failed to secure favour. Undoubtedly the classification and the arrangement of the then extant daffodils, made by Mr. J. G. Baker in 1869, and subsequently modified by Messrs. Barr and Burbridge, were an admirable compromise, and the main outlines will continue to serve the grower and the exhibitor. The present classification is practically the same, and its differences are chiefly in the direction of simplification. At first thought, it may seem strange that classification should proceed from complex to simple, considering the vast and intricate output of seedling forms. But reflection will show that convenience will always tend to simplification. To take the instance of the Rose, nothing can be more complicated than the interbreeding which, from original forms, has given us the roses of our gardens of to-day. If fanciers had recorded the original elements and the intercrossing of the Rose as they have of the Daffodil, no doubt their classification would at one time have been highly intricate. But now a very few groups, with some popular

name for each variety, suffice for the whole multitude in the Rose garden or Rose show. A long step in simplification was taken when, in 1884, it was decreed by the Royal Horticultural Society "that garden varieties of *Narcissis* . . . should be named or numbered in the manner adopted by florists, and not in the manner adopted by botanists." Consequently, in Messrs. Barr's catalogue which has always served as a standard, since they have taken far more than a trade interest in the Daffodil—" *Narcissus incomparabilis sulphureus marginatus minor* " became plain "Queen Mab." And the classification has dropped rather than increased its divisions; for example, the sub-classes *Humei* and *Vincenti* have been struck out as superfluous. The classification here reviewed has aimed at the utmost possible simplicity, i.e., at creating no more classes than enough to contain all well-known daffodils. Two, indeed, out of its eleven divisions are a provision for future rather than for present requirements. Division VI., for cyclamineus hybrids, may perhaps hardly be filled in the near future, for the flowers are so early as rarely to appear at the April shows. But cyclamineus crosses so readily with other forms that it is sure to yield a large variety. Under Division VII., for *Jonquilla* hybrids, few examples are as yet in commerce, but many are in the hands of raisers, and the "break" is beautiful, and likely to prove of high trade value. *Triandrus* hybrids (Division V.) are already a considerable and increasingly admired class. In particular, the hardiness and loveliness in texture and colour of the *Leedsii-triandrus* seedlings demand their recognition in any adequate scheme. Full consideration was given to every recommendation to make more classes, but it was evident that no exhibition schedule or stage could embrace, without hopeless complexity, the classes which *might* plausibly be made of interbred forms. For this reason, the sub-committee braved the charge of inconsistency in retaining colour alone, without reference to form, as the criterion of Division IV., *Leedsii*. It seemed better to have various white, short-crowned daffodils shown in one and the same class than to separate them into classes according to length of crown. At the same time the distinctness in natural character of *Leedsii* forbade its being classed as white *incomparabilis*. The sub-divisions according to colour, three in Division I., two in each of Divisions II and III., are certainly an irreducible minimum, but it was thought they would cover the ground. There has been some little controversy as to the retention of poeticus as a class apart from its small-cupped hybrids which approach it so closely. It was, however, the opinion of the most experienced raisers and growers that pure poeticus has still an unmistakable character which isolates it, and therefore, after full deliberation, it was kept separate. It is to be remembered that the classification has been drawn up chiefly for the exigencies of the Daffodil show, a point of view which explains such an arrangement as the relegation of the smaller species such as cyclamineus *triandrus* and *Jonquilla* to Division XI. (various), since they are not likely to find a place on the exhibition stage with their larger blood-relatives.

The writer would urge upon critics of this classification that no scheme can faultlessly cover the whole of its intricate maternal-

* Classified List of Daffodil Names. (Royal Horticultural Soc. etc.). Price 1s.

certainly not for the future as well as for the present; but that a very simple scheme, capable of expansion and addition, is preferable to premature and cumbersome attempts to classify minutely every one of all our myriad actual or potential daffodils. *G. H. E.*

DETAILS OF THE NEW CLASSIFICATION OF DAFFODILS.

The 11 Divisions are as follow:—

Division I.—TRUMPET DAFFODILS.

Distinguishing character: Trumpet or crown as long as or longer than the perianth segments.

- (a) Varieties with yellow or lemon-coloured trumpets, and perianth of same shade or lighter (but not white).
- (b) Varieties with white trumpet and perianth.
- (c) Bi-color varieties, *i.e.*, those having a white or whitish perianth and a yellow, lemon, or primrose trumpet.

Division II.—INCOMPARABILIS.

Distinguishing character: Cup or crown not less than one-third but less than equal to the length of the perianth segments.

- (a) Yellow shades with or without red colouring on the cup.
- (b) Bi-color varieties with white or whitish perianth, and self-yellow, red-stained, or red cup.

Division III.—BARRII (INCORPORATING BURBIDGEI).

Distinguishing character: Cup or crown less than one-third the length of the perianth segments.

- (a) Yellow shades, with or without red colouring on the cup.
- (b) Bi-color varieties with white or whitish perianth, and self-yellow, red-stained, or red cup.

Division IV.—LEEDSII.

Distinguishing character: Perianth white, and cup or crown white, cream or pale citron, sometimes tinged with pink or apricot; embracing all dimensions as found in the *Incomparabilis* and *Barrii* groups (Divisions II. and III.).

Division V.—TRIANDRUS HYBRIDS.

All varieties obviously containing *N. triandrus* blood, such as *Queen of Spain*, *Earl Grey*, *Eleanor Berkeley*, *Moonstone*, *Agnes Harvey*, &c.

Division VI.—CYCLAMINEUS HYBRIDS.

Division VII.—JONQUILLA HYBRIDS.

All varieties of *N. Jonquilla* parentage, such as *Buttercup*, *odorus*, &c.

Division VIII.—TAZETTA AND TAZETTA HYBRIDS.

To include *N. Tridymus*, Poetaz varieties, the Dutch varieties of *Polyanthus Narcissus*, *N. biflorus*, *N. Muzart*, and *N. intermedius*.

Division IX.—POETICUS VARIETIES.

Division X.—DOUBLE VARIETIES.

Division XI.—VARIOUS.

To include *N. Bulbocodium*, *N. cyclamineus*, *N. triandrus*, *N. juncifolius*, *N. gracilis*, *N. Jonquilla*, *N. Tazetta* (*sp.*), *N. viridiflorus*, &c.

CYPRIPEDIUM REGINALD YOUNG.

(*C. HITCHINSÆ* [ELMIREANUM] × *C. INSIGNE* HAREFIELD HALL.)

AN Award of Merit was accorded this showy hybrid when exhibited by its owner, H. J. Bromilow, Esq., Rann Lea, Rainhill, Lancashire (gr. Mr. Morgan), at the Royal Horticultural Society's meeting on October 25 last. Reference to the illustration will show that it is a fine, bold flower, with the markings attractively displayed, the large chocolate-purple blotches on the dorsal sepal (which has an Indian yellow base and pure white upper part) being even more pronounced than might have been expected from the parents used. The petals and lip are honey-yellow tinged and slightly veined with pale purple. Specialists in *Cypripediums* always appreciate good new varieties, and the one here illustrated is well worthy of their attention.

NOTES FROM A "FRENCH" GARDEN.

THE USE OF CLOCHES.

THE cloches or "bell glasses," indispensable as they are in a French garden, are supplementary to the frames and lights. They encourage plants to make a sturdy and healthy growth in winter, partly because their peculiar shape prevents excessive dampness, which is so prejudicial to seedling plants at this time of the year. Plants grown under cloches in the spring are very strong, but as the sun gets warmer the growth becomes spindly and soft; the plants require shade and more ample ventilation. For the latter reasons, the cloches are almost disregarded in the summer months, their use being confined to 10 months of the year. They are used for the following purposes: (1) For the rearing of the Cabbage and Cos Lettuces, and (2) for the growing of Cabbage and Cos Lettuces as market crops from February till May 3. (3) For the temporary shelter of plants set in their final quarter at a precarious stage of growth, such as Cauli-

flower exercises his judgment in using the mats, and only covers the cloches at night when it appears to be absolutely necessary; exception is made, however, with new cloches; they should be covered more often, as the new glass is apt to break during frost.

From January 15, the hot-beds for the frames and lights are started, and the "Little Gott" Lettuces are transferred from the cloches to their final quarters in the frames. At the end of that month, the frames for cold work are also planted with either "Little Gott" or "White Passion" Lettuce; the former variety is preferable. In a well-organized garden, this work is finished by February 10, and about 400 cloches are at liberty. At that date, the hot-beds for forcing Cos Lettuces under cloches are begun, utilising for that purpose the 400 cloches from the "Little Gott" Lettuces. When the fermentation of the manure commences, two or three "Little Gott" Lettuces and one Cos Lettuce, "Paris Grey," are set under each cloche, and within seven or eight days the spaces between the three rows of cloches on

FIG. 166.—CYPRIPEDIUM "REGINALD YOUNG": A HYBRID WITH FINELY-MARKED DORSAL SEPAL.

(Received R.H.S. Award of Merit, October 25.)

flowers in the spring. Tomatos early in May and ridge Cucumbers in June. (4) For the first stage of growth of Melons or Telegraph Cucumbers on hot-beds until frames and lights from the earlier batch of Melons are available in July. It is necessary to explain how this system is put into practice, for example, in a garden containing 1,000 cloches and 250 lights. Early in October the ground has first been dug and then top-dressed with 2 or 3 inches of well-decayed manure. Five hundred cloches are planted with 15,000 Lettuces of the variety Little Black Gott, and 300 cloches are set with 4,200 "Paris Grey" Cos Lettuces. At the second transplanting, in November, the "White Parisian" Cos Lettuce is transferred to the frames, where it remains till late in March. Two hundred cloches are planted with 6,000 "White Passion" Lettuces. They are planted in the above order. The plants remain there throughout the winter, the only care they require being ventilation in mild weather and protective covering in case of frost. The

each bed are planted with another "Paris Grey" Cos Lettuce, as shown in the diagram published in the *Gardeners' Chronicle*, March 13, 1909, fig. 70. As the work proceeds, all the cloches are brought into use by the end of the month, excepting those under which the "White Passion" Lettuces are grown. It is then time to plant this variety in the open ground, putting the plants 10 inches apart each way, and the remainder are used either for some hot-beds, or, as is often the case, for cold work. When they are employed for the latter purpose, the ground is prepared previously, and Radishes are sown broadcast before placing the cloches three rows for every bed. Three "White Passion" Lettuces, with one Cauliflower, are set in each cloche on the outside rows; in the middle row one Cos Lettuce is planted instead of a Cauliflower. By this method the cloches are brought again into use, and will supply a succession of Lettuces from March 20 until the middle of June. From early in May the Cos Lettuces under cloches will do better if the

latter are removed, as the sun is too strong. The cloches are then used for sheltering Tomatos planted in the open ground, which have been previously grown in frames or a greenhouse. The cloches are shaded with linewash. As the plants get established, they receive proper ventilation, and the first truss of blooms is very often set when the cloches are removed three or four weeks later. In some gardens, they are used for sheltering Vegetable Marrows during May, and it is a common occurrence to obtain in that manner Marrows of a marketable size in the middle of June. By June 10, the cloches are removed to ridge Cucumbers, where they remain until early in July. When ridge Cucumbers are not grown, hot-beds are made early in June, as for frames, and they are planted either with Melons or Telegraph Cucumbers, with the cloches as covers. The space under the cloches is quite sufficient for their growth till the middle of July, when they are replaced by the frames and lights which are then at liberty: these latter increase the head-room necessary to the growth of the plants. Then the cloches are washed and stacked until the end of August, when about 150 are used for growing Lettuces for marketing in November, at which time they will be needed for the second transplanting of the Cos Lettuces.

To carry out these arrangements satisfactorily, it is necessary to know the space required for each crop, and to have the ground in proper condition, so that no time is wasted. The average breakage of cloches in a well-conducted garden rarely exceeds 2 per cent. each year. *P. Aquatias.*

ALPINE VALLEYS.

(Continued from page 356.)

THE ROJA.

It is a tiresome paradox that, though only a few miles, as the enviable crow flies, intervene between the Valley of the Vésubie and that of the Roja, that is to say, between St. Martin Vésubie and St. Dalmas de Tende, yet so high and tumultuous are the mountain ranges that occupy those few miles that, to get from one place to another, one must needs, from St. Martin, go down all the way to Nice, and thence all the way along the coast to Ventimiglia, and thence again all the way up the Valley of the Roja to St. Dalmas. Three sides of a square, that is, instead of one. The Valley of the Roja, ascending from the sea, is dull. It rises very, very slowly; the moment you think you are really beginning to mount a little, the road drops again down a declivity, the reason of all this being that, although one is making for one of the greatest of Alpine passes, the Col de Tende rises abruptly from very low levels to a very great height. The Roja River flows in what seems to be an almost flat bed. Night descended upon us long before we had reached St. Dalmas (which, as we are now in Italy, must henceforth be called San Dalmazzo de Tenda), and nothing of interest had I seen on the way, except one plant of *Saxifraga cochlearis*, which is the special proprietor of the Roja Valley, even as *S. lan-toscana* possesses that of the Vésubie.

San Dalmazzo, even more accessible than St. Martin, is no less delightful. It lies not far from the foot of the pass, at some 2,000 feet, at a point where the little Briga Valley comes down into the main valley of the Roja, thus bringing a cool breeze even in the height of hot summer. Chestnuts grow thick round San Dalmazzo, and even in winter, with snow on the ground, the place is as warm and delicious as it is deliciously cool in summer. *Cephalanthera rubra* is the first rarity one finds, growing along the rills in the Chestnut groves; and, on the one side, rise cliffs of limestone, and, on the other, cliffs of granite, offering promise of a double flora.

On the limestone, in places which I will not further precisify, grows in the most glorious

abundance *Primula Allioni*. This eccentric plant inhabits for choice (though I have found it also thriving on the open cliffs) little pecked caves and shallow grottoes in the rock-face. From their roofs and walls it hangs in enormous, aged masses—the growth of centuries—in such places as can never be reached either by sun or rain. The *Primula*, thus armed against any sort of superficial moisture, has developed so intense a viscosness of foliage that if dust or dirt falls on its leaves, not all the licking and flicking in the world can get them clean again. It grows perpetually on from one rosette: a mass some feet across is sometimes formed—each rosette—on a long stalk, still clothed with the dead, sticky leaves of innumerable seasons. When I saw this precious plant, the flowering time was over, and not a blossom was to be seen. However, my collected pieces—though the plant travels ill (owing to the fact that its stickiness causes it to ferment)—all took hold and began to flower within three months of their arrival in England. Even on the Cliff it has taken firm hold, and emitted several of its lovely blossoms. Above San

However, lest I should do the lesser *Columbina* injustice, I was allowed at last to see it in character. For it was our fate to ascend the Miniera Valley. It is granitic, long, and steep, and very, very dull and hot. *Lilium bulbiferum* abounded, *Sempervivum arachnoideum* in its transalpine form was white as wool on the black rocks, and *Geranium macrorrhizum* grew among stone slopes here and there. But altogether we hated the Miniera Valley, in our setting forth, in our arrival at our goal, and in our return. The one bright spot was a bank all blue with *Aquilegia Reuteri*, and *Campanula stenocodon* growing a little lower down at the edge of the path. And Reuter's *Columbina* is really very lovely—half the size of *A. alpina*, it is true, but of an even clearer and intenser colour. At twilight, among the coarse grasses on that stony slope, it seemed to glow like a pure blue fire. It was very abundant at this one point, brilliant and beautiful, very different from the feeble, fading specimens I had seen under the *Primula's* cliff. And I also saw a double form—*monstrum horrendum*—a calamity that I have never observed before

FIG. 167.—VIEW IN THE DELL, EAST BURNHAM PARK.

(See p. 498.)

Dalmazzo though, it begins to flower, I believe, in December, and may be seen in glory from any moment thenceforward until the end of May.

Those same cliffs give also *Potentilla Saxifraga* and *Moerhingia sedoides*, besides here and there a mass of *Saxifraga cochlearis*. At their feet, are to be seen *Aquilegia Reuteri* and *Lilium pomponinum* (I only saw one plant of this, which is entirely out of its place here), together with *Lilium viscosum*, tall and pink and splendid, with its great cups which, in one form, had varied to a lavender-lilac. The *Columbina* is, to all intents and purposes, a much-diminished version of *A. alpina*. I had expected to find it in these parts, yet the discovery took me by surprise. I had been promising my companion much emotion from his first sight of *A. alpina*, and, when we came upon *A. Reuteri*, I felt, with a shock of apology, that the Alpine *Columbina* must have sadly grown in my imagination, or sadly shrunk in reality. But, after a moment of disillusionment, I steadied myself, realising that this poor, puny thing could not be *A. alpina* at all, but *A. Reuteri*.

among the wild Alpine *Columbines*. The *Campanula* is a rare plant of high stone banks and moraines. It is even rarer in cultivation, though I believe it to be as amenable as it is interesting and lovely. In habit, it is almost rotundifoliate, thin and wiry, with very narrow leaves. The flowers, carried as in the rotundifolia section, are of a very rich dark violet-blue. Their characteristic is their shape, which is that of a long, narrow trumpet, entirely different from that of any other *Campanula* one grows.

I draw a veil over the Miniera Valley. At its welcome end it becomes the Valmasco Valley, with a view up to the magnificent crags and cliffs of the Rocca del Abisso. Its boulders are clothed with *Primula marginata*, and its upper woods are gorgeous with *Aquilegia alpina* (we saw a big sheaf of this in a bowl, and the sight made one hate oneself for having thought that *A. Reuteri* could even be a form of it), and *Fritillaria Moerhridgei*, the yellow variant of *F. delphinensis*, with which, we were told, it here grows indiscriminately. On one side of the glen, rise limestone cliffs which were given us as

a station for *Saxifraga diapiensoides*. *Viola Nummularifolia* is said to abound in the higher primary screes, together with *Campanula Allionii*, which here occurs, though rarely, in a form about twice the size and twice the purpleness of the ordinary *Allionii*. And, finally, the Valmasco Valley and the cliffs of the Rocca mark the extreme Easterly limit of *Saxifraga florulenta*. *Reginald Farrer*.

EAST BURNHAM PARK.

(See figs. 167, 168, 169, 171, and Supplementary Illustration.)

MR. HARRY J. VEITCH'S estate of some 88 acres in extent, situated within a few minutes' walk of the famous Burnham Beeches, in Buckinghamshire, was purchased by the present owner in 1892. The garden attached to the house is one of the most beautiful, varied, and scientifically-formed gardens of our time, and one in which a very large number of recently-introduced trees and shrubs form objects of great interest to those engaged in out-door gardening. The older portion of the residence, the part covered with the *Wistaria* in bloom, seen in the supplementary illustration, was built by Grote, the distinguished author of the *History of Greece* (1850); from this fact Grote named his house "History Hut." The place was sold in 1857, and the new owner made considerable additions to the house, and also built commodious stabling. The principal addition made by Mr. Veitch is a large billiard-room, the walls of which are hung with many beautiful pictures. But, with all these modern improvements, the building bears evidence of age in the climbers which clothe parts of its walls, and the trees and shrubs which surround it. On the house, for example, is a fine specimen of *Magnolia grandiflora*, with its large, shining, green leaves and fragrant, white flowers, the shoots reaching to the top of the building. The *Flame Nasturtium* (*Tropæolum speciosum*), planted on either side of the entrance, rambles over the adjacent shrubs, displaying its brilliant flowers in a manner possible only with long-established specimens. The view across the grounds from this spot takes in a gigantic Cedar of Lebanon, the trunk of which is more than 17 feet in circumference at 5 feet from the ground. The tree is over 90 feet in height, and, although age and storm have left their marks on the branches, especially on one side, the tree is still very handsome.

The grounds contain large Limes and Chestnuts, and clumps of stately Pines. *Cedrus atlantica glauca*, with its delicate blue tint, and *Cedrus atlantica aurea*, with foliage of a clear, light-yellow hue, are effective at several points; other rare Conifers seem to thrive in the sheltered, warm situations in which they are planted. *Magnolias* form fine bushes that flower well in these grounds; two that were finely in flower the past summer were *M. parviflora* and *M. Watsonii*. Other plants that were especially beautiful include *Fremontia californica*, with its clusters of yellow flowers; *Quercus pannonica*, with large, ornamental leaves; *Populus lasiocarpa*, the massive green foliage having crimson veining; ornamental species of *Vitis*, trained to tree-stumps and over arches; and many newly-introduced Chinese shrubs of uncommon beauty and interest. A fine stretch of green lawn exists on the garden side of the house, and beyond it are beds of flowering shrubs, planted in rings or masses, the several kinds in each bed flowering in succession throughout the year. The edgings only of these shrubberies are planted annually with flowering subjects, for summer bedding is not practised, or only to a very limited extent. Beds of *Rhododendrons* furnish a display of flowers in their season, the principal varieties being *Purity*, *Fred Waterer*, *Amphion*, *Kate Waterer*, *Marchioness of Lansdowne*, and *Pink Pearl*. *Azaleas* are arranged in beds also, and these not only give colour in the flowering season, but their brightly-tinted foliage is beautiful in autumn. *Roses* are extensively planted

in several parts of the garden, the central beds of *Catherine Testout*, *Frau Karl Druschki*, *Mrs. John Laing*, *Hugh Dickson*, *Marie van Houtte*, *Paul's Scarlet*, *Victor Hugo*, and other showy varieties being bounded by pillars and arches of *Climbing Captain Christy*, *Queen Alexandra*, *Paul's Carmine Pillar*, *Electra*, *Wedding Bells*, a selection of hybrid *Wichuraianas*, *Dorothy Perkins*, and others. The white sport of *Dorothy Perkins* appeared in these gardens, and this year it has sported again, producing flowers of a deep crimson, darker even than *Crimson Rambler*.

The value of planting in masses for effect is well exemplified in these fine gardens (see fig. 167), where even ordinary subjects give remarkably fine effects, especially from a distance. For example, *Spirea Lindleyana* is beautiful in its fresh, green, fern-like foliage, and its plume-like sprays of flowers; *Bocconia cordata* provides foliage of a very uncommon tint; masses of alternately-arranged yellow and white-leaved *Acer Negundo*; and purple *Prunus Pissardii*. Most of these permanent beds are edged with spring-flowering

and trailing species, which beautify the pathway with their sprays of flowers. One of the most effective is the common *Lysimachia nummularia* (*Creeping Jenny*), a common British plant, which sends forth a profusion of its slender sprays with yellow flowers. *Alpine Pinks*, *Saxifrages*, *Gentians*, and a large number of other rock plants make a fine show in the rock-garden, whilst in moist dells, *Iris Kæmpferi* and other species of *Iris*, massive *Gunneras*, *Senecio clivorum* and other large *Senecios*, and *Rheums* form beautiful objects. On and near the rockeries specially attractive plants were *Cotoneaster congesta* and *C. humifusa*; *Pinus sylvestris globosa*; a dwarf set of the pretty *Japanese Maples*; *Lonicera Maackii*; the curious miniature *Holly*, *Ilex Pernyi*; *Berberis Wilsonie*; and a specimen of *Davidia involu-crata*, which it is hoped will soon reach the flowering stage. In a moist dell, with stepping-stones over the running water, are *Saxifraga peltata*, *Onoclea sensibilis*, *Struthiopteris germanica*, *Osmundas*, and *Astilbe palmata*; whilst on the banks was observed a very interesting col-

FIG. 168.—WATER GARDEN IN THE GROUNDS OF EAST BURNHAM PARK.

bulbs, amongst which *Dianthus*es, *Asters*, and other summer flowers are planted after the bulbs have passed out of bloom. In every available space, both on the greensward and beside the walks in the woodland glades bordering the gardens, innumerable spring-flowering bulbs are planted. *Iris reticulata* is one of the first plants to bloom.

Passing from the gardens surrounding the house, by the water gardens (see fig. 168), which, in summer-time, are beautiful with coloured *Nymphaeas*, the banks being bright with the flowers of *Iris*es and various bog plants, the visitor reaches the pergola (see fig. 169). The upright supports of roughly-cemented brick have been adopted to avoid the collapse inevitable when wooden uprights are used. The pergola is covered with *Roses*, *Honeysuckles*, *Jasmines*, and other flowers that trail amongst the massive foliage of ornamental vines. From one of the *Rose* gardens, a charming rock garden is reached, the paths in which are formed of roughly-hewn Dartmoor stone, the spaces between the slabs being planted with dwarf *Alpine*

lection of *Primulas*, with thousands of self-sown seedlings of *P. japonica* coming up around.

The woodland and wild garden are traversed by moss-covered walks, winding beneath the trees, amongst which *Rhododendrons*, *Bamboos*, and uncommon shrubs are planted. *Arundinaria nitida* and *A. Veitchii* form large masses; *Rubus lasiostylus*, with its singular white stems arching round; *R. phœnicolasius*, the *Japanese Wineberry*, handsome in its foliage, flowers, and fruits; *Sambucus canadensis*, which has fine, ornamental foliage, and produces immense heads of bloom; *Spirea gigantea*, and other attractive foliage plants were observed in passing. There is a maze formed of *Beech* and *Hornbeam* in these parts of the grounds.

The path through the *Pine* trees leads to the aviaries, model dairy, farmyard, and the kitchen garden; the last is brightened in summer-time by borders of *Salpiglossis*, *Shirley Poppies*, and other flowers. In front of the gardener's house are a number of flower-beds: this season they were planted largely with scarlet and crimson-coloured, tuberous-rooted *Begonias*, the dull

season apparently suiting them admirably, for they presented a mass of colour. *Azara microphylla*, with its elegant sprays of shining, green leaves, *Choisya ternata*, species of *Olearia*, and New Zealand *Veronicas*, with innumerable pretty shrubs not often seen in gardens, afford further variety. Altogether, the estate is maintained in as perfect a manner as can well be. It is personally supervised by Mr. Veitch.

AUTUMN FLOWERS IN THE SOUTH-WEST.

SOME of the *Nerines* flower well here in the open year after year. They are growing in a narrow, raised border, in front of a wall facing south-west. Last year there were over a dozen spikes of *N. Fothergillii* major, which is, without doubt, the handsomest of the family, bearing large heads fully 6 inches across, the scarlet petals appearing, in the sunshine, to be sprinkled with gold dust. This year there were only five flower-heads, but *N. Bowdenii* bloomed well, producing seven bloom-spikes. This species has flowered every year since it was first planted. Curiously enough, it is unlike the rest of its race,

was put in as a little plant last November, has made, as I mentioned in my last article, enormous growth, and, in September, produced a few of its attractive, flesh-pink blossoms. The Australian *Brachysema acuminatum* perfected a second crop of its red flowers in October, but it is not a very showy plant. *Plumbago capensis* flowered finely in August and September. It was put in as a small plant last November, but has made good growth, being now 5 feet high and as much across; I hope it will, in time, cover a 12-foot wall. In the spring, I received a present of a small plant of *Hermannia ciliaris*, a name I cannot find in the horticultural dictionary. This bore yellow flowers, and even now, at the end of November, is still carrying some. As the rest of the genus appear to be natives of South Africa, this is probably a compatriot. It is entirely unprotected, but, as some South African shrubs stand the winters unsheltered, it may survive. *Alonsoa Warszewiczii* carried its scarlet flowers well into September, and springs up here every year from self-sown seed. At Mount Edgcumbe it is a perennial, but in this locality it has always died in the winter. *Gilia coronopifolia* was beautiful in September,

of 10 feet, with trails of gorgeous scarlet flowers, which contrasted well with the glaucous foliage, and produced a glorious effect. *Diascia Barbere* is a pretty little plant, with soft, salmon-pink flowers. It is generally treated as an annual, but, in the neighbourhood of Chepstow, it has proved perennial, and here lives through the winter. *Witsenia corymbosa* had only two flower-spikes this year, whereas three years ago it carried 55, each bearing from 50 to 60 blossoms, and, when in full bloom, was a marvellously beautiful sight. *Wyndham Fitzherbert, Kingswear.*

THE ROSARY.

CULTURAL HINTS FOR DECEMBER.

ALL arrears of planting should be completed as opportunity occurs, so that the work may be finished by Christmas. Severe frosts have appeared earlier this year than usual, and precaution should be taken to protect tender varieties of dwarfs by earthing up soil about them or covering them with Fern or light sprays of evergreens. During mild weather the protective covering should be removed. Before planting is resumed and where the ground is likely to be beaten down by heavy rains prick in, with a fork, some burnt earth, sandy grit, and wood ashes. All plants and cuttings should be given a good surface mulching of well fermented manure, which will help to protect and nourish the roots in cold weather. Although September was a very favourable month for the wood ripening, the subsequent heavy rains kept the sap active later than usual. Standard Roses should not be planted too deeply, but in the case of dwarf-budded Roses the union between the stock and scion should be well below the ground level, or the dry east winds of spring will cause injury before root action begins. Failure after planting is often due to neglect in well treading the soil about the roots. When newly-planted Roses are blown about by the wind the roots are likely to suffer; to prevent this put a brace across the stems in the row and tie the standards to it; the brace may be secured at intervals with a stake.

The planting of Roses during autumn and winter in town gardens is not always advisable; smoke and other impurities in the air have their effect, whereas in the spring a clearer and purer atmosphere affords a better chance to the plants. March and April should be selected for preference. Some of the best Roses for town gardens are the following: *Rosa rugosa* Blanc double, de Coubert, Cabbage Provence, Sweet Briars, Mme. d'Arblay, Queen of the Belgians, climbers, and of H.T.s and H.P.s *Caroline Testout*, *Magna Charta*, *Thos. Mills*, *Ulrich Brunner*, *Mrs. J. Laing*, *John Hopper*, *Anna Alexieff*, and *Gabriel Luizet*.

Hardy climbing Roses that have been neglected should be well pruned, the branches thinned, and the shoots trained either to wall, trellis, or fence.

The Roses in pots started into growth last month will now be making progress, and as December is one of the dullest months of the year the temperature should not exceed 50° to 55° by day with a decline of several degrees during the night. For the present, ventilation may be given for a few hours at the top of the house, closing the house early in the afternoon and damping down the stages earlier in the day. On occasional bright mornings, a light syringing may be given overhead, provided the foliage dries up before evening. It is beneficial to turn the plants round occasionally to the light. At the turn of Christmas, when the plants have made some growth, a dusting of Clay's fertiliser stirred into the surface soil will help them considerably. The first batch of grafted Roses will, if conditions have been favourable, be making headway, and the temperature of the pit may be increased. When there are signs of a good callus and some top

FIG. 169.—PERGOLA AT EAST BURNHAM PARK.

which are leafless when the flowers appear, retaining its foliage until the flower-spikes are thrown up. *N. flexuosa alba* also blossomed well. *Zephyranthes candida* produced many flowers, but not a single bloom showed on the larger and finer *Z. Atamasco*, probably owing to last year's dull summer, and, as this year has been worse, they will probably be flowerless next season. *Berberidopsis corallina* bore a profusion of drooping, scarlet flower-clusters in September. The plant does not look very well, as it has been allowed to get too dry, and it requires abundant moisture. *Manettia bicolor* carried its tubular scarlet and yellow blossoms well into the autumn. It is a plant that does well in the south-west, and is pretty when in full bloom. *Solanum aviculare* bore its large, deep-purple, golden-centred flowers until October. This is a self-sown seedling plant that appeared this spring, and has made prodigious growth, being now 6 feet high and 6 feet through. It is a tender species and the growth of this specimen is very sappy; though it is protected, it may succumb if we should experience a severe winter. *Tacsonia mixta* [quitensis], which

the tall, bright-scarlet flower-heads making a splendid show where the plants were grown in bold groups. It is always well to pinch back the seedlings when they are a few inches high, as this causes them to throw up several flower-heads in place of the one they would produce if un-stopped. Some late-raised seedlings did no good, as they did not commence to expand their flowers until mid-November, and never perfected their blooms, so these plants should be raised as early as possible in the year. *Aconitum Wilsonii* flowered fairly well, but felt the shift severely, being only 3 feet in height, as against 6 feet in the old garden. The Shamrock Pea (*Parochetus commutis*) was a glorious sight in October, being absolutely covered with pale-blue Pea-like flowers. Last year it died out in the old garden, and this spring I obtained some plants from Mr. Walpole, of Mount Usher, which, after the first few weeks, made prodigious growth, and smothered all their neighbours. The South African *Tulbaghia violacea* did not flower until the autumn, when it produced its rose-purple bloom heads borne on long stalks. *Tropeolum Lobbianum* Fire King covered walls to a height

growth, fresh air can be gradually given during the day to dry up excess of moisture and strengthen the grafts. Before grafting, the stocks should be brought into the house for a few days so that the growth will be in advance of that of the scion. Those potted last will be ready at the end of January or in February for herbaceous or soft grafting.

Since being pruned the Roses planted out under glass are making good progress. Light syringings may be given during bright weather in the morning when the temperature is above 50°. In dull weather the moisture arising from the surface mulch will be sufficient.

Ventilate with caution, and in all cases guard against insects and mildew, remembering that these pests are less difficult to combat now than later in the season. *J. D. G.*

WHITE GARDEN ROSES.

It is unfortunate that many of our modern white Roses, however admirable in other respects, are so destitute of fragrance. This is largely owing to the fact that many of them are descended from Baroness Rothschild, which variety, however beautiful and productive, is, nevertheless, lacking in perfume. For this special reason I have discarded the gracious Baroness, perhaps somewhat unjustly, for many years. But her derivatives, at least, are sufficiently prominent in my garden, where, as a general rule, they are greatly admired for their handsome appearance, their large dimensions, their vigorous character and splendid floriferousness. The first very notable descendant of this prolific parent was Merveille de Lyon, introduced by Pernel, its famous raiser, in 1882. Impressive as it often was, under favourable conditions of culture and climate, it could hardly be termed a pure-white production, for it had always a faint, yet quite perceptible, suffusion of rose, which became greatly intensified in showery weather, thereby revealing a very serious limitation. Margaret Dickson, still one of the grandest of the New-towards Roses, which (seeing that some of its best attributes were attributable to the variety Lady Mary Fitzwilliam, I have always regarded as a half-hybrid Tea) has still more delicate pink suffusion, which tint, however, does not deepen so perceptibly as that of its predecessor under the influence of humid atmospheric conditions.

The most perfect of all the pure-white Hybrid Perpetuals is the incomparable Frau Karl Druschki (Lambert, 1901), the purest Rose of its own character in colour and the most commanding in dimensions that has hitherto appeared. It was, I understand, originally termed "The Snow-Queen," La Reine de Nieve, assuredly a much finer and more expressive name. It has, so far as I can discern, no fragrance whatever, though one of its parents was the richly-odoriferous Caroline Testout, while the other was Merveille de Lyon. Nevertheless, it is the grandest of pure-white Hybrid Perpetuals, and likely to retain this unique distinction for many years. Another superb Rose of imposing aspect is Marchioness of Londonderry, which, however, is only ivory-white in colour and (perhaps because its floral offspring are giants) somewhat sparing of its blooms. Among Tea Roses adapted for garden culture, one of the latest and loveliest is Molly Sharman Crawford, a veritable gem, which, were it only a little more vigorous, would be even more valuable. Among my own supreme favourites are The Bride, which has shining through its white petals a most delicate suggestion of green, and that extremely charming derivative from Souvenir d'un Ami, namely, Souvenir de S. A. Prince.

Niphotos is best adapted by its nature, which is somewhat susceptible, for conservatory cultivation. Aimée Vibert is a charming and prolific Noisette, but of this fair family and its not too numerous hybrids, by far the most graceful and attractively fragrant variety is Mme. Alfred Carrière. *David R. Williamson, Mans of Kirk-maiden, Wigtonshire, N.B.*

The Week's Work.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Gardenia.—Gardenias cultivated for flowering in autumn and winter may be encouraged to flower again early in the new year, provided that the plants are manured liberally and kept in a warm atmosphere. The best specimens I have seen were planted out in beds provided with bottom heat, but this practice is not to be recommended for winter flowering plants, which should be confined in pots and supplied with diluted liquid manure from the farmyard and occasional dressings of some approved chemical fertiliser. Plants cultivated in pots can be kept clean from insect pests, such as brown scale and mealy bug, more conveniently than if they were growing in borders. Before the flowering stage is reached, the pots can be placed on their sides, in order that the plants may be syringed with an insecticide wash. When once the flower buds have formed, such pests must be sought for with a sponge and brush. Two additional pests, namely, Aphides and Thrips, are apt to make their appearance upon the plants during the flowering season when the atmospheric conditions are somewhat drier than usual. Therefore, the plants should be fumigated with a nicotine compound immediately before the buds begin to open, and, if the pests become very prevalent, the open flowers may be cut and further fumigations carried out. Gardenias are easily raised from cuttings inserted in spring or summer. In cases where large specimens are desired, three or more cuttings may be kept together in a pot and shifted into larger pots as more root-room becomes necessary. Gardenias are moisture and heat-loving plants. In the growing season, they require an atmospheric temperature at night of 70°, and this should rise to 75° or even 80° during the day. During the winter months and when the plants are in flower, a night temperature of 65° is sufficient. The plants thrive best in a fibrous, peaty compost, from which the fine particles have been shaken, but with added mortar rubble and charcoal which have been passed through a ¼ inch sieve.

Rhododendron indicum (Azalea indica).—The variety Deutsche Perle is the earliest of the Indian Azaleas to flower; when plants of this variety have been subjected to early forcing for two seasons such plants may be brought into flower by Christmas without further forcing than they would get in a warm greenhouse.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman, Royal Gardens, Windsor.

Early Potatos in pits.—Tubers should be selected for the earliest plantation, and placed in gentle warmth so that sturdy young shoots may be produced by the middle of December. Very little heat will be necessary to start them into growth. When the young shoots are about ½ inch in length the tubers should be planted in a heated pit, over a gentle hot-bed. The bed should be formed of fallen leaves, trodden tightly together, as only a slight bottom heat is desirable. The soil over the hot-bed should be at least 9 inches deep, and may consist of two parts loam and one part leaf-mould; loam which has been used in the Melon house will suit them well. The tubers should be planted in rows 18 inches apart, allowing 10 inches between the plants. The surface of the bed should be 2 feet from the glass. A temperature of 45° at night will be high enough, and as soon as the plants appear above the ground air must be admitted freely or spindly growth will be the result. May Queen is one of the best varieties for this early forcing, both for quality and productiveness.

Early Peas in frames.—If frames are available for Pea culture, a sowing may be made about the middle of December. But if the pits are at present occupied with other things the seeds may be sown in drills 3 inches deep, and covered with fine soil. Very little heat is necessary for this crop, but it requires a good, rich bed of soil. Old Melon or Cucumber soil will suit them well, and this compost should be made at least 12 inches deep and moderately tight.

Only dwarf varieties should be grown, and 18 inches between the rows will be quite sufficient for them. There are many good dwarf varieties, such as Harbinger, Sutton's Seedling, and Chelsea Gem. The plants must not be crowded, and air should be given freely in mild weather. Water must be sparingly given in cold and dull weather; do not damp the foliage overhead in dull weather or mildew may prove troublesome. The pits should be covered at night during severe weather.

Mushrooms.—The demand for Mushrooms is sure to increase as the supplies of other choice vegetables become less. In order to keep up a regular supply throughout the winter it is necessary to make preparation now by collecting all the available manure and turning it frequently in some dry shed. This material may be left thicker during cold weather to prevent loss of heat. When all danger of sourness is over, the manure should be removed to the Mushroom house and allowed to remain loose for a day or two, after which it should be turned and beaten tightly together; the bed when finished should be at least 15 inches in depth so that it may retain the heat as long as possible. Additional beds should be made up every three weeks during winter. If supplies are being gathered from houses in which new beds are made care must be taken to protect the Mushrooms from steam while the manure is being moved. A temperature of 55° is sufficient for the Mushroom house during cold weather.

Endive, &c.—Endive should be brought into a dark chamber in order to maintain a supply of blanched heads. The same remark applies to Chicory and other salad plants. Mustard and Cress should be sown weekly in boxes, and placed in heat, covering the boxes with paper until the seeds germinate.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Planting and root-pruning.—The severe weather during the past fortnight has retarded all planting and root-pruning operations, and the ground will be in a very sodden condition when the frost is over, rendering all such work impossible for some considerable time, especially in the case of heavy and retentive soils. Any fresh trees that may arrive from the nurserymen before planting is again possible should be "heeled in" for the time being. Make sure to place plenty of soil over the roots, as it may be several weeks before they can be planted permanently. Should very severe weather set in during the period the trees are heeled in, it will be wise to protect the tops of the trees; some rough straw or long stable litter should be got in readiness for the purpose, and if a few old mats are placed over the litter, they will prevent the straw from being blown about by rough winds. Should any trees be delivered from the nursery during frosty weather, it is advisable not to unpack them until the frost is entirely out of the wood and the packing materials. In the meantime, they should be placed in a shed just as they are until the weather becomes favourable, when they can be heeled in as advised above.

Permanent borders.—After the pruning and training of the trees have been completed, the surface of the borders should be lightly pricked up with a fork, for the top soil is sure to have become trodden somewhat firmly by the pruner.

General work.—Select scions of Apples and Pears that may be required for grafting purposes next season. Tie them in small bundles, affix labels, and heel them in on a north border until required for use in the spring. In pruning and training fruit trees, be careful to cut out all dead wood, and remove the old ties and shreds, as they are likely to harbour all kinds of insect pests. Collect the rubbish with the prunings, and place them on the fire heap to be burnt. When refastening the branches of fruit trees, be careful to allow ample room for the natural swelling of the stems. Black Currant bushes badly infested with the Bud-mite should be dug up, as advised in a previous Calendar, and conveyed to the rubbish fire; but in cases where the bushes have only a few enlarged buds, it will only be necessary to pick off the swollen buds and burn them.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

An appliance for tying trees (see fig. 170).—In my notes last week, reference was made to an appliance for tying trees which I designed some years ago. It is distributed by Messrs. Wm. Wood & Sons, and the illustration (fig. 170) will afford readers some idea of its qualities. At Aldenham, this method of tying has equalled all expectations. The tie not only holds the tree se-

FIG. 170.—MR. BECKETT'S METHOD OF TYING TREES.

curely to the stake, but it is capable of expansion as the stem of the tree expands. The material is sufficiently strong to last about two years, and, after a certain amount of expansion, it collapses before injury is done to the tree stem. This is the chief advantage that the tie possesses over ordinary supports of string and similar material.

The season.—Since writing my notes of last week there has been a spell of wintry weather with a succession of severe frosts, the most severe being that on the morning of November 23, when 17° were registered. Most kinds of ground work, including the planting of trees, was suspended for the time being. The frost followed closely upon damp, mild conditions, therefore the frost was all the more dangerous. The present opportunity may be taken for emphasising the necessity there is for having a supply of suitable material at hand for covering plants in frames and other subjects which require protection. In the event of another spell of similar weather, the time may be spent profitably in examining the stocks of bedding plants, removing any decaying foliage from them, loosening the surface soil, washing the pots and cleansing the surroundings. At such a period any seed that was saved from the flowering plants during the past season may be cleansed and placed in packets, which should be labelled with the name of the variety of plant. Specimen plants of Bay, Agave and Myrtle may be sponged with a safe insecticide. Labels may be prepared and the names written upon them. The borders containing herbaceous plants should be made to appear as tidy as possible by cutting the plants down to the ground level; let the surface soil be forked up and a mulch applied, such as manure from a spent Mushroom-bed, leaf-mould or well-rotted manure from the farmyard. Continue to clear up fallen leaves as quickly as possible, transferring them to suitable positions, where they will not give further trouble. When all the leaves are down, an effort should be made to have the shrubberies cleaned out, and all the leaves and rubbish should be picked up before Christmas. Vacant ground should be dug or trenched in suitable weather, leaving the surface in as rough a condition as possible until planting time.

Climbers.—The present is a suitable time for planting climbers. The choice of sorts is extremely varied, and most species can be obtained as established specimens in pots. These are much to be preferred to plants left upon the open ground, although the cost is but little

more. Make the ground perfectly firm around each specimen as it is planted, but do not tie the growths permanently until the ground has settled; simply loop them up in the meantime. For northern aspects only those with the hardest constitution should be employed, excluding Roses entirely, but for south and south-western aspects the suitable sorts are numerous, including evergreen and deciduous species. Few plants are more attractive here than *Solanum jasminoides*, which bloomed abundantly until the recent frosts. In a southern aspect the plant makes rampant growth, and is very beautiful with its snowy-white flowers. *Ercilla* or *Bridgesia spicata* is an evergreen climber worthy of extended culture; it is neat in habit, self-supporting, and quite hardy on an eastern aspect. *Berberidopsis corallina* is a beautiful climber for a sheltered spot. *Akebia quinata* and *A. lobata* are quite hardy here, and they are well suited for covering poles and pergolas. *Actinidia arguta*, *A. chinensis*, *A. Kolomikta*, and *Menispermum canadense*, are excellent plants. *Periploca graeca*, the Silk Vine, is a good, deciduous, flowering-shrub for a north aspect. *Polygonum Balduanum* and *P. multiflorum* are both excellent plants for covering buildings quickly; *Passiflora corulea* and the variety *Constance Elliott* (white) require a warm position. The foregoing are a few species one might plant in addition to the great variety of Vines, Clematis, *Hedera*, *Ampelopsis*, *Wistaria*, *Roses*, &c., though these latter yield the greatest amount of floral wealth.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Pleione.—*Pleione maculata*, *P. lagenaria*, *P. Wallichii*, *P. praecox*, *P. concolor*, and similar species are now passing out of bloom, and require repotting immediately, and before those green shoots from which the flowers have sprung have produced a number of small white roots, as these brittle roots are very easily injured. Light, shallow pans which may be suspended, are suitable receptacles for the plants, those 10 inches in diameter holding about two dozen plants, being most convenient. These should be provided with good drainage, and over the crocks a thin layer of Sphagnum-moss should be placed. The rooting material may consist of fibrous loam, *Osmunda* fibre, and Sphagnum-moss in equal parts, adding a moderate quantity of small crocks, and coarse, silver sand. In repotting, make each bulb quite firm. When the work is finished suspend the plants near to the roof-glass of the Cattleya or intermediate house. If the compost is fairly moist at the time no water need be afforded for about a week afterwards, and then but sparingly, until the roots push their way through the soil, and the leaves begin to unfold. The cooler-growing sorts, such as *P. humilis*, *P. Hookeriana*, *P. yunnanensis*, and *P. poronoides*, having finished their growth, should be suspended in a light position in the *Odontoglossum* house, watering them often enough to prevent shrivelling. They should flower in or about February.

Trichopilea.—Amongst Orchids now in bloom is the lovely white *Trichopilea fragrans*, often called *Pilumna nobilis*, one of the sweetest-scented Orchids with flowers suitable for almost any form of decoration. This plant requires a trifle more warmth than is generally afforded to the *Odontoglossums*, but it will thrive very well at the warmest and driest part of the *Odontoglossum* house, if it is not possible to place it in a position near to the roof-glass in a cool intermediate house, where the temperature does not fall below 50°. While the plant is in bloom, and until new growth commences, it must only be given very little water indeed. *T. laxa* also in bloom requires similar treatment. Such species as *T. suavis*, *T. coccinea*, *T. tortilis*, *T. crispa*, *T. Wagneri*, *T. Galleottiana*, *T. rostrata*, *T. Backhouseana*, and *T. Hennisiana*, thrive well in a cool intermediate house temperature the whole year round. As most of these plants have now made up their growths, they must not be often watered. In some cases where plants have started late into growth they should be given a light position in the Cattleya house, and still be treated as growing plants. Any of these *Trichopileas* that need repotting should be attended to when growth recommences;

they require considerable pot-room. Well-drained *Osmunda* fibre, *Polypodium* fibre, and Sphagnum-moss in equal parts, cut up moderately fine and well mixed together with a moderate quantity of small crocks, may form the compost. Keep the plants well elevated above the rim of the pots, so that they can be watered easily without any water lodging in the young breaks, or around their base. All *Trichopileas* should be grown in a light position, but one which is not exposed to direct sunshine.

Miltonia cecillaria.—Plants of this *Miltonia* now in full growth should be in the cooler part of the Cattleya house, and be kept well supplied with water at the root. At this season the tips of the leaves frequently turn black; to avoid this keep the compost drier for a few days, and do not damp or syringe between the pots. Examine the young growths occasionally, and carefully liberate any of the new leaves that may be adhering to each other. See that the sheaths around the base of the leading breaks do not prevent the young roots from entering the compost. Carefully examine these plants each night for woodlice, as these insects often do much damage to the roots. These remarks apply also to *M. Bleuana* and its variety *nobilior*. The rare *M. Phalenopsis* thrives best when suspended in small shallow pans close up to the roof of the Cattleya house.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir Ernest Cassel, G.C.B., Moulton Paddocks, Newmarket.

Pineapples.—The directions given in a recent Calendar (see p. 315) may be generally carried out during December. Early-potted suckers will now be nicely rooted, and need careful attention as regards water, more especially if placed in a bed where the bottom heat is provided by hot-water pipes. In severe weather, when the fires are kept going to maintain the necessary temperature, additional attention to watering will be necessary. Never allow the plants to become so dry as to cause the soil to leave the sides of the pot. It is desirable, as the month advances, to choose the most forward plants to form the first batch of early Pines, and place them in a higher temperature, say, 65° to 70° at night, allowing a rise of 5° to 10° by day, according to the weather, and a bottom heat of 30° to 35°. Before plunging the pots, give the plants a thorough soaking with chilled water, as they are sure to be dry at the root. Maintain a humid atmosphere in the house by damping the paths and wall several times daily, but do not syringe the plants overhead, as moisture lodging in the centres is injurious at this time of the year. After removing the most forward plants, the main batch may be given more room, and the same treatment afforded as previously advised. Any plants which are still swelling fruits will require a bottom heat of 80°, with an atmospheric temperature of 70° to 75°; a little mild stimulant may still be given until the fruit changes colour. If the roof is covered with litter or Spruce branches during severe weather, as previously advised, the protection will be found useful in reducing the need for fire-heat. Lose no opportunity of giving just a "chink" of air at the top of the house for half an hour or so during the middle of the day, to sweeten the otherwise stagnant atmosphere. Towards the end of the month it will be necessary to make fresh beds of fermenting material, and these should be of sufficient depth to maintain a steady heat for some considerable time. Towards this end it is advisable to turn the dung frequently, and prepare it by adding a liberal quantity of good Oak or Beech leaves; the leaves will prevent the temperature from rising suddenly, and they will cause the bed to last good for a long period.

RUST IN CHRYSANTHEMUMS.—We have heard it urged, apparently on the principle that "a certain number of fleas is good for a dog," that a moderate attack of rust (*Uredo Chrysanthemi*) does no harm to Chrysanthemums. With this view, however, we are disinclined to agree, and would recommend careful cultivators to combat the disease by choosing rust-free plants from which to propagate, by dipping the leafy parts of the cuttings in liver of sulphur solutions, and by occasionally spraying the young plants with this specific.

EDITORIAL NOTICE

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations. The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, DECEMBER 5—

Nat. Chrys. Soc. Conference at Essex Hall.

TUESDAY, DECEMBER 6—

Roy. Hort. Soc. Com. meet. Scottish Hort. Assoc. meet. British Gard. Assoc. Ex. Council meet. National Vegetable Society Annual Meeting.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—40.9°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, November 30 (6 p.m.): Max. 44°; Min. 35°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, December 1 (10 a.m.): Bar. 29.8; Temp. 46°; Weather—Dull.

PROVINCES.—Wednesday, November 30: Max 43° Essex; Min. 35° Hull.

SALES FOR THE ENSUING WEEK.

MONDAY—

Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 11.

TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—

The Tenth Portion of Nursery Stock, at St. John's Nurseries, Worcester, by Protheroe & Morris at 11.30.

WEDNESDAY—

Dutch Bulbs, at 11; Roses, in variety, at 1.30; Palms and Plants, at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

THURSDAY—

Greenhouse Plants, Palms, Orchids, Lights, Furniture, &c., at "Pymont," Salway Hill, Woodford Green, by Protheroe & Morris, at 11.30.

FRIDAY—

500 Choice Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Damping in Chrysanthemums.

As Chrysanthemum growers know only too well, the flowers are liable to "Chrysanthemum rot"—that is to say, to premature decay. Mr. Crépin* attributes this disease, which may attack the disc or the ray florets, to the wide-spread parasitic fungus *Botrytis cinerea*, the spores of which only germinate readily in a moist atmosphere. In order to prevent the successful attack of this fungus, the use of nitrogenous manures should be avoided, particularly in the early vegetative stages. Such manures induce a luxuriant and sappy growth, whereby the plant is rendered more susceptible to the attack of the fungus. Therefore the soil in which Chrysanthemums are grown should be somewhat poor in nitrogen, and only at later stages of development should the plants receive nitrogenous manures.

After the flower-buds commence to expand, and the plants are placed in shelter, every means should be adopted to prevent accumulations of atmospheric moisture in the neighbourhood of the plants. Ventilate freely, and water sparingly and in the morning, is the advice of Mr. Crépin. Where possible, the house containing the plants should be closed completely early in the evening, and the roof should be well covered in order to prevent condensation of water on the plants. Mr.

Crépin even goes to the length of advising large growers to spread water-absorbing materials, such as powdered quicklime, on the ground between the pots.

An interesting confirmation of the value of the recommendation to withhold nitrogenous manures is provided by the results of manurial experiments carried out by Mr. Decaux (of Blois), and published in the current number of the journal already quoted. The experiments consisted in five series of plants growing in soils poor in nitrogen, which were treated in the following manner:—(1) no manure; (2) a complete manure, namely one containing added nitrogen, phosphates, potash, and lime; (3) sulphate of potash and calcium phosphate (ground bones); (4) nitrogenous and phosphatic manures, but no potash, and (5) nitrogen and potash, but no phosphates. The net results of the experiment were as follow:—

The plants in unmanured series grew tall, produced weakly leaves fading readily in sunshine, and bore large flowers of poor shape. The plants grown without added phosphates were mediocre, and badly attacked by mildew, whilst those grown in soil to which nitrogen and phosphates, but no potash were added, were the poorest of all.

The series of plants which received a complete manure made splendid growth up to the middle of July, and bore immense, dark-green leaves on strong stems, but during August and September the plants deteriorated. Some, however, produced enormous flowers, which soon became discoloured; the plants, moreover, were attacked by rust.

The third series, that consisting of plants to which phosphatic and potash manures only were applied, gave the best results. The leaves and stems showed vigorous development, and the flowers were very large, shapely, well-coloured, and but little susceptible to rot.

The striking results yielded by these experiments make it worth while to mention the exact composition of the manure applied. This M. Decaux gives as follows:—50 grammes (1½ ounce) of sulphate of potash, and 100 grammes (3½ ounces) of ground bones per square yard. It should be remarked that the soil used in the manurial experiments cited above contained a fair quantity of lime, and that it seems clear that where there is a deficiency in this substance lime should be added to the soil.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will take place on Tuesday, the 6th inst. At 3 o'clock a lecture on the "Cooking of Vegetables" will be delivered by Mr. C. HERMAN SENN.

ROYAL HORTICULTURAL SOCIETY'S FIXTURES FOR 1911.—According to present arrangements fortnightly meetings will be held on January 3, 17, 31; February 14, 28; March 14, 28; April 11, 25; May 9; June 6, 20; July 18; August 1, 29; September 12, 26; October 24; November 7, 21; December 5. Other important dates are as follows:—January 16, examination for employes in public parks and gardens; February 14, annual meeting; March 14 and 15, Spring Bulb Show; April 5, general examination in horticulture; April 26, examination of school teachers in cottage and allotment gardening; May 23 to 25, Temple Flower Show; July 4 to 6, Summer Show at Olympia; October 10, 11, Autumn Fruit Show;

October 11, annual conference of affiliated societies; November 30 to December 2, Colonial Fruit Show. The Masters' Memorial Lectures will be delivered on February 28 and March 14, by Mr. G. F. SCOTT-ELLIOT, the subjects being "Recent Work in Seed Selection" and "Origin of Varieties." Other dates of interest are April 25, National Auricula and Primula Society's Show; July 11 and 12, National Sweet Pea Society's Show; July 25, Carnation Society's Show; August 30, National Vegetable Society's Show; September 14, National Rose Society's Autumn Show; and December 12, Perpetual-Flowering Carnation Society's Show. There will be no meeting of the Fellows on August 15 and December 19, but the Committees will meet as usual.

NATIONAL ROSE SOCIETY.—The thirty-fourth annual meeting will take place at the Westminster Palace Hotel on Thursday, December 8, at 3 p.m. In addition to the election of Officers and Council for the ensuing year, and the transaction of other general business, it is proposed to alter Rule 10 by omitting the following words: "and the 40 other Members of the Council," and to add a new rule as follow:—Rule 10a.—"The Council shall consist of 42 Members (exclusive of ex-officio Members) one-third of whom shall retire at each Annual Meeting by rotation, but shall be eligible for re-election. Such election to take place at the Annual Meeting." For the purpose of arranging the rotation referred to in Rule 10a, the Council at the first meeting after the passing of Rule 10a, shall determine such rotation for the ensuing three years by ballot, and the year of retirement shall then be placed against the names of all members of the Council. In the evening a conversazione will be held in the large room at the Westminster Palace Hotel from 4.30 to 6 p.m., to which all members are invited. A selection of music will be given at intervals during the conversazione. Each member is entitled on application to one free ticket and to purchase other tickets for friends, including ladies, at 2s. each. Application for tickets must be made to the hon. secretary on or before Saturday, December 3.

NATIONAL ROSE SOCIETY'S FIXTURES FOR 1911.—Mr EDWARD MAWLEY informs us that the National Rose Society will hold its Metropolitan Show in the Royal Botanic Gardens, Regent's Park, on Friday, July 7, and the Provincial Show at Ulverston, on Wednesday, July 19. The Autumn Show will take place in the Royal Horticultural Hall, Westminster, on Thursday, September 14.

NATIONAL SWEET PEA SOCIETY.—The annual general meeting will be held in the North Room, Hotel Windsor, at 3 p.m., on Thursday, December 15. In the evening, at 7 p.m., a conference will be held when papers on "Judging Sweet Peas" and "Cultivation of Sweet Peas" will be given by Mr. WALTER P. WRIGHT and Mr. GEORGE HERBERT respectively. For the convenience of members, dinner will be provided at the Hotel Windsor, at 5.30 p.m., the cost of tickets being 5s. each. Application for tickets must be made to the hon. sec., Mr. CHAS. H. CURTIS, Adelaide Road, Brentford, Middlesex.

AYRSHIRE CARNATION AND PICOTEE SOCIETY.—A meeting, called by advertisement by Mr. J. HENDERSON, Cummock, was held in Kilmarnock on the evening of November 26 for the purpose of considering the desirability of forming a Carnation and Picotee Society for Ayrshire. Mr. DAVID WALKER, Kilmarnock, a well-known cultivator and exhibitor of Carnations and Picotees presided. The response was considered favourable to the scheme.

* Journal de la Société Nationale d'Horticulture de France (1910).

"ARBOR DAY" AT SANDGATE.—A society instituted for promoting an annual arbor day at Sandgate has met with every encouragement. The Folkestone Corporation, Lord RABNOR, and Mr. BROCKMAN have given their consent to trees being planted on Castle Green. The committee has decided to postpone the celebration until after the General Election.

"THE BOTANICAL MAGAZINE." The issue for December completes volume VI. of the 4th series. It is appropriate that the volume is dedicated to Mr. HARRY JAMES VEITCH, as it includes a large number of plants which have been introduced by the Veitchian firm.

PINUS ARMANDI. tab. 8547.—This interesting Pine was described by Dr. MASTERS in *Gardeners' Chronicle*, January 31, 1903, p. 66.

packages of tobacco. It is not with wild in the northern parts of Bahia, Brazil.

CORYLOPSIS VEITCHIANA. tab. 8549.—This species was found by WILSON in Western Hupeh, who forwarded seed to Messrs. JAMES VEITCH & SONS. Plants raised at the Cocombe Wood Nurseries of this firm supplied the material from which the illustration in the *Botanical Magazine* was prepared. The flowers are produced in drooping racemes along the branches like a flowering Currant. The petals are of a primrose yellow colour, and the five stamens have reddish-brown anthers. Mr. W. J. BRAY, who is responsible for the description, states that the plant is apparently quite hardy, grows well in an open, sandy loam, and can be propagated by means of cuttings.

JACOBINIA SUBERECTA. tab. 8550.—This is a prostrate growing plant that sends up erect

Chronicle, June 12, 1909, p. 374, by Mr. ROUTE, who also writes the description in the *Botanical Magazine*.

CHEER FOR THE DESPONDENT.—What the trade Press in England has said about dwindling profits of florists, nurserymen and gardeners seems hardly borne out by the Government reports on business failures in these trades. Close records are kept, from which it appears that in the last five years there were only 294 failures, involving total liabilities of \$1,007,250, the English pound being figured as \$5 in the following record:—

Year.	Failures.	Liabilities.
1905	51	\$155,325
1906	32	\$511,715
1907	45	\$177,555
1908	48	\$219,055
1909	48	\$163,820

FIG. 171.—ROCK-GARDEN WITH PATH OF STEPPING-STONES AT EAST BURNHAM PARK. (See p. 409.)

figs. 30 and 31, from material sent home by Mr. E. H. WILSON. The tree has been referred to under several names, including *P. koraiensis*, to which it is most nearly allied. In its natural habitat it grows about 60 feet high, and has smooth, greenish-coloured bark. The leaves are produced in bundles of five.

NEOGLAZIOVA CONCOLOR. tab. 8548.—This plant has a general appearance resembling a *Billbergia*, with the characteristic spiny leaf margins. The flower-spikes bear violet-coloured flowers set in a scarlet calyx. Like many other members of the Bromeliaceae the leaves furnish a useful fibre, which is made into ropes for binding

flowering branches, terminated with long tubular flowers of bright scarlet colour. It is recommended as suitable for planting in hanging baskets in a warm plant house. Colonel H. BEDDOME, who furnished the material for the plate from plants growing in his garden at West Hill, Putney, recommends it to be raised annually from young succulent cuttings rooted in the spring, as large plants are not so satisfactory in flowering. As a potting medium Col. BEDDOME recommends leaf-mould, loam, sand and Pea-shaped crocks.

DENDROBIUM SANDERLE. tab. 8551.—The species was described and figured in *Gardeners'*

This makes an average liability for each of the 294 failures of only £987, or, in round figures, \$4,000. Similar figures are not available for the United States, but if they were it is to be doubted if they would make an equally good showing, certainly not in number of failures, and probably not in percentage of failures as compared with the numbers engaged in the florists', nursery and gardening business, or in the smallness of the average liabilities. And this in spite of the fact that the period covered includes the most prosperous years the rapidly expanding horticultural trades of the United States ever have experienced. *The Weekly Florists' Review*.

SALTAIRE ROSE SOCIETY.—This society has had a successful season, and starts the new year with a cash balance of more than £500. The profits on last year's working amounted to £58 11s. 5d. The 50-guinea trophy, presented by Mr. G. C. WAUD, has been won finally by Messrs. ALEXANDER DICKSON & SONS, LTD., who have succeeded in winning it four times in succession. The society is making arrangements to replace it with a 100-guinea trophy, and this will be offered either for 72 blooms, distinct, or for 48 blooms, distinct, as the committee decides. The date for the next show is fixed for Tuesday, July 11, 1911. The hon. secretary is Mr. E. WRIGHT, Rosedene, The Glen, Saltaire.

LEAMINGTON FLOWER SHOW.—It has been decided to continue the summer show at Leamington. The prize list will be increased, and a determined effort will be made to attract the public from a wide area. Last summer's show, though but the second, in many respects rivalled some of the leading exhibitions. The dates for next year's show are July 28 and 29.

FOOTPATHS AND THE ELECTION.—Lord EVERSLEY presided over the recent monthly meeting of the Commons and Footpaths Preservation Society. Amongst others present being LORD ROBERT BRUCE, SIR WILLIAM VINCENT, SIR WALTER MURTON, the Master of the Charterhouse, and the secretary, Mr. L. W. CHUBB. It was decided, in view of the pending General Election, to make a strenuous effort to secure for the Society's Rights of Way Bill promises of support from candidates of all political opinions. The Bill has three times received a second reading in the House of Commons, and has twice been approved by a Grand Committee. Moreover, it has now received the support of all the large associations of the various Highway Authorities, and over 500 resolutions have been passed in its favour by Corporations and District Councils. Mr. P. BIRKETT, the society's solicitor, expressed the opinion that if the Bill passed into law it would reduce the expense of Rights of Way litigation by 75 per cent. The Bill seeks to bring into operation, in cases affecting footpaths, the principles of the Prescription Act, which have applied for nearly eight years to all disputes regarding private paths or other easements. It proposes to fix 20 years as the period of evidence required in the case of an estate occupied by the owner in possession, and 40 years where the estate is in the hands of trustees or a tenant for life. It was reported that during the last month the society had succeeded in securing the re-opening of 15 footpaths by means of friendly negotiation with the landowners.

THE CHILLING OF CUT FLOWERS.—Though the practice of exposing cut flowers for a short time to a fairly low temperature (about 40° F.) is not uncommon among the larger florists, it is doubtful whether the effect of this procedure in prolonging the life of the cut blooms is as widely known as it should be. *The Weekly Florists' Review* (Oct. 20, 1910) draws attention to the subject in an interesting note entitled "Refrigeration for Florists," and points out that the only precise information on the subject is that published by Professor J. MERCIER in *L'Industrie Frigorifique*. We agree with our contemporary in thinking that a careful investigation of the behaviour of the more important classes of florists' flowers with respect to chilling would be of considerable practical value. Precise information is wanted as to the length of time for which given kinds of flowers should be chilled, the temperature to which it is best to expose them, and whether, as appears to be the case, the chilling should be done in a saturated atmosphere.

"CROWN GALL" OF FRUIT TREES.—The current number of the *Journal* of the Board of Agriculture gives information that this disease is present in England. Specimens of Plum trees, Raspberry canes, Roses, and Chrysanthemums recently received at Kew have been found to be affected by galls at the crown of the stem or on the roots; it appears that these galls are identical with the affection known as "Crown Gall" in the United States, where the same and various other plants, including Apples and Peaches, are attacked. Before planting fruit trees, nurserymen and fruit-growers will do well to examine their stock carefully and discard any trees which show signs of "Crown Gall." It is important to obtain information as to the distribution of the disease in this country. The galls characteristic of this disease vary considerably in size, the larger ones being confined to the collar of the stem just below the surface of the ground. Young plants are more liable to the disease than plants which are well established. A fruit tree affected by "Crown Gall" grows feebly and yields much less than a healthy tree. Though there is still some doubt as to the exact organism which causes "Crown Gall," there can be no doubt as to the infectious nature of the disease. In the United States "Crown Gall" causes serious losses to orchardists. TOUMEX, of that country, considered that the disease was due to an organism closely allied to that which causes "Anbury" or "Finger-and toe" in Turnips. The more recent and critical work of SMITH and TOWNSEND points to the view, however, that a bacterium is the primary cause of the injury, the organism described by TOUMEX being considered to be only a secondary agent. Nevertheless, the Chrysanthemums received at Kew contained the organism of TOUMEX, whereas no trace of the bacterium described by SMITH and TOWNSEND could be found.

WITCHES' BROOM ON SPRUCE AND LARCH.—Professor SOMERVILLE calls attention in the *Quarterly Journal of Forestry* (October, 1910) to the recent observations of TUBEUF on the cause of witches' broom of the Spruce, Larch and Pine. Hitherto the cause of the witches' broom, which is met with occasionally in these trees, has remained undetected, although fungi, bacteria, and mites have been suspected in turn of being responsible for the malformation. TUBEUF's observations and experiments appear to demonstrate that the exciting cause of witches' broom of the above-mentioned trees is not due directly to any external agent, but that it is a case of a sport or mutation called forth not by external but internal factors. Thus in January, 1907, TUBEUF obtained seed from a cone bearing witches' broom of the Spruce. The seeds were planted, and of the plants, which are now in their fourth year, though most are normal, a certain number are densely bushy, and in fact have the witches' broom form. It is therefore to be concluded that, as Professor SOMERVILLE points out, the witches' broom of the Spruce is due to an individual peculiarity which is transmitted from parent to offspring. The observation suggests that the remarkable dwarf Spruces used in rock gardens are derived from seed carrying the witches' broom character. What he has demonstrated in the Spruce, TUBEUF believes also to be the case in the Pine and Larch. It would be interesting to determine by further breeding experiments whether this abnormal character is inherited in a regular manner. Recent experiments have demonstrated that dwarfism is so inherited; that, for example, in the case of the Garden Pea dwarfs arise, when semi-dwarf races are crossed, in the proportion of 1 to 16. On the other hand, further experiments may show that the inheritance of the witches' broom character follows a more irregular course, like, for example, that which obtains in the case

of doubleness in certain florist's flowers, such as *Primula sinensis*. The fact that witches' broom in Spruce occurs generally on certain branches only points to its inheritance resembling that which obtains in doubleness of flowers rather than the more regular course of events which we know to occur in the inheritance of dwarfism. Nevertheless, the possibility is not excluded that the dwarf forms of various conifers, so much beloved by our allies the Japanese, are "extracted dwarfs," produced by crossing varieties, neither of which when bred true ever produces dwarfs. In any case, the observations of TUBEUF open up a promising field for further experiment, and confirm the urgency of the plea made recently by Dr. HENRY for experimental breeding of forest trees. From the practical point of view, the discovery of the non-parasitic origin of witches' broom in the case of the Spruce is of importance. Evidently there is no fear of the "disease" being spread from one tree to another in the manner that fungous diseases are disseminated, for the only source of the malformation is in the seed itself.

AUSTRALIAN GRAPES FOR THE ENGLISH MARKETS.—The Acting Agent-General for Western Australia (Mr. R. C. HARE) has received from Mr. R. L. GILBERT, Officer-in-Charge of the Western Australian Government Agency in Melbourne, Victoria, particulars of an interesting and important experiment in connection with the cool storage of table Grapes for export to London and other British markets. Several shipments of Western Australian Grapes arrived in London a few months ago and sold in some cases up to 1s. 4d. per lb. wholesale. Mr. GILBERT informs the Agent-General that early this year he received a consignment of Western Australian Grapes through the Department of Agriculture for exhibition at the Melbourne Government Agency. The Grapes were packed in bunches in granulated cork-dust in wooden cases containing about 23 lbs. of fruit each, precisely similar to the shipments which had been sent from Western Australia to the London market. The Melbourne consignment had been ten days in the steamer's hold before it reached Mr. GILBERT's hands, and it was placed by him in exactly the same condition as that in which it was received in the chambers of the Government Cool Stores, Melbourne. There the Grapes remained untouched for three months, at the end of which period (on July 11 last) the cases were brought out and opened in the presence of the Right Hon. Sir JOHN FORREST, G.C.M.G., ex-Treasurer of the Commonwealth, the Victorian Minister for Agriculture, the Government Viticultural Expert, and a number of members of the Commonwealth Parliament. They concurred in reporting that the Grapes were found, after their ten days' sea journey and three months' cold storage, in a perfect condition. The varieties experimented upon were Almeria (known in Spain as Obanez), Flame Tokay and Purple Cornichon. They were grown by Mr. BARRETT-LENNARD, of Guildford, Western Australia, who was also the grower of a shipment which realised 35s. per case of 23 lbs. in London a few months ago. Mr. GILBERT writes:—"The Obanez (Almeria) opened up absolutely perfect, and the same can be said of the Flame Tokay. With regard to the Purple Cornichon, although the berries were perfectly sound, some of them fell away from the stalks when the bunch was lifted. The remarkable freshness and quality of the fruit excited great enthusiasm among those present, and it was unanimously agreed that the experiment had been a great success." Subsequently, several cases were sent to the Federal Parliament, which was in Session in Melbourne. "It was generally agreed among the members who inspected and tasted the fruit," says Mr. GILBERT,

"that it was in a perfect state of preservation and of excellent quality, the bloom of the fruit had been retained in a wonderful manner, and the berries were as firm and fresh as if the bunches had been cut on that very day." The Grapes which came to England from Western Australia in April and May last were stored only a few weeks between the time they were gathered at the vineyards and the time they were marketed in London, but the Melbourne experiment indicates that even three or four months' storage does not induce deterioration in freshness, firmness, flavour or appearance. Of four shipments of Grapes from Western Australia, totalling over 4,000 cases, one shipment averaged 14s. per case of 23 lbs., another 19s., a third 25s., and the best of all 33s. for 82 cases, which was also the top market price of the day for Grapes in London. The cost per case, including all charges, was 4s. 5½d., so that the net return to the growers was highly satisfactory. The Victorian Government Viticultural expert was so impressed by the success of the storage of Grapes at the Melbourne Cool Stores that he is procuring several thousands of cuttings of Flame Tokay from Western Australia for propagating at the Viticultural College in the State of Victoria, and an immense impetus has been given to the Grape-growing industry in Western Australia by the results of last season's London shipments. It is calculated by viticulturists that there are twenty million acres in Western Australia suitable for Grape growing, but if only a small proportion of that vast area is laid down in vines the amount of production within a few years should be sufficient to ensure a cheap and ample supply of high-quality table Grapes in British and European markets at a time of the year when home supplies are out of season.

PUBLICATIONS RECEIVED.—*Morphology of Gymnosperms*, by John M. Coulter, Ph.D., and Charles J. Chamberlain, Ph.D. (Cambridge: University Press.) VANDA CÆRULEA SANDERÆ.

THE variety of *Vanda cœrulea* shown by Messrs. Sander & Sons at the meeting of the Royal Horticultural Society held on the 22nd ult., presented a striking difference from the forms of this species hitherto exhibited. Instead of the flowers being tinged with blue, this variety had the tips and margins of the sepals tinged with magenta-pink, the petals being flushed with the same colour, whilst the lip was of a deep shade of magenta. The Orchid Committee recommended this extraordinary novelty a First-class Certificate.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

CEDARS AT EASTBURY MANOR, SURREY.—Calling a few weeks ago upon Mr. Noah Fuller, who has been gardener at Eastbury Manor for almost a generation, I was greatly interested in the magnificent specimens of Cedar of Lebanon which adorn the lawn. The trees are of considerable height and handsome shape, notwithstanding that many limbs have been lost in storms of wind and snow. There are four trees in one row and another which stands isolated. The biggest specimen measures 18 ft. in circumference at about 4 feet from the ground, and the others are respectively 15½ feet, 14½ feet, 14½ feet and 15½ feet. On the other side of the mansion a sixth tree has a circumference at the same height of 14½ ft. Another grand tree at the end of the lawn is a Sweet Chestnut 15½ feet in circumference. Eastbury Manor is the residence of Mrs. Ellice, and the whole place is maintained perfectly. *Horace J. Wright.*

HARDY BAMBOOS.—In his note on p. 396 Mr. Jas. Hudson does well to call attention to *Arundinaria nitida*. Amongst the numerous varieties in these gardens, it is certainly one of the most graceful, and is especially striking when grown as a single specimen on the grass. There are two forms of *A. nitida* in cultivation: one is more erect than the other, and it would appear that some nurserymen have a stock of one, while some grow the other, hence the diversity often seen in this variety. I saw some good specimens of *A. nitida* and other choice Bamboos recently in the lovely gardens of A. G. Soames, Esq., at Limber, in North Lincolnshire. Considering the comparatively short time they have been planted, they have done remarkably well, which shows that under proper management, even in that uncongenial district, a Bamboo garden can be made a success. Given a sheltered situation and a rich loamy soil, there should be no difficulty in growing Bamboos. Thorough protection from the north-east winds is most essential, for the plants suffer more from them than from hard frosts in winter. In exposed districts it is necessary to erect screens to protect them during the winter and early spring months. One of the most distinct and

plants, 5 yards to 6 yards through, in these gardens; some of these we are removing on account of their size. *A. nitida* is an upright growing species, and in dry winds or frosty weather is the first one to lose its leaves, but as soon as there is moisture and the frost is out of the air, it quickly rights itself. I consider that *A. anceps* is more ornamental, as this species bears tall, arching plumes, and the whole bearing of the plant is most graceful, and, moreover, it is always green and perfectly hardy. *Bambusa fastuosa* is an upright-growing evergreen plant, very ornamental, and one of the tallest growers in these gardens. *Phyllostachys aurea* and *P. flexuosa* are always graceful. *P. heterocycla* is always remarkable for its brightness and hardiness. *P. nigra* is one of the most beautiful of Bamboos and forms an ideal specimen. In *P. Marliacea* the fluted canes shine like enamel; it is a most graceful Bamboo. *Bambusa Veitchii* is a fine, broad leaved, variegated plant, which is beautiful all through the winter. *Arundinaria auricoma* is a charming, dwarf Bamboo, having golden variegated foliage of an exceedingly soft, velvety appearance: it is quite hardy. *Bambusa Fortunei* has silver variegation in the leaves, and is perfectly hardy, being useful for planting in

FIG. 172.—VANDA CÆRULEA SANDERÆ.

(Awarded R.H.S. First-class Certificate on November 22, 1910.)

beautiful Bamboos is *Arundinaria aristata*. It is a free grower of erect habit, but the shoots droop slightly at the tips, and its purple stems are very showy. This variety is seen to the best advantage when planted as single specimens on the lawn. For planting along the banks of a stream or as a background to ornamental water, *A. japonica* is very effective. It is a fairly broad-leaved, vigorous grower and spreads rapidly. *A. Veitchii* is a dwarf-growing variety well adapted for planting in the rock-garden. *A. Fortunei* variegata is showy and looks well bordering a walk in the wild garden, or on the outskirts of a shrubbery. *Phyllostachys fastuosa* is quite distinct and erect-growing with fairly broad leaves. It attains a height of 15 feet and looks well associated with shrubs, and as a background to dwarfier varieties. *P. nigra* is an attractive variety and vigorous grower, but with us one clump has flowered badly this year. A large clump of *P. Quiloi* flowered a year ago, but several plants of this variety remained quite immune from this defect. *P. aurea* is a handsome and vigorous growing Bamboo, and is one of the best varieties for massing. *J. Gardner, Batsford Park Gardens, Gloucestershire.*

—This species is certainly one of the hardest Bamboos, but it is not so handsome as others that are equally hardy. I do not wish to depreciate *A. nitida*, as I like it, and there are several very large

borders amongst general plants. These are only a few Bamboos which have suffered no harm after exposure in these gardens to 24° of frost. *W. A. Cook, Leonardlee Gardens, Horsham.*

THE BIRD SANCTUARY.—During severe weather, such as we are now experiencing, my committee is accustomed to put out food in the Brent Valley Bird Sanctuary for the benefit of the birds. At this time of year, our funds are usually low, and we should welcome gifts of bladders of lard, cocoa-nuts, bird seed, and meal-worms. Subscription would also be useful, as at present our only income is derived from the sale of nesting boxes made in the sanctuary by the keeper. *Wilfred Mark Webb, Honorary Secretary of the Selborne Society and Chairman of the Brent Valley Bird Sanctuary Committee.*

WEATHER AT LEONARDSLEE.—In the week commencing November 20, we registered 12° of frost, on Tuesday, November 22, 12°, and on the next day 10°. The thermometer never rose above 40° all the week till Sunday night, or rather early Monday morning, when the mercury reached 50°. It remained nearly stationary till 6 o'clock, when it commenced to fall again, and continued to go down till 10 a.m., when it registered 36°, after which it commenced to ascend again. The readings were taken from a self-registering and recording thermometer. *W. A. Cook, Leonardlee Gardens, Sussex.*

MONTBRETIAS.—Mr. Beckett states, on p. 335, "The bulbs of Montbretias may now be lifted for storing away for the winter, as excessive wet would cause the bulbs to decay." In the gardens here a border some 30 yards in length and 5 feet in width contains about 20 clumps of Montbretias. My employer informs me that they have been planted about five years. The border faces south, with a Beech hedge 10 feet in height at the back; the soil is a sandy loam resting on sand. Some of the clumps have produced as many as 60 flower-spikes this season, and the old inflorescences are thickly set with seed pods. The foliage is still green, and the seed pods are of a light-brown colour, giving the plants a neat appearance, nearly as attractive as when they were in flower. My employer says there were from 6 to 12 bulbs planted in each clump, and now there are more than 60 in several of the clumps; how they have increased in such a short time is astonishing. I do not believe the extra labour of lifting the bulbs now and planting them again in the spring would be productive of better results. *L. Johnson, The Lodge Gardens, Halesworth.*

Few gardeners will disagree with the advice given by Mr. Divers on page 318 as to the advisability of dividing and replanting Montbretias every two or three years. The bulbs increase rapidly in good garden soil and quickly form a tangled mass, the growths producing puny flower-spikes compared with those having ample space to develop. *Schizostylis coccinea* and *Campanula glomerata* require similar treatment to obtain the best results. There can be no two opinions as regards the value of Montbretias for furnishing cut blooms, and nothing is better to add than their own foliage when arranging them in a vase. They are also very serviceable as pot plants. Montbretias prefer a sunny position out-of-doors and enjoy copious waterings during dry summers. *J. Mayne, Bicton.*

There are clumps of Montbretias in this island which have not been divided for several years. During the past season they have made strong growth and produced abundant flowers on long, strong spikes. A batch removed (owing to building operations) and planted very thickly have also flowered profusely. This is all the more interesting because they are planted in a fully-exposed position and only a few feet above high-water mark. Two or three clumps planted in boggy soil and in partial shade have flowered fairly well and made strong growth. The soil here varies much in texture; that in which the Montbretias are growing is a light vegetable loam. *Kuiphofias (Tritomas)* in a north border of an enclosed garden have also grown into remarkably fine specimens, and for months past their fine flower-spikes have been conspicuous objects. *C. Rust, Lambay Island, Rust, Co. Dublin.*

It might interest those of your correspondents who have given their experiences as to the benefits accruing, or otherwise, from the annual or biennial lifting of these plants, to know that Mr. Davison, Westwick Gardens, near Norwich, lifts the whole of his plants each year at the end of October. If my memory serves me aright, all the plants are lifted, including seedlings of the first year. For the most part the rootstocks are suspended in a shed or other place secure from frost, where they remain till the opening days of April. No one having seen the robust vigour of the plants at Westwick, their freedom from disease, and prolific flowering, could for one moment doubt the wisdom of Mr. Davison's method of treating his plants. Obviously, the Montbretia enjoys a long season of rest, and the isolated plant, as opposed to the crowded groups of undeveloped corms which are to be seen so frequently in gardens, produces the finest display at flowering time. *E. H. Jenkins.*

WASPS.—On reading Mr. A. C. Bartlett's note on p. 353 on queen wasps, I thought we were getting rid of one destructive enemy or, rather, that they were decreasing rapidly. On November 12, to my surprise, I found a very strong wasps' nest in the bank close to the lake; the insects were as busy as if it were August. I should think it unusual to find them so late in the year. At several country shows they award prizes for the greatest number of queen wasps killed; this is a great help in combatting the pest. *W. Edwards, The Hall Gardens, Crawley, Sussex.*

PARTI-COLOURED PAPAVER RHŒAS.—The accompanying illustration (fig. 173) represents a bloom taken from a wild specimen of *Papaver Rhœas* found by me growing with normal examples at Dunstable. The plant was a small one, with a single stem and a solitary flower at the apex. *Papaver Rhœas* is exceedingly common on the calcareous soil of Dunstable, and it varies but little in its crimson scarlet flowers. I have, however, seen it rose colour and very rarely pure white. This bloom would seem to be a hybrid.

FIG. 173.—PAPAVER RHŒAS WITH PARTI-COLOURED PETAL.

between a white and scarlet example, as may also be the rare rose-coloured form, but the bloom illustrated is remarkable for the strange distribution of the colours, two petals being wholly scarlet, one white, and the fourth half white and half red, the colour division being exactly up the centre of one of the petals. The white was pure white, without the slightest indication of scarlet or rose. So far as I know this specimen does not appear to agree with Shirley

FIG. 174.—VINCA MINOR WITH PARTI-COLOURED PETAL.

Poppies, although it is possible that this form may sometimes appear amongst them. A few years ago an illustration was published in the *Gardeners' Chronicle* of a bloom of *Vinca minor* (reproduced in fig. 174) in a parti-coloured state. I noticed the plant in a garden near here where the white and purple forms were cultivated. *W. G. S.*

CARNATION RUST.—I have used sulphide of potassium for Carnation rust with very good results. I dissolved 1 ounce to each gallon of water, and dipped the plants in the solution. In a few days, after dipping, I went over them with a small brush to catch any disease patches which had not been destroyed. The plants are now clear of rust; I enclose a few leaves which were dipped three weeks ago. *L. Harrington, The Gardens, Condover Hall, Shrewsbury.*

CHRISTMAS ROSES.—I am proud to know that such a well-known authority on hardy plant cultivation as Sir Herbert Maxwell reads my *Calendar on the "Flower Garden,"* and I welcome his friendly criticism. I may point out that it was my intention to refer only to *Helleborus niger*, the species generally known as the Christmas Rose, and not to the species of *Helleborus* generally. Few plants resent disturbance at the roots more than *H. niger*, and I particularly mentioned loosening only the surface soil with a fork. On many kinds of land, especially that of a stiff retentive nature, such as the soil at Aldenham, this is advantageous rather than otherwise. I have found a surface dressing of decayed manure an advantage both in improving the quality of the flowers and protecting them against severe frost. Many well-known authorities advise mulching with manure in the spring of the year, but my experience teaches me that November is the most suitable time, and to have the flowers in perfection at Christmas and during mid-winter it is necessary in most parts of the country to assist the flowers to open at their best by placing handlights or other suitable glass coverings over the plants. *E. Beckett.*

SAXIFRAGA LANTOSCANA.—On returning from abroad my attention is drawn to Mr. Robinson's letter on *Saxifraga lantoscana* (see p. 371). So far as this goes, a seven-year-old *Handlist* need not necessarily, I think, be held to have a quasi-papal infallibility, and, of course, Prof. Burnat is obviously a far greater authority on the flora of the Maritime Alps. However, on reference to him, I find that he also makes *S. Bellardii* and *S. lantoscana* mere varieties of *S. lingulata*, so that *cadit questio*, my high claims for my beloved *S. lantoscana* ought certainly to subside, although I must add that Correvon's *Atlas de la Flore Alpine* accords full specific rank to the plant. However, there is no matter for any very lethal controversy, for even granting the subsidiary status of *lantoscana*, it is a plant so completely and so incurably different from *lingulata* that it must always, from the cultivator's point of view, be placed as a separate "species," and as such, with all due reservation, spoken of. I would even dare to suggest that the three plants *lingulata*, *lantoscana* and *cochlearis* are all, perhaps, local developments of a common original which, in ancient days, pervaded the limestone ridges of the Maritime Alps, even as unmodified *florulenta* still occupies the granitic. These three plants, forms or species, seem never to gradate into one another, and where hybridisation occurs it is with one of these and *Aizoon*. Such, with Mr. Robinson, I believe, are the Correvonian *lantoscana*s: these are no longer in my collection, but I have now a large series of all three plants, collected on their native rocks this year, and among them, for instance, from the gorge of the Vésubie, I have a fine rosetted, poor-flowered *lantoscana*, which puzzles me the more that I know of no *Aizoon* in close proximity, but *Aizoon* is clearly implicated, and not either *lingulata* or *cochlearis*; and on the Pass of Pesio I found (and left) an ugly and almost certainly mongrel *Saxifrage* suggesting a *mésalliance* of *lingulata* with *Aizoon* (*cochlearis* did not occur there, nor have I, so far, happened on the two together). Now let us consider the species. *Saxifraga lantoscana* is entirely restricted to the Valley of the Vésubie, and varies not at all essentially, showing no sort of tendency towards *lingulata*. Then, in the eastern valleys, comes *S. lingulata*, completely distinct and equally invariable. (For, in talking of *lantoscana* as "polymorphic," the term must only be taken to mean small differences in size of flower or precise length of leaf—variations, that is, within the very narrowest limits, never shading towards other forms, or showing anything like the radical diversities that so bewilder one among the *Aizoons*.) Now, while *S. lingulata* remains always the same on its native rocks, though it is obviously very close to the smaller and different-habited *lantoscana*, and though their young seedlings are indistinguishable, there does occur with *lingulata* a real variation of *lantoscana* which, if the two plants were merely forms of one another, so to speak, ought certainly to shade off into various missing links. For, while Burnat restricts true *lantoscana* to the Vésubie, he gives the varietal name of *Bellardii* to a form of *lantoscana* which anyone may see for himself growing in the Eastern Maritimes actually in and among *S. lingulata*. It is, however, uncommon by comparison with either

lingulata or cochlearis: lantoscana clearly feels that it belongs only to the Vésabie, and cannot luxuriate of its own right in the territory of its cousins. Now, in the summer, I hunted long and wide, and have just returned from yet another searching quest among these; and never once, on hillsides bristling with Saxifrages, did I find a plant of lingulata which showed the very slightest tendency towards Bellardii, nor a single Bellardii with any inclination towards lingulata. The two plants, born, perhaps, of a common parent, seem to remain by now incurably distinct. And before I finish with these two, I will add that I know of several splendid and high-named varieties of lantoscana, but should be glad of Mr. Robinson's further enlightenment. Of lingulata I know no garden forms, but am amused to see that Mr. Robinson boldly cites the Oxford plant, whose dwelling-place I myself had cunningly dissembled. With regard to *S. cochlearis*, I would remark that, while both lingulata and lantoscana show a marked preference for shady exposures (marked indeed, but less inveterate in the case of lingulata), cochlearis is the sun-tolerating member of the trio, bearing heat, in point of fact, with such philosophy that it is even found above the Mediterranean at Portofino. It certainly occurs in dank dells (as below Saorgio, abundantly), but here, by its comparative rankness, shows itself not so well at home as on such sun-beaten rocks as those below San Dalmazzo, where it hangs in vast and thriving cushions. And might it not be a conceivable theory that these sun-loving proclivities (or accident of original place) have forced the plant to develop in the direction of smaller foliage and wider masses? For it is hardly possible not to feel that, while lantoscana is very close to lingulata, cochlearis is quite as close to lantoscana, and might almost be recognised as the compressed, sun-loving development of a lost Saxifrage, whose other nearest branch diverged into northerly gullies and became ultimately the larger and diffuser *S. lantoscana*. With regard to the unilateral flower-spikes, this tendency, I think, is clearly marked even in *S. cochlearis*, though not to the same extent as in the other two. But a spike of cochlearis is far closer in design to lingulata and lantoscana than to Aizoon or longifolia. The whole question, of course, of the relationship of these three plants needs a great deal more working at on the spot. My own double huntings of this season produced nothing which showed any trace of intermediateness or indefiniteness between any of the three species themselves, though Aizoon interferes and is responsible for occasional confusions. In our own gardens we all know how powerfully Aizoon forces its attentions on both cochlearis and lantoscana, and with what diverse results—results that are probably often responsible for the dubious lingulatas and lantoscanas from which we have long been suffering. For, as I repeat, the real plants are so essentially invariable as to be always unmistakable—at least, so far as I can see. Since writing this, I have been comparing my collected plants of *S. cochlearis* with old bought plants; with the conclusion that the type cochlearis of the Roja Valley is a much bigger plant in all its parts than the type cochlearis of gardens. It is nearer to what is called *S. cochlearis major*, and in certain circumstances its approximation to *S. lantoscana* is very clearly suggested. *Reginald Farrer.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

NOVEMBER 22.—*Present:* E. A. Bowles, Esq., M.A., F.L.S. (in the Chair); Messrs. W. E. Ledger, J. Douglas, R. Hooper Pearson, A. Worsley and F. J. Chittenden (hon. sec.), with W. W. Pettigrew (visitor).

Pine seeds.—Mr. J. DOUGLAS, V.M.H., drew attention to the sale of the seeds of *Pinus Pinca* under the name of "pignolia" in Bournemouth and elsewhere. They are used for flavouring, &c.

Gentiana Pneumonanthe forma alba.—Mr. CHITTENDEN showed a white-flowered specimen *G. Pneumonanthe*, found by Admiral Carr on Chobham Common, and already referred to in these columns (see p. 372).

WOOLTON CHRYSANTHEMUM.

NOVEMBER 16.—This show fully sustained its high position as an effective exhibition. Chrysanthemums in pots were unusually numerous, being staged across the end of the room, making a bold and effective feature.

A Challenge Vase, the gift of the President, Sir W. H. Tate, Bart., was offered for the best exhibit of 24 Japanese blooms in not fewer than 18 varieties. It was secured by W. TOP, Esq. (gr. Mr. G. Eaton), for the third time, thus becoming his property. The blooms were fresh and of good size; Col. J. B. GASKELL, J.F. (gr. Mr. J. Stoney), was placed 2nd.

Sir W. H. TATE, Bart. (gr. Mr. G. Haigh), took the lead in the class for 18 Japanese blooms, distinct, with a good stand; the same exhibitor was also to the fore in the class for 18 Incurved blooms.

For 12 Japanese blooms, J. P. BARR, Esq. (gr. Mr. T. Keightley), led, and for the corresponding class of Incurveds, T. CLARKE, Esq. (gr. Mr. J. Clarke), was the most successful exhibitor.

In the class for 10 Japanese and five Incurved blooms, arranged in vases with any foliage, Mr. G. HAIGH was placed 1st, and the same exhibitor was successful in the class for four vases of incurved sorts, three blooms in each vase.

The class for nine vases of single varieties, distinct, nine blooms in each vase, brought four competitors. Woolton is held in high repute for the displays of single Chrysanthemums, a handsome Challenge Vase being presented by A. H. Tate, Esq. Mr. G. EATON secured the coveted position with a wonderful collection of flowers, remarkable for their fine substance, form, and purity of colour; moreover, they were arranged admirably; it is difficult to make a selection in such a meritorious stand, but possibly Edith Pagram, Admiral Seymour, Motta, G. W. Forbes, and Mensa were the choicest flowers. The other prizewinners in this class were Mr. T. KEIGHTLEY, A. T. MATHER, Esq. (gr. Mr. H. Howard), and S. S. BACON, Esq. (gr. Mr. J. Rothwell).

CHRYSANTHEMUMS IN POTS.—The trained specimens were models of good culture and form. Mr. T. KEIGHTLEY showed the best three plants, having heavily-flowered specimens. W. CUNNINGHAM, Esq. (gr. Mr. W. Wilson), led in the three classes for single plants of Incurved Pompons and single sorts. Mr. HAIGH had the best reflexed, and Mr. T. KEIGHTLEY the best Anemone variety. In the other plant classes prizes were won by Mr. G. HAIGH, J. W. HUGHES, Esq. (gr. Mr. J. McColl), Mr. HOWARD A. G. DENT, Esq. (gr. Mr. G. Hodnett), Mr. G. EATON, and Mr. T. KEIGHTLEY.

FRUIT.—Mr. J. McColl had the best black Grapes, showing Black Alicante, and Col. W. H. WALKER, M.P. (gr. Mr. J. Hoggarth), the best white Grape in Muscat of Alexandria.

Mr. J. CLARKE was the winner of the 1st prize for six varieties of vegetables in the gardeners' class, and Mr. JAMES GORE in that for farmers.

BRISTOL CHRYSANTHEMUM.

NOVEMBER 16, 17.—This society held its 47th annual show in the Victoria Rooms, Bristol, on these dates. The exhibition proved to be the best, especially with respect to Chrysanthemum blooms, that has been held for several years past. Fruit, and particularly Apples and Pears, constituted another important feature.

There were two groups of Chrysanthemum plants, arranged in a space of 50 square feet. The better one was shown by Mrs. STUCKY WOOD (gr. Mr. F. A. Burt); J. BUCKLAND, Esq. (gr. Mr. Hunter), was the other exhibitor.

Mrs. ST. VINCENT AMES (gr. Mr. Bannister) was awarded the 1st prize for a group of Chrysanthemums and ornamental-leaved plants, arranged in a space of 50 square feet; 2nd, L. T. NOTT, Esq. (gr. Mr. P. Thoday).

Two groups of miscellaneous plants were staged, the better one by Mr. ELLIS, Weston Nursery, Weston-super-Mare, who employed Palms, Crotons, Azaleas and Ferns, with Oxidiums, Cattleyas, Poinsettias, and Liliums; 2nd, Sir W. HOWELL DAVIES (gr. Mr. J. T. Curtis).

CUT BLOOMS.

The class for a collection of 36 blooms of Japanese Chrysanthemums in not fewer than 18 varieties made a splendid display, there being

six exhibits. The executors of Lady ASHBURTON (gr. Mr. G. Hall) led with fine, deep, well-coloured blooms of Lady Talbot (adjudged the best bloom in the show), Mary Inglis, Maud Jefferies, W. A. Etherington, John Peed (a grand specimen), Annie Hamilton, Purity, Mrs. J. C. Neil, Miss M. Hankey, Ernest Godfrey, and Mrs. F. W. Vallis. Mr. IGGULDEN, Frome, who was placed 2nd, also showed well, amongst his best blooms being those of Mme. G. Rival, Mme. P. Radaelli, Frank Jolliffe, (splendid in colour), W. Mease, and Mrs. W. Iggulden. The Executors of Lady ASHBURTON excelled in the class for 12 blooms of Incurved varieties.

VASE CLASSES.

These were particularly attractive, and included some of the best blooms in the show. In the class for six vases of Japanese varieties, distinct, three blooms in each vase, there were five exhibits. The executors of Lady ASHBURTON again won the 1st prize, having Mrs. G. Mileham, Lady Talbot, F. S. Vallis, Mrs. F. W. Vallis, Mary Inglis, and Annie Hamilton; J. A. WALLER, Esq. (gr. Mr. C. Vincent), was placed 2nd.

Mr. IGGULDEN secured the 1st prize for six blooms of any variety shown in two vases, having grand blooms of Mme. P. Radaelli; 2nd, H. CORNELIUS, Esq., with J. H. Silsbury. There were 12 exhibits in this class.

Other winners of 1st prizes in the Chrysanthemum classes were: (1) six blooms of a white Japanese variety, Mr. IGGULDEN, with Purity; (2) six blooms of a yellow Japanese variety, Mr. IGGULDEN; and (3) six vases of single varieties, distinct, F. CALVERT FISHER, Esq. (gr. Mr. A. O. Shelton).

There were eight classes for Orchids. As these plants were staged together they made a showy feature. Col. CARY BATTEN (gr. Mr. Spowage) was awarded the 1st prize for a group arranged with Ferns and other suitable plants in a space of 6 feet by 4 feet.

Classes were provided for such plants as Primulas, winter-flowering Begonias, Cyclamen, small Ferns, Salvias, and ornamental fruiting plants, which were shown in capital condition.

FRUIT AND VEGETABLES.

Fruit was provided for in 16 classes, the chief one being for a collection of six dishes, in which three exhibits were staged, H. ANDREWS, Esq. (gr. Mr. J. R. Tooley) being awarded the 1st prize, having excellent Black Alicante Grapes, and Cox's Orange Pippin Apples, and good Muscat of Alexandria Grapes, Early Favourite Melon, and Bergamotte Espere and Beurre Bachelier Pears. G. A. GIBBS, Esq. (gr. Mr. Wilkinson), followed closely for the 2nd prize.

The best Muscat of Alexandria Grapes were shown by Mr. ANDREWS, who also excelled in the classes for Black Alicante, Gros Colman, and Mrs. Pince, staging grand bunches from every point of view. The best Lady Downe's were shown by R. DALTON, Esq. (gr. Mr. R. H. Jennings).

The best dishes of Pears out of six collections were shown by Mrs. ST. VINCENT AMES (gr. Mr. Bannister); 2nd, Lord ISLINGTON (gr. Mr. McIntosh). Several contested the class for four dishes of Pears, Mrs. ST. VINCENT AMES again led, followed closely by Mr. LITTLE.

Apples were staged in first rate condition. In the class for six dishes of dessert varieties, 16 exhibits were forthcoming. The leading one being shown by G. POW, Esq., who had excellent fruits of Rival, Cox's Orange Pippin, Allington Pippin, Ribston Pippin, Lord Burghley, and Baumanni's Red Reinette; 2nd J. H. VIRGO, Esq.

Messrs. Jas. Carter & Co., Sutton & Sons, J. Garaway & Co., Webb & Sons, and Clibans each offered prizes for collections of vegetables.

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to the BRITISH COLUMBIAN GOVERNMENT for Apples, Messrs. J. CYPHER & SONS, Cheltenham, for Orchids, Messrs. CLIBRANS, Manchester, for vegetables, and Mr. S. MURRIEN for floral designs.

Silver Gilt Medals to Messrs. GAWWAY & Co., Bristol, for Apples, Zonal Pelargoniums and decorative plants, and to Messrs. PARKER & SONS, Bristol, for floral designs.

Silver Medals to Messrs. STUART LOW & Co., Enfield, for Orchids, Messrs. E. PARSONS & Co., for Bulbs, &c., and the TILFHURST POTTERY Co. for horticultural pottery.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 17.—*Committee Present:* Messrs. E. Ashworth, R. Ashworth, Ashton, Cowan, Cypher, Keeling, Parker, Shill, Thorp, Ward, and Weathers (hon. sec.).

J. H. CRAVEN, Esq., Keighley (gr. Mr. Corney), exhibited *Cypripedium Fairrieanum*, "Beeche's variety," a distinct form of rather large proportions and very light in colouring. (Award of Merit.)

S. GRATRIN, Esq., Whalley Range, was awarded a First-class Certificate for *Cypripedium* × Queen Mary, a good hybrid between *C.* × (*Eson giganteum* × *C. insigne* "Harefield Hall variety.")

W. THOMPSON, Esq., Stone (gr. Mr. Stevens), exhibited a few interesting plants, which included *Odontoglossum* × *Thompsonii* var. *pumilum*, *O. crispum* var. *Eclipse*, and *O.* × *ardentissimum* var. *Grairianum*, each of which received Awards of Merit.

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), received First-class Certificates for *Cypripedium* × *Antinous*, and *Cattleya Leugae* var. *magnifica*, and a Cultural Certificate for *Odontoglossum* × *Harryano crispum*, carrying an enormous spike of flowers.

Messrs. J. & A. McBEAN, Cooksbridge, received Awards of Merit for *Cattleya* × *Stavio* var. *alba* and *Odontoglossum* × *Harryano crispum* var. "The King."

F. A. HINDLEY, Esq., Gt. Horton, Bradford, was awarded a Silver Medal for a miscellaneous collection.

R. G. THWAITES, Esq., Streatham Hill, exhibited a good collection of *Cattleya* hybrids. (Vote of thanks.)

Messrs. SANDER & SONS, St. Albans and Bruges, made a fine display of good *Cattleyas*, *Cypripediums* and *Odontoglossums*. (Vote of thanks.)

Messrs. CYPHER & SONS, Cheltenham, were awarded a Silver Medal for a choice group.

Messrs. STUART LOW & Co., Mr. E. V. Low, Mr. W. SHACKLETON, The LIVERPOOL ORCHID & NURSERY Co., E. ASHWORTH, Esq., also exhibited, and received the thanks of the Committee.

BOLTON CHRYSANTHEMUM.

NOVEMBER 18, 19.—The 24th show of this society was held in the Albert Hall on these dates, the number and quality of the exhibits being well up to the average at this show, which is recognised as one of high merit in connection with groups of miscellaneous plants. This year there were five displays in the group class; the place of honour was gained by J. W. MAKANT, Esq. (gr. Mr. H. Shone), who filled a circle of 12 feet in diameter with a noteworthy collection; JOHN HARWOOD, Esq. (gr. Mr. W. Burgess), was a close 2nd.

The 1st prize for a group of Chrysanthemums arranged in half-circular form was won by Mr. W. BURGESS; W. G. HUGHES, Esq. (gr. Mr. H. Bishop), was awarded the 2nd prize.

The best group of large-flowering kinds was displayed by H. PARKE, Esq. (gr. Mr. H. Drinkwater).

The tables of Orchids were, as usual, highly attractive. J. McCARTNEY, Esq. (gr. Mr. W. Holmes), was well to the fore with *Vanda cornuta*, *Cattleyas*, *Odontoglossums*, and other kinds. In addition to the 1st prize the Silver Medal of the R.I.S. was awarded to this collection. The best table of *Cypripediums* was also shown by Mr. McCARTNEY, his plants giving evidence of good culture.

CUT BLOOMS.—For 24 varieties of Chrysanthemums, distinct, including 12 Japanese and 12 incurved sorts, there was a strong competition. F. W. JAMESON, Esq. (gr. Mr. C. Jennings), was adjudged the 1st prize winner, his best blooms being (incurved) *Romance*, *May*, and *Shields*, and (Japanese) *F. S. Vallis*, *Lady Talbot*, and *Mrs. A. T. Miller*; Mr. G. W. DRAKE secured the 2nd place, having perhaps the smartest stand of Incurveds shown in the neighbourhood this season.

The class for 36 Japanese blooms in not fewer than 24 varieties brought four competitors, all of whom staged well. The leading prize was won by A. JAMES, Esq. (gr. Mr. A. Chandler), with handsome blooms, his best being *F. S. Vallis*, *Lady Talbot*, *Hon. Mrs. Lopes*, *W. Mease*, and

J. H. SILSBURY; the second prize was awarded to Mr. G. HATCH, who had excellent blooms.

Mr. W. FOSTER had the best dinner-table plants, and Mr. MAKANT scored in the class for one Palm in a good *Phoenix rupicola*. Mr. R. CALDWELL proved the 1st prize winner in the class for three pots of single Chrysanthemums, and in that for three Japanese Chrysanthemums.

The best two bunches of black and the best two bunches of white Grapes were shown by E. LORD, Esq. (gr. Mr. J. Wright). Mr. JAMES BAILEY staged the best collection of eight varieties of vegetables.

ABERDEEN CHRYSANTHEMUM.

NOVEMBER 25, 26.—The annual show was held on the above dates in the Music Hall Buildings, Aberdeen. The entries showed an increase over last year, there being over 500 exhibits. Financially, too, the show was successful. Mr. M. H. Sinclair, the energetic secretary, carried out the arrangements in a most efficient manner.

CUT FLOWERS.—The display in this division reached a standard that has never before been attained at Aberdeen. In the class for 36 blooms (12 varieties), the Dowager Countess of SEAFIELD (gr. Mr. Alex. Morton) secured the 1st prize with a capital collection, comprising the varieties *Elsie Fulton*, *Algernon Davis*, *Francis Jolliffe*, *Mrs. L. Thorn*, *William Beadle*, *Mrs. A. T. Miller*, *Victoria* and *Albert*, *Lady Talbot*, *J. H. Silsbury*, *Purity*, *Mrs. G. Mileham*, and *Mrs. C. Penford*. The blooms of *Mrs. A. T. Miller* gained the highest number of marks. Mr. JAMES JENKINS, Clifton Road, Aberdeen, was placed 2nd with an exhibit little inferior to that from the Cullen House gardens. Only two points separated the competitors—106½ to 104½. The specimens of *F. S. Vallis* shown by Mr. JENKINS were unquestionably the finest blooms in the show.

Mr. WILLIAM PATTERSON, gardener, Minmore, Glenlivet, Banffshire, had a fine win in the class for 12 Japanese Chrysanthemums. Mr. JENKINS, Clifton Road, was placed 1st in the section for six vases, with a very good entry. Mr. JOHN A. GRIGOR, gardener, Seapark, Forres, carried off the 1st and 2nd honours for six Japanese Chrysanthemums, with blooms of exquisite colour and beautiful texture.

An outstanding feature in this division was the fine array of cut flowers of decorative and single Chrysanthemums. There was a large entry in this class, the leading honours for 18 varieties being won by Mr. J. A. GRIGOR, Seapark, Forres. Other exhibitors who were successful in this division were Mr. A. GRIGOR, Duff House, Banffshire, for 9 varieties; Mr. ROBERT BEGG, Garthdee, Cults, Aberdeenshire, for 12 varieties; and Mr. A. DUNCAN, Rubislaw Den House, Aberdeen, for six varieties.

POT PLANTS.—Exhibits in this section were numerous and of excellent quality. There were two entries in the class for a group of Chrysanthemums and other plants, arranged in semi-circular form, on a space 8 feet by 5 feet. The 1st prize was won by Mr. ROBERT BEGG, gardener, Garthdee, Aberdeenshire. The arrangement gave rise to some criticism, not a few considering the group much too crowded. In point of quality however, the group was deserving of high praise. 2nd, Mr. JOHN MATHIESON, gardener, Craigielea, Aberdeenshire.

For six Chrysanthemum plants, in not fewer than four varieties, Mr. BEGG again showed in capital style, winning both the 1st and 2nd prizes. For four pot plants of single Chrysanthemums, Mr. A. MURRAY, Ashley House Gardens, Aberdeen, won the 1st prize easily, and he also excelled in the class for two pots of single Chrysanthemums, distinct. This exhibitor was also successful in the class for two pot plants of decorative Chrysanthemums, one each, disbudded and naturally-grown specimens. For four pot plants of decorative Chrysanthemums, the 1st prize was awarded to Mr. ALEXANDER DUNCAN, Rubislaw Den House Gardens, Aberdeen. The entries in the class for specimen Chrysanthemums, disbudded, any variety, made a fine show, nothing better having been seen at Aberdeen for many years past. Mr. COUTTS, Sunnybank Place, Aberdeen, won handsomely with *Soleil d'Octobre*. He was closely followed by Mr. BEGG.

Winter-flowering Begonias were well shown by Mr. WILLIAM DICK, Queen's Road, Aberdeen, and Mr. W. B. CORMACK, Dyce, Aberdeenshire.

FRUIT.—The principal prizes in the classes for Apples were won by Mr. CHARLES G. CUMMING, Pitgaveny, Elgin, and Mr. J. COUTTS, Rosefield, Elgin; whilst Mr. JAMES W. ROBERTSON, Letham Grange, Ayrroath, took the leading honours for Pears. The best Grapes were shown by Mr. JOHN ELDER, Norwood, Cults, Aberdeenshire, and Mr. ROBERTSON, Letham Grange.

VEGETABLES formed a prominent feature of the show. For a collection of vegetables, six varieties (Tomatos excluded), there were no fewer than eight entries. Messrs. J. & D. MCKENZIE, Lower Buxburn, by Aberdeen, staged a magnificent collection, and were worthily awarded the 1st prize. 2nd, Mr. HARPER, gardener, Tulliebelton, Perthshire. Mr. FERGUSON, Linton House, Sauchen, N.B., won no fewer than five 1st prizes in the Potato classes.

NON-COMPETITIVE EXHIBITS.

Chief among these was a display of Apples exhibited by the BRITISH COLUMBIAN GOVERNMENT.

Messrs. WILLIAM THOMSON & SONS, LTD., Tweed Nurseries, Clovenfords, staged a large number of Grapes. (Award of Merit.)

Messrs. W. WELLS & Co., Merstham, exhibited single Chrysanthemums. (Certificate of Merit.)

Messrs. G. BUNYARD & Co., LTD., Maidstone, exhibited a collection of Apples. (Award of Merit.)

Mr. ANDREW REID, Durris House, was awarded a Certificate of Merit for Citrons grown at Durris House Gardens.

NATIONAL CHRYSANTHEMUM.

(ANNUAL DINNER.)

NOVEMBER 29.—The annual gathering at dinner of members and friends of this Society took place on Tuesday last at the Holborn Restaurant. The President, Sir Albert Rollit, occupied the chair, and amongst others present were Messrs. Thos. Bevan, E. F. Hawes, C. Harman Payne, D. B. Crane, C. H. Curtis, R. F. Felton, W. Higgs, W. Wells, W. Howe, H. J. Jones, D. Juganells, N. Davis, J. H. Witty, E. F. Such, J. T. Simpson, F. W. Ladds, William Collins, Thos. Stevenson, and G. L. Casleton. The company of about 100 included many lady members and friends. The tables were decorated with Chrysanthemums by Mr. R. F. Felton. The proceedings were marked with great enthusiasm, forming a pleasant termination to a successful year. Everything, including a better financial condition, augurs well for the future prosperity of the Society; the recent show was referred to by more than one speaker as one of the most successful ever held.

After the usual loyal toasts had been observed, the vice-chairman, Mr. E. F. Hawes, proposed the "Donors of Special Prizes." Mr. Hawes thanked all those who had contributed in this manner, and stated that the success of the show was in no small measure due to their liberality. Mr. J. H. Witty replied, and the President then presented the various trophies and medals. One of the most interesting presentations was a Special Medal awarded to Mr. W. Higgs, in recognition of having won the Holmes Memorial Cup for 36 Incurved blooms, 12 times in succession. Amongst the principal prizes, Mr. Stevenson received the President's cup and the Holmes' Memorial Cup for 43 blooms of Japanese varieties. Mr. W. Mease the Holmes Memorial Cup for 36 Incurved blooms. Messrs. Butler Bros. the Dean Memorial Gold Medal, and Mr. Norman Davis the cup offered by Mr. Shea and the gold medal presented by Messrs. Clay & Son for the best non-competitive exhibit at the November show.

The principal toast, "The National Chrysanthemum Society," was given by the President. Referring to the history of the N.C.S., Sir Albert Rollit said it had not only a brilliant past but the prospects of a brighter future. As president, he took great pride in the Society, and he felt it a great honour to officiate in that capacity for so long. During his office as Mayor of Hull, he inaugurated the first Chrysanthemum show in the North. He had known the National Chrysanthemum Society for a long time, had seen the exhibitions at the old Aquarium as well as at the Crystal Palace, and, although there had been periods of vicissitude, he had always been impressed with the zeal

of those who were responsible for the management. Sir Albert Rollit said the Chrysanthemum was a glorious flower; it typified the land of the Rising Sun; in beauty of form it was difficult to match; whilst in splendour of colours it had no equal in flowers. The Chrysanthemum was the consolation of the dreariest month of the year. The speaker said he had noticed a great advance in the decorative side of the flower, and in this respect he could point to no better example than the display around him. He had never seen so perfect a show of Chrysanthemums as the Society's autumn show at the Crystal Palace, and his opinion was shared by experts. Shows, said Sir Albert Rollit, are useful in marking progress, and they have a wider significance in educating the citizen to appreciate the beautiful. The cultivation of flowers for exhibitions teaches patience, is a healthy recreation, and flowers have a refining influence. The speaker also pointed to the good-fellowship which results from international shows. He had visited, with other officials of the N.C.S., the recent show of the National Horticultural Society of France. The visit resulted in knowledge gained, and knowledge is the basis of business. Sir Albert Rollit said, as a member of the Executive Committee, he extended to the members of the French Society a welcome to the international exhibition of 1912. After referring to the approaching conference at Essex Hall, and the work of the committee, Sir Albert Rollit put the toast, which was accepted with enthusiasm.

Mr. Thomas Bevan replied. He was glad to know Sir Albert Rollit intended to stick to the Society, and the committee felt encouraged by this knowledge. Referring to the autumn show, Mr. Bevan said it was surprisingly fine, and only lacked the large plants of the Aquarium days. At the recent show in Paris, the trained plants were an "eye-opener" to English visitors. Some were trained in square pyramids with 400 to 500 blooms, and the training was marvellous, for each flower seemed set in its place as though it were made to fit. Other plants were grafted, and displayed blooms of several colours; some were worked on the Marguerite stock, with stems as thick as one's wrist. In Brussels also he observed many fine plants, but the "finish" was not comparable to those seen in France.

The toast of "The President" was given by Mr. J. T. Simpson, and received with musical honours. Mr. Simpson pointed to the part taken by Sir Albert Rollit in literature, science, commerce, law, politics, and horticulture. He was assured they had the right man in the right place. Other toasts included the exhibitors and affiliated societies, proposed by Mr. C. Harman Payne, and responded to by Mr. F. W. Ladds, "The Ladies and Visitors," by Mr. D. B. Crane, with response by Mr. W. Collins, and "The Press," given by Mr. H. J. Jones and replied to by Mr. C. H. Curtis.

NEW INVENTIONS.

PACKING FLOWERS FOR TRANSIT.

WITH reference to our reply to T. H. K. in the Answers to Correspondents column, p. 291, Messrs. William Jowett, Ltd., Cataract Bridge Mills, Mellor, near Marple Bridge, send us a sample of their tissue-wadding specially made for the purpose. The wadding is coated on either side with tissue paper, so that there is no danger of the material adhering to the flowers as is often the case when ordinary wadding is employed.

A NEW BULB PLANTER.

THE drawing reproduced in fig. 175 represents a new bulb planter which I have found to be the best of the various implements used for this purpose. It consists mainly of two parts: a brass tube (A) and the handle with cross-piece attached (B). Inside the metal tube is a wooden plunger which moves up and down, this being connected with the lever (C), by which the depth of planting can be regulated, a scale of inches being marked on the side of the slot where the lever works. The arm (D) is a fixture. By placing the foot on this, the metal tube is forced into the soil, which pushes up the lever C with the wooden plunger until the desired depth is reached; the tube is then withdrawn from the hole and the bulb inserted. A slight pressure of the foot on lever C will push back the displaced soil into the hole,

and the operation of planting is completed. The implement can be worked very easily and quickly, and the bulbs thus planted thrive well. The planter is the invention of Mr. Ashby, of Syston Hall Gardens, Grantham, who has taken out patent rights for his invention. W. H. Divers, Belvoir Castle Gardens, Grantham.

LAW NOTE.

SALE OF POISONOUS COMPOUNDS.

AT the Winchester County Court, on November 16, before his Honour Judge Gye, the Pharmaceutical Society of Great Britain sued Mr. C. W. Breadmore, seedsman and florist, of Winchester, claiming a penalty of £5 for an alleged infringement of the Pharmacy Act of 1868.

Mr. Jackson, for the Pharmaceutical Society, said that Mr. George Waldoek, a pensioned detective of Scotland Yard, paid a visit to Winchester on July 15, and called at defendant's shop in the High Street. He bought a pair of gardening gloves and a bottle of XL-All insecticide. He

witness's possession until the contents were handed over for analysis on November 7.

Cross-examined as to the penalties going to the society, witness said that when the society was successful the Treasury allowed them to retain the penalties. He denied that the society got any benefit; on the contrary, it cost the society £500 a year to protect the public in carrying out the Act.

His Honour asked witness to examine the bottle, and asked if he could find any mark as of another label having been on it.—Witness said he failed to see such a mark.

Mr. Snelling, in addressing the Court for the defence, said he need not trouble himself very much in speaking of the method in which the prosecution had been conducted. He thought it must have formed a great impression on his Honour's mind. He contended that it was perfectly obvious that the objects of the prosecution, although the witnesses for the plaintiff put it the other way, were in the interests of the members of the Pharmaceutical Society as opposed to the seedsmen and florists who were authorised by the Act of 1908 to sell those preparations which they were formerly not allowed to sell. And the Pharmaceutical Society, rightly or wrongly, were going round the country doing everything they could to catch respectable tradesmen on technical offences in the pursuit of their business, and for which they held licences.

An employe named Newton, who is still in the employ of Mr. Breadmore, stated that he checked the goods by the invoice when they were received in May, 1909. Witness on that occasion labelled each bottle himself; there were only six pint bottles, and it was absolutely impossible to miss one, because they were all labelled before being passed into stock.

Head constable Sim, inspector under the Poisons and Pharmacy Act of 1908, stated that, on three occasions, he had paid surprise visits to Mr. Breadmore's premises since October, 1909, in order to see that the proper obligations of the Act were carried out. The particular nature of his examination was to ascertain that poisons were suitably stored, and were not in contact with foods. He had examined the bottles and tins, but had not discovered one without a label.

His Honour, in giving judgment, said this was a most unsatisfactory case, because he had to determine upon evidence which was also extremely unsatisfactory. In the first place, the witness who bought the stuff went in such a manner that could not, he thought, be intended otherwise than as a blind, to make the assistant believe that it was wanted for ordinary agricultural purposes. The purchaser then had to sign the poisons book, and it was obligatory upon the vendor to obtain the purchaser's signature in that book. The purpose of this was perfectly clear, in order that the buyer could be traced should it become necessary. Yet they had there the Pharmaceutical Society, who came there for the protection of the public, through their agent, doing that one thing which of all others was calculated to defeat the ends of justice, and to defeat the tracing of that particular bottle of stuff. He must say they did not come to Court with very clean hands. In order to prove that an offence had been committed against the public, they then, in his (the Judge's) opinion, committed a still greater offence against the public by not only allowing their agent—because the society must be taken to have allowed him to act in this matter—to do as he had done. They expressly directed him to buy the poison, although he did not know what they did with regard to keeping his name and address secret. When he was directed to go and buy the poison as their agent, the least that Waldoek could do, his Honour thought, was to observe closely all the requirements of the Act and of the Privy Council regulations. Whatever the society might have done, Waldoek did not do so, because he did that which was calculated to defeat those provisions. He must say for a public body like the Pharmaceutical Society to permit one of its servants to do this, and then to bring it into Court and let him state it, was an act which he would rather not characterise by saying what he thought of it. But these were details which did not affect the result of that case; all he had to determine was whether he was satisfied that this particular bottle of poison was sold by the defendant without a label. After reviewing the evidence of the salesman, he said it was evident that he made it a regular practice of looking at

FIG. 175.—A NEW IMPLEMENT FOR BULB PLANTING.

requested a bill, and when asked for his name and address, gave that of "G. Wilson, Shawford," and he signed the poisons book in that name.

The Judge: "What are your instructions about signing the poisons book?"—Witness: "I received no instructions as to signing."

"Well, you know the statute requires that a purchaser shall sign his name in the poisons book, and you didn't do it?"—"I was not aware that the statute required it."

His Honour: "Do you live at Shawford?"—Witness: "No, sir."

"Then, if they wanted to trace you, they would have no means whatever of doing so. If any person or public office, like the Board of Trade, wanted to trace you, they wouldn't be able to do so?"—"I am not known at Shawford."

Mr. Snelling: "So you may have committed an offence under the Act yourself?"

Mr. Harry Moon, the official in charge of the law department of the society, stated that he received the bottle on July 16. The bottle did not bear Mr. Breadmore's name, and was in

all these labels, and he swore positively that this one was labelled. He had described what he did, and had not been contradicted. He could not help thinking that, in some way or another, the witness Waldo had made a mistake, or that the label had come off the bottle as he was unwrapping it. It was absolutely vital to the case, so far as the vendor was concerned, that there must have been a label on the bottle, and, having regard to the great care taken by the defendant in respect to the labelling of these things, the evidence of the assistant who went over the stock a year before, and the confirming, although not conclusive, evidence of the head-constable, and having regard to the fact that the sale of poisons without the label involved that penalty, he had come to the conclusion that there had been a mistake made on the part of the plaintiffs, and he found, as a fact, upon the evidence, that he was not satisfied that this bottle was sold without the label. Anything more lax and unbusinesslike on the part of a public authority he had never heard, and when a public authority was established for the purpose of carrying out the requirements of an Act of Parliament, it ought to be done in a proper manner. Officials who had such power placed in their hands ought to do nothing with a view to catching every penalty they could get in prosecuting such cases for the mere sake of bringing an action and recovering the penalty. There should be a bona-fide exercise of their powers, and a bona-fide effort to protect the public. He said this after due reflection. His Honour proceeded to call attention to the fact that there was an alternative procedure under the Act before the Justices, under which the Justices had the option of inflicting a graduated penalty as they thought fit. But, in this case, he (the Judge) had no option whatever, and he was compelled, if he found the case proved, to give judgment for £5. Whether that were a factor in inducing the society to bring the action there instead of before the magistrates, he could not say, but it had a very awkward appearance. The result of the case was that the plaintiffs, in his view, had failed to prove the case, and there must be judgment for the defendant, with costs upon the highest, or C scale, his Honour concluding with the remark that it was not becoming to his mind that a public body should permit their agent to do what was really fraud

ACETYLENE GAS REFUSE AS A MANURE: *Gardener, Bracknash.* In vol. xlv, there are numerous references as to the value of this material for garden purposes, including the results of experiments carried out by Mr. W. B. Burgess, of the South-Eastern Agricultural College, Wye, which formed the subject of a leading article in the issue for April 24, 1909, p. 264.

AJUGA ON LAWN: *J. G.* The plant you are troubled with is doubtless Ajuga reptans, the Creeping Bugle, which grows in huge patches and is most difficult to eradicate. Apply at once a mixture of three parts sulphate of ammonia and one part sulphate of iron at the rate of 2 ounces to the square yard. In early spring give a dressing of soot mixed with some dry, sifted fowl manure. Another good plan to get rid of this plant is to give a liberal watering with gas liquid to be obtained from the gasworks, which must be well diluted with common water. This can be applied twice or three times from winter to early spring.

BEGONIA UNHEALTHY: *H. Tullitt, Durham.* There is no fungus or insect present on the plant. The "browning" apparent on the veins on the under surface of the leaf is not due to "rust" or to any fungus. Afford drier conditions and ventilate the house when occasions permit.

Books: *F. S.* The work by Mr. Elwes and Dr. Henry on *The Trees of Great Britain and Ireland* consists of six volumes. Five have been issued, and the sixth is still in the press. The net price for the six volumes is £21, carriage extra.

BRUSSELS SPROUTS: *E. K. T.* The stem of the plant is infested with the common white spring-tail, *Lipuria ambulans*. As a means of prevention we would recommend that the soil be ridged roughly so that it may be exposed thoroughly to the action of frost. Give the land a good dressing of lime, or lime and soot, and, if it needs manure, apply an artificial fertiliser.

CARNATIONS DISEASED: *G. F. R.* The disease-like spots on the leaves of the plant of *Souvenir de la Malmaison* Carnation are not due to the attacks of any fungus or insect pest. They suggest injury due to watering with something harmful, or to some other adverse cultural conditions.

COLEUS THYRSOIDES DISEASED: *R. W.* The injury has been caused by fungus *Cladosporium epiphytum*. This disease usually appears when too much moisture is present. Admit more fresh air to the plant house and sponge the foliage with a rose-red solution of permanganate of potash.

DENDROBIUM: *J. G. D., Lochgilphead.* The insect attacking the Dendrobium is a Scolytid beetle, probably introduced from some foreign country. The beetle is breeding in the pseudo-bulbs. All infected stems should be cut off and burned. There is no need to treat the soil, as the beetle is confined in all its stages to the pseudo-bulbs.

FRENCH BEANS: *H. T. S.* The cultivation of French Beans should not be attempted so late in the season unless you can maintain a temperature of 60° at night and 70° by day. This is not a remunerative crop in winter under any circumstances, and should only be practised where an occasional dish is desired. The cause of your failure seems to be low temperatures, aggravated probably by unsuitable soil. If you desire to cultivate French Beans under glass, you should clear out your plants and sow seeds again at about the middle of January, but you must first satisfy yourself that you can maintain the necessary heat.

"FUNGUS" ON A LAWN: *G. Claridge.* The specimen from a lawn is a Lichen (*Peltigera*). To destroy lichens and moss in grass, rake out (during winter) as much as possible, then apply "steam bone flour" at the rate of 1 lb. to 7 square yards, and rake over again. In spring, apply sulphate of ammonia at the rate of 1 lb. to 20 square yards, giving this dressing in wet weather. Such manuring will cause the grass to grow strongly, and starve out the lichen and moss.

GARDENER AS "MALE SERVANT": *W. J. W., Ltd.* See reply to *H. L.* in the issue for October 22, p. 308. Also *Gard. Chron.*, August 13, p. 130.

GRAPES FAILING TO COLOUR: *H. P. C.* You cannot reasonably expect your Grapes to colour after this date. The variety Gros Colman requires either a house to itself, or it should be planted in the warmest part of a house where other varieties are grown. It is a mistake to plant Gros Colman between other varieties—it invariably fails to colour when grown in this manner. The variety requires more artificial heat than other late Grapes. If your plants of Gros Colman are intermixed with other kinds you should replace them by encouraging young canes from the vines next to them, choosing the most convenient growths from points as near to the base as possible. This is frequently done with success.

LARCH: *E. Cross.* Larch will succeed well amongst old standard Oak trees, and should be planted about 6 feet apart, stout, well-rooted plants about 4 feet high being used. The shelter afforded by the Oaks allows of thinner planting and larger plants being used than is usually the case. For purely economic purposes the common Larch is to be preferred to the Japanese.

LIME TREES: *R. J.* The trees have been infested with one of the slime fungi. Thoroughly drench the trunks with a solution of copper sulphate (bluestone) at the rate of 1 lb. in 25 gallons of water. The soil around the trunk of the tree should also be treated with this specific. This must be done during the winter, before the leaf-buds begin to swell.

MANURES FOR POTATO CROP: *Hollywood.* Salt is not to be recommended for Potatoes as it tends to make the tubers soapy when cooked. The reason being that the chloride of the salt tends to retard the conversion of the sugary juice of the tubers into starch. A useful manure for Potatoes on fairly good land would be 12 cwt. of farmyard dung per acre, 3 cwt. of superphosphate, $\frac{1}{2}$ cwt. of sulphate of potash, 2½ cwt. of quicklime, and 20 bushels of soot. If the land is heavy, mix together and sow broadcast in January or February the superphosphate, potash and lime, then apply the dung, plough the land and leave it until planting time. Sow the soot in the opened ridges and bout in with the seed. If the land is light and sandy apply all the manures at the time of planting. If a heavy crop is required, apply, after the young plants are well through the ground, $\frac{3}{4}$ cwt. of nitrate of soda or of sulphate of ammonia per acre.

NAMES OF FRUITS: *J. B. B. W.* 1 and 2, Bishop's Thumb.—*P. H. R.* 1, Bramley's Seedling; 2, Roundway Magnum Bonum; 3, Graham; 4, Tower of Glamis; 5, not recognised; 6, Sturmer; 7, Scarlet Pearmain; 8, Golden Pearmain.—*A. W.* Pear Beurré Diel.—*Essex.* Apple Scarlet Golden Pippin.

NAME OF PLANTS: *J. M. B.* 1, Podocarpus chilina; 2, Ligustrum lucidum; 3, Cupressus Lawsoniana.—*E. K. S.* Send the variety of Chrysanthemum to some grower who has means of comparing it with varieties already well known.—*D. F.* *Vancouveria hexandra* (The Barrenwort).—*Tunnicliffe.* *Maxillaria picta*.—*Morton.* 1, *Lastrea varia*; 2, *Onychium japonicum*; 3, *Pteris geraniifolia*; 4, *Davallia papulata*.

PEACH TREE DYING: *J. Taylor, Dartford.* It is impossible to say, from the piece of wood sent, what is causing the injury to the Peach tree. Possibly the fungus *Eutypella prunastri* has attacked it. All diseased wood (showing brown stain) should be cut out, and surface of wound painted over with Stockholm tar.

POTASSIUM CYANIDE AS A FUMIGANT: *J. D.* If you refer to the issue for April 23, 1904, you will find a detailed account of the methods of fumigating with cyanide of potassium, including the proper proportions of the chemicals, and the quantity to use per 1,000 cubic feet contents.

TRAVELLER FOR SEED AND BULB FIRMS: *H. R. S.* Travellers are usually appointed from among men who have had experience in nursery work and management, but occasionally such positions are filled by private gardeners. If you wish to become a traveller, you should write to some of the leading nurserymen, offering them your services; they will probably tell you that it is necessary for you to spend some time in the nursery before taking up the duties you wish to carry out. If you fail to get an appointment in this way, you might still be successful by means of advertisement.

WALLFLOWER: *E. R. Finlayson.* The warty swellings on the stem of the Wallflower have been caused by the attack of the Downy Mildew (*Peronospora parasitica*). This can still be observed as a whitish "mould" on the surface of the swellings. To prevent the mildew spreading, spray the plants with the Bordeaux mixture (4 lbs. bluestone (copper sulphate), 4 lbs. quicklime, 50 gallons water).

WEEDS ON LAWN: *J. P.* Lawn sand is a useful manure for getting rid of obnoxious weeds from a lawn. The quantity to be used will be given in the directions printed on the purchased tin. If the plants are very large, the only method for their eradication is to dig them up. We can also recommend a dressing of sulphate of ammonia at the rate of 2 ounces per square yard mixed with a little sand to ensure its more even distribution. This should be sown during the winter, then in early spring apply a good dressing of soot.

"ADAM'S LUXURY AND EVE'S COOKERY."

THE sub-title of this old garden book is "The Kitchen Garden Display'd in Two Parts," and, after other remarks, it proceeds, "Designed for all who would live Cheap, and preserve their Health to old Age, particularly for Farmers and Tradesmen in the Country, who have but small Pieces of Garden Ground, and are willing to make the most of it. London: Printed for R. Dodsley in Pall Mall; and sold by M. Cooper at The Globe in Paternoster Row, 1744." A second edition appeared in 1756. There is no author's name to this small volume with the taking title of which it would be rash to insinuate that it fails to discourse of things which would have been luxuries to Adam, or that its recipes are equal to anything in the household book of his wife. But one cannot help thinking it is an instance such as *The Grub Street Journal* of a few years earlier draws attention to, especially in the matter of titles. "The composing of them is fallen into the Hands of Booksellers—even Authors themselves are scarce fit to be trusted with so delicate a Province," and the government of the day was entreated to step in to see that "due names and titles [were given] to all writings which come from the Press that Readers may not be impos'd on with *quid pro quo's*, Chaff for Grain." The sub-title probably had a meaning, *The Flower Garden Display'd* and *The Fruit Garden Display'd* having been published only a few

years previously. The price of the volume was one shilling, and it is now a rather scarce book.

Part I. succeeds a short Introduction and contains The Products of the Kitchen Garden and a brief Calendar of 20 pages. Part II. contains a "Collection of Receipts for dressing all Sorts of Kitchen-Stuff," &c., &c., and the "Physical Virtues of Every Herb and Root." The two parts are of about equal length, and, like every book, however mean or uninviting it may appear, it contains a good deal which is not to be found elsewhere. Asparagus has three kinds of culture described. Under "Broccoli" it is said "that Sort called the Roman and by some the Blue Broccoli is the best." "About Christmas or little after they will produce little Heads in shape like a small Callyflower, which is to be cut off and eaten, and afterwards is succeeded by a great number of side Shoots," which, it need hardly be remarked, also contributed to the luxuries of the table. Cabbages, of which *P. nictitans* was the earliest, succeeded by the *Battersea*, were not ready to cut till May. Cauliflowers were cultivated with great care and with the expenditure of much labour, some of the details reminding us of French culture. They were planted for early cutting on dung-heated soil, three plants under one glass. Two were removed in February and replanted for a succession. The plants from a later autumn sowing were grown in the open but protected, and when transplanted, Radishes, Lettuces and Spinach were sown among them. In February, more seeds were sown, this time on a hotbed, and "about the tenth of May yet more from which heads were produced about Christmas." The Cucumber and Kidney Bean were other important crops, and also Lettuces. Of the Melon this interesting remark is made: "To enumerate all the different Sorts would be not only endless, but impossible, there being annually new sorts brought from abroad." Mushrooms, too, were grown extensively. It is noted of Peas that "some People are at great Expence to produce Pease in April or sooner," and one is almost astonished to discover that the Potato was already a subject for controversy, our Author preferring large tubers cut into pieces for seed rather than small uncut tubers, which many esteemed the better. The supply of Potatoes gave out in March or a little later. As an illustration of the changes which inevitably occur even in domestic affairs, it is interesting to note how Tansy was not only largely cultivated in the garden but forced in frames from December onwards.

The directions in the Calendar are extremely terse, and what is noted concerning the physical properties of Radishes may serve to illustrate that portion. These, it is affirmed, "are detensive and cutting; if eaten to excess they make People lean, create Vapours, and cause Pains in the Head."

Though the portion in which Eve is catered for lies outside gardening, there are a few things which may be mentioned as being not without interest. Obviously it is written by another hand belonging to a person of inferior education to him who was responsible for the first part. Thus "An Amulet of Green Beans" is discovered to be not a charm but an Omel-tte. The "Receipts to dress Potatoes" exhibit in a curious manner the changes that have taken place in cooking this

vegetable. Who, now, would dream of stewing Potatoes "with Salt, Pepper, and Ale," or to "bake them with Herrings, mixed with Layers of Pepper, Vinegar, Salt, Sweet Herbs and Water." How the liquids are to be stratified waits explanation! "An excellent Pudding to put in the Bellies of Rabbits, Hare, Fish, &c., when roasted" is "to mash boiled Potatoes very fine; then take sweet Herbs, dried and beaten small, with spice, Butter, and Salt mixed all together." There are a great many more receipts, and the following will serve to show the sublimer uses to which the tuber may be put. It is a "Potato Pye." Boil Potatoes (not too much), cut them in slices as thick as your Thumb, season them with Nutmeg, Cinnamon, Ginger and Sugar; your Paste being ready, put them in upon the Bottom; add to them the Marrow of two or three Bones seasoned with Orange-Juice, Orange-flower water, beaten spices and Rose-water, a handful of stoved Raisins of the Sun, Dates, Mango Citron, with Eringo Roots sliced; put Butter over it and bake them. Let their Layer be a little Vinegar, Sack and Sugar, beaten up with the Yolk of an Egg, and a little drawn Butter; when your Pye is enough, pour it in, shake it together, scrape over Sugar, garnish it and serve it up." After which the Pye was probably eaten. "The Art of Keeping all Sorts of Fruit," including Strawberries and Raspberries, enables us to compare present-day methods with those of 160 years ago, and it is apparent that the same principles were pursued, though the outfits were less perfect. *R. P. Brotherton.*

THE MARKET FRUIT GARDEN.

AN "IMPOSSIBLE" NOVEMBER.

THERE has seldom been a November more unfavourable to the planting of fruit trees and bushes than the month just ended, at least, in my own district. We had rain on 14 days up to the 29th amounting to 5.60 inches, and so spread over the month that the land was constantly in a very wet condition, except when it was had with frost. From 2° to 9° of frost were registered on 15 occasions, even close to the south coast, whilst further north, as much as 12° was reported. The measurements were those made on the screen, and 20° of frost occurred on one occasion on the ground level, as reported by the Meteorological Office for some district not named. Consequently, even when the soil was not too wet for planting, it was usually hard from frost for fully half a day at a time, and when it had been thawed it was in a sticky mess. So far, then, the weather of the planting season has been worse even than it was last year.

FEATHERED TREES.

In connection with fruit-planting, a few remarks upon the abomination of producing untopped, feathered trees are seasonable. The slovenly fashion of leaving both Apples and Plums untrimmed until they are two years old has become very prevalent. It is cheap, no doubt, and nurserymen, by adopting it, are able to sell trees at very low prices, grown, as they are, in a crowded state and without the labour of trimming. For tall standards, the fashion is not detrimental, because all the strong growth, as a rule, is made at the top of a lanky, feathered tree, where it is wanted. But for half-standards or bushes, an untopped, feathered tree is very bad indeed, for the same reason which renders it suitable for a tall standard. I say an untopped tree because to leave the side shoots, except any of gross growth, on the stems until the

second season is desirable for increasing the substance of the stems. What is objectionable for half-standards or bushes is a lanky, feathered tree, which has no substantial shoots lower than 5 feet or 6 feet from the ground, and sometimes no dormant buds from which substantial shoots will develop.

It is chiefly to trees intended to be trained as half-standards or as bushes on stems about 3 feet high that my objection applies. Bushes which branch out from close to the ground can be obtained by those who order them specially. These, of course, were topped when maidens. No doubt, too, partially-trained half-standards may also be obtained; but if a grower simply orders two-year-old Apple or Plum trees, he will almost certainly get untopped, feathered trees, mostly lanky. The case with Plums is even worse than it is with Apples, because the latter almost invariably have some dormant buds below the strong shoots at the tops, which latter can be cut off. This is a sacrifice, comparing such trees with those which have strong side shoots requiring only shortening at a moderate distance from the bases. But with Plums, which are so lanky that the only strong side shoots are 5 feet to 6 feet from the ground, with nothing but "feathers" below this level, it is most difficult to form a fruitful tree; for it is doubtful whether any of the "feathered" branches will develop into strong shoots, as they are really nothing more than spurs, or, rather, feeble and short shoots, which will develop into fruit-spurs or die off.

Fortunately, I have raised nearly all the trees I have required for planting, and these have all been topped as maidens at the height at which I desire them to branch out. Consequently they have been partially formed when two years old. Last season and, again, this year a few hundreds of trees were needed to complete plantings, and those obtained were mostly lanky trees, from which the only strong shoots had to be cut off, in the hope of inducing proper growths at the desired height from the ground. Among some Plum trees lately received many are quite devoid of latent buds below the strong side-shoots 6 feet from the ground, every bud having started an incipient spur. The tops have been cut off, but there is much doubt in my mind as to whether any of the feeble "feathers" will develop into branches. The nurseryman who supplied the trees was asked why he had not topped them as maidens at a proper height for half-standards, seeing that for one tall standard it is probable that a hundred half-standards are demanded. The reply was that if he topped his maidens he should never sell his trees. If this is the case, it is growers, rather than nurserymen, who are to blame for the growth of the fashion of raising untopped, feathered trees.

THE PRUNING SEASON.

The weather of November was as unpleasant for autumn pruning as it was for planting. It was cold work, and trampling around trees when the soil was like an ooze reduced it to mud, disagreeable for the operator and bad for the condition of the land. When frost prevailed, the latter objection did not apply, but there is some misgiving as to the policy of pruning when the cut surfaces will be immediately subjected to a freezing temperature. Experiments at Woburn appear to indicate that no harm results from pruning in frosty weather. This may be the case with Apples, to which the trials, if my memory serves, were limited; but I doubt whether it is true of Plums, because I have noticed that the bud next below a cut in a Plum tree frequently dies off, so that the shoot emerges from the next bud lower down, usually pointing in the wrong direction. This may be the result of frost.

It is a commonplace truth that pruning cannot be learnt by means of general rules. To prune properly, the habits and vigour of growth of the several varieties must be studied. The only general rules which apply in all cases are those which direct the pruner to

cut just above a bud pointing in the direction in which he wishes a branch to extend, and to keep the interior parts of every tree open to sun and air. Most varieties of Apples require spur-ring, but some make such a profusion of natural spurs that interior laterals at least, if not required for extension to fill spaces, are best cut out entirely. As to pruning for the direction of branch extension, the treatments desirable differ widely. The common direction to cut just above a bud pointing outwards should not be followed indiscriminately, as it often happens that extension is needed inwards to fill an undesirable large empty space, while, in other cases, extension of low branches outwards would cause growth which would be injured by horse cultivators or the harness. A few varieties, moreover, like the Lane's Prince Albert Apple and the Victoria Plum, require to be cut for the most part just above buds pointing upwards. Trees of an upright habit of growth, on the other hand, such as Golden Spire and Duchess of Oldenberg, need cutting back severely in the early years of their life to out-pointing buds, they require also much interior thinning. Warner's King has a tendency to make long and stout branches too thinly disposed, and, therefore must be cut back severely in its early years; while Bramley's Seedling needs less severity. Worcester Pearmain calls for little beyond the thinning of its super-abundant inside laterals, as it is naturally short jointed. Lord Grosvenor is a variety requiring somewhat severe pruning until it has become well furnished with branches, as its habit of fruiting prematurely all along its growths checks the formation of side shoots. Allington Pippin is a troublesome variety to train, although it shapes itself admirably, because a formation of laterals is profuse, and more thinning out than spur-ring is desirable in its case. Domino is an example of varieties which do best with little or no spur-ring, as it forms natural spurs in almost too great abundance.

With respect to Plums, the case of Victoria has been already mentioned. Its sustained vigour of wood-formation and its pendulous habit of growth render necessary pruning annually for years after contemporary varieties have ceased to need anything beyond the cutting out of superfluous, interior shoots. Pond's Seedling tends to make irregular and lanky growth, some of its branches being disproportionately vigorous and requiring severe cutting back. Of all Plums with which I am acquainted, it is the most difficult Plum to bring into symmetrical shape. Monarch shapes itself so admirably that the temptation is to leave it without any considerable pruning. This temptation, however, should be resisted in the early years of the growth of the variety, cutting back with some severity being necessary to induce the production of more sturdy branches than it is the natural habit of this Plum to grow. Later on, it may be left alone almost entirely. The bushy habit of growth of Rivers's Early Prolific points to the need of thinning rather than any other attention after the first two or three years. Czar shapes itself nearly as well as Monarch, but is a much more vigorous grower in my soil, and needs less severe pruning in its early life.

CHARLES ROSS APPLE.

At the Hexham Conference, Mr. Banyard condemned in unqualified terms this Apple as a market variety, declaring that it was useful only as an exhibition fruit. Certainly, it is very slow in coming into bearing, and when it begins to fruit it produces only a small number of large and beautiful specimens. The case of the mother to the trees I have raised, however, which was obtained when Charles Ross was first sent out, leads to the hope that the variety will do well hereafter. This year, the original tree bore a good crop of Apples of suitable dessert size. In flavour it is vastly superior to its half-brother, Allington Pippin, and in beauty it has hardly a superior. *A Southern Grower.*

TREES AND SHRUBS.

BAMBOOS IN THE SOUTH-WEST.

BAMBOOS are practically hardy, far harder than was imagined on their first introduction to our islands, and, where adequate shelter is provided, will withstand severe frost without injury. Shelter is, however, absolutely necessary, for a windswept site is fatal to the beauty of the Bamboo, which has a miserable appearance where it is exposed to the full force of biting gales that are far more injurious than the severest frosts. No plant is dowered with such delicate grace of form as the Bamboo, and though some species far excel others in elegance, none of the family is destitute of decorative value. Some species, such as *Arundinaria nobilis* and *A. Falconeri*, generally lose the majority of their leaves in the winter, but in exceptionally sheltered spots, such as Penjerick, near Falmouth, *A. nobilis* retains its foliage, and a few years ago was to be seen over 25 feet in height in full beauty in the month of March, when the rocks were building in the leafless Elms in the background. Lately, however, these giant Bamboos have seeded and died. At Menabilly, *A. nobilis* has been even finer, specimens 28 feet in height being on view four years ago, but these have since then, unfortunately, seeded and died. In some years, Bamboos commence their growth very early in the season, and at the end of March pointed shoots may be seen pushing up from the ground to a height of 6 inches or more. When in vigorous growth, the shoots of Bamboos lengthen at a surprising rate, and in a certain Cornish garden a shoot of *Phyllostachys Quiloi* was found to have grown 14 inches between Saturday afternoon and Monday morning. This Bamboo is one of the latest to make growth, often not pushing up its strong shoots until the month of September, these generally being ruined by the frost before they have had time to harden, except in very sheltered and warm nooks. The flowering of Bamboos is a great drawback to their culture, for, if they flower on every culm, the plant almost invariably dies, and where many in a large collection perish they create unsightly gaps. *A. Simonii* is the most given to flower of all the species, and may generally be seen in bloom in over a dozen places. Where it only flowers on a few culms it generally lives, but if it blooms on all it is almost certain to die. It has been asserted that when a Bamboo flowers, every individual plant of the same species also blooms, but this is evidently an incorrect assumption, as plants of *A. Simonii* have flowered in different years. A few years ago I was in a Cornish garden, where about three dozen species of Bamboos were grown. The majority had been planted eight years, and I was able to ascertain the heights of the various species. All of them were put in as small plants about 3 feet high. The heights give some idea of what may be expected in eight years from planting:—*Bambusa aurea*, 12 feet: This species is not particularly graceful in habit, but is very valuable on account of its bright, emerald green, which it retains during the entire winter. *Bambusa Maximowiczii*, a dwarf, 4 feet. *Arundinaria anceps*, 15 feet. *Phyllostachys Boryana*, 14 feet: This species has black blotches on the stems. *Bambusa disticha*, 2 feet. *B. falcata*, 14 feet. *Arundinaria Falconeri*, 18 feet: This is one of the most beautiful of all the Bamboos when in full leaf. *Bambusa fastuosa*, 14 feet, with yellow and green foliage. *Fortunei*, 5 feet. *B. Henonis*, 20 feet: This is the queen of Bamboos, being exquisitely graceful and keeping a lovely green through the whole winter. Where one species only is required, this should certainly be chosen. This grew to a height of 24 feet and then seeded and apparently died. Subsequently the roots were excavated with pickaxes and the sections were thrown on a piece of disused ground. A year later I was in the garden, and the owner and myself passing

the spot where the roots had been thrown, saw that they were all sprouting strongly. They were then taken up and carefully planted, and have since made good growth and show no sign of flowering. *Arundinaria Hindsii*, 16 feet. *A. Hindsii* var. *graminea*, 11 feet. *Arundinaria japonica* or *Metake*, 17 feet: This has made rampant growth and had been transplanted to form screens in different portions of the grounds. *Phyllostachys mitis*, 18 feet: This species, generally praised by writers and mentioned as the giant among Bamboos, leaves much to be desired. It is very chary of producing shoots, and the clumps were not a quarter of the size of those of *Bambusa Henonis* planted at the same time. *Arundinaria nitida*, 12 feet, with a spread of 16 feet, a small leaved Bamboo, though not keeping its colour in the winter like *aurea*.

dug out to a depth of 2 feet, and the soil beneath well broken up with a fork to the depth of another foot. The Bamboos were then planted in loam and leaf-mould, and in the winter a heavy mulch of cow-manure was given them. A few had not this trouble taken with them, but had been planted in holes only just big enough to contain the roots, and these showed a remarkable difference in size and vigour from others of the same species planted in prepared pits at the same time. The safest time to plant is considered to be from the middle to the end of May. *Wynndham Fitzherbert*.

PEROWSKIA ATRIPLICIFOLIA.

This Himalayan subshrub, belonging to the natural order Labiate, is well deserving the appellation "The Blue Spiraea." It forms compact

NEW OR NOTEWORTHY PLANTS.

PALISOTA ELIZABETHÆ,* L. GENTIL.

This new species (see fig. 176) is intermediate between *P. Pynartii* de Wild. and *P. Albertii*, L. Gentil. It resembles the former in its hairy petioles, but differs in its general form, whilst the leaves are longer and the petiole widely channelled, as in *P. Albertii*. The long acuminate leaves are marked with greenish-yellow variegation along the median line, so that a well-cultivated specimen makes a handsome stove plant, though considerable space is required for its proper development, as the leaves are 2 feet to 3 feet long.

FIG. 176.—PALISOTA ELIZABETHÆ N.SP.

Bambusa palmata, 8 feet. *B. quadrangularis*, 10 feet. *Arundinaria spathiflora*, 8 feet. *Phyllostachys sulphurea*, 15 feet. *P. Quiloi*, 18 feet. *Bambusa tessellata*, 4 feet. *Phyllostachys viridi-glaucescens*, 15 feet. *P. violascens*, 13 feet. *P. nigra*, 16 feet: The black stems of this species have a handsome effect. *Arundinaria nobilis*, 20 feet: This species well merits its name, the giant specimens lately at Menabilly and Penjerrick, with arching, pennoned canes towering aloft to a height of nearly 30 feet, being the very personification of grace. *Bambusa marmorea*, 7 feet. *Bambusa gracilis*, 13 feet 6 inches (a very charming Bamboo). *Arundinaria Veitchii*, 2 feet: In the winter, the outer rims of the leaves of this species fade and become white, giving the plants a variegated appearance. All these Bamboos, except a few, were carefully planted. Circular pits 4 feet in diameter, were

bushes about 3 feet high and as much in diameter. The erect stems are clothed with silvery-grey foliage and terminate in spikes of rich violet flowers, which are slightly overcast with a silvery-grey mealy powder. The combination of silver grey and rich violet makes this shrub exceedingly handsome, and its value is greatly increased by the lateness of the flowering period; it flowers at a time when most shrubs are past blooming. From August until the end of October the bold spikes of flowers are produced, the individual flowers are small pea-shaped and cover densely the erect stems. *P. atriplicifolia* is an ideal subject for shrubberies, but it can also be used with good effect in the herbaceous border. It will grow splendidly in a sunny position in light and well-drained soil, and is easily increased by means of cuttings in the spring. *H. Paul, Guildford*.

PALISOTA ALBERTII,† L. GENTIL.

At first sight this species bears a resemblance to *P. Elizabethæ*, but the leaves are not variegated, and the petioles are without the marginal hairs. It is a stronger-growing species, and scarcely so fine a garden plant as the other, but would appear to advantage in a Palm house or other large hothouse, where ample room could be afforded.

* *PALISOTA ELIZABETHÆ*, L. Gentil.—Canescens. Internodia 15-20 cm. longa. Folia maxima, cm. 35-40 longa, 10-25 cm. lata, in petiolum longe attenuata, ad summum latera, obovato-lanceolata, apice longe acuminata albo-maculata; pagina sup. glabra, viridi-nigrescente, pagina inf. velutino-grisea, v. argenteo-albescente; petiolus crassus pilosus, 10-25 cm. longus, late canaliculatus marginibus fibrillosis; pilinumerosi, longis rufescentes. *Louis Gentil*.

† *PALISOTA ALBERTII*, L. Gentil.—Subcaulis. Folia maxima immaculata, viridi-nigrescente, subtus velutino-grisea vel velutino-argentea, cm. 45-60 longa, 10-25 lata, in petiolum longe attenuata, ad summum latera, apice subito breviter acuminata, petiolo crasso, 10-25 cm. longo, lato canaliculato, piloso pilis brevibus, appressis, marginibus fibrillosis. *Louis Gentil*.

THE ROSARY.

SOME MORE YELLOW ROSES.

I was much interested in the note (see p. 363) on yellow Roses by the Rev. D. R. Williamson. But surely he is mistaken in supposing that Mme. Bérard is a hybrid between Gloire de Dijon and Général Jacqueminot. My authority describes it as a hybrid between Mme. Falcot and Gloire de Dijon, and the variety has every appearance of being so, both in foliage, wood and form of bloom. The selection given by Mr. Williamson is very good, but if Gloire de Dijon and Bouquet d'Or are to be included to make up the list he has overlooked a number of varieties with clearer colours and also good growers. Perle des Jardins, Isabella Sprunt, Etoile d'Or, and Boule d'Or are better. But

understand why Austrian Yellow, Harrisonii and Persian Yellow are left out of any list of yellow varieties, however short. But, as the Rev. D. R. Williamson has mentioned so very new a variety as Miss Alice Rothschild, I would like to call attention to a few others, also new, which, with the exception of the splendid Wichuraiana Aviator Blériot (a yellow Rose that promises to rival William Allan Richardson on account of being more constant and clearer yellow in colour), I have proved to be really excellent.

The first is Golden Aimée Vibert. This is identical with the original in all respects but colour, which is a decided golden yellow in the young flowers, and retains much of its depth when expanded. When I say it resembles its parent in other respects, it needs no further praise. The others are ordinary dwarf growers,

while I know of few Roses to equal it for perfume. Mrs. Peter Blair is lemon-coloured with a golden-yellow centre; this variety also is very free in blooming, whilst the flowers are of good form and sweet-scented. Four gold medal roses are found in Goldfinch, a deeper golden-yellow than Electra, and, like that Rose, very early. It is a strong-climbing Polyantha and decidedly more hardy than I have found Electra. Shower of Gold has not quite so much orange as in William Allan Richardson; it is very hardy and vigorous, and with the glossy foliage so characteristic of the Wichuraianas. Both this and Aviator Blériot are grand additions to our climbers. Duchess of Wellington is saffron-yellow in its main colouring; while the newer Lady Hillingdon produces beautiful, long, tapering buds of pale orange-yellow, and was already known as a good Rose for market cut-flower production before it was put into commerce. This last is the newest on my list. With us it produces long stems and stalks with solitary flowers. I must not omit Gardenia from the Wichuraianas, as this is so very early and so decidedly golden-yellow in its younger stages. It is a good grower and handsome even when not in flower, as its foliage is very beautiful. I fancy it must have received its name from the perfume which so closely resembles our stove shrub of the same appellation. If Medea will grow in the Rev. D. R. Williamson's garden, all of the above will succeed there. *A. Piper, Uckfield.*

FIG. 177.—CYPRIPEDIUM CHARLESWORTHII TÉMÉRAIRE.

perhaps the flowers of the last two do not open well with him. By the way, it would be interesting to know if Peace succeeds so far north as Kirkcaldy. Here (mid-Sussex) it is invariably one of our best Roses, especially in autumn, and often the blooms develop as deep a yellow as Isabella Sprunt, Perle de Lyon, Etoile d'Or and Mme. Pierre Cochet are omitted from the list. So, too, is Mme. Carnot (I mean the *Nesette* variety, not the Tea-scented Rose of that name). Billard et Baré, Belle Lyonnaise, C. de Forestier, Alister Stella Gray and William Allan Richardson are five other climbers that it would be inadvisable to leave out from any collection of yellow Roses that includes Gloire de Dijon and Mme. Bérard. Among the Climax, Arthusa and Chin Chin are good pure yellows. Then there are Sublimen, Caroline Kuster and Beryl among the dwarf growers. It is not easy to

but all are free-blooming and I have found them hardy:—

James Coey, deep golden-yellow, good both for bedding purposes and furnishing out flowers. Senateur Mascaraud, amber-yellow with canary-yellow centre; this is indeed a grand Rose, and although very large and full-petalled, always opens well; the blooms are globular and carried boldly upright. Instituteur Surdey is a very rich and deep golden-yellow Rose; the blooms are carried in bold, spreading trusses, relieved with handsome foliage. Mrs. Dudley Cross is a clean is-yellow, tinted in the autumn somewhat like Marie Van Houtte. Why has this last been omitted from the list? It is a more decided yellow than Gloire de Dijon. Mme. Paul Varin-Bernier has very deep melon-yellow-coloured blooms. This is a very free-flowering variety, grand as a bedder, and the blooms make pretty

ORCHID NOTES AND GLEANINGS.

CATASETUM LONGIFOLIUM.

THIS species of *Catasetum* is totally distinct in growth from any other species, its habit being semi-pendulous, the long, narrow leaves arching gracefully from the hard, Cymbidium-like pseudo-bulbs. It was originally discovered in 1856 by Sir R. Schomburgk growing high up on Palm-trees in Demerara, and has been occasionally flowered in gardens, the last time we recorded it being when it flowered so finely with Sir Trevor Lawrence, Bart., K.C.V.O., some years ago. In the form of its flowers, too, it scarcely ranks with any other species, for although at first sight appearing to belong to the small section *Ecicrhosæ* (without *cirrhæ*), it bears a pair of short bristles or rudimentary *cirrhæ* on the column. The flowers, which are showy for a *Catasetum*, have the sepals and petals tinged with rose, the deep, pot-like labellum orange spotted with red on the upper half, which has a blackish-velvety margin. It is in flower in the gardens of W. E. Balston, Esq., Barvin, Potter's Bar.

CYPRIPEDIUM CHARLESWORTHII TÉMÉRAIRE.

THE very remarkable *Cypripedium* illustrated in fig. 177 was shown by Messrs. Sander & Sons at a meeting of the Royal Horticultural Society, held on November 22. It is a unique variety, being perfectly distinct from the thousands of plants of this species which have been imported. Its chief characteristic is due to the wonderful development of the dorsal sepal, which is very large in proportion to the other parts of the flower. The petals and lip, both in form and colour, resemble a large form of typical *C. Charlesworthii*, but the dorsal sepal is more than 3 inches in height and nearly 4 inches in width. In form, it is broadly ovate, the apex is carried to a point, and, at the time of exhibition, the sides were wavy, as shown in the illustration. These wavings might be expected to smoothen out a little as the flower became older. The ground is white, closely veined with a delicate tracery of a rosy-blue colour. The veining is well shown in Mr. Worthington Smith's sketch.

CYPRIPEDIUM MINOTAUR.

CYPRIPEDIUM MINOTAUR, which is illustrated in fig. 178, is the result of a cross between *C. Euryades* and *C. Minnie*, and it may be described as one of the very best hybrid *Cypripediums* which have been raised by Lieut.-Colonel Sir Geo. L. Holford (gr. Mr. H. G. Alexander). The broad dorsal sepal is pure white, with a small, yellowish-green base, and much blotched with deep claret-purple colour. The petals and lip are yellow at the margins, the inner portions being tinged with purplish brown. The flowers are very large, much larger than is shown in the illustration, and they are remarkable for the thick substance which characterises all the parts. Respecting the parentage of *C. Minotaur*, it is interesting to observe that *C. Euryades* is a cross between *C. Boxallii* and *C. Lecanum*; whilst *C. Minnie* was obtained from a cross from *C. Nitens* and *C. Lecanum*. Thus it may be said that *C. Minotaur* is of three parts insigne, two of *Spicerianum*, one of *villosum*, and one of *Boxallii*. *C. Minotaur* was awarded a First-class Certificate at the meeting of the Royal Horticultural Society on November 22.

LÆLIO-CATTLEYA OLIVIA (see p. 431.)

(*LÆLIA JONGHEANA* × *CATTLEYA SCHRÖDERÆ*.)

At the meeting of the Orchid Committee of the Royal Horticultural Society on November 3, Lieut.-Col. Sir George L. Holford, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander), showed this handsome new hybrid raised in his gardens, and for which an Award of Merit was given. Its nearest ally is *L. C. Baroness Schröder* (*L. Jongheana* × *C. Trianae*), but in this new hybrid the flowers are larger and the charming peach-blossom tint of *C. Schröderæ* and its fine substance and sweet odour are well displayed (see fig. 131). The sepals and petals are of a delicate peach-blossom tint, with the veining slightly darker. The greater part of the finely expanded labellum is deep orange colour, lighter towards the margin, which is tinged with rose colour. *L. Jongheana* when used as a parent has the habit of narrowing the labellum of the progeny, but in this case *Cattleya Schröderæ* has provided the dominant feature.

PHOTOGRAPHING FLOWERS.

THE art of taking photographs of flowers is by no means a simple one, nor can it be properly accomplished without a considerable amount of skill acquired only by much practical work and keen observation.

The photographer of flowers has a much more difficult range of subjects to deal with than the portrait or landscape photographer. He has to take into consideration the variety and range of colours which are so delicately blended in flowers, and these colours require special treatment.

In order to obtain the proper degrees of light and shade it is best to use specially-sensitised, dry plates, known as "Orthochromatic" plates. These are of great value in obtaining good results (according to the light and shade relationship) with such colours as yellow, blue, red, orange, violet, and purple, as they are more sensitive to colour than the ordinary plates.

In conjunction with the Orthochromatic plates, it is advisable to use a coloured screen or filter. The object of the screen is to slow down the action of the blue and violet rays of light, and thus to enhance the photographic effects produced by the slower acting colours of red, yellow and green.

The colour screens, or filters, are placed either in front of or behind the lens. Since the light has to pass through this coloured medium, a longer exposure is necessitated, which varies according to the density of the colour of the medium used in making the screen.

With some, the exposure has to be put in at six, and with others as much as twelve, times longer than when no screen is used. But a longer exposure must not be taken to be a disadvantage, as will be readily seen when a plate is exposed with and another without a colour screen.

Much depends on correct exposure, as the strength of the light varies greatly both in

chromatic plates are developed in the same manner as ordinary ones. Careful handling and accurately judging the required density during the process of developing are important factors towards success. The printing is carried out in the usual way.

For the amateur who does not care for the rather long process of toning and fixing his prints, I would recommend the use of self-toning

FIG. 178.—CYPRIPEDIUM MINOTAUR.

to day and also according to locality. To obtain the best results, it is highly important that the camera should be equipped with a high-class lens. Suitable backgrounds in variety are also necessary. For outdoor subjects it is advisable, if possible, to choose a day when there is little wind and the light not too glaring.

After the exposure has been made, the Ortho-

chromatic plates which only need a few minutes' development requiring about 10 minutes. At this time of the year, when sunlight cannot be depended upon, it is often convenient to use some kind of gas-light printing paper, such as "Velox."

In all cases it is necessary to well wash the prints afterwards, and to keep all the dishes and other utensils clean. W. J. F. J.

FOREIGN CORRESPONDENCE.

THE SAXIFRAGAS OF THE MARITIME ALPS.

MR. FARRER'S interesting notes on the Saxifragas of the Maritime Alps have induced me to send a few lines about this very controversial subject. In his *Flore des Alpes Maritimes* my countryman, Mr. Burnat the first authority, I think, on these questions, gives his opinion which is that of the scientific botanist purely. For a long time I have collected, sown, grown, nursed and studied every one of these Saxifragas, and I must say that on one or two points I cannot accept his opinion. In the group of *Euaizoon* he first mentions *S. lingulata* (Bell.) which occurs, according to him, from the "confluent du Var et de la Vesubie jusque dans les roches de la region Alpine" to Tenda. This will horrify my friend Mr. Farrer, but the explanation is this, that Mr. Burnat considers the *S. lingulata* under two forms, *S. lingulata Belardi* of Sternberg, and *S. l. lantoscana* of Engler. I always said that these are two quite different plants in cultivation, requiring different treatment, and that their seedlings are differentiated in character. I agree with the view of Mr. Boissier, who published the first *S. lantoscana* in his *Diagnoses* (Ser. ii., fasc. 2., p. 63). My own *S. lantoscana*, the first plant I had of it, came from Mr. Boissier himself, the author of the plant, and I always kept it to be conserved here as a document. This is in answer to Mr. Robinson, who, in his note in a recent issue, seems to doubt whether I have the right plant. I suppose Mr. Boissier knew his plant better than anybody else! The primitive mother plant is still in the wall garden of Boissier at Valleyres, and cannot have been crossed with *Aizoon*, as it never was sown. On the other hand, I never found a *Saxifraga lantoscana* in the Maritime Alps elsewhere than in the Lantosque and in the Var valleys, where it

where it flowered in 1852 on the wall. There it still exists, so that there can be no doubt about the plant which I obtained from Boissier 30 years ago. Moreover, it is identical with those I found several times in the Lantosque and Var Valleys.

For many years I have been studying particularly these Saxifragas of the Maritime Alps, so that I am very anxious to keep the true names at Floraire, where they are grown in separate places in order that they may not intercross.*

Saxifraga lingulata (Bell.) is the Tenda Saxifraga. It grows there in the limestone rocks

beautiful, the most elegant, if not the most brilliant, of all the Saxifragas. It is a perfect gem, and much better in every respect than *S. longifolia* of the Pyrenees. The description of it is well given in Engler's *Monograph of Saxifraga* (pp. 235-236). From the main road, between Tenda town or village—which you like—and the station of Vievola, that beautiful plant adorns the rocks and hangs over the road. It is a marvellous sight which, once seen, is never forgotten. Quite another thing is *Saxifraga cochlearis* (Reich), which my good friend Engler, I cannot think why, identifies as a variety of

FIG. 180.—THE BORÉON VALLEY: THE ROCKS IN THE BACKGROUND ARE COVERED WITH SAXIFRAGA FLORULENTA.

FIG. 179.—ST. MARTIN LANTOSQUE WITH THE BORÉON VALLEY IN BACKGROUND.

abounds at an altitude of 1,000 feet to 3,000 feet. Burnat gives a great many localities outside that territory, and even at Valdieri in the north of the Maritime Alps; but Boissier speaks only of the plant in the Lantosque Valley. Of course it may have been found since 1850, when he discovered it, in some other place, and Mr. Burnat might be right. But I myself found it only in the Alps of Lantosque and of the Var Valley. The forms I found in the Cairons all belong to the *Cochlearis* group. Boissier described the plant growing in his garden at Valleyres,

between 3,600 feet and 4,800 feet, and is found again in Sicilia and on the south Apennines and the Abruzzes. In my opinion, it is the most

* Here is Boissier's description of *Saxifraga lantoscana*:—*S. perennis* late caespitosa glaberrima, foliis rosularum patulis linearispatulatis inferne attenuatis obtusiusculis supra convexis margine integris foveolatis foveolis squamulis calcareis albis oblongis versus apicem folii confluentibus tectis, canile erecto foliato in paniculam oblongam subnilitatelem superne aequanti, foliis caulibus linearisoblongis dimidiatis, ramalibus linearibus minutis, ramis tenuibus erecto-patulis 4-7 floris, calycis pallide virentis lacinis ovatis . . . petalis lacteis obovato-oblongis subspathulatis calyce triplo longioribus quinque nervis ad unguem lineis punctorum carneorum saepe pictis.

lingulata! This Saxifraga was discovered by our Swiss botanist, J. de Charpentier, in 1827 when he visited the Maritime Alps, and Reichenbach, discovering it in the herbarium of Charpentier much later on, supposed at first that it was a hybrid between *S. cuneifolia* and *S. lingulata*! I do not believe that there is a plant better marked and characterised than this one. It is so well known that there is no need to give a description of it. In our gardens it is the last to flower of every Saxifraga of the *Euaizoon* group. It comes out in July, and keeps its pure white flowers borne on red stems till the middle or sometimes the end of August. Its culture, as well as that of the two first-mentioned plants, is quite simple, all three requiring sun and, if possible, a vertical position. If planted in old walls they succeed admirably, but they grow in the rock garden, too, and in sunny and dry places in England. But this is a very polymorphic plant, not that its general form is changing or not stable, but the size of the rosettes, of the leaves, and of the flowers varies much according to habitat, namely, the main valley of the Roja or in the lateral ones. In the Cairons Valley there is a form of *S. cochlearis*, which seems to be the *S. cochlearis* minor of nurserymen (which is very often sold as *valdensis*, and which I found generally under that name in English Alpine gardens). This very pretty plant is quite distinct by its very glandular and short stems, also by its short and thick leaves, and the dense habit of the plant. I took the liberty to dedicate it to General Sir Dighton Probyn, who grows it so well in his Alpine garden at Windsor Castle, and called it *Saxifraga Probynii*. The most curious of all the Maritime Alps Saxifragas is certainly *S. florulenta*, which Mr. Farrer praises so much that I have nothing further to add. I send some photographs taken in the Boréon Valley a year ago, showing the rocks, where it grows, and the lake which Mr. Farrer mentions in his note (see p. 365). The whole

country is a bed for *S. florulenta*, and at the foot of these steep rocks flowers *Viola nummularifolia*, which I am glad to know Mr. Farrer found there. He must recognise now that when I praised it to him I was not exaggerating by calling it the first of the Alpine *Violas*. Unhappily I cannot grow it well at Floraire. It is "re-belle" to my culture, and I hope my friend at Ingleborough has better results than myself. But we shall try it again.

About *S. lingulata*, of course I never meant collectors to seek this in the Borçon Valley. If I wrote to Mr. Farrer of it, it was, as he says, himself, a slip of the pen, as I meant *S. pedemontana*. *Henry Correvon, Geneva, November 27.*

— I am delighted to have such timely reinforcement from M. Correvon. His remarks even embolden me to stand firm against Burnat himself in maintaining the full specific rank of *S. lantoscana*. I have not his volumes here, though, and if, as M. Correvon says, he merely quotes *S. lingulata lantoscana* from the Vésudie, and *S. lingulata Bellardii* from the other ranges, without setting up an archetypal *lingulata* as their head, then am I to suppose that the ordinary *lingulata* of Tenda is his *Bellardii*? I myself had imagined him to quote *Bellardii* and *lantoscana* as forms, both of them, of *lingulata*. If this is not the case, what becomes of the Tenda variety of *S. lantoscana*, which occurs with *lingulata*, and yet remains obviously and invariably distinct from that plant, while it is equally obviously not identical with *lantoscana* of the Vésudie? For this plant still remains to be accounted for, if it is not, as I had concluded, the *Bellardii* form of *lingulata* (if form it be) answering to *lantoscana* of the Var and the Vésudie. It is interesting, by the way, to hear the origin of *S. Probyni*, which had puzzled me. But I cannot help regretting that M. Correvon should have complicated complication still further by launching upon us a new species, which is really our old friend *cochlearis* minor under another name. All M. Correvon's remarks on *S. lingulata* I echo, with applause; but do not easily see how Burnat can quote *lantoscana* from the Valdieri district, for the Valdieri district is purely granitic, I fancy, fertile in pedemontana and *florulenta*, and, therefore, no sort of dwelling-place for such calcareous plants as *lingulata* and *lantoscana*. Far down the valley, indeed, near Borgo San Dalmazzo, a friend of mine saw a big Silver Saxifrage on a sunny limestone rock. But, from his description and the neighbourhood (the Borgo is the Northern Gate of the Col de Tenda), this must have been the type *lingulata*. With regard to *cochlearis*, and my suggestions about its origin, I commend to M. Correvon and to all sympathisers the fact that it is where *cochlearis* adopts a *lantoscana* situation that its approximation to *lantoscana* becomes so suggestive. In the shady gorge below Saorgio, in places exactly similar to those favoured by *lantoscana* in the gorge of the Vésudie, *S. cochlearis* grows large and diffuse and pale and spatulate, until one cannot help guessing its affinity to the other. In the sunny rocks, which it usually prefers, it grows smaller and denser and much more clearly distinct. Yet it is no less abundant in the Saorgio gullies than on the hot rocks of San Dalmazzo. I have a very large series now from these different stations, and could show an enormously varied set of leaves, some of which draw very near to *lantoscana* (one plant, indeed, so plainly *lantoscana* itself or *Bellardii* that I must needs insist that a label has been misplaced). Finally, I would add that, though *cochlearis* and *valdensis* take any amount of sunshine in gardens, and though *lingulata* seems to be quite indifferent in the matter, there is no sort of doubt that here, at least, *S. lantoscana* is most grateful for such northerly rocks and cool exposures as remind it of St. Martin and the sunnied rocks by the Vésudie. *Reginald Farrer.*

ABUTILON THOMPSONII AND OTHER SPECIES.

IN the *Gardeners' Chronicle* for October 22 of this year, p. 297, Mr. R. L. Lynch has pointed out that there are two similar, although, in point of fact, different, plants in cultivation under the name of *Abutilon Thompsonii*. This note has produced the inevitable enquiries, and several specimens of the cultivated plant have been sent, but Mr. Lynch states, in the issue for November 12, p. 353, that no one has sent to him the true *A. Thompsonii*, and I find it is not in cultivation at Kew, therefore it would appear to be a rare plant. Mr. Lynch also considers the original *A. Thompsonii* to be a variety of *A. striatum*, having the same glabrous leaves, and flowers of the same colour, merely differing in its variegated leaves, whilst the plant generally known as *A. Thompsonii* has pubescent leaves, and flowers (according to Mr. Lynch) less conspicuously veined. Having been favoured by Mr. Lynch with good specimens of the plant he knows to be the original *A. Thompsonii* and of *A. striatum*, I have compared them critically with the material in the Kew Herbarium with a somewhat surprising result.

Turning first to *A. striatum*, it soon became clear that two perfectly distinct species are involved under this name, and that all previous authors have made a remarkable mistake with regard to it. I find that it was first imperfectly described as "*Abutilon striatum*, Dickson, in *The Botanist* (ined)"; by Lindley, in his *Botanical Register*, 1839, Miscellany, p. 39, and was well figured and fully described that same year by Dickson in *The Botanist*, vol. iii., t. 144. The specimen Mr. Lynch sends as *A. striatum* is unquestionably the true plant of Dickson, agreeing accurately with his description and figure. An inferior figure of it is given in the *Botanical Magazine*, t. 3340, under the erroneous name of *Sida picta*. But, to my surprise, not a scrap of the cultivated plant described as *A. striatum* or as *Sida picta* is preserved in the Kew Herbarium. Dickson states that it was "introduced about two years ago (i.e., about 1837) into the Glasgow Botanic Garden, most likely by seeds from Mr. Tweedie." And, in speaking of its geographical distribution, he states that South Brazil is its native country, and that it had been collected there by Gardner, and at Rio Negro by Tweedie. Lindley, at the place above quoted, refers to it as "this South Brazilian species." From that time until now, all authors have identified *A. striatum* with the Brazilian and Uruguayan plant, whereas I find it to be an entirely different species, very easy to distinguish. I cannot find any South American specimen in the Kew Herbarium that is like *A. striatum*. But I do find one specimen that is identical with it, and this was collected in 1892, near Santa Rosa in Guatemala, by Heyde and Lux (No. 2,960), and distributed by Mr. J. Donnel Smith under the wrong name of *A. venosum*. Now it happens that Mr. G. Ure Skinner settled in Guatemala in 1831, and sent from there a great many plants into this country. I have very little doubt that *Abutilon striatum* was one of them, its origin by some mischance having been lost. Mr. Skinner was a Scotchman, and would be likely to send plants to his native land. At any rate, there can no longer be any doubt that Guatemala is the native country of *A. striatum*. A specimen of it is in the British Museum collected there by Lehmann, and another specimen (a variety), mentioned below, from the same country, are confirmatory of this conclusion.

With regard to the plant from South Brazil, Uruguay and Buenos Ayres, hitherto mistaken for *A. striatum*, I find that this was first described in 1835 as *Sida picta*, Gill., in Hooker's *Botanical Miscellany*, vol. iii., p. 154, and was subsequently published as *Abutilon pictum*, by Walpers in his *Repertorium Botanices*, vol. i., p. 324, under which name the plant should now be known. It was in cultivation in the Paris

Botanic Garden in 1857, and there are dried specimens at Kew, collected in gardens in India many years ago. Some of the Brazilian specimens have variegated leaves, so that it varies, like *A. striatum*, in that character. It is a plant well worth a place in our gardens. To make clear to botanists the plant I mean, I quote the two following distributed specimens:—Organ Mountains, Gardner, 321; Corcovado, Gardner, 5,369.

Turning now to *A. Thompsonii*, it would appear that this must have been introduced 42 or 43 years ago, since a First-class Certificate was awarded for it when first exhibited by Messrs. Veitch and Sons at the Royal Horticultural Society's meeting on September 1, 1868. There is a notice of it in the *Gardeners' Chronicle*, 1868, pp. 918 and 945, and in *The Florist and Pomologist*, 1869, p. 20, are a short note and a figure of a branch without flowers, but no description; it states, however, that Mr. Veitch introduced it from Jamaica, and that it "is evidently a sport from *Abutilon striatum* . . . now naturalised in Jamaica." The plant Mr. Lynch sends as the true *A. Thompsonii* agrees with that figure, and, I think, may be accepted as correctly named. Also, there can be no doubt that it is only a variegated form of *A. striatum*, differing from it in no other character. Of this also, there is no specimen preserved in the Kew Herbarium. Next, we have the plant commonly cultivated as *A. Thompsonii*, which, as pointed out by Mr. Lynch, is at once distinguished from the original plant by the pubescence on the leaves, especially on the under surface.

Mr. Lynch, however, writes to me that "there is a great difference in the flowers and buds, the flowers not being at all like those of *A. striatum*; they are without the characteristic veins." Also, there is the very distinct difference I note in the colour of the pubescence on the calyx, as detailed below. From Mr. Lynch's note on p. 353, it appears that no one interested in the matter appears to have the original *A. Thompsonii*, and no one can give the history of the origin of the plant now cultivated under that name. The case, therefore, is as follows:—Over 40 years ago a handsome decorative plant was introduced into and doubtless widely distributed from Messrs. Veitch & Sons' nursery, yet at the present day only two plants of it are recorded as extant, although another form is widely cultivated all over the country under the same name. It seems incredible that the original form can have everywhere died out and been replaced by the plant in question. I am inclined to believe that the explanation is contained in a suggestion made by Mr. James Mayne, of Bicton Gardens, Devonshire, who writes:—"I am forwarding growths and flowers of a variety that has passed under the above name for close upon 30 years to my knowledge, but according to Mr. Lynch it is not *A. Thompsonii* at all. Wrongly named or not, it is a very valuable plant for summer decoration of the flower-garden, its highly-coloured foliage and flowers claiming much attention from the many visitors who come to see these gardens during the summer, when they are opened to the public for a small fee twice weekly. Mr. Lynch informs me that the true *A. Thompsonii* is growing in a conservatory near the Cambridge Botanic Gardens, and has been there for over 30 years; now it would be most interesting to learn whether that variety has been used for sub-tropical work or not during those many years, and, if so, with what amount of success?" The specimen Mr. Mayne sends is identical with that received from Mr. Lynch as being the false *A. Thompsonii*, though the variegation is much more beautiful, the yellow being far brighter, but the form of the leaf and its pubescence are the same. The question then is this: Are the original *A. Thompsonii* and the plant now generally known by this name distinct varieties of separate origin, or is the commonly-cultivated plant a mere condition of the true *A. Thompsonii*, which owes its pubescence and change in the colour of the flowers to having been annually subjected to an open-air treatment for several years? Also, would

cuttings of the original *A. Thompsonii* become pubescent and the flowers alter in colour if annually planted out in the open air? The leaves of the original *A. Thompsonii* and *A. striatum* are, however, not absolutely glabrous, the pubescence being represented by a few scattered minute tuft-like or stellately-branched hairs, only visible under a lens. With regard to this variation in pubescence, it is interesting to note that the Kew Herbarium contains another wild specimen from Guatemala, collected by Heyde and Lux (No. 6,073) on the Cerro Redondo, which has leaves very pubescent beneath, and is practically the same as the pubescent *A. Thompsonii*, except that the leaves are not variegated and the hairs not quite so fine, more stellate, and those on the calyx brownish.

Upon examining the plant grown at Kew as *A. Thompsonii*, I have been surprised to find that there is still another form cultivated under that name, for it is not quite the same as either of the above-mentioned forms of that plant. The leaves are slightly different in outline, more cordate at the base, the lobes seem more closely placed, have more bulging margins, and the middle lobe is relatively much shorter, and as long as or longer than the undivided part, but never twice as long, as it is in *A. Thompsonii*. The pubescence on the leaves is minute, fine and scattered and is best seen with the aid of a lens, except on very young leaves. I am informed that this plant does not flower at Kew, so cannot say if there is any other difference. I think it probable that this may be a hybrid form, of which a few appear to have been raised between 30 and 40 years ago and later. As it appears to have no distinctive name, I propose to call it *A. striatum* var. *kewense*.

Finally, I find that there is a plant cultivated at Kew as *A. Thompsonii* var. *flor. pleno*. This again is quite different from *A. Thompsonii* in the form of its leaves, and cannot be considered as being merely that plant with double flowers, the leaves being only three-lobed, not variegated, and glabrous on both sides. It is not improbable that this is of hybrid origin, and that *A. pictum* may have been one of its parents, as the general outline of its leaves more nearly approaches that of the leaves of *A. pictum* than of *A. Thompsonii*. As it can scarcely be considered to be a variety of the latter, I propose to call it *Abutilon pleniflora*.

The distinctive characters of all the forms above-mentioned may be conveniently tabulated for reference as follows:—

A.—Leaves three-lobed:—

Leaves green, glabrous on both sides, with the middle lobe nearly half as long again as the undivided part and slightly narrowed in at its base. Flowers double. Of garden origin: *A. pleniflora*, N. E. Br.

Leaves green or variegated, sometimes glabrous on both sides, sometimes glabrous or pubescent on the veins above and more or less pubescent beneath, with the middle lobe usually shorter than but sometimes equalling the undivided part and broadest (not narrowed in) at the base. Calyx inch long, half or more than half as long as the corolla, with lobes very little longer than the tube, velvety-pubescent with brownish hairs. Corolla $1\frac{1}{2}$ – $1\frac{3}{4}$ inch long, orange or yellow, veined with crimson. A native of South Brazil, Uruguay and Buenos Ayres: *A. pictum*, Walp.

AA.—Leaves five-seven-lobed, with the middle lobe more or less narrowed in at its base:—

Middle lobe usually twice or more than twice as long as the undivided part of the leaf, and more than twice as long as broad. Calyx $\frac{3}{4}$ – 1 inch long, half or more than half as long as the corolla, with lobes nearly or quite twice as long as the tube. Corolla $1\frac{1}{2}$ – $1\frac{3}{4}$ inch long, orange, conspicuously veined with dark crimson. Leaves glabrous above and nearly so beneath, the hairs being few and scattered, minute and only visible under a lens. Calyx thickly pubescent with brownish hairs. Leaves green, without variegation. A native of Guatemala: *A. striatum*, Dicks.

Leaves variegated with yellow, not pubescent: *A. striatum* var. *Thompsonii*, Veitch.

Leaves variegated with yellow, thinly pubescent above, more thickly beneath with fine hairs. Calyx velvety-pubescent with white hairs. Corolla light reddish-orange, with deeper reddish veins, not very conspicuous. *A. striatum* var. (*A. Thompsonii*, Hort.).

Middle lobe less than twice as long as the undivided part of the leaf and sometimes only about equalling it, usually much less than twice as long as broad; pubescence as seen with aid of lens, minute and fine, rather scattered. Flowers not seen. Probably of garden origin: *A. striatum* var. *kewense*, N. E. Br.

The pubescence mostly consists of stellately-branched or tuft-like hairs, mingled with some simple ones.

The original spelling of the name is *Thompsonii*, not *Thompsonii*, but the terminal "ii" is now duplicated in order to bring it into agreement with the accepted rule as to specific names ending in a consonant, adopted at the Vienna botanical congress. N. E. Brown.

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burf. rd., Surrey.

Warm house Orchids.—In the East Indian house most of the species of *Aerides*, *Saccolabium*, *Angraecum*, *Vanda*, *Renanthera*, *Sarcanthus*, *Rhynchostylis*, and *Stauroplexis* have practically finished their growth, for although such plants are never absolutely dormant, they require to be treated, in many respects, as resting plants. These species, having no pseudo-bulbs, should never be kept so dry at the roots as the deciduous kinds, neither should they be given so much water as during the growing period. When affording water to those that are dry, it is advisable to just lightly sprinkle the moss on the surface, merely to keep it alive. *Aerides crispum* and its varieties *Lindleyanum* and *Warneri*, we find, do thoroughly well elevated on the centre stage of the intermediate house, growing in this comparatively cool temperature, as may be seen in their robust growth and short, shiny leaves. *Renanthera Lowii* should be placed in the darkest corner of the house, where no sunshine can come on it at any time. The winter-flowering *Angraecum sesquipedale*, now showing for flower, should receive a trifle more root moisture than those which are at rest, but the Sphagnum-moss must not be kept in a saturated condition. Should there be any yellow thrips in the house, they will be sure to find their way to the flower-buds as they commence to open, therefore, if the presence of these insects is suspected, it is advisable to vapourise the house every week until the flowers are past. Plants of the beautiful *Vanda corulea*, although tried in this and other houses, have always proved difficult to keep in good health for long together. During the past summer the plants (about 30) were placed at the cooler end of a small Cattleya house, where the bottom ventilators close to them have been, and are now, always more or less open. The plants have been kept well shaded at all times, and, during the past two months no damping between the pots has been allowed, the surface moss of those that were dry being very lightly watered with a fine rose can just before sunset. The plants generally have made good growth, and some of them have bloomed well, one plant, the variety *Chaletiana*, is now in bloom, with two spikes carrying 19 fine flowers between them. Up to the present time, there is no indication of fresh spot or disease among them. The temperature at this, the cooler end of the house, fluctuates between 55° and 60°, the atmosphere immediately surrounding the plants is fairly dry, and as the water pipes are rather close up under the open stage, a piece of zinc is laid along them, so as to prevent direct fire-heat from reaching the plants. The supposed natural hybrids from *V. corulea*, as *V. amona*, *V. Charlesworthii*, and *V. Mooreana*, appreciate similar treatment. Such *Phalaenopsis* as *P. Schilleriana*, *P. Aphrodite*, *P. amabilis*, and others, that are sending up their flower-spikes, should be kept fairly moist at the root, but it is not a safe practice to dip the baskets in water at this season, because the compost then remains wet for a very long time, and the roots that are inside suffer considerably. It is better to allow the Sphagnum-moss to become of a whitish green colour before a fresh supply of water is given, and then only to lightly spray the moss on the surface, and around the sides of the baskets. When affording water, care should be taken that none of it remains in the centre of the plants. One plant are placed with their

leaves in as slanting a position as possible, so that this danger is avoided. Well-rooted plants of *Oncidium Cavendishianum* now showing their flower-spikes should be kept well supplied with water at the root, but its allied species, *O. Lanceanum*, being at rest, should be kept rather drier. The dwarf-growing *Laelia rubescens* (*peduncularis*) grows and flowers freely when suspended on the south side of this house, and now that its flower-spikes are pushing up, the plants should be elevated among other plants on the stage; if kept too near the roof glass, the tips of the spikes are apt to get injured by frost. Among small-flowering *Oncidiums*, *O. chierophorum* is a very pretty object. The spikes are now pushing up, and when the flower-buds are prominent the plant may be removed to the warm house, where the flowers will open better than if left in the cooler division, but when fully open the plant may be returned to its growing quarters, and the flowers will last in good condition for several weeks if not injured by damp. After the flowers fade, afford but little water to the roots till growth recommences, when repotting may be done. This *Oncidium* requires only a very thin layer of *Osmunda* fibre to root in, and it does best when elevated to the light in the intermediate house.

THE KITCHEN GARDEN.

By JOHN DESS, Kitchen Garden Foreman, Royal Gardens, Windsor.

Cucumbers.—Provision should be made for sowing Cucumber seeds, so that good, strong plants may be ready to put out by the third week in January. The pit in which these young plants are to be grown should be thoroughly washed and a hotbed made up to within 18 inches of the glass. The seeds should be sown singly in small pots, which should be partly plunged when the temperature of the bed is at about 80°. The soil may consist of loam and leaf-mould in equal parts and the seeds should not be covered too deeply; $\frac{1}{2}$ inch of fine, sifted soil is quite sufficient. If the compost is in good condition no water will be necessary until growth commences, when the seedlings may be gently watered with soft water at a temperature of 80°. When the young plants are well above the surface they should be kept as near the glass as possible by raising the bed in which they are plunged to within a short distance of the glass. The variety *Every Day* is a good sort for sowing at the present time. If all has gone well with August-planted Cucumbers, they will still be bearing freely, and if the roots have been confined to a small body of soil a top-dressing is now necessary. Small but frequent top-dressings are desirable as soon as the white tips of the roots appear through the soil; a slight covering and a dusting of bonemeal should be applied. Moisture in the atmosphere, so necessary for the healthy growth of Cucumbers, must not be produced through the too liberal use of the syringe on the foliage, but by damping the walls and floor of the house, or by watering the edges of the mounds with diluted manure water at a temperature of 80°. Very little pinching will be necessary now, but the plants may be assisted in their growth by cutting all fruit as soon as they have attained the desired size. A little air may be given on bright days, but care must be taken not to lower the temperature of the house by doing so.

Asparagus.—Batches of roots should be placed in heat fortnightly throughout the winter if a constant supply is desired. This crop may be grown without fire heat, provided a hotbed is available and sufficient covering material to keep the pit crops for next season. It should be decided now where next season's crops are to be grown, so that the ground may be prepared for them as soon as possible. That intended for Onions should be trenched and made rich with well-decomposed manure. Ground trenched now and exposed to the influence of the weather through the winter will be in good condition when the time for sowing arrives. Land intended for the main crop of Peas should be treated in the same way. The same remarks apply to Cauliflower. The ground for this crop can hardly be made too rich, provided sufficient room is allowed between the plants. Root crops such as Carrots and Parsnips will succeed best on land which was manured for the previous crop, but this should be thrown up to the influence of the weather as soon as possible.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Hedges.—Nothing tends so much towards the general good appearance of any establishment as the formation and thorough upkeep of good hedges. To promote a free growth, the ground to be planted with a hedge should be brought into a fertile condition by thorough trenching and the incorporation with it of a good dressing of rotted manure and other suitable material. Perfect drainage is essential, and, if the natural condition of the soil does not allow of this, artificial means must be employed. Select plants of a uniform size and shape, and such as have been transplanted frequently and prepared for the purpose by the nurserymen. For the "Flower Garden" those of an evergreen character are generally preferred, as besides providing more shelter, they are attractive at all seasons, and more conspicuous, though neat in appearance. Planting of most of the subjects may now be satisfactorily carried out. Amongst material suitable for those of an evergreen nature may be mentioned *Viburnum Tinus* (Laurestinus), Privet, Holly, Yew, both the upright common English and the Golden, and Irish Yew; Box, Cupressus (in variety), Laurel and Thuya. Of deciduous sorts, there are Sweet Briar, *Berberis vulgaris*, Beech, Hornbeam, Black Thorn, American Thorns (such as *Crataegus Crus-Galli*), Myrobalan Plum and Lilacs. Old hedges that require renovating may now be given attention.

Perennial Asters.—The growths of these plants may now be removed to the rubbish heap or smoulder fire, and any plants that are scarce should be protected at the base from slugs, etc., by placing a handful of short cinder ashes round them. Seeds of these, which were removed when the weather was dry, and have since become thoroughly ripened, may now be sown. We consider boxes best for the purpose. They should be well crocked and filled with soil of a fine nature on the surface. Sow the seeds thickly, many of them will prove to be infertile. Cover the seed with a thin layer of the finely-sifted compost, press the soil firmly, and place the boxes in a house or frame where there is a gentle heat. Leave them there until germination has taken place, then remove them to cooler quarters. Keep the conditions moist.

Pampas Grass.—Few plants are more attractive when properly placed than the Pampas Grass. At this season of the year the plants are particularly elegant with their tall and decorative plumes. As isolated specimens on the lawn, or when planted on either side of a walk or drive, or beside water, the Pampas Grass is effective. A position sheltered from strong winds should be afforded it, otherwise the slender stems carrying the feathery plumes will be damaged and their beauty marred. Though it is practically hardy, in this cold district we generally place a mat or some protection round the plant during very severe weather.

General remarks.—The regravelling of paths and drives should now be done where needed and thoroughly well rolled. During wet weather make a good quantity of pegs, labels and sticks ready for use next season. Wash all dirty pots and thoroughly clean out the sheds. Overhaul the tools, and do any work of this nature that is possible.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSEL, G.C.B., Moulton Paddocks, Newmarket.

Cherries.—To obtain ripe Cherries in April it is necessary to close the house containing the trees as soon after the present date as possible. Before this is done, however, the structure should be cleansed thoroughly, the trees pruned and cleaned, and everything inside the house made sweet and wholesome. If pot-trees are employed to produce the early crop, a thorough soaking of clear lime water may be given them when they are brought indoors. This will expel any worms which may be present and will also have a beneficial effect on the trees. Very little fire heat will be necessary for some considerable time, as the Cherry cannot stand anything in the nature of forcing. The night temperature may range from 40° to 45°, or, in severe weather, it may be allowed to drop to 35°, merely using sufficient warmth in the water pipes to keep the air-tem-

perature above freezing point. Admit air for a short time during the day whenever possible, closing the ventilators early enough to cause the temperature to rise 5° or 10° with sun heat. Damping the floors, etc., to promote atmospheric moisture will depend upon the state of the weather. The practice of damping floors and syringing trees once or twice daily in all circumstances is to be condemned, such treatment doing more harm than good on dull, cold days. Excessive moisture and low temperatures will often cause many of the buds to start weakly, besides creating a muggy, stagnant atmosphere. Syringe the trees freely on bright, sunny days at about noon, so that they may become fairly dry again before nightfall. Whether the trees are in pots or planted out, see that they are thoroughly moist at the roots when starting the house.

Early-pot Figs.—The pot trees for providing the earliest crop may now be started. If pinching and regulating the growth were carefully attended to during the growing season, little or no pruning will now be necessary. For the successful forcing of pot Figs so early in the season it is advisable to provide bottom heat, either by means of fermenting material or water pipes, the latter method being preferable, as the heat can be more easily regulated. A bottom heat of 65° to 70° will be high enough until the leaves begin to unfold, when it may be increased by 5°. The atmospheric temperature may range from 48° or 50° by night to 55° by day, increasing the temperature as growth advances, say 5°, when the leaves unfold, and gradually rising another 5° a few weeks later. Attend carefully to the supply of moisture at the roots. Here it may be said that with pots plunged in hotbeds the state of the surface soil is not always a reliable guide to its condition lower down in the pot, especially if syringing is being practised twice daily. Therefore, pains should be taken to ascertain if water is necessary before applying it. Syringe the trees once or twice daily, according to the weather, and maintain a moist atmosphere by damping floors, etc., as often as may be considered necessary.

Permanent Fig trees.—The house containing the earliest planted out trees may now be closed in order to provide a crop in succession to the pot trees. Start with a night temperature of 45°, and allow a rise of 5° to 8° by day. See that the border is in a moist condition, and apply a mulch of well-rotted horse droppings to encourage surface roots.

Later Fig-houses.—Trees in later houses may be pruned whenever the wood is mature, afterwards washing them with some safe insecticide. The glass and woodwork of the houses may also be thoroughly cleansed with warm water and soap, walls whitewashed, and everything put in readiness for starting when required.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Weetwood, Yorkshire.

Begonia Gloire de Lorraine.—The earliest plants of this winter-flowering Begonia will have passed out of bloom. The inflorescences should be cut away and the plants afforded a short season of rest before the growths are shortened to about 12 inches in length. Following this pruning, they should be placed in a house having a warm, moist atmosphere, where the plants can be sprayed frequently to induce them to produce growths for the supply of early cuttings.

Begonia Gloire de Secour.—This Begonia is set freely with flowering buds, and the plants will provide a handsome display of bloom very soon after the commencement of the New Year. Gloire de Secour flowers most freely when cultivated in small pots, and afforded frequent waterings with clear soft water and diluted liquid manure from the farmyard. In the winter season, when most insect-heat has to be used, the plants are apt to be infested with thrips and aphides. These pests must be eradicated by fumigations with a nicotine vaporising compound.

Perpetual-flowering or tree Carnations.—At the present season these sweetly-scented, brightly-coloured flowers are more appreciated than at any other time. The variety Carola is a most welcome sort on account of its delicious

clove scent and its richly-coloured flowers. Let the plants have constant ventilation that the growths may not become sappy, or the buds for providing spring flowers will be very weak. In respect to such varieties as the grower desires to increase, but of which the number of cuttings is limited, the very first opportunity should be taken to insert what cuttings can be obtained, although this may have to be done at the expense of some flowers. After the first batch of flowers has been cut, the lateral shoots should be looped up to the central stake, and each plant exposed as much as possible to the influence of light. The roots should be given a top dressing, at intervals of a week or 10 days, with Clay's Fertiliser, or some other approved chemical manure. In no case must the quantities recommended by the vendors of these concentrated manures be exceeded.

Sourcil de la Mulmaison Carnations.—It is still possible to cut a few excellent blooms from the spring batch. The plants should now be kept as cool as possible, without allowing them to suffer from frost, therefore admit ventilation on all favourable occasions. The interior of the structures must be kept as dry as possible. Examine the plants frequently with a view to watering any which are really needing moisture, remembering that the roots should be kept on the dry side, but also that excessive dryness will be just as injurious as over-watering. Any specimen plants which have not been staked should be given attention at once. If the rust fungus is present on any of the plants, the worst of the leaves should be pinched off and burnt, and the remaining ones treated with a brush dipped in a fungicide, taking care not to miss any of the affected parts. This season's layers now growing in pots 6 inches in diameter will need but little further attention at present beyond supplying them with a stake for supporting the centre growth. Keep the plants in a light, well-ventilated structure and water them with care.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Strawberry beds.—The present is a suitable time for preparing land intended for the planting of Strawberries next year. The ground should be thoroughly trenched, incorporating plenty of farmyard manure as the digging proceeds, also a liberal dressing of soot, which will not only be beneficial to the plants, but will also assist in destroying insect pests. The surface of the ground should be left in as rough a condition as possible, so that it will be exposed to the full influences of the weather. Many advantages are gained by preparing the ground early, for not only is it more exposed to the influences of frost and air, but, in addition, the manure becomes well decayed and incorporated with the soil, so that the latter settles again before planting time arrives, for Strawberries, in addition to being gross feeders, delight in a firm rooting medium. But the ground need not remain idle in the meantime, for good crops of Early Peas may be obtained from it in time to allow it to be made clean and tidy before putting out the Strawberry plants, which should be done during the latter part of August or the beginning of September. After the ground has been cleared of the haulm of the Peas and weeds, it will only be necessary to lightly point over the surface with a fork just previous to planting the Strawberries.

Wall trees.—The work of pruning wall trees should be pushed on as fast as possible, but the training and relastening of the shoots of Peach and Nectarine trees should be deferred as long as possible, in order to retard the flowering period, and thus minimise the danger to the blossom from late spring frosts. After pruning and cleansing the trees thoroughly, tie the branches together in loose bundles, which must be securely fastened to the wall, or, better still, to temporary stout stakes, so placed as to hold the shoots away from the wall.

General work.—See that all newly-planted trees are properly staked and securely fastened. Use pieces of felt or sacking around the stake and tree, so that the ligatures or stake will not cause the bark to be chafed. All newly-planted trees should be mulched at once with long stable litter as far as the roots extend, to protect them from severe frosts.

EDITORIAL NOTICE

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Illustrations. The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, DECEMBER 12—
United Hort. Ben. & Prov. Soc. Com. meet.

TUESDAY, DECEMBER 13—
Perpetual-flowering Carnation Soc. Exh. at R.H.S. Hall, Westminster; Annual meet. at Anderton's Hotel, Fleet Street, 8 p.m.

THURSDAY, DECEMBER 15—
National Sweet Pea Soc. Annual meet. at Hotel Windsor, 3 p.m. Conference at 7 p.m.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—40.4°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, December 7 (6 p.m.): Max. 51°; Min. 43°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 8 (10 a.m.): Bar. 29.3; Temp. 49°; Weather—Dull.

PROVINCES.—Wednesday, December 7: Max. 51° Cornwall; Min. 43° Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY—
Dutch Bulbs, at 11; Roses and Plants, at 1.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

TUESDAY—
Dutch Bulbs, at 11; Roses, at 1.30; Palms and Plants, at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

WEDNESDAY—
Miscellaneous Bulbs and Roots, at 12; 2,996 cases Japanese Lilioms, &c., at 2.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—
Imported and Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

**The
Japanese
Creeper
and the
Virginian
Creeper.**

In the whole world, there is probably no cultivated trailing or climbing plant that covers so much space as the Japanese Creeper does in this country, though it was introduced no longer ago than in 1868, or nearly 250 years later than the Virginian Creeper, of which it has become a most successful rival. It flourishes in all aspects, at least in the south of England, and equally well inland or facing the sea, where it is within the influence of a salt-laden atmosphere. Whole streets of houses, especially the newer ones, are often more or less covered by it, and individual plants sometimes spread very widely, even more widely, perhaps, than the more robust and woody Wistaria; but on this point we have no exact data. The largest Japanese Creeper that has come under our observation exists at Worthing, in the Steyne Road, skirting the west side of the Steyne Gardens, which face the sea, with only a road and promenade between. The houses in the Steyne Road have an eastern aspect, and are more or less shaded by tall trees in the gardens opposite. They are houses of four stories and basement, with an area or merely excavations for the windows, such as the one from which the big creeper starts. The plant in question was placed in position 22 years ago in a flower-pot. Eventually the growing plant burst the pot, and then the owner had a brick receptacle built for it against the wall of the house. This is 2 to 3 feet across and about

as much above the public pavement outside. Thus situated, very little water could reach the roots of the plant naturally, but it was watered very copiously during the earlier years of its existence. The result is that it now covers, more or less, the front of five private houses and the side of the hotel, which is at the end of the street and faces the sea. The extensions are not quite equal, that in the northern direction being somewhat the greater. We estimated the total horizontal extensions at 50 yards, but that can only be accepted as a rough approximation. The very short main stem may be 6 inches in diameter, and it is divided into five unequal secondary stems almost close to the ground. After leaving the first house, the growths are mostly above the first-floor windows, reaching the eaves in the central part and completely covering many of the windows of an unoccupied house. In September of the present year there was a profusion of flowers on the stems and older branches.

Thus much concerning the remarkable Worthing specimen of the Japanese Creeper; but, before leaving the subject, we may refer to some peculiarities observed in the direction taken by the growths of this plant. Usually, a young plant against a wall develops a fan shape, filling up later the vacant space below. Sometimes all the branches grow obliquely, either to the right or the left, apparently uninfluenced by light or aspect or clear space. Sometimes the extensions are all horizontal, with dips downwards. A very striking instance of this may be seen at Kew. About a dozen years ago a portion of the residential part of the Herbarium buildings was pulled down, in consequence of its proximity to the main building and the danger of fire arising therefrom. This left a large expanse of naked wall facing west. On the south front of the building there was a Japanese Creeper in a losing competition with Ivy. It soon turned the corner and spread horizontally over the whole face of the bare wall, from the ground to the roof; but the Ivy seems to have made no effort to extend in the same direction. What the influences are that control these physiological phenomena it is difficult to determine.

The Japanese Creeper was distributed in cultivation by Messrs James Veitch & Sons in 1868 (*Gardeners' Chronicle*, 1869, p. 838), under the name of *Ampelopsis Veitchii*, having been introduced by John Gould Veitch, and this name it will probably bear to the end of time; for gardeners do not like changing the names of their plants. The species had previously been described as *Ampelopsis triancipitata*, and there are botanists of repute who maintain that, whatever the generic name should be, *triencipitata* is the proper specific name. Unfortunately, there is great divergence of opinion on generic limits in the Vitaceae, and different writers severally refer the plant to *Ampelopsis*, *Cissus*, *Vitis*, *Quinaria* and *Parthenocissus*, whilst the obscure name, *Pseclera*, has recently been revived. It would serve no useful purpose to give the full synonymy here, but it may be mentioned that *Parthenocissus triencipitata* is the name adopted by the late Dr. Planchon, the accomplished author of the only recent monograph of the whole of the Ampelidaceae, otherwise Vitaceae.

The exact date of the introduction of the Virginian Creeper is not known. Parkinson has a note on it on the last page of the descriptive part of his *Paradisus* (1629) under the name of *Hedera quinquefolia*. He is not at all enthusiastic about it, and includes it "because it adds to the number of plants in cultivation." However, he recognises its value as a town plant of rapid growth, attaining as much as 20 feet in one year, and climbing to the top of the highest chimneys; nor has the famous Philip Miller, writing about a century later, much to say in its favour. This vine also has a copious synonymy, and is the *Parthenocissus quinquefolia* of Planchon.

The Virginian Creeper, it may be added, has an unusually wide geographical distribution, ranging from Canada to Florida, Texas, Mexico and Cuba, and from the Atlantic to the Rocky Mountains.

LINNEAN SOCIETY.—A meeting of the Fellows of this Society will be held on Thursday, December 15, at 8 p.m., when the following papers will be read:—(1) "Reports on the International Botanical Congress at Brussels, 1910," by Dr. OTTO STAFF, F.R.S., and others; (2) "Non-calcareous Sponges from the Red Sea. Collected by Mr. Cyril Crossland," by Mr. R. H. W. Row, B.Sc.; (3) "Comparative Anatomy of Leaves of *Veronica*," by Mr. R. S. ADAMSON.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting, being the first of the two afternoon meetings arranged for the convenience of country members, will be held in the Lecture Hall of the Institution on Monday, December 12, at 4 p.m., when a paper will be read by Mr. ROBERT M. D. SANDERS, entitled "The Organisation of Agricultural Credit under Land and Local Credit Societies."

THE LEAMINGTON FLOWER SHOW, 1911.—This show, which we mentioned last week, will be held on July 26 and 27, not July 28 and 29 as stated.

INTERNATIONAL AGRICULTURAL CONGRESS, MADRID, 1911.—The Board of Agriculture and Fisheries are informed that the 9th International Agricultural Congress will be held at Madrid from May 1 to May 6, 1911, under the distinguished patronage of His Majesty the KING OF SPAIN. In accordance with the decision of the last congress held at Vienna in 1907, the congress at Madrid will be divided into eight sections, and the subjects to be discussed will include the organisation of co-operation and agricultural credit, re-afforestation, diseases of fruit trees, animal nutrition, and the application of new manures. Societies or private persons can participate in the Congress, the subscription for each person or representative being 20 pesetas (or approximately 16s.). Applications for admission, which must be made before March 15 next, should be addressed to the Secretaries of the Organising Committee of the Congress, at the offices of the Society of Spanish Agriculturists, 12, Campoamor, Madrid.

CLARKIAS AS HONEY PLANTS.—A note in the current issue of *Die Gartenwelt* (xiv., 47) advises bee-keepers to plant Clarkias in their gardens. Owing to the plentiful supply of nectar in their flowers, *Clarkia elegans* in particular is recommended as a honey-plant, and to a lesser extent *C. pulchella*. It should be noted that the single-flowered plants are more suitable for this purpose than the doubles, since the former contain more honey and also more pollen.

THE WATER REQUIREMENTS OF PLANTS.—

All gardeners know that the amount of water absorbed by plants from the soil and given off in the form of vapour by the leaves is very considerable, though few probably could offer a precise estimate of the total amount of water which thus passes through a plant during its growing period. Hence the numbers quoted by Dr. RUSSELL in an article on Agriculture in the Dry Regions of the British Empire (*Nature*, November 24, 1910) may be of interest. In

of one pound of dry matter, 480 lbs. of water were found to pass through the plant in the case of Barley growing on manured soil, whereas no less than 680 lbs. of water was transpired in the case of plants growing on unmanured soil.

A TREE FOR PLANTING IN NARROW STREETS.

—So long as narrow streets are tolerated and so long as only large-growing trees are used for street-planting, the narrow streets will remain

those of the species, and have the essential merit of remaining on the tree till late in the autumn. The variety, moreover, bears transplantation well.

INCREASED TREASURY GRANT FOR UNIVERSITY EDUCATION.—All interested in higher education have read with appreciation the announcement of the Chancellor of the Exchequer that the grants to universities and university colleges are to be increased by £50,000 per annum. It is the custom to grumble at the somewhat

FIG. 181.—LÆLIO-CATTELEYA OLIVIA: SEPALS AND PETALS, SOFT PINK; LIP, ORANGE-COLOURED, WITH ROSE SHADING AT THE MARGIN.

(See p. 425.)

Barley the amounts of water which are absorbed and transpired in the course of the production of one pound of dry matter have been estimated variously as 257 lbs. (Lawes & Gilbert, Rothamsted, 1850); 774 lbs. (Wolley); and 393 lbs. (King, Wisconsin, 1894). The most recent measurements, those of Mr. J. W. LEATHER (Pusa), are of particular interest in that they were made both on plants growing in manured and in unmanured soils. During the formation

tree-less. It is therefore desirable that search should be made for trees suitable for planting in the less-spacious of our thoroughfares. From an account given in *Moller's Deutsche Gartner-Zeitung* (No. 46, 1910), by Mr. G. FRAHM, it appears that *Ulmus montana* var. *Gaujardii* is singularly well adapted for planting in streets where space is limited. This variety forms a slender, tapering stem and bears a pyramidal head; the leaves are bright green, somewhat smaller than

grudging support given by the Treasury to the cause of university education; but when it is remembered that the principle of State aid for university education has been admitted but comparatively recently in this country, the friends of higher education have reason to congratulate themselves on the fact that Chancellors of the Exchequer of both political parties have recognised in practical manner the claims of University education for increased financial support.

NOVEMBER RAINFALL IN ABERDEEN.—A table, compiled by Mr. DAVID McHARDY, of Cranford House, Aberdeen, shows that the rainfall in that city during the month of November was 5.98. This amount has only once been exceeded in the past 11 years, namely in 1905, when it was 6.85.

ASSOCIATION OF EDINBURGH SEED TRADE ASSISTANTS.—The sixteenth annual dinner of the Edinburgh seed trade assistants was held in the Royal British Hotel, Edinburgh, on December 2, under the chairmanship of Mr. J. W. McHATTIE, City Gardener. The toast of the evening, "The Seed Trade Assistants," was proposed by Mr. McHATTIE. He impressed upon the assistants the importance of their calling and the high position the Edinburgh assistants had always taken in the trade. He pointed out that the prosperity of gardening and farming largely depended upon the efficiency of seedsmen and their assistants. Mr. W. J. THOMSON replied in a suitable manner. Mr. J. W. FORBES, advocate, proposed "The Seed and Nursery Trade." He said that Edinburgh was one of the centres of the trade in the United Kingdom, and that such a gathering as that present augured well for its future success. He coupled the toast with the name of Mr. WELSH, of Messrs. DICKSONS & Co., who responded to the toast. The evening concluded with a splendid entertainment of songs and recitations.

POTATOS IN 1910.—The preliminary statement as to produce of crops, issued by the Board of Agriculture, estimates that the average under Potatoes in Great Britain was 539,684 as compared with 575,461 in the previous year. The yield per acre in 1910 is estimated at 6.45 (England 6.55, Wales 5.11, and Scotland 6.42), which yield is not far short of 10 per cent. better than the decennial average (5.93). As a result of the reduction of average the total crop is smaller by 200,000 tons than that of 1909, and nearly half a million tons less than 1908. Having regard to these facts and also to the poor crop in France, it will not be surprising if Potatoes show an advance in prices during the next two months.

HONOUR FOR DR. T. DURAND.—By Royal decree, dated November 24, Dr. TH. DURAND, Director of the Brussels Botanical Gardens, was promoted to the rank of Officer of the Royal Order of the Crown of Belgium, and his daughter HELENE was appointed Chevalier. We offer our congratulations to both recipients. Many of our readers know that Dr. DURAND has given much time to a study of the Tropical African flora. So far back as 1884, he published *Reliquia Lecardiana*, in 1895 the *Conspectus Floræ Africae*, in 1896 *Études sur la Floræ de l'État Indépendant*, articles that were followed by many others. He also gave some excellent lectures last winter before the Royal Academy of Belgium, the Royal Linnean Society of Brussels, and the Belgian Society of Colonial Education upon the botanical explorations in the Congo. Respecting these lectures, the Baron VAN ETVELDE, former Secretary of State for the Independent State, the founder of the *Annales du Musée du Congo*, wrote to Dr. DURAND, saying, "What a grand scientific harvest our countrymen have had in the Congo! I am proud of it, and I gratefully remember the patriotic devotion and lofty scientific spirit with which you have directed and rendered their work fruitful." Miss HELENE DURAND early in life showed a remarkable artistic talent in scientific matters. In 1905 she won the silver-gilt medal for her Orchids exhibited at the Ghent Quinquennial exhibition, which proved, as Count OSWALD DE KIRCHHOFF of DENTINGHEM said, that the artist "united the talent of the painter with the knowledge of

the botanist." In 1905 she drew the much admired plates for the paper by Mme. BOMMER and M. ROUSSEAU on the fungi of the Antarctic expedition of the "Belgica," then a series of entomological and botanical plates for the *Annales du Musée de Terracotten*, and others which were published in the leading foreign scientific periodicals. Miss HELENE DURAND is her father's devoted co-worker, and it will be remembered that last year the Royal Academy of Belgium awarded substantial honours to their work. *Sylloge Floræ Congoanae*.

APPLE SCAB.—The current number of the *Zeitschrift für Pflanzenkrankheiten* (Journal for Plant Diseases) contains some interesting observations by Dr. VOGES on Apple scab (*Fusicladium dendriticum*). Dr. VOGES is strongly of opinion that the chief danger of reinfection in successive seasons lies in the hibernation of the fungus in young shoots, a view in which he will be supported by British mycologists, who have often called attention to this matter. VOGES, however, thinks that winter spraying is of little use in controlling this fungus, because the fluid cannot come into contact with the bulk of the resting mycelium in the scabbed shoots. He urges that spraying for this fungus should be practised only during the spring. It is noteworthy that SALMON, in his address at the Hexham Fruit Congress, advocates spraying in February as well as during the spring (see p. 353). It would be interesting to have clear evidence of the value of the earlier spraying, i.e., one would like to know how a part of an orchard sprayed only in the spring compares with the remainder of the same orchard sprayed both in February and in the spring. Of course, the plan of pruning away shoots affected by scab has been suggested before, and has also been denounced as impracticable, but in orchards which are badly infested by scab year after year it would certainly seem that the expense of removing scabbed twigs would not be too much in comparison with the benefits conferred. CLINTON, an American writer, considers that great danger of reinfection during the spring lies also in the production of spores belonging to a higher stage in the development of the fungus. These spores are produced in the leaves which remain lying on the ground. One does not yet know how abundant is this stage in our own country, but at any rate spraying an orchard in the winter would have little influence in preventing the formation of these spores. If it is found that the higher stage of the fungus is of frequent occurrence, collection and destruction of the decaying leaves will become necessary. In the article referred to at the commencement of these notes, Dr. VOGES controverts the idea that the scab fungus is unable to enter the fruit except through a wound. He also makes some observations on certain varieties of Apples and Pears which are less susceptible to scab than others, and mentions the interesting fact that red-skinned varieties of Apples are relatively immune from the attacks of this devastating pest.

PUBLICATIONS RECEIVED.—*Flora of Jamaica*, by William Fawcett and Alfred Barton Rendle, Vol. I. (London: Natural History Museum, Cromwell Road.) Price 10s. 6d.—*Gardening in the Tropics*, being a sixth edition of *Gardening in India*, by G. Marshall Woodrow. (Paisley: Alexander Gardner.)—*Bulletin of Miscellaneous Information*, Royal Botanical Gardens, Kew. Appendix I., 1911: Contains list of seeds of hardy herbaceous plants and of trees and shrubs for exchange with botanic gardens and with regular correspondents of Kew. (London: Parling & Son, Ltd.) Price 1d.—*The Development of British Forestry*, by A. C. Forbes. (London: Edward Arnold.) Price 10s. 6d.—*The Art of Publicity*, by Ernest A. Spiers. (London: T. Fisher Unwin.) Price 5s. net. This volume is intended to assist advertisers in regard to the selection

of the best media for advertising. It discusses the merits of bill-posting, advertising in periodicals, field advertising, circularising, and other forms of obtaining publicity.—*The "Borough" Pocket Guides: Richmond, Surrey*, No. 418. (Cheltenham: Edward J. Burrow.)—*The Melbourne Argus*. Tables of the Australasian Mails for 1911 (London: Australian Press Association, 80, Fleet Street.)—*Macmillan's Monthly List of New Books*, December, 1910.—*Annual Report of the Bureau of Industries, for the Province of Ontario, 1909*. (Toronto: Ontario Department of Agriculture.)—*Department of Agriculture, Trinidad*. Special Bulletin. (Annual). (Trinidad: Government Printing Office, 2, Victoria Avenue, Port of Spain.)—*Report of the Department of Agriculture and Immigration for the year ending December 31, 1909*. (Winnipeg, Manitoba: James Hooper.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

WHITE ROSES.—The contributor to the Rosary (see p. 410) when writing of white Roses, states that the variety Frau Karl Druschki was distributed in 1901. So I always thought. But the N.R.S. Catalogue says 1900. How do these discrepancies occur? I feel sure that the first we heard of the variety was in the summer of 1901 when King Edward admired it at one of the London shows. This happened before King Edward's coronation but after the death of Queen Victoria. Lady Quartus Ewart is a strong-growing, white Rose of the first excellence, and Mrs. Allen Chandler and Mme. Lacharme are to be recommended. *E. Kitley*.

MONTBRETIAS.—Among the notes on the culture of these generous plants, I do not observe any mention of their excellence for naturalisation. Planted out in the grass or by woodland walks, *Montbretia Pottii* and its vigorous varieties take care of themselves, and, to my mind, are far more decorative in such places than in the borders. They grow luxuriantly, but do not get so crowded at the roots as to flower less freely, which is their decided tendency in garden soil. They seem to benefit by competition with grass and other wild growth, and, with me at least, rabbits do not attack them. A woodland dell planted with *Montbretias*, *Aconitum autumnale*, *Lysimachia clethroides*, and *Funkia Sieboldii* is a beautiful sight in late summer and autumn. *Antholyza paniculata* takes equally kindly to wild life, and develops rich colouring in October. These notes apply to a cool soil and moist western climate. *Herbert Maxwell, Monreith*. ☺

—In your issue for December 3, p. 416, Mr. Johnson refers to my advice respecting lifting and storing away the bulbs for the winter. Many years ago, when I knew but little about *Montbretias*, the whole of our stock here was completely killed through leaving them in the ground during the winter months. Ever since, I have made it a practice to lift them after the growth is well ripened and store them away in a place of safety till the spring. I am convinced that the extra labour incurred by this practice is more than repaid, especially on wet, retentive ground. Even in situations where they survive if left in the ground, I have often observed that they make a thick mass of growth and small spikes with few flowers, compared with those which are lifted annually and replanted in the spring. On the same page, Mr. E. H. Jenkins mentions the plan adopted by Mr. Davison, of Westwick Gardens, and probably no man has achieved greater success with this class of plant than Mr. Davison, both as to their culture and the raising of new varieties. I have had the pleasure of visiting these renowned gardens, and I must confess I have never seen *Montbretias* so well cultivated anywhere else. *E. Beckett*.

SCARCITY OF ROSE FLOWERS ON THE RIVIERA.—Mr. Woodall writes me that owing to the terrible drought, Rose flowers, usually sold at 8 francs and 10 francs per 100, are now selling at 36 francs per 100. The country is now having plenty of rain, which is much needed, but the rains are spoiling the effects of the autumn gardens. *Georg. Paul*.

HOME-GROWN AND COLONIAL APPLES.—It is difficult to avoid a feeling of regret that such a superb collection of home-grown Apples as was presented at Vincent Square on November 22 from Kent could not have been staged at the Colonial Fruit Show held recently in the same hall. From the examples of Apples exhibited from British Columbia, Nova Scotia, or other parts of Canada, the British visitors, and Colonial ones also, may infer that we cannot grow Apples at home. Why is not the great exhibition of Home-grown Fruits held in October advertised as widely as are these Colonial Fruit Shows, and why not have a member of the Ministry to open the home show as Sir Edward Grey was advertised to open the Colonial show? No greater misfortune to home fruit culture could well happen than that consumers should conclude that home growing of fruits is played out, and that we have to depend on Colonial growers generally for our Apple supplies. It is in the matter of quantity but not quality that our Colonies beat us. With their land is cheap, and is not given over to myriads of useless purposes as so much of our good land at home now is. Colonel Burton's Apples were grown in a comparatively small garden. What we need is that such Apple gardens should be multiplied by the thousand. Then fruit growers at home would be fully able to compete with produce of the most highly-favoured of Colonies. Of Apples, we grow too few high-class varieties, and of the low class far too many. In that respect we may well set our own house in order, and influential encouragement may well conduce to great fruit-growing reforms in this country. D.

WASPS.—How advantageous it would be to gardeners and fruit growers if these destructive insects could be destroyed. For many years past they have spoiled nearly half our choice fruits. During the present autumn, when the sun blinds were taken down from the residence here, no fewer than 10 queen wasps were found in them. And yet not a single nest was seen in this locality. Where could they all have come from? Is it they never made their nests, owing to the wet season? J. Johnson, *The Lodge Gardens, Halesworth.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 6.—The last meeting of the year provided only a moderate exhibition. The big collection of Apples shown by British Columbia at the Colonial Exhibition remained on view, and there were one or two other exhibits from that show, so that the hall was fairly well filled. Apart from these, Orchids and Begonias constituted the more important displays. The FLORAL COMMITTEE granted three Awards of Merit—two to Chrysanthemums and the other to a form of Begonia Gloire de Lorraine. The ORCHID COMMITTEE granted four Awards of Merit and three Botanical Certificates.

There was little before the FRUIT & VEGETABLE COMMITTEE, and no award was made by this body to a novelty.

At the afternoon meeting in the lecture room Mr. Herman Senn gave a lecture on the "Cooking of Vegetables."

Floral Committee.

Present: Henry B. May, Esq. (in the Chair); and Messrs. Charles T. Drury, T. W. Turner, Jas. Walker, John Green, J. W. Barr, W. J. Bean, G. Renthe, J. F. McLeod, C. R. Fielder, W. Bain, H. J. Jones, Charles Dixon, J. T. Bennett Poe, Charles E. Shea, James Hudson, W. P. Thomson, W. A. Bihely, Wm. J. James, E. A. Bowles, R. C. Notcutt, R. W. Wallace, Herbert J. Cutbush, John Jennings, W. B. Cranfield, James Douglas, and E. H. Jenkins.

Messrs. T. ROCHFORD & SONS, Broxbourne, staged 18 large baskets filled with forms of Begonia Gloire de Lorraine; some delightful bunches of Lily-of-the-Valley, and varieties of Codiaums (Crotons). The Begonias resembled large posies of flowers, several plants being employed in each basket, and arranged so as to present a cone-like mass of blossoms. The varieties were Rochford's Masterpiece, having bright-rose flowers, and vigorous growths; alba grandiflora, rather purer white than Turnford Hall,

which was also included in the collection; amabilis, with larger flowers than the type and very strong flower stems; Rochford's variety (new) and Rothschild's variety, a finely-coloured flower and compact grower. (Silver Flora Medal.)

Messrs. W. CUTBUSH & SONS, Highgate, staged a miscellaneous collection of greenhouse flowering and foliage plants suitable for indoor decorations. Ericas were well flowered; small Orange trees were laden with their golden fruits, Skimmias, and other shrubs were bright with scarlet berries, and besides these was a large assortment of Palms, Ferns, Aralias and Dracaenas. This firm also exhibited a showy group of perpetual flowering and other types of Carnations, having large sheaves of such popular sorts as Enchantress, May Day, White Perfection, Beacon, Lady Elphinstone (new, a rich shade of pink), Mrs. Fortescue and Aiterglow. Novelties included several perpetual-flowering varieties of the Souvenir de la Malmaison type, of which King George (scarlet), Vasconitess Gochon (rose-pink), and Lady Miller (flesh tint) were remarkably effective. (Silver Banksian Medal.)

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, again showed their beautiful varieties of winter-flowering Begonias, some as basket plants, for which system of culture they are eminently suited, and especially the pink-flowering variety Agatha. The same firm showed pot plants of Chrysanthemums, heavily fruited trees of Citrus species, and varieties of Bouvardias. (Silver Flora Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, filled a large table with greenhouse flowering plants, Codiaums (Crotons), and Ferns. The exhibit was very attractive; the flowering subjects comprised bright batches of Begonias, Primula Seeboldii and Euphorbia pulcherrima (Poinsettia), these being interspersed with varieties of decorative Ferns. All the plants were well grown specimens. (Silver Flora Medal.)

Mr. L. R. BUSELL, Richmond, Surrey, again made an attractive exhibit with pot plants of Golden and Silver-leaved Ylves, Elaeagnus in variety, Aucubas, Euiya latifolia, golden-leaved Box, Ligustrum coriaceum, Osmanthus purpureus, Cupressus macrocarpa lutea and an assortment of horrid shrubs. (Silver Banksian Medal.)

Mr. FRANK LILEY, Les Hôches, Guernsey, showed varieties of single Chrysanthemums, including the new variety Strawberry.

A selection of Chrysanthemums was also displayed by Messrs. W. WELLS & CO., LTD., Mersham. Crimson Jewel (single, bronzy red, tipped with gold), Lady Funnis (see Awards), Caldonia (a large pink single variety) and R. F. Felton in yellow decorative kind are varieties worthy of special notice. (Silver Banksian Medal.)

Bronze Banksian Medals were awarded to two exhibits of floral paintings exhibited by Mrs. ORCH, Streatham Common, and Miss FARRER, Buntingford Gardens, respectively.

AWARDS OF MERIT.

Chrysanthemum Mrs. Gilbert Drabble (Japanese)—A very large creamy-white bloom, resembling the variety Mrs. Norman Davis, but larger. One of the flowers exhibited measured 2 feet 5 inches in circumference and nearly 1 foot in depth. The petals are of good substance. The variety promises to make a first-class exhibition Chrysanthemum.

Chrysanthemum Lady Funnis (single)—This is a late flowering variety of the exact colour seen in May Richardson, a shade of terra cotta on a yellow ground. Both these were shown by Messrs. W. WELLS & CO., LTD., Mersham.

Begonia Gloire de Lorraine Rochford's variety—A finely-coloured form of this well known Begonia, the shade in the young blooms being rose-red. It is the nearest approach to the "Red Lorraine" desired by cultivators. Shown by Messrs. T. ROCHFORD & SONS, Broxbourne.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. James O'Brien (hon. sec.), H. Little, W. Thompson, F. J. Hanbury, A. A. McBean, C. H. Curtis, W. Cobb, J. Charlesworth, J. Cypher, W. H. Hatcher, W. P. Beard, H. G. Alexander, A. Dye, W. H. White, Gurney Wilson, J. Wilson Potter, W. Bolton, C. Cookson, C. J. Lucas, H. Ballantine, Harry J. Veitch, and Sir Jeremiah Colman, Bart.

Lieut.-Col. SIR GEORGE L. HOLLFORD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander), displayed a small selection of rare Orchids, the finest of which was the rich indigo-blue Vanda cœrulea Bluebeard (see Awards). The others were Cymbidium Plato (Mastersii × Tracyanum), the pretty yellowish flowers dotted with red lines, and the lip white with purple blotches; Cypripedium nitens Læcanum var. aureum; C. Draco (Sallieri × Euryades), with handsomely blotched dorsal sepal; Laelio-Cattleya Arethusa and L. C. Elva, both finely-flowered specimens.

Lady AUDLEY NEELD, Grittleton, Chippenham (gr. Mr. Pitt), showed Cypripedium Draco splendens.

His Grace the Duke of MARLBOROUGH, Blenheim, Woodstock (gr. Mr. Hunter), showed Cypripedium Troilus var. Lord Nelson and C. Lord Ivor (insigne Harefield Hall × Hera).

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), displayed Laelio-Cattleya Gwendia, a beautiful primrose-yellow flowered form with gold veining and reddish flush on the lip; Cypripedium J. W. Mills, a delicately-tinted flower with a strong suggestion of C. insigne Sandersæ; C. Etouense, and C. Thalia The Baron, the last having a fine, darkly-blotched flower.

W. H. ST. QUENTIN, Esq., Stampton Hall, Yorks., staged an interesting exhibit of home-raised Laelio-Cattleyas.

SAMUEL LARKIN, Esq., The Ridgeways, Haslemere (gr. Mr. Hall), was awarded a Silver Banksian Medal for an effective group of Odontoglossums, Phalenopsis Schilleriana, P. Aphrodite Kimbesidenum with distinct rose marking on the lip; Cypripedium Zeus and other Cypripediums, Cymbidium giganteum and Wigamium, and various Laelio-Cattleyas and Cattleyas, one unnamed seedling having very dark flowers resembling those of C. Hardyana.

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier), showed a small group of rare Orchids, the noble specimen of Dendrobium speciosum nitidum gaining a well-deserved Cultural Commendation. The exhibit also included the large, pure white Cologyne Mooreana, Zygopetalum rostratum, Dendrobium tiffonum, Masdevallia Mooreana, M. Courtauldiana, a large form of Cirrhopetalum picturatum, Seraphyta multiflora, Calanthe Alpha, and others.

The Right Hon. Lord HILLINGDON, Hillingdon Court, Uxbridge (gr. Mr. A. R. Allan), was awarded a Silver Banksian Medal for a group of the best old form of Zygopetalum Mackayi, the plants having about 70 fine spikes of flowers.

Messrs. CHARLESWORTH & CO., Haywards Heath, were awarded a Silver-gilt Flora Medal for a group containing several new hybrids, including Laelio-Cattleya × Myrtha (L. C. Gottomina × C. Dowiana Rosita), a beautiful flower with gold-tinted sepals and petals flushed with rose and rosy-crimson lip with gold veining; L. C. Bola (L. C. callistoglossa × C. labiata), having a large flower coloured similar to labiata; and a fine yellow form of L. C. Golden Oriole. In the middle of the group were finely-flowered plants of Vanda cœrulea, and the white form of Odontoglossum audentissimum; at one end were hybrid Odontoglossums and Odontiodas; and at the other Laelio-Cattleyas, Sepia Cattleyas and other kinds. Other specially fine Orchids noted were Cypripedium Gaston Bultel, Odontioda Diana (C. Nozliana × O. amabile), and a number of finely-flowered plants of Oncidium preetatum.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for an interesting group containing several new species sent home by their collector Forget. A Cattletum from Peru had greenish-yellow flowers barred with red and an extraordinary, much-divided lip. Among Cypripediums we noticed C. Merlin var. Atlas, a fine, bold flower; and varieties of C. Læcanum, C. insigne and others. Some bright Laelio-Cattleyas, including Haroldiana and Statifera; varieties of Lælia anceps, the new white Heulletia Sandersæ, and some good Odontoglossums comprised other features of interest.

Messrs. STUART Low & Co., Bush Hill Park, Enfield, received a Silver Banksian Medal for an effective group, at the back of which were some good plants of Oncidium, including O. varicosum, and Dendrobium Phalenopsis. Besides these, the white-flowered Cattleya Dusseldorfei Undine, a good white form of C. labiata, a grand specimen of Cirrhopetalum Meduse, Bulbophyllum hirtum, a selection of Cypripediums, Masdevallia Lauchiana, M. tovarensis, Oncidium

ornithorynchum album, O. cheiroporum, Houlletia Sanderae, and Grobya galeata were noticed.

Messrs. MANSELL & HATCHER, Rawdon, Yorks., received a Silver Banksian Medal for a group of excellent *Cypripediums*, amongst which were fine examples of *C. insigne* Bohnhoffianum, *C. i. Sanderae* Harefield Hall, *C. Hoyleanum* (with a large and attractive flower), *C. Leeannum* Corona (with emerald-green base to the large white dorsal sepal), *C. F. L. Ames*, and a plant of pure white-flowered *Spathoglottis plicata* alba.

Messrs. J. CYPHER & SONS, Cheltenham, were awarded a Silver Banksian Medal for a group of good *Cypripediums*, amongst which varieties of *C. Leeannum* and *C. Charlesianum* Cypher's variety were very fine. *C. Actæus* Miss Carr is an attractive variety. Besides these were observed *C. Thalia* giganteum, *C. Mme. Jules Hye*, the delicately-coloured *C. Actæus* virginale, *C. triumphans*, *C. Leeannum* Corona, *C. Mines* Veitchii, and *C. Vandyke*.

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, staged a good group, for which a Silver Banksian Medal was awarded. The best plants were *Cypripedium* *Thalia* Mrs. Francis Wellesley, still one of the most beautiful of *Cypripediums*, and two new and pretty hybrids—*C. Captain Spender Clay* (*villosum* amiferum ×

staged a group of *Cypripediums* and finely-coloured varieties of *Laelia anceps*.

Messrs. W. B. HARTLAND & SONS, Ardcairn, Ballintemple, Co. Cork, showed *Cypripedium* *Minos Youngii* in fine condition, *C. Thalia* Mrs. Francis Wellesley, *C. insigne* gigantea, and *C. Euryades splendens*, the last with a finely-developed claret-red dorsal sepal tipped with white.

Messrs. JONES, HOWES & CO., Elmdon Nurseries, Kenilworth, exhibited a distinct white form of *Vanda corulea* with a violet-coloured lip.

Mons. MERTENS, Mont. St. Amand, Ghent, staged a selection of handsome hybrid *Odontoglossums*.

HENRY LITTLE, Esq., Baronsalt, Twickenham (gr. Mr. Howard), showed *Cypripedium* *insigne* "Little's variety," which is a distinct form of the *C. insigne* Chantini class, there being a goodly proportion of white in the dorsal sepal.

Messrs. JAS. VEITCH & SONS, Chelsea, showed *Cypripedium* (*Actæus* × *insigne* Harefield Hall), a finely-shaped flower of good substance and markings, the upper half of the dorsal sepal being white.

RICHARD LE DOUX, Esq., Marlfield, West Derby, Liverpool, showed *Cypripedium* *Richard le Doux* (*Leeannum* giganteum × *Prospero* majus).

Cypripedium *Waterloo* (Mrs. Wm. Mostyn × *Ranjitsinhji*), from Mr. E. V. Low, Vale Bridge, Haywards Heath.—A handsome and distinct *Cypripedium* with large, white, dorsal sepal, the base being clear purple, the petals and lip yellowish, tinged with light purplish brown.

BOTANICAL CERTIFICATES.

Angraecum pellucidum, from J. S. BERGHEIM, Esq., Belsize Court, Hampstead.—A remarkable species from West Africa. Phalenopsis-like in growth, and with three long pendulous racemes of semi-transparent flowers of a cream white, tinged on the sepals with salmon colour, the lip being fringed.

Dendrobium speciosum nitidum, from Sir JEREMIAH COLMAN, Bart., V.M.H. (gr. Mr. Collier).—The plant is taller and more slender than the variety *Hillii*, and has numerous large spikes of cream-white flowers.

Brassia Forgetiana, from Messrs. SANDER & SONS.—The growth and individual flowers somewhat resemble *B. maculata*. The flowers are greenish-white, with chocolate bars on the sepals and petals: the crest is orange-coloured.

CULTURAL COMMENDATION

To Mr. W. H. White (Orchid grower to Sir TREVOR LAWRENCE, Bart., K.C.V.O.), for a specimen of *Lycaste costata* bearing 21 flowers.

To Mr. Bristow (gr. to Mrs. TEMPLE, Groombridge), for a plant of *Laelia anceps* *Amesiana* Temple's variety, bearing many flowers.

To Mr. Collier (gr. to Sir JEREMIAH COLMAN, Bart., V.M.H.), for *Dendrobium speciosum nitidum*, the plant bearing 46 flower-spikes.

To Mr. Balmforth (gr. to FERGUS MENTEITH OGILVIE, Esq., The Shrubbery, Oxford), for a fine, deep-red variety of *Odontioda Charlesworthii* with 17 flowers on a single spike.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the Chair); and Messrs. J. Cheal, A. Dean, E. Beckett, G. Woodward, J. Willard, H. Parr, A. R. Allan, H. Markham, J. Vert, P. D. Tuckett, G. Reynolds, J. Jaques, O. Thomas, W. Poupart and J. Davis.

The Chairman reminded members that at the next meeting on the 20th inst. there would be no exhibition, but that the Committee would sit as usual.

Mr. W. BAYLOR HARTLAND, Cork, Ireland, sent further samples of Apple *Ard Cairn Russet* from trees grown both in clay and in loam. Those from the loamy soil were the largest and best flavoured fruits.

An Apple named *Best's Seedling*, not unlike *Rosemary Russet*, was submitted for award, but the fruits were soft and somewhat shrivelled.

EXHIBITION OF COLONIAL FRUITS.

DECEMBER 1, 2, 3.—The 14th exhibition of Colonial produce, held under the auspices of the Royal Horticultural Society, was opened by Sir Edward Grey. The President, Sir Trevor Lawrence, occupied the chair, and amongst those present were the Agents-General for British Columbia and Tasmania, the Mayor of Westminster, the Hon. J. H. Turner, the Hon. Price Ellison, Sir Daniel Morris, Sir Albert Rollit, and the Rev. W. Wilks (secretary).

The list of lectures included "Cider Making," by Mr. B. T. P. Barker and Mr. J. Ertle; "Methods of Growing Fruit in the Colonies," by Mr. Henry Hooper; "The Life of a Fruit Farmer in East Kootenay," by Mr. Tormay; address to small growers, by Mr. W. Staley Spark; and "Fruit Bottling," by Mr. W. H. Plowman. Demonstrations on "The Preservation of Fruit by Drying" were given by Messrs. McDoddies at their exhibit in the Large Hall.

Taken all round, the exhibition was the most successful of the series, but it was not so representative as some of the former shows, being mainly a Canadian—and particularly a British Columbia exhibition. The displays from British Columbia so surpassed all others that without them the exhibition would have been quite commonplace. It was a magnificent effort (see fig. 182), intended to show what can be done by that part of the Dominion in the way of fruit culture, and in Apple-growing especially. Gardeners all over the country have had an opportunity recently of seeing what

THE COLONIAL FRUIT SHOW.

FIG. 182.—PORTION OF THE BRITISH COLUMBIAN EXHIBIT.

Fairrieanum) and *C. Mrs. Spender Clay* (*Actæus* Drewett's variety × *Fairrieanum*), *C. Germane* Opoix Westfield variety was shown well, also *C. Niobe* Westonbirt variety, *C. Euryades splendens*, *C. Thalia* giganteum, and *C. vexillarium superbum*.

Messrs. STANLEY & CO., Southgate, staged a small group, which included *Coleogyne fusciceps*, *Cypripedium* *Minos Youngii*, *C. Mme. Jules Hye*, *C. insigne* Brilliant (with fine, bright-reddish-purple markings), *C. insigne* Harefield Hall, and a promising white variety of *Cattleya labiata*.

Mr. E. V. Low, Vale Bridge, Haywards Heath, staged a small group, the principal plant in which was the new *Cypripedium* *Waterloo* (see Awards). Others noted were *C. Earl of Tankerville*, some good seedling *Cypripediums*, and the scarlet-coloured *Sophracattleya* *Doris*.

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham (gr. Mr. J. M. Black), showed a selection of hybrids, including three of his beautiful white-petalled strain of *Cattleya* *Mary de Wavrin* (with handsome purplish-rose and gold-veined labellums), the pretty rose-red *Sophracattleya* *Wellesleyae* perfecta, and two good plants of *S. C. Saxa*.

Messrs. J. & A. A. McBEAN, Cooksbridge,

R. BROOMAN-WHITE, Esq., Arddarroch, Garelochhead, sent a good example of the original form of *Oncidium sarcodes* and cut spikes of *Odontoglossums*.

AWARDS.

AWARDS OF MERIT.

Vanda corulea *Bluhardii*, exhibited by Lieut. Col. Sir GEORGE L. HOLLARD, K.C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—The flowers of this striking variety are almost circular, broad in all the segments, the tone is a clear indigo-blue, with a little white showing between the veining. The lip is coloured dark-violet.

Odontoglossum Rouge Dragon (*Phoebe* × *ardentissimum*), from W. R. LEE, Esq., Plumpton Hall, Heywood, Lancashire.—A showy hybrid, the flowers being heavily blotched with deep reddish-crimson; the tips of the sepals and petals and the lip show the influence of *O. cirrhosum*, obtained through *O. Gladys*.

O. Ceres Plumpton Hall variety (*Rossii* × *Rolfea*), from W. R. LEE, Esq.—The largest and best variety of this pretty hybrid, the broadly-ovate lip being tinged with rose and the basal halves of the sepals barred with red.

British Columbia can produce in Apples, for at the Chrysanthemum shows in London and the more important of provincial exhibitions, fine collections of Apples have been staged by the Government of this Canadian province. But on this occasion British Columbia surpassed itself. In size, no exhibit of Apples in Great Britain

Garden salesmen, and firms dealing in Colonial produce.

THE NATIONAL FRUIT AND CIDER INSTITUTE, Long Ashton, Bristol, showed samples of Cider Apples, cider juice, in various stages of fermentation, and the pomace, before and after pressing.

Mr. W. H. PLOWMAN, who delivered lectures on "Fruit Bottling" during the exhibition, showed types of bottles, old and new, sterilising apparatus, and samples of bottled fruits.

Messrs. McDODDIE, Addington Square, London, showed compressed vegetables.

AWARDS.

The principal Awards are as follow:—Gold Hogg Memorial Medal to the BRITISH COLUMBIAN GOVERNMENT for Apples; Gold Medals to the WEST INDIAN PRODUCE ASSOCIATION for West Indian produce, and to Messrs. GARCIA JACOBS, Covent Garden, for Apples; Silver Cups to Messrs. R. H. FORTUNE and J. W. COCKLE, British Columbia, for dessert Apples; Silver-gilt Knightian Medals to SALMON ARMS, British Columbia, and Messrs. GILLMAN, New Brunswick, for Apples; Silver-gilt Banksian Medals to Mrs. JOHN SMITH, GRAND FORKS DISTRICT, and VANCOUVER ISLAND DISTRICT, British Columbia, for

Apples; Silver Knightian Medals to Mr. W. H. PLOWMAN, Westminster, for sterilising outfits, and Messrs. McDODDIE, Kennington, for dried fruits and vegetables.

THE LECTURES.

On the opening day, Mr. Henry Hooper delivered an address on "Methods of Fruit Culture in the Colonies." The lecturer, a fruit-grower of long standing in the colonies and abroad, spoke from personal experience. He said, that, although it was generally believed that success in fruit growing in so many of the colonies was to be attributed to "soil" and "climate," it was due to the combined efforts of all concerned in the industry; to the uniform efficiency and thoroughness of the cultural methods employed; to the happy relations existing between science and practice in colonial horticulture; and to the paternal assistance, supervision, and legislative support of the State. "Community of interest engendered community of action."

Mr. Hooper urged the fruit-growers of England to accept the splendid object-lesson afforded them, and to build up a great fruit industry in this country by the same means adopted by our colonial kinsmen, and said that the only obstacle to the doing of it lay in the apparently constitutional disability to combine and organise which characterises the home-staying Britisher generally and the rural Briton in particular.

—On each of the three days of the exhibition, Mr. J. A. Tormey gave a lecture dealing with fruit-farming in the district of East Kootenay, British Columbia (see figs. 183, 184). Mr. Tormey's object was to direct attention to that part which, being the last of the fruit-growing districts of the colony to be supplied with irrigation facilities, is the least known, whereas it ought to be the best known, as land there can be purchased on very favourable terms, and the local markets are the finest in British Columbia. He said that Strawberries and all bush fruits grow in profusion, whilst

Cherries, as well as Apples, especially such red-skinned varieties as Jonathan, McIntosh Red, Rome Beauty, Winesap, Wealthy and Gravenstein, will grow there in perfection. Mr. Tormey claimed that these advantages, coupled with an ideal climate, place the district in the forefront of the fruit-growing parts of British Columbia, and that East Kootenay offers the greatest opportunities to the man of small capital. Mr. Ernest H. Arnott, the managing director of the British Empire Agency (British Columbia), Ltd., who is returning to East Kootenay in March next, knows the country intimately, and will be pleased to give information to anyone who cares to communicate with him.

BIRMINGHAM AGRICULTURAL.

NOVEMBER 26-DECEMBER 1.—Potato competitions were held in connection with the 62nd exhibition of the Birmingham Agricultural Society, in Bingley Hall, on these dates. The potatoes formed an interesting feature amidst the animals, poultry, and farm produce generally, there being close upon 2,700 tubers staged in 10 classes. Generally there were seven and eight competitors in each class, but most of the principal prizes were won by Mr. W. COLEMAN, 4, Hunter Street, Buckingham, who led in the classes for twelve, six, four, two long, two round, and one dish of kidney-shaped tubers. In the class for 12 varieties the 1st prize was £5, the varieties shown by Mr. COLEMAN being Dalmeuy Beauty, Provost, Scot, Mr. Bresse, Purple Perfection, Factor, Talisman, Up to Date, King Edward VII., Table Talk, and Queen of the Veldt. The 2nd prize was won by the Duke of PORTLAND, Welbeck Abbey, who staged very fine specimens of White City, Sherwood (new), Abundance, Windsor Castle, Superlative, and White Kidney; 3rd, Mr. J. W. NEEDHAM, Wildsworth, Gainsborough.

Mr. NEEDHAM, who was placed second for six varieties, had fine tubers of Table Talk, Up-to-Date, King Edward VII., and Factor, and also

FIG. 183.—BRITISH COLUMBIA: A SETTLER'S HOME IN EAST KOOTENAY.

has ever approached this one. Imagine 1,100 cases of Apples, most of them weighing 40 lbs. each, and aggregating about 20 tons, piled up in one huge exhibit. They were arranged tier upon tier, in half-circular fashion, reminding one of the grand orchestra at the Crystal Palace, with boxes of Apples for singers, and surmounted by a phalanx of Union Jacks and other emblems in place of the great organ. Quite one-third of the Hall was required for the exhibit, and, to make it more exclusive, the space was railed off by a rustic fence, with arches as entrances. Even the Annexe at the side, where the Orchid Committee usually sits, was taken over by British Columbia for the purpose of showing visitors, by means of the cinematograph, the scenery and industries of the colony. Judging by the pictures, wonderful crops of Apples are obtained in British Columbia, and the rate of picking the fruits appeared even more wonderful! Turning to the Apples, the first thing that impressed us, after numbers, was the colour. Nowhere in this country—not even in Kent—do we produce Apples of such deep reds. There were a few sorts with clear, golden skins, but, generally, the fruits were coloured on all sides. Sometimes they were deep maroon, reminding us of a dark Tulip. A few varieties we specially noted were (*red*) Spitzenberg Wagner, Jonathan (very dark coloured), Ben Davis, Blue Pearmain, Gano, King of Tompkin's County, McIntosh Red; (*yellow flushed with red*) Winter Barrana, Rome Beauty, Red Cheek Pippin, and (*yellow*) Grimes' Golden, this being of fine flavour. Not a spotted or imperfectly-formed fruit was observed, not a bruised one either, so well had the packing been done. They were gathered about six weeks ago, and the time occupied in transit was just over two weeks. The Council marked its appreciation of this fine effort by having the Hogg Memorial Medal struck in gold, for the first time, as a fitting award.

Taking the other portion of the show, the next largest display was made by the province of New Brunswick, and here again the exhibit was of Apples; but the quality of the fruits was not to be compared with that of those noticed above, whilst the packing and grading left much to be desired. This colony is young in fruit-growing, but it possesses splendid possibilities in this direction, and there is a good market at hand. We were informed that the trees bear very heavily, and, where spraying and other up-to-date methods are practised, the results are remarkable. New Brunswick contains six million acres of land suitable for orchards.

DOMINICA sent Limes and other fruits of the Citrus family, but the majority were delayed in transit, and were only staged on the second day.

There were exhibits staged by shippers, Covent

FIG. 184.—BRITISH COLUMBIA: PLANTATIONS OF ONIONS, STRAWBERRIES, AND POTATOS AT EAST KOOTENAY, PRODUCING AN AVERAGE RETURN OF OVER £70 PER ACRE.

in the class for four varieties, staging Evergood and Mr. Bresse in fine condition. He was placed 2nd in the class for "any variety not yet in commerce" with Trout Cropper, a handsome, long, pebble-shaped white Potato.

Another successful exhibitor was Mr. J. NEAVESON, Eye, Peterborough, who won the 1st prize for four firm varieties, staging bulky specimens of King Edward VII., Evergood, Satisfaction, and Langworthy; the 2nd for one dish of a round variety, with Britannia; and the 3rd for six and four dishes respectively.

Mr. THOS. BANNISTER, Malthouse Farm, had the best dish of a round Potato in Table Talk.

Mr. BEN PARKER, Scotforth, secured the premier award for "any variety not yet in commerce."

Agricultural roots in competition numbered 1,100 specimens, in addition to some 60 bushels of corn.

A number of trade exhibits were staged in the gallery, a notable display being made by Messrs. E. WEBB & SONS, Stourbridge.

FRUIT CONGRESS AT WYE.

DECEMBER 2.—A Fruit-growers' Conference—in conjunction with the National Fruit-growers' Federation—was held at Wye College, Kent, on this date. About 600 persons were present, the majority being fruit farmers in the county.

In introducing as chairman, Mr. C. S. Martin, of the Toddington Orchard Co., Gloucester, President of the Federation, Mr. M. J. R. Dunstan, Principal of Wye College, announced that application had been made to the Development Commissioners for a grant to establish a Fruit Experimental Station on good fruit-growing soil in Kent.

Mr. C. S. Martin, in opening the Conference, mentioned the aims of the Federation and the useful work it had already done. He alluded to the necessity at the present time for combination among fruit-growers, and urged all those present who were not members to join the Federation.

The first subject discussed was the grading and boxing of English Apples. Mr. J. A. Raynham, Hon. Sec. of the Marden and District Fruit-growers' Association, pointed out that the older orchards had contained too many varieties of Apples, many of them unsuitable. Then, too, growers had only recently learned how to keep their Apples free from disease. Following advice obtained from Wye College he had found himself able, by the use of Bordeaux mixture, to grow during the past few years Apples free from "black spot," with the result that the Apples could be graded, and instead of fetching 3s. to 6s. per bushel as formerly now made 6s. to 10s. Most varieties should be packed in boxes in three grades; some, however, only in two. Very choice fruits of Cox's Orange Pippin, Quarrenden, and Worcester Pearmain should be packed in dozens in boxes. All boxed fruit should be distinctly labelled with an attractive label, and sent to the same buyer for several seasons—in this way a reputation was established. He expressed the opinion that in the near future all first-grade Apples will be sold in boxes. His association, at its fruit show, has offered prizes for boxed Apples, and obtained good entries—13 entries in 1909 and 17 entries in 1910. His experience was that in the early part of the season it certainly paid the commercial grower to box Apples.

Mr. C. S. Smith, Lecturer in Commercial Fruit-growing at Wye College, remarked that the foreign supply of Apples arriving in boxes was teaching the English grower a lesson. The latter must either allow the foreign grower to monopolise the market, or rise to the occasion. An important fact to remember is that the grower wants non-returnable packages; English Apples should be in grocers' shops in neat packages, attractively labelled. When the Apples are being packed, they should be divided into two grades, and the best only put into boxes. These latter should be graded into three or four sizes, and properly and carefully packed on different systems, dependent on the size of the Apple; on the whole, the "diagonal pack" was preferable to the "straight pack." Wood-wool should be used at top and bottom, but it was not advisable to wrap each individual Apple in paper; the first packed layer should become the top layer of the box.

Miss J. Smith, of the Horticultural College, Scarborough, mentioned that they had found it pay to box the best Peasgood's Nonesuch. The best Apples, packed by the dozen in boxes, had realised 2s. a bushel more than the same quality sold in half-sives. On the contrary, Bismarcks when boxed had not sold for so much as

when in baskets. Mr. C. Murdoch, of Linton, near Maidstone, said that in his experience it paid to box early dessert Apples, an increase of 2s. a bushel being obtained. Mr. C. S. Martin remarked that he had found it pay handsomely to box Cox's Orange Pippin. Mr. F. Ivo Neame, of Faversham, pointed out that in British Columbia and other places legislation was employed in the form of a "Sales Act," under which Apples were graded by statute; this ensured an absolutely regular quality, and accounted for the well-known good supply and demand. He did not suggest legislation for this country, but a regular supply of well-graded Apples must be their aim. He personally boxed all his sound Apples, both eating and cooking, with satisfactory results as to prices obtained.

Mr. E. A. Bunyard considered that the crux of the matter was the distribution of their Apples. He believed that, by boxing, growers would obtain a new and very important market by means of the grocer.

Mr. H. M. Cobb, of Hingham, Rochester, reported that he found Beauty of Bath, Quarrenden, Gascoyne's Scarlet, Worcester Pearmain, and Charles Ross the best varieties to box. The boxes he used measured 19½ inches by 2½ inches by 4½ inches, with iron clasps on the corners.

Mr. T. J. Pompart, of Covent Garden, remarked that there was undoubtedly a great future for good English Apples in boxes—but not for bad ones. It was necessary that a regular supply should be sent in. Mr. Bernard Champion, fruit-grower and salesman at Covent Garden, reported that of the boxed Apples which had passed through his hands some had sold extremely well, while some had realised only the same price as when in baskets. What is wanted, he said, is for one or two big growers to stick to the game tight through the season, as the big markets do not respond to "ticking."

ADVANTAGES OF CO-OPERATION.

Very interesting papers were then read by Mr. C. F. Hooper, Chairman of the Pershore Co-operative Fruit Market, and Colonel A. C. Borton, President of "Yalding Farmers, Ltd.," in which striking instances of successful co-operation among growers were given. Mr. W. Fearnside, Hon. Sec. of the Pershore Co-operative Fruit Market and Mr. W. H. Press, of the Agricultural Organisation Society, opened the discussion following these papers.

Mr. F. Ivo Neame read a paper on "Commissions for the Selling of Fruit in London and the Provinces." A drastic change in the system of selling fruit in the London markets was advocated. Dealing with the subject as a large fruit-grower, Mr. Neame pointed out the great advantage—particularly in times of glut—of fruit being sold on a percentage basis of commission instead of by fixed charges per package.

COMMERCIAL VARIETIES OF APPLES.

After luncheon, the first subject dealt with was the best commercial varieties of Apples. Mr. C. S. Smith, of Wye College, first gave his views, founded on experience as a grower in the Maidstone district. It was obvious, he said, that locality and soil must influence to a certain extent the choice of varieties. Far too many varieties were being grown at present. In his opinion, Apples could be divided into four classes: *Class 1.*—Varieties thoroughly satisfactory, which any grower may reasonably expect to be able to grow and to market with profit. In this class there were enough cooking varieties available, but there was a decided lack of dessert varieties (medium and late). For cooking: Bramley's Seedling, Lord Derby, Lane's Prince Albert, and Grenadier were selected. For dessert: Beauty of Bath and Gladstone. *Class 2.* consists of varieties which are commercially suitable only in some districts, being unsatisfactory in others. In this class was placed Early Julian, Lord Grosvenor, Early Victoria, Stirling Castle (should be on crab stock and is suitable only for good soils, but is liable to "canker"), Bismarck (should be pruned hard and tipped every year), Newton Wonder (should be on Paradise stock, is apt to have "black spot" in unkindly seasons), Worcester Pearmain (tree should be thinned and kept open, is liable to "black spot," and is now showing indications of "cankering," suggesting that it is now "played out" like Wellington), King Pippin (subject to "canker" and "black spot"),

Allington Pippin (liable to be too large for dessert). *Class 3.*—Varieties which are called "commercial," but which should not be planted by the commercial grower: Wellington, Cox's Orange Pippin, Ribston Pippin, Lord Suffield, Peasgood's Nonesuch, Cox's Tomona, Devonshire Quarrenden, Gascoyne's Scarlet, Warner's King, Tower of Glamis, Summer Pippin, and Eckhville. The above are the most frequently recommended of the commercially useless varieties. *Class 4.*—Varieties, of more or less recent introduction, which show promise but which are not yet completely tested. Cooking: Norfolk Beauty, Hector Macdonald, Edward VII. Dessert: Hunt's Early (opening with Beauty of Bath), Langley Pippin, Ben's Red (flavour poor), and James Grieve (liable to "canker," perhaps due to over-manuring), the last two may prove valuable to replace Worcester Pearmain. For a late variety Baumann's Winter Renette should be tried. The varieties Houblon, Coronation, Charles Ross, and Christmas Pearmain appear to be of no commercial value. The need for an English Apple to be produced which could compete with the Newtown Pippin was emphasised; such an Apple would put thousands of pounds into the pocket of the English grower.

Mr. George Mount, of the Canterbury Nurseries, opened the discussion by remarking that he occupied a curious position, while as a nurseryman he wanted to sell as many different varieties as possible, he was obliged to say, speaking as a commercial fruit-grower, that he had found by experience that it paid to grow only a few commercial varieties of Apples. He strongly supported Mr. Smith in the view that too many varieties were being grown. He considered that the following 12 varieties (six kitchen and six dessert) were amply sufficient to choose from: Kitchen: Bramley's Seedling, Newton Wonder, Lord Derby, Grenadier, Lane's Prince Albert, and for the sixth either Bismarck or Stirling Castle (the latter on Crab stock). Dessert: Worcester Pearmain, which was still in his opinion the best variety out of which to make money; he did not consider that in his district (East Kent) this variety was deteriorating and "cankering"; as for "black spot," he had completely cured it by spraying with Bordeaux mixture made as recommended by Mr. Salmon, of Wye College; Allington Pippin (to be planted in the place of Cox's Orange Pippin, which is entirely unsuitable for commercial purposes), Beauty of Bath, Gladstone, James Grieve (which was good so far as it had been tested), and Miller's Seedling, a new Apple of good flavour, which already, in spite of its light colour, was coming into favour with the public, being preferred, he found, to Worcester Pearmain. Mr. Mount quoted instances of plantations on his own fruit farm, which showed how profitable Apple growing may be if the right varieties are grown. He mentioned that he was planting up 60 acres more this winter with 11 of the above-mentioned varieties. Bramley's Seedling or Worcester Pearmain could be worked on Cox's Orange Pippin.

A long and animated discussion followed. Mr. B. G. Berry, of Selling, stated that he had found Blenheim Pippin and Dumelow's Seedling (Wellington) do well in his district on half-standards. Mr. J. D. Maxted, of Littlebourne, observed that "Smith's New Ingestre" (which was reported not to crop well in the Maidstone district) did well in East Kent. Mr. B. G. Berry confirmed this, mentioning that it fetched 8s. a bushel with him.

Mr. F. V. Theobald, Vice-Principal and Entomologist at Wye College, then dealt with the damage done to fruit trees by Thrips ("Thunder-Fly"). This insect attacks the Apple, Pear, Plum, Raspberry, Loganberry, and Strawberry. The winged female Thrip enters the opening buds, and then, using its conical mouth, lacerates the buds so that the latter die soon after opening. The leaves and blossoms are also attacked in the same way; these become distorted in shape; Pear leaves become cup-shaped, and Plum leaves become curled and twisted. The Thrip then lays its eggs in slits cut in the young leaves and sprigs. The larvae, when hatched, are pale and wingless; they feed in the blossom, and as the petals dry off feed under their shelter on the young fruit. They also feed on the anthers, style, &c., of the flower and become black; this is seen especially in the Strawberry. The laceration caused by Thrips on young fruitlets may be such that the fruitlets crack and fall prematurely, or if the

damage done is only slight, then one finds on the larger fruitlets, small dark or pale areas or scars, which eventually disfigure the fruit or even completely ruin it. The larva, when mature, once the soil and produce there a pupal stage; then the winged Thrip appears again. The winter is passed in the larval state in the earth. Spraying affects Thrips but little, because of their sheltered positions. Soil treatment in winter would seem the best way to deal with this pest.

Mr. C. S. Martin remarked that in his district Thrips had become a serious pest. Neither lime-sulphur washes, nor the soft soap and quassia wash did any good. When Plums were attacked, the blossom was given the appearance of having become double. On Black Diamond the Thrips made the Plums drop off whilst still small.

FUNGUS DISEASES OF FRUIT.

Mr. E. S. Salmon, of Wye College, in a lecture on "Fungous Diseases of Fruit," dealt with a disease which, during the past few years, has been doing great damage to young fruit trees in certain districts in Kent and Worcestershire, particularly Plums, although Cherries and Apples are also attacked. This disease is caused by the fungus *Eutypella Prunastri*, which attacks the stems of young trees up to 10 years of age. It is not uncommon for half the trees in a plantation or orchard to be killed. Details were given of a case of a mixed plantation of Plums near Canterbury, consisting of 1,200 Victorias, 1,200 Czars, 1,000 Monarchs, and 150 Rivers. The Victorias were attacked first, and 200 died each year for four years, and about 350 in the fifth year, so that practically a clean sweep was made of all the Victorias; of the 1,200 Czars, 300 died; of the 1,000 Monarchs, 50; while none of the Rivers was attacked. By means of lantern slides, the appearance of the disease on the stem of the trees was shown; the first indications of its presence are dried-up patches followed by the appearance of clusters of minute slit-like openings, through which the spores of the fungus exude in tendril-like coils. Sooner or later the tree dies, and then new fructifications are formed (bursting through the bark) in which the winter-spores of the fungus are found. Spraying is useless, and no cure is known; if the disease is recognised and the tree destroyed promptly (for no tree recovers) before the spores are produced, the attack in a plantation is checked, but if this is not done, the disease becomes epidemic.

The life history of the fungus which causes "black spot" or "Apple scab" was then described in detail. Instances were given of farms where the Apple crop formerly infested has been kept clean by the use of home-made Bordeaux mixture (prepared from stock solutions).

Mention was made of the discovery this autumn of the fungus *Leptothyrium* on English Apples. This fungus is the cause of the "sooty blotch" disease, well known in America. A full and illustrated account of this new disease will be given in an early number of this journal.

The results of spraying experiments were mentioned, in which the susceptibilities of different varieties of Apples to injury from Bordeaux mixture were demonstrated. Thus, under the same weather conditions and with the same mixture, the foliage of Duchess Favourite was severely scorched, while that of Warner's King remained uninjured. When a plantation of mixed varieties is sprayed with Bordeaux mixture, the grower should note its effect on the varieties. Where injury occurs, a lime-sulphur summer wash should be tried experimentally.

The remaining part of Mr. Salmon's paper, and a paper on "The Chemical Analysis of Soils and its Use to the Fruit-grower" were postponed, owing to lack of time, till the annual meeting of the National Fruit-growers' Federation, to be held in London next February.

NATIONAL CHRYSANTHEMUM.

DECEMBER 5.—A conference was held under the auspices of this Society, at the Essex Hall, on the above date. There were two sessions of the conference—one in the afternoon and the other in the evening. In addition, there was a special meeting of the Floral Committee and a small exhibition.

Exhibits of Chrysanthemums were shown by Mr. NORMAN DAVIS, Framfield Nurseries, Sussex (Silver-gilt Medal); Messrs. W. WELLS

& Co., Meistham (Large Silver Medal); Messrs. PHILIP LADDS, Swanley (Silver-gilt Medal); Mr. R. B. LEECH, East Purwich (Silver Medal); and W. W. MAXN, Esq., Bexley (gr. Mr. J. Simon) (Silver Medal).

THE CONFERENCE.

The afternoon session of the conference was presided over by Sir Albert Rollit, LL.D., D.C.L., President of the Society.

The first paper was read by Mr. Norman Davis, and was entitled "The Culture of Japanese Chrysanthemums for Exhibition." Mr. Davis remarked that one of the principal points to remember at the commencement was the source from whence the cuttings are obtained, rather than their size; therefore, those who wished to prove successful should endeavour to procure their stock from plants which have previously given the most perfect blooms. He advised occasional resting, by planting out, as a means of building up the constitution of the plants. In order to have a perfect flower, it was first necessary to obtain a perfect plant, and, having done this, to take steps to properly mature it. Root restriction, taken in conjunction with bud formation—that is, taking care to have the pots well filled with roots by the time the flower-buds are formed—was of great assistance in the matter. Amateurs were warned against over-feeding, but a fairly rich soil was recommended for potting, in preference to poorer soil and top-dressing that might be given later. Mr. Davis stated that damping of the blooms is more often caused by immature wood and over-feeding than by external conditions. The external conditions most fatal were sudden changes in temperature. In respect to colour, Mr. Davis stated that highly nitrogenous foods were detrimental to obtaining the best results.

A discussion followed, in which Messrs. Moorman, Runciman, Stevenson, and others joined.

At this stage of the proceedings the President vacated the chair, which was taken by Mr. Thos. Bevan.

The second paper, on "The Culture of Incurved Chrysanthemums for Exhibition," was read by Mr. W. Higgs. The object of the cultivator, said Mr. Higgs, was to adopt measures, from November of one year to November of the following year, calculated to produce perfect flowers. Neglect in attending to the cuttings or the young plant was just as fatal as neglecting the blooms. The growths must be kept healthy during the summer, and at no time should they be allowed to suffer a check. The keynote to success was careful cultivation day by day throughout the whole period of growth. He had studied the points of Incurved blooms for many years, and, on looking back at the old varieties, notably the Queen family, the Princess of Wales and its sports, the Teek family, and others, it was evident that great advances with respect to size and colour had been made. Had not Japanese blood been worked into them, the varieties to-day would have been smaller and less bright in colour. As regards shape, "Queens" of 14 or 15 years ago were models of what an Incurved flower ought to be. No variety could be nearer perfection than a well-grown specimen of Lord Alcester.

A discussion followed, in which Messrs. Tyler, Moorman, Ladds, Jones, Stevenson, Cragg, and Felton took part.

EVENING SESSION.

The evening session was commenced at 6.30 p.m. Mr. Thos. Bevan in the chair. Mr. H. J. Jones read the first paper on "Methods of Exhibiting Japanese and Incurved Chrysanthemums."

Mr. Jones said that where the pointing of exhibits is not observed by judges at Chrysanthemum shows, an exhibitor who makes the most of the colour of his blooms and studies their skilful arrangement in his stand, frequently scores over his rivals having heavier flowers, but who fail to recognise the value of these arts of exhibition. No one can deny that an exhibit that is made to present a bright and attractive appearance often impresses the judges most favourably, although heavier blooms of less pleasing colour-display, and less attractively set up, are shown in competition with them.

Quality, however, should always come first. Quality should not mean size of bloom only. An exhibition Chrysanthemum bloom of good quality should be of large size, even form, of

good colour, deep in proportion to its breadth, and, when finished, of perfect contour. Therefore, when considering the methods of exhibiting Japanese and Incurved Chrysanthemums, it is of the highest importance that the foregoing points should be carefully observed.

Whilst a great deal of prejudice appears to exist in the minds of some of those who are responsible for the government and control of the leading shows in regard to exhibiting blooms on boards, those who are best qualified to express an opinion are strong in their views that blooms skilfully set up on boards enable both judges and others to see and compare the respective flowers better than by any other method now in use. By these means the quality of the blooms is apparent to everyone who can judge the value of these flowers, and growers who are exhibitors are more satisfied with the decision of the judges in such cases.

The method of exhibiting large Japanese and Incurved blooms in vases leaves much to be desired. The arrangement, in one vase, of three or five blooms, as now generally practised, is distinctly detrimental to the cultivation of the Chrysanthemums in its widest sense. The difficulty is to arrange the flowers satisfactorily. The vases that are usually provided at the shows are unsuited for the purpose, and it is next to impossible to adjust the blooms in such a fashion as to display adequately the full proportions and true character of each individual specimen. The larger the flowers, the more difficult are they to arrange effectively. A point not to be overlooked is the fact that, in encouraging the vase classes, as now constituted, the number of varieties at our exhibitions is of an extremely limited character. The leading class at the great November festival at the Crystal Palace is for 12 vases, each vase to contain three blooms of one variety, 12 varieties only, out of the many hundreds of varieties in general cultivation. The N.C.S. cannot regard itself as promoting the cultivation of the Chrysanthemum, when one of its leading classes is for 12 varieties only. Another important fact in connection with the limited numbers of varieties staged in the vase classes is the practice of staging only the giant varieties to the exclusion of many handsome varieties of beautiful form and grand quality. Growers have come to recognise that the judges pay more than proper respect to mere size, and, on this account, only the largest varieties are exhibited; in a series of entries varieties are duplicated, triplicated and so on correspondingly with the number of exhibits staged. As instance of what I mean, how frequently we see vases of Hon. Mrs. Lopes, Lady Talbot, F. S. Vallis, Reginald Vallis, Mme. Paolo Radaelli, Mme. G. Rival, &c., exhibited in the vase classes simply because they are the largest and most impressive. Surely there is equal quality in varieties such as W. Gee, Frank Payne, Mrs. G. Milham, Mrs. C. Beckett, Superb, Mrs. Trevor Williams, Capt. Julian, Evelyn Archer, Keith Luxford, W. Beadle, &c.

The vase classes, as at present constituted, provide for the exhibits to be arranged in long, straight lines of somewhat top-heavy arrangements of handsome blooms. Between the vases are induly large, unlovely, blank spaces, of which no advantage is taken, and there is a distinct loss in not providing something to remove the barrenness of this system. Therefore, a return to the lecturer's suggestion of exhibiting large blooms individually in vases is to be advocated. For there is no method to equal this for representing each individual flower in its true character.

As an illustration of decorative effect achieved when the exhibitors have had the opportunity given them, Mr. Jones pointed to the exhibition of single varieties at the great show at the Crystal Palace in November last—which was the most pleasing and artistic table of singles ever arranged.

Classes should be created either for groups of cut Chrysanthemums on a given table space, or for a specified number of blooms, leaving it to the exhibitor to make the most of his space.

Reference was made to a class provided at the show of the Dulwich Chrysanthemum Society with which Mr. Hogg was much impressed. The class in the schedule provides for "A table of Chrysanthemums, any varieties, 4 feet by 3 feet, to face three ways, arrange with foliage plants." This class represented some of the most beautiful exhibits of large Chrysanthemums which the

lecturer had ever judged. It is a method that should be adopted by every Chrysanthemum society that desires to prove the decorative worth of big blooms.

Classes should also be formed for 12, 24, or 48 blooms, more or less distinct, which should be set up in the way already referred to. Classes for both Japanese and Incurved blooms could be provided for, and their value as decorative material proved. The blooms could be set up individually in vases, and be disposed in any manner that the exhibitor in his discretion thought well. There should be foliage plants or cut foliage disposed in pleasing and artistic fashion amongst the blooms. An extremely simple utensil for exhibiting in this fashion is the "Godfrey tube." This simple contrivance can be inserted in the ball of soil of the foliage plants if desired, and the work of arrangement simplified.

The discussion which followed Mr. Jones's paper was distinctly in favour of retaining boards at the National show for a portion of the exhibits, and it was thought that something should be done to render the vase and decorative classes more interesting from a spectacular point of view.

LARGE BLOOMS FOR FLORAL DECORATIONS.

Mr. R. F. Felton followed with an interesting paper, dealing with "The Use of Large Blooms in Floral Decorations." The paper on this subject opened with the statement that the Chrysanthemum provides a more-perfectly graduated system of colouring for floral decoration than any other plant. There had been what might be termed a crusade against the use of large blooms. But Mr. Felton was perfectly sure that large blooms were a distinct advantage if used in their proper positions. The principal point to bear in mind was that flowers must always be used in proportion to their size, and, in the case of large blooms, to be useful, they must be individually perfect. If a large vase or table is filled with specimen blooms, it not only looks well as a whole, but every individual flower is a picture in itself. Where, in many cases, the large flowers alone look out of place, their effect and appearance can be greatly improved by inserting light and graceful sprays in combination, and thus a most pleasing effect is secured. The practice of flooding the market with poor miserable flowers was strongly deprecated, and growers were advised to keep the quality as high as possible.

LATE-ROOTED CUTTINGS.

Mr. T. Stevenson gave the concluding paper, on "Late-struck Japanese Chrysanthemums for Exhibition." In dealing with this subject, Mr. Stevenson stated that a great many varieties of Chrysanthemums will give equally as good flowers if struck late, and grown on a single stem in 6-inch pots with a check, as if struck early in the season. The practice advocated was to strike the cuttings in pots or boxes about the third week in March, pot on directly the cuttings were rooted, and put them into the flowering pots, generally 6-inch pots, about the first week in June. He was opposed to much stopping, as most varieties could be grown naturally on the first crown bud. He also found that varieties grown in this manner required more manure than those grown in large pots, and that they finish better.

In the discussion, Mr. Stevenson stated that on his famous stands at the Crystal Palace during the present season nearly half his blooms had been produced by plants struck in March and grown on single stems in small pots.

SMITHFIELD CLUB.

DECEMBER 5 9.—The Cattle Show at Islington always serves to emphasise the close relationship between agriculture and horticulture. After the visitor has inspected the cattle, sheep, and pigs, there remain the thousand and one side shows, which go to complete the exhibition, always reminding us of a Holland House show, where the "sundries" have an interest of their own. But, as any reference to a cattle show would be incomplete without mentioning the champion beast, it may be stated that Mr. J. J. CRIDLAN, Home Farm, Maisemore Park, Gloucester, beat all comers with his Aberdeen-Angus heifer, a magnificent beast 2 years 11 months and 3 weeks old, and weighing 14 cwt 1 qr. 24 lb. The pen containing this fine animal was decorated with cards of honour, announcing it the

winner of the King's Challenge Cup, a piece of plate of the value of 100 guineas given by the Society, two silver cups, and money. His Majesty the KING, who met with success in many classes, was Mr. CRIDLAN's nearest competitor. The sheep appeared larger and fatter than ever whilst those interested in pigs found breeds of all kinds well represented.

Most of the exhibits of the seed firms were arranged in the gallery. Mangels, Swedes, Turnips, Parsnips, and other roots used as food by the stock-breeder were piled in the usual orthodox fashion, forming walls to convenient offices. Amongst the largest exhibitors of roots and seeds were Messrs SUTTON & SONS, Reading. The roots seemed bigger than ever, one specimen of Prize-Winner Yellow Globe Mangel turned the scale at 42 lb. Very fine also were this firm's Onions and other garden vegetables, two new Potatoes being seen in Acquisition and Garden Favourite, the latter a second early variety of promise. There were Carrots of the White Belgian variety weighing 10 lb. each, a selection of Grasses, some interesting entomological specimens, Mushroom spawn, plump, clean samples of cereals of all sorts, representing the choicest strains, and some Cyclamens in flower, giving a touch of colour to the display.

Messrs. JAMES CARTER & Co., Holborn, also exhibited farm and garden roots and vegetables extensively, making a prominent feature of Sugar-Beet, which might easily be mistaken for a coarse Parsnip, and not in the least like a garden Beet. These roots were said to contain 20 per cent. of sugar. Several other firms displayed Sugar-Beet on their stands, pointing to a demand in this direction. Messrs. CARTER had fine samples of Ailsa Craig and Cranston's Excelsior Onions, a selection of garden Beet, including fine roots of Crimson Ball; Carrots, including a "giant" variety in Red Elephant, used as cattle food; Globe Mangels, weighing 30-40 lb. each, and a new Mangel, Red Windsor, of which the seeds will be distributed in 1911. Bottles of juice from Sugar-Beet, illustrating the saccharine properties, were arranged along the front of the stand.

Messrs. LITTLE & BALLANTYNE, Carlisle, had an interesting stand, with a magnificent show of roots grown from selected seeds, including their "Chieftain" Yellow Turnip. Samples were also shown of seed Potatoes grown at their farms.

Messrs. EDWARD WEBB & SONS, Wordsley, Stourbridge, showed mammoth Mangels, Turnips, and Swedes, sacks of cereals, seed Potatoes, Onions, Peas, and other vegetables. Their sample of White Queen Wheat was especially good, Giant King Swede, and mammoth Long Red Mangel are splendid roots of stock-feeding. Some excellent Onions were shown in their bulbs of Improved Banbury.

Messrs. TOOGOOD & SONS, Southampton, were found in their usual place in the Gilbey Hall, having a selection of garden vegetables, besides cattle roots and cereals.

In the same hall, Messrs. LAXTON BROS., Bedford, displayed 50 varieties of Apples, with standard and trained fruit trees.

Similar displays were made by the KING'S ACRE NURSERY Co.; Messrs. W. & J. BROWN, Peterborough; and Messrs. HORNE BROS., Cliffe, near Rochester, Kent. Messrs. HORNE BROS. had some remarkably fine Apples, especially Mère de Ménage, Chas. Ross, The Houblon, and Lord Derby. The KING'S ACRE NURSERIES, Hereford, had choice fruits of their fine Apple King's Acre Bountiful, also Tyler's Kernel, and Golden Noble.

Messrs. JOHN K. KING & SONS, Coggeshall, made a magnificent display with roots. Their Golden Tankard yellow-fleshed Mangel has furnished 94 tons to the acre. In the centre of the stand they showed Kohl Rabi of fine appearance. Their Empire Sugar-Beet is said to contain a high percentage of sugar. They also showed Grasses and Clovers, cereals, and Potatoes.

Messrs. E. W. KING & Co., Coggeshall, showed fine roots of Mangels in Orange Globe and Essex Marvel, also Potatoes, Beans, Peas, varieties of Beet, and seeds of cereals. Some Sugar-Beets were observed on this stand. Amongst the Potatoes was the celebrated Northern Star variety, which is said to be coming into favour again. Their Centenary Turnip, with yellow flesh and skin netted like a Melon, is said to be splendid for culinary purposes.

Messrs. HARRISON & SONS, Leicester, had gar-

den as well as field roots. Selected Crimson Globe and Cheltenham Beet were excellent, also Early Market Carrot and Ailsa Craig Onion. A new Mangel named Sunset is of exceptional size. Brussels Sprouts, Potatos, Leeks and Onions were presented in excellent condition.

Messrs. KENT & BRYDON, Darlington, showed roots and Potatos. Some of their specialities were Green-Top Yellow Turnip, Yellow Intermediate Perfection Swede, Darlington Potato (new), and Darlington Swede.

Spraying machines, syringes, nozzles and knapsack sprayers were displayed by THE FOUR OAKS Co., Sutton Coldfield, in the King Edward's Hall, and Messrs. WALTER VOSS & Co., Carlton Works, Millwall, had manures and washes, including the Woburn specialities. Woburn Bordeaux paste is easy to mix, costs less than copper sulphate, and is very efficient. Messrs. KNIGHTS & MUNDY, Bermondsey, showed some uncommon manures. They had salt, from the fish markets, specially recommended for pasture and Asparagus beds; rags, fur waste, seal fleshings, flock, horn-parings, fish guano, a mixture of meat, fish, wool and blood, and many others.

Messrs. W. COOPER & NEPHEWS, Berkhamsted, showed their specialities in insecticides and fungicides, including Apterite. A preparation named Corvuline should be valuable to gardeners if the claims of the makers are justified. Seeds treated with this substance are claimed to be immune from attacks of birds and vermin. The maker is Mr. Arthur E. Hawker, 59, Mark Lane, London.

JEYES' SANITARY COMPOUND Co., LTD., recommend their Cyllin soft soap as a wash for aphides, caterpillars, and other foliage pests.

The TARSAP Co., 155, Fenchurch Street, London, make a preparation called "Aphicide," for similar purposes.

A handy tool was seen in "Fastnut," a spanner that adjusts itself automatically to a bolt-nut, enabling it to be removed easily and quickly. Amongst other exhibits were various forms of fencing, poultry houses and appliances, bee-keepers' requisites, lime-washing machines, vaporisers, cultivators, pumps, cloths, wagon covers, cordage, netting, mowers, and brushes, useful alike to the gardener and the farmer.

NATIONAL VEGETABLE.

ANNUAL GENERAL MEETING.

DECEMBER 6.—The first annual meeting of the members of this Society took place at the Royal Horticultural Hall on Tuesday last. In the absence of the President, the Duke of Portland, K.G., the chair was taken by Mr. Alexander Dean, V.M.H. There were also present Messrs. Owen Thomas, S. Mortimer, J. Jaques, W. A. Cook, E. Beckett, H. Markham, R. Pinches, G. Gordon, F. W. Harvey, J. Harrison Dick, and Horace J. Wright, with the hon. sec., Mr. E. G. Quick. Letters expressing regrets for unavoidable absence were read from Messrs. C. Foster and G. Wythes, the treasurer.

In moving the adoption of the report and balance-sheet, the Chairman alluded to the fact that these had already been distributed to the members. He thought that they might congratulate themselves upon a most successful first year, and he ascribed this largely to the excellent spirit in which the trade had supported the Society alike in its show and its trials. In further reference to the trials, Mr. Dean said that the thanks of the members were especially due to Messrs. C. Foster, G. Hobday, and W. Poupart for the manner in which they were conducted. The most scrupulous care was taken to ensure perfect equality for all participants.

The crops dealt with were autumn-sown spring Cabbages, and the trials were triplicated, the stations being Twickenham, Middlesex; Sutton Green, Surrey; and Romford, Essex; the soils are respectively fairly retentive loam on a deep base of gravel; very sandy loam on a deep base of yellow sand; and clay. At two stations—Twickenham and Sutton Green—there were trials of autumn-sown Onions, no fewer than 72 stocks being sent by 19 seedsmen. At Sutton Green only there was a trial of early Potatos, the planting being done on April 20 and the inspection made on July 29. As the results of the Committee's awards have already been published, they need not now be repeated.

In reference to the show which was held on

September 23, Mr. Dean said that it must have been a source of gratification to all the members to see the magnificent display. There was quantity, and in almost all instances refinement and quality. It visitors were not so numerous as might have been wished, they were at least intensely interested in, and keenly critical of, the produce staged. He thought, taking the first show as an augury, that they might confidently look forward to a larger and finer display at the second exhibition, which was fixed for Wednesday, August 30, 1911, at the Royal Horticultural Hall.

The financial affairs of the Society were most satisfactory, for while the total receipts were £229 14s., the expenditure only amounted to £201 8s. 6½d., thus leaving a credit balance of £28 5s. 5½d.

The number of members, inclusive of vice-presidents, was 166, and the speaker affirmed that there would be two or three times as many in a couple of years, provided that the management of affairs is as good in the future as it has been in the past.

The report further embodied thanks to all who had rendered assistance in the successful launching of the society, and recommended that the hon. sec. be given an honorarium of 10 guineas as a tangible recognition of the services that he had rendered. Mr. Owen Thomas, V.M.H., briefly seconded the adoption of the report and balance-sheet as presented, and it was carried without dissent.

Mr. J. Harrison Dick proposed and Mr. J. Jaques seconded, and it was unanimously resolved that the report and balance-sheet, as passed, should be published as a portion of the 1911 schedule.

It was reported that arrangements had been made to conduct trials of early Cauliflowers, early Peas, Beet, Carrots, and Onions, the last to be sown under glass and transplanted during 1911. In reference to the donors of special awards, the Secretary said that arrangements had been completed with Messrs. Clay & Son, Dickson & Robinson, Dobbie & Co., G. Massey, and Robt. Sydenham, Ltd., and that several other houses were in favourable negotiation.

The proposition that the Duke of Portland, K.G., should be again asked to accept the presidency of the Society was carried with acclamation, and the re-election of Messrs. Alexander Dean chairman, Owen Thomas vice-chairman, George Wythes treasurer, and E. G. Quick hon. secretary was accepted with similar enthusiasm. Messrs. R. Pinches and W. R. Wilson, neither being officials of the Society nor members of the committee, were elected auditors, and Messrs. A. G. Gentle, A. Grubb, and Horace J. Wright were placed on the committee.

The Chairman asked the Press to announce that the committee would meet on Tuesday, January 3, to arrange the schedule for 1911.

WEST BIRMINGHAM AND DISTRICT HORTICULTURAL.

NOVEMBER 12.—The first annual meeting of the society was held on the above date. There was a large attendance. A letter was read from Mr. William H. Morter, the superintendent of the City parks, resigning the post of chairman of committee. The report of the hon. secretaries (Messrs. Lamb and Cuddington) was gratifying, as it had been a most successful first year. The financial statement showed a sum in hand of £63 15s. The expenditure amounted to £145 11s. 9d. The report and balance-sheet were adopted, several members commenting upon their satisfactory character. Various alterations to the rules were considered and certain amendments made. The officers were appointed, Mr. Councillor Fraley being elected to the position of chairman of committees, vacated by Mr. Morter. It was decided to request the City Parks Committee to grant the use of Warley Woods on Friday and Saturday, August 18 and 19, for the purposes of the annual exhibition.

TRADE NOTICE.

LEAMINGTON NURSERYMEN AND FLORISTS, LTD. This business has been purchased by Alderman J. Bennett, who intends carrying it on as a florist, nurseryman, and seedsman. Mr. J. Smith, who was appointed manager just before the liquidation, has been re-appointed to that position.

MARKETS.

COVENT GARDEN, December 7.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Anemones, Arum, Azaleas, Bouvardia, Camellias, Carnations, Chrysanthemums, Gardenias, Hyacinth, Lapageria, Lilium, Marigolds, and others.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and plants, including Adiantum, Asparagus, Croton, Ferns, and others.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants and their prices, including Aralia, Asparagus, Begonia, Chrysanthemums, Cocos, Crotons, Cyclamen, and others.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples, Apricots, Bananas, and others.

Fruit: Average Wholesale Prices (continued).

Table listing various fruits and their prices, including Apples, Medlars, Nuts, Oranges, Pears, Lemons, and others.

Christmas Fruits and Preserves.

Table listing various Christmas fruits and preserves, including Figs, Nuts, Dates, and others.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Asparagus, Beans, Beetroot, Cabbages, Carrots, Cauliflowers, Celery, and others.

REMARKS.—The market is well supplied with Apples, but prices and the amount of trade are about the same as last week. Pears from Belgium, Holland and France, are principally of the Cattiac variety. There are some splendid Pears of the Easter Beurre variety from Oregon, U.S.A.; these are finding a good market. There is a slightly better demand for Grapes compared with last week. English Tomatoes are almost finished for the season, but plenty are arriving from the Canary Islands. The first shipment of

Californian Seedless Grapes is due to arrive next week. The crop this season is reported to be good, and the quality superior. Vegetable prices this week show a decrease in supply, with a tendency to higher prices. *E. H. R., Covent Garden, December 7, 1910.*

REMARKS.—The demand for Potatoes is not quite so good as last week, and stocks in London are still large. There is an indication in that prices will be lower in the near future. *Edw. J. Newton, Covent Garden and St. Pauls, December 7, 1910.*

COVENT GARDEN FLOWER MARKET.

Trade is very uncertain and supplies of most subjects continue to be in excess of all demands. Chrysanthemums are still the leading feature, and are of better quality, supplies from out-of-doors being over. Fine specimen blooms (white and yellow) are offered at very moderate prices. Medium-sized blooms sell rather better, although numbers remain unsold at the close of the market, when some of the growers clear them for what they will fetch. Carnations are well supplied and prices are rather low for December. Liliums are not very plentiful, and their prices may advance considerably. Supplies of Roses continue to be fully equal to all demands. Safrano Roses from the south of France are arriving in good condition. Lily of the Valley varies but little; supplies are plentiful and the quality is good. Richardias (Callas) are making rather better prices, due probably to supplies being held back for the Christmas trade. Roman Hyacinth is very good, and supplies are more than equal to demands. Inflorescences of Poinsettia (Euphorbia) are good this season, and with mild weather the bracts stand up well. At present, the demand for them is limited, and prices are lower than they may be later on. The value of all cut flowers will be very uncertain during the next few weeks.

POT PLANTS.

Good Chrysanthemums are fairly plentiful though the supplies are beginning to fall off a little, and higher prices are asked for plants of good quality. Begonias Gloire de Lorraine and the Turfied Hall variety are well flowered, but they have not been selling readily. Fricas are good this season and plants of *B. byemalis* will be available later than usual; prices very little, yet buyers should secure their supplies for the Christmas trade early. *E. cracilis* is not quite finished, but the autumn variety will not last much longer. Poinsettias are good, but rather tall. Roman Hyacinths grown in boxes are useful as the plants can be transferred easily to pots or fancy bowls. Ferns in all sizes are well supplied and their value varies very little. Palms are making fairly good prices, and it is probable that they will be dearer in the near future. Already higher prices are asked for the smaller plants of Kentias and Cocos Weddelliana. Hardy shrubs of various sorts are seen on several stands. *I. H., Covent Garden, December 7, 1910.*

LAW NOTE.

FLOWER SHOW DISPUTE.

At the Wolverhampton County Court recently a claim was made against members of the committee of the Codsall Horticultural Society, for £1 19s. prize money, which had been refused on the ground that plaintiff's exhibit was not a bona-fide one.

The plaintiff showed six spikes of Ten Week Stock at Codsall Flower Show, but he was subsequently disqualified on the ground that his exhibit was not grown by himself. He told the committee that they could send someone down and he would show them where his spikes came from, but the deputation did not go down until it was getting dark.

Plaintiff's wife said the Stocks grown in the garden were the same as shown at Codsall, and a witness deposed to seeing the Stocks which were exhibited at Brewood growing in the exhibitor's garden.

His Honour pointed out a rule of the society that all specimens exhibited for competition must be the bona-fide productions of the exhibitors, and another to the effect that matters in dispute at the show must be proved to the satisfaction of the committee.

The Vicar of Codsall, chairman of the committee, stated that the objection was proved to the unanimous satisfaction of the committee.

His Honour, having regard to the rule, found for defendants. He intimated, however, that he should himself have been inclined to find for plaintiff.

Obituary.

WILLIAM ROTHWELL.—We regret to record the death, on November 19, of Mr. Wm. Rothwell, late gardener at Leighton Hall, Welshpool, after a painful illness lasting for 12 months. The deceased, who was 66 years of age, had lived at Leighton for 40 years, 34 as head gardener. Mr. Rothwell was a member of the Leighton Parish Council. He was held in high esteem by his employers, and his loss will be greatly regretted by a large circle of friends.

ROBERT MACFEE.—The death of Mr. Robert Macfee, nurseryman and seedsman, Paisley, occurred on the 4th inst., after a short illness. Mr. Macfee was not only a well-known nurseryman, but he officiated for 25 years as secretary of the local horticultural society. He leaves a widow and daughter.

AIR SLAKED LIME: *T. W. M.* Quicklime on exposure to an absorbent water and becomes reduced to powder; it is then termed slaked lime. It is this form of lime which was recommended for use in the reply to *Inquisitor* in the issue for November 26, p. 404.

BEGONIA: *L. G.* The leaves are infested with mites which cannot be discerned without the use of a microscope. It is the injury done to the exterior of the leaves by the mites which causes the rusty appearance you complain of. The mites attack the under surfaces of the leaves, and, in some instances, we have seen even the growing point crippled and destroyed by this pest. The best method of treatment is to dip the plants when they are out of flower in Tobacco water, or if the plants are in flower you may sponge the under sides of the leaves with Tobacco water or dust them with dry Tobacco powder by means of a puff ball.

BEGONIA GLOIRE DE LORRAINE: *W. McC.* There is no trace of disease present caused by either fungi or insects. The general condition of the plant suggests that it has been growing in a place not provided with sufficient shade.

COKE STORAGE: *J. I.* Fresh coke certainly burns away more quickly than that which has been stored. It is probable that a certain amount of gas is retained by fresh coke, which assists the combustion. During storage, this gas escapes into the atmosphere. At the same time there is a disadvantage in allowing coke to be exposed to wet weather, for the wet which is absorbed must be driven off before much heat is developed. A covered shed should certainly be provided for storing coke.

FLOWERING PERIOD OF CHRYSANTHEMUMS: *G. H. H.* We believe it to be the common experience of Chrysanthemum cultivators that the time of inserting the cuttings has some influence upon the period at which a plant will form its first natural break. If this is the case, the time of inserting the cutting may be said to have a distinct influence on the period at which flowering will commence. At the same time, it would be contrary to the facts to state that the insertion of the cutting determines in itself the period of flowering, for it is only one of many causes which go to determine that period. As a rule, a grower knows whether he requires a given variety to flower on the crown bud, or whether the flower can be obtained at its best only on the terminal bud. The crown bud usually gives the greater size and the terminal bud refinement of petal and better colour. Having decided which bud he wishes to develop, he so arranges the cultivation, as to have that particular bud in flower at the time when the exhibition takes place. As the first step towards securing this end, he inserts his cuttings at a particular date; in most cases after the proper date is ascertained the plants will yield flowers from the chosen bud at the desired time. But in other cases the cultivator has to stop the growths in order to force the plants to break into secondary growths earlier than they would do so naturally.

NAMES OF PLANTS.—*H. A. A.* 1. Epidendrum elongatum; 2. Cochloboda sanguinea; 3. Masdevallia simula; 4. Restrepia trichoglossa; 5. Maxillaria tenuifolia.—*F. G.* 1. Codium triumphans; 2. C. variegatum; 3. C. Johannis; 4. C. Nevillei; 5. C. angustifolium; 6. C. Macfarlanei; 7. C. Evansianum; 8. C. chrysophyllum; 9. C. Wilsonii; 10. C. Laingii; 11. C. Van Oerstedii; 12. C. elegans.

NOTICE TO LEAVE: *H. L.* and *A. J.* It is customary for head gardeners to give or receive a month's notice before terminating their employment. We have repeatedly urged the desirability of a written agreement being arrived at between the contracting parties at the time of the appointment. In the absence of an agreement, questions of this nature are always likely to arise.

PYRAMIDAL APPLE TREES: *G. C., Boston, U.S.A.* Apples on the broad-leaf Paradise stock are grown for market in bush rather than in pyramid shape. This stock was raised from a good strain of the French Doucin. It is important to avoid the use of the ordinary French Paradise, except for gardens, as it is of too dwarfing a habit of growth. The varieties that flourish in one district of this country are not the best for another, and it is not certain that many of the English varieties would do well in the United States. At any rate, very few American Apples flourish in this country. There is such a vast number of varieties that it is impracticable to name all that are grown successfully for market in this country. Favourite varieties which succeed in most districts are Lord Grosvenor, Queen, Ecklinville Seedling, Warner's King, Bramley's Seedling, and Lane's Prince Albert as culinary Apples, and Beauty of Bath, Worcester Penman, Allington Pippin, James Grove, and Sturmer Pippin for dessert. These are named in the order of ripening. Cox's Orange Pippin, the best of all dessert Apples, succeeds only in specially favourable districts. Soil in a friable condition, that was heavily manured for the last crop, such as Potatoes, and subsoiled, is suitable for planting. Bush trees on the Paradise are planted from 9.60 to 12 feet apart each way; but less than 12 feet is not advisable. Gooseberries or Currants are usually planted between the trees. The best fertiliser is farmyard manure, applied in the autumn or winter. A good dressing of artificials is a mixture of 4 cwt. of superphosphate, 2 cwt. of sulphate of ammonia, and 2 cwt. of sulphate or muriate of potash per acre, applied in the spring. There is much difference of opinion as to the advantage of growing bush trees as compared with half-standards. The latter are most commonly grown in commercial plantations. As they do not branch out from close to the ground, and are usually planted 15 feet or more apart, they allow horse cultivation to be carried on much longer than is possible in the case of trees in bush shape. The advantages of low trees, as compared with tall standards, are numerous. They facilitate spraying, thinning of fruit, and gathering, whilst they suffer less of fruit from wind, and the Apples that fall are less injured than those which drop from tall trees. But it is to be borne in mind that the Paradise is a surface-rooting stock, and it is doubtful whether it is suitable to withstand the dry summers of the United States. Apple trees on the Paradise, or any other stock, should not be allowed to bear fruit until the third year after planting, and not much then, as premature fruiting dwarfs wood growth. Some varieties would fruit to a small extent in the second year, if allowed. The variation in quantity of fruit is so very wide that it is impossible to give an average for the first five fruiting years. There are no official estimates of fruit yields in this country. An average of a bush per tree on a large acreage of different varieties would be a good one in the tenth year from planting, and there are 300 trees per acre at 12 feet apart each way.

THE JUNO IRISES.

THE name Juno was applied to a certain section of the Iris family, apparently for no better reason than that in ancient mythology Iris, the messenger from gods to men, was sometimes represented as being more particularly attached to Juno than to the other deities. The application was scarcely apt, for Iris was in any case subordinate to Juno, and the names are now used in the opposite relation. However this may be, the name Juno stands for a very clearly marked section of bulbous Irises, distinguished by the fact that the bulb in its resting state has attached to its base a number of tapering, fleshy roots, which quickly send out branching rootlets when growth begins again in the autumn. The leaves, too, are unlike those of any other Irises, and in the larger species, at any rate, closely resemble those of the Maize (*Zea Mays*). The flowers are produced from the axils of the leaves, and may be either solitary in the small species or as many as eight or nine in number in well-grown plants of *I. bucharica* or *I. Willmottiana*. The Juno Irises are also remarkable in that they are the only species which have spherical pollen grains. Another peculiarity of the group is that the

inner perianth segments, which in other species are commonly and conveniently known as standards, are here much reduced in size, so as to be far shorter and narrower than the falls. Moreover, they usually extend horizontally, and are even in some cases depressed and droop down to touch the perianth tube. In fact, the words "fall" and "standard" are singularly inappropriate to the outer and inner segments of these Irises.

Hitherto, it has been usual, apparently, to make no subdivisions in this section, but increasing familiarity with the plants has shown that there are at least two well marked divisions comprised within it. It is characteristic of many species of this group that the haft of the fall bears large projecting wings—hence the name of the well-known species, *alata*—which tend to curl over, and meet above the branches of the style. Moreover, it is a curious fact that all the known species, which possess these winged falls, have also globular seeds, while all those of which the sides of the falls are parallel have seeds of distinct types. The majority of them are roughly cubical, the minority comprise only the rare species *Rosenbachiana* and *drepanophylla*, and possibly another species, as yet unpublished, from Bokhara.

The first group, those with the winged falls and globular seeds, comprises the following species:—*alata*, *palestina*, *persica*, *caucasica*, *sindjarensis*, *Willmottiana*, *fumosa*, and *Stocksii*. Even among these there is a well-marked line dividing off from the rest the two winter-flowering species, namely, *alata* and *palestina*. In both (and to some extent also in *persica*, which is the next to flower in order of time) the ovary remains for protection below the ground level until it is nearly ripe and the flowers are raised on long perianth tubes. Another peculiarity of these two Irises is that they—and they alone of all the species at present in cultivation—have pollen grains that are covered with minute spines. It has been suggested that these spines may afford some protection against moisture in the atmosphere, which would not penetrate among the closely lying points unless it were present in very large quantities. All Iris pollen grains swell up and burst at once if immersed in water, and it may be that this provision of spines on the pollen grains has enabled these species to propagate their kind, even in the winter months. The other main sub-group, consisting of plants with strap-shaped falls, comprises *ochioides*, *bucharica*, *Warleyensis*, *Fosteriana*, which all have cubical seeds, and *Rosenbachiana*, of which the seeds have a conspicuous cream-coloured seam or rhaps extending all down one side from top to bottom, and are consequently readily distinguishable from those of any other known Iris, unless it be *drepanophylla*, which is only imperfectly known from dried specimens. It might be thought that the flat sides of the cubical seeds of the majority of this group were produced by pressure of the grains against each other in the capsule, but the experience of several years has shown that even when only a few seeds ripen in the capsule they are still compressed with flattened sides, while seeds of the species of the other group never become flattened, however closely crowded they may be.

The home of the Juno Irises is a comparatively narrow belt of country, stretching from the western shores of the Mediterranean to the Punjab in the east. *Alata* is found in Spain, especially in the neighbourhood of Cordova, where its time of flowering varies with the elevation; in Algeria and in Sicily, where it is abundant near streams on the slopes of Etna. *Palestina*, a near relative, is a native of Syria, while *persica* is found in Eastern Asia minor and North Persia, and has many local colour

varieties, of which *stenophylla* and *Taurii* are the best known. The home of *caucasica* is sufficiently indicated by its name, and so is that of *sindjarensis*, if one happens to remember that *Sindjar* is a mountain in Mesopotamia. *Bokhara* is the home of a number of the more recently introduced species, while *Stocksii* and *Fosteriana* are found further east in Afghanistan, and, lastly, *Aitchisonii* occurs in the Salt Hills of the Punjab.

As regards cultivation, the Juno Irises cannot be said to be difficult, provided that they are given a sunny, well-drained position. It is curious that the species that has probably been longest in cultivation in England, namely *persica*, should be on the whole the least easy of the group, but the explanation probably lies in the fact that it seems to prefer a good stiff loam to a very sandy soil. Unfortunately, it is almost impossible to lift these bulbs, with their lightly-attached, fleshy roots intact, from a heavy soil that cakes hard in summer. Consequently, the bulbs of *I. persica* supplied by the trade are usually without their roots. They make a feeble attempt, perhaps, to flower in their first season, but fail to form a good bulb for the following year. When once established therefore they are best left alone, or very carefully lifted when they have become too crowded.

The larger species seem less fastidious in their demand for heavy soil, and thrive amazingly in a well-drained bed, well enriched with old leaf soil and manure. Flowering as they do in the early months of the year, they are a most welcome addition to our hardy bulbs, and if the bed cannot be placed in a sheltered corner, a temporary frame will preserve the flowers from the weather. Each plant of the taller species, such as *bucharica*, will remain in flower for two or three weeks, since the blooms open in succession from the top of the stem downwards.

There is a delightful range of colours in the flowers of these Irises. *Alata* is usually a deep blue, with a central orange-coloured ridge, though pure white examples are known. *Palestina* varies from deep blue, through pale blue and bluish-green to a distinctly yellow green. *Persica* is a wonderful combination of white, sea-green, and brown purple, set off with a central streak of orange. Of its varieties, *stenophylla* has large flowers of grey-blue blotched with indigo, and *Taurii* is mainly red-purple striped with gold. Golden yellow is supplied by *ochioides*, while *bucharica* has flowers of a milk-white colour, tipped with brilliant yellow on the blades of the falls. *Fosteriana* is distinguished by the olive-green coats of its bulbs, and by the contrast of its yellow falls with its dull purple standards. Perhaps the most brilliantly coloured of all is *Rosenbachiana*, of which no two seedlings appear to be alike. The prevailing colours are red purple, white, and gold, but of late years some forms have been imported that have primrose yellow flowers, slightly veined with purple. These are said to come from a locality that rejoices in the name of *Tabidara Bolo*, but repeated enquiries and searches on maps have failed to establish the whereabouts of this place, beyond the fact that it is somewhere in Central Asia. Any one who has once grown *Rosenbachiana* and seen the gaudy flowers develop at an amazing pace in a few sunny days in March will never wish to be without it again, and it is much to be hoped that it will not remain as rare and expensive as it unfortunately is at present. Seed is freely produced in some years, and a single capsule has been known to contain between 80 and 90 seeds, but the process of raising flowering bulbs from seed is somewhat tedious and slow, and takes at least four or five years from the time the seedlings appear, which is sometimes two or three years after the seeds are sown. W. R. Dyke, *Chatterhouse, Godalming*.

SCOTLAND.

THE WAVERLEY MARKET, EDINBURGH.

Visitors to the spring shows of the Royal Caledonian Horticultural Society and to the Chrysanthemum shows of the Scottish Horticultural Association in the Waverley Market, Edinburgh, have felt the want of heating apparatus in that huge hall, whilst in some cases exhibits have suffered from severe frost during their exposure in the unheated hall. It is gratifying, therefore, to know that there is a prospect of this drawback being remedied, and that the Markets Committee have made a remit to ascertain the cost of heating and ventilating the market.

NEW RANGE OF HOUSES FOR DUNFERMLINE PARK.

The Carnegie Dunfermline Trust, which has already done so much in the interests of horticulture in that town, has decided to replace the old range of glasshouses in the Pittencrieff Park, Dunfermline, by one of modern design and construction. The old range is unsuitable for the purposes required, and the new houses will be a great improvement from a horticultural, and also from the public point of view. The new range will be of handsome design, the central feature being a Palm-house, whilst along the north side there will be a corridor some 20 feet wide. The contract has been entrusted to Messrs. Mackenzie and Moncur, Ltd., and the price is, we understand, about £4,000. It is anticipated that the buildings will be ready in May.

PRESENTATION TO A SCOTTISH GARDENER.

Mr. James Carson, head gardener to Mrs. Jasper Young, Garroch, Kirkcudbrightshire, who is retiring from this appointment, has received a presentation from a number of his friends, as a mark of their esteem and of their good wishes for his future success.

EDINBURGH CHRYSANTHEMUM SHOW

The next annual exhibition of the Scottish Horticultural Association will be held in the Waverley Market, Edinburgh, on November 16, 17, and 18, 1911.

ORCHID NOTES AND GLEANINGS.

L.ELIO-CATTLEYA MEASURESII.

(*C. maxima* × *L. pumila*).

A FLOWER of this pretty hybrid, which was originally raised in the "Measures" collection, and blossomed in 1902, is sent by Mr. H. Haddon, gr. to J. J. Neale, Esq., Lynwood, Penarth, who states that, in this case, the variety *prastans* was used as parent instead of typical *L. pumila*. The flower is equal in size to a good *Cattleya Percivaliana*, and is of similar colour. The sepals and petals are light lilac; the lip, which shows the wavy margin of *C. maxima*, is deep purplish-crimson, with chrome-yellow showing between the lines extending from the base to the centre; the column is white tinged with purple.

DENDROBIUM SPECTABILE.

A VERY fine inflorescence of 11 flowers, borne on a stout spike over 1 foot in height, is sent by Mr. E. J. Thorne, gr. to Major Joicey, Sunningdale Park, Sunningdale. This specimen is the more interesting because it was taken from the plant for which a First-class Certificate was awarded when Mr. Thorne showed it at a meeting of the Royal Horticultural Society on December 19, 1902. The exhibit was illustrated and recorded in the *Gardeners' Chronicle*, December 30, the same year.

The species, which stands almost alone in the genus *Dendrobium*, with its pale yellow, spirally-twisted sepals and petals striped with purple, and its peculiarly elongated white labellum striped and veined with reddish purple, has been known to science for many years, having been figured in Rumphius as *Latourea spectabilis*. The few plants in cultivation were introduced from

New Guinea by Messrs. Sander & Sons, and it is pleasant to see that Mr. Thorne has been successful in growing this reputedly difficult plant for so many years. It requires to be grown in a warm, moist house, and to be kept drier for a time after the growths are completed.

BRASSO-LELIA LELLIEUXII
(*B. Digbyana* × *L. anceps*).

A FLOWER of this remarkable hybrid has been sent by Sir John Edwards-Moss, Roby Hall, Torquay, who now has it in bloom. The narrow sepals and the broader petals are 4 inches in length. The labellum, which is folded over the column at the base, has the side lobes and front expanded and finely fringed. The ground colour, which shows most at the bases of the segments, is greenish-white, the greater portion of the outer parts being tinged with rosy-lilac. There is distinct evidence of *L. anceps* in the dark lines at the base of the primrose-yellow disc of the lip and in the form of the sepals. It was first flowered by M. Denis in 1905.

also flushed with rose. The prevailing colour in the petals and lip is brownish-purple. The plant was exhibited by Mr. E. V. Low, Vale Bridge, Haywards Heath, at one of the recent meetings of the Royal Horticultural Society, when it was awarded a First-class Certificate by the Orchid Committee.

VEGETABLES.

ONIONS.

THERE is no gainsaying the fact that Onions succeed best in a deep soil, as I have traced Onion roots to a depth of 2 feet. The ground should be deeply trenched in autumn or winter, and, if the soil is not very rich, a quantity of decayed manure should be worked into it, but if it is already rich it is better not to use the dung but add in its place a quantity of slaked lime and wood ashes to the surface soil, forking the ground over several times before transplanting or

FIG. 185.—CYRTRIPEDIUM "KING GEORGE V.": AWARDED R.H.S. FIRST-CLASS CERTIFICATE.

"THE ORCHID WORLD."

THE December issue of this journal contains portraits of Dr. John Lindley and Sir Joseph Banks, with an account of their connection with the Royal Horticultural Society, and pictures of the Lindley and Banksian Medals. Other illustrations include one representing an Orchid house in Java, whilst several specimen Orchids from various collections are shown.

CYRTRIPEDIUM "KING GEORGE V."

THIS handsome variety of *Cyrtopidium* (see fig. 185) is remarkable as much for its beautiful colouring as for the almost perfect development of its floral segments. In some respects it may be likened to the well-known *C. Gaston Bultel*. The dorsal sepal is extremely beautiful, being green at the base with dark lines that merge into a rose shade in the white upper part, which is

seed sowing, in order to mix the ingredients thoroughly together.

An excessively rich soil makes Onions the more liable to the attacks of the Onion fly, and thick-necked bulbs are, in most cases, caused by the soil being too well enriched with dung. Most growers of Onions for ordinary purposes look for their crop from a spring sowing made out of doors. But if the seeds are sown under glass early in the year and pricked out for planting as soon as the weather is favourable, heavier crops are obtained, and the plants are less susceptible to the attacks of the Onion fly. Still, they are not completely immune, for I have lost many a half acre of Onions from the fly, although the plants were raised indoors. It is advisable to make two sowings, one under glass to produce good-sized bulbs for keeping, and another sowing out of doors in March. *Thos. Francis.*

"SOOTY BLOTCH": A NEW FUNGOUS DISEASE OF APPLES.

DURING the past three or four years I have, on several occasions, been told by fruit-growers that Apple "scab" or "black spot" is a disease which will frequently develop on Apples after they are stored. I have been assured that Apples which have been quite clean when put into store will show, when examined after some months, spots of "scab" over their surface.

Now, the true "scab" fungus (*Venturia inaequalis*, syn. *Fusicladium dendriticum*) does not spread from "scabby" Apples to clean Apples in the store-room. An example of a "scabby" Apple is shown in fig. 186; if such Apples are placed adjoining Apples free from "scab," the latter will remain free, however long they are stored. (It may be noted here that while "scab" does not increase in the store-room, "scabby" Apples are, as a rule, soon attacked by other fungi, which cause a more or less rapid "rot" of the Apple—these fungi invading the Apple at places where the "scab" has injured the skin).

As no examples of the alleged "scab" which spreads to clean Apples when stored, were at the time furnished by my informants, I have been puzzled to account for their statements. Re-

FIG. 186.—PEASGOOD NONISUCH APPLE ATTACKED BY "SCAB."

cently, however, certain facts have come to light which explain the matter. During this autumn Mr. W. B. Burgess, B.Sc., of the Horticultural Staff of Wye College, brought me some Apples (gathered from trees in the College fruit plantation) showing sooty-looking blotches on the skin. On microscopical examination these proved to be a species of *Leptothyrium* not previously recorded for this country. These sooty blotches—which can be seen in the photograph reproduced in fig. 187—are more or less rounded, $\frac{1}{2}$ inch, or under, in diameter, and sometimes coalescing to form larger patches. They are composed of straggling threads (hyphae) of the blackish spawn (mycelium) of the fungus. This spawn is wholly superficial, but grows so closely attached to the skin of the Apple that the sooty patches cannot easily be wiped off by a damp cloth.

On the same Apples, near the sooty patches, minute black spots, usually collected in groups, and very closely resembling fly-spots, were noticeable. These proved to be minute, compact, circular masses of spawn (mycelium), of a shining black colour. No spores are formed on these spots. The name "fly speck" disease has been given in America to this fungous growth.

The "sooty blotch" and the "fly speck" are comparatively well-known diseases of the Apple and other fruits in America. In that excellent,

recently-published book, *Fungous Diseases of Plants*, by Prof. B. M. Duggar, a most life-like illustration is given of both "sooty blotch" and "fly speck," together with the following remarks:—"According to the unpublished observations of Floyd, the sooty blotch and the fly speck are apparently stages of the same fungus. They seem to occur upon the fruit of the Apple throughout the limits of its culture. A sooty blotch and a fly speck are also found upon the Pear, and along a roadside near Columbia, Missouri, there were found more than 25 hosts affected by what was apparently the same fungus. These plants were all woody in texture, and the fungus occurred generally on the younger twigs and petioles. Observation indicates that the organism is most abundant under conditions of considerable moisture, half shade, and abundant dust. The market value of Apples is affected by the discolouration which results. . . . In the case of the blotch, as the season advances, the cell-aggregates may develop a definite sclerotia-like body. By March, this body has differentiated into a pycnidium, 25 to 100 μ in diameter, of the *Leptothyrium* type, bearing hyaline, elliptical spores. The latter measure 12-14 by 2-3 μ ."

In another account, *Diseases of Economic Plants*, just published by Dr. F. L. Stevens and Mr. J. G. Hall, "sooty blotch" is ascribed to the fungus *Phyllachora pomigena*, and "fly speck" to *Leptothyrium pomigena*. Sooty blotch is described as follows:—"Irregular sooty black blotches, especially conspicuous on the lighter-coloured varieties, are frequently seen on unsprayed fruit. . . .

The fungus attacks the fruit late in the season, and is strictly superficial. It may be easily rubbed off with a cloth. The loss in ready saleability, due to the unsightliness of the fruit, is reason enough for protective spraying. Bordeaux mixture, applied at intervals of about two weeks, from the middle of June until the middle of August, is effective." The following remarks are made concerning fly speck:—"This disease causes disfigurement of

the Apple. Though the disease is of very wide distribution, the loss occasioned by it is not serious, and is almost entirely prevented by the sprayings employed against other diseases."

With regard to the occurrence of these diseases in this country, noted above, they were first observed in October last on Apples on the tree, and subsequently in greater abundance on Apples stored in the fruit room. The most severely attacked variety has been Newton Wonder; but Seaton House and many other varieties have also been found infested. Pears also have been attacked. It is quite clear that "sooty blotch" is a disease which spreads on stored Apples; it is this disease, undoubtedly, which has been confused by some growers with "scab."

It is regrettable that a new fungous disease has to be added to the list of those that attack the Apple in this country. It would be interesting to know if—like the American Gooseberry-mildew—the "sooty blotch" fungus has been imported into this country from America. I have frequently noticed this and "fly speck" on American Apples on sale in our shops. If "sooty blotch" becomes common in this country, it is likely to prove troublesome by damaging the look of well-grown Apples, and thereby interfering with the practice of marketing the best Apples in boxes.

Where the disease appears, systematic sprayings with Bord-aux mixture (4 lbs. copper sulphate, 4 lbs. quicklime, 50 gallons water) should be given except on Cox's Orange Pippin and Duchess's Favourite. Besides the two applications of this mixture, given just before and just after the blossoming period—which are necessary to keep down "scab"—a light spraying during August should be given experimentally. Since the above was written, further specimens of "Newton Wonder" affected with "sooty blotch" have been brought to me by Mr. R. Wellington (one of the Kent County Council's inspectors for Gooseberry-mildew) from a fruit farm near Maidstone. *E. S. Salmon, F.L.S., South-Eastern Agricultural College, Wye, Kent.*

NOTICES OF BOOKS.

A NEW WORK ON DAFFODILS.*

THE advent of the Daffodil book in the series of volumes issued under the title of "Present-Day Gardening" will be welcome to many. Some may ask is there room for it? Those who associate themselves with the cultivation of the Narcissus have no hesitation in answering—Yes. There can hardly be too many works dealing with special branches of gardening when they are

FIG. 187.—NEWTON WONDER APPLE ATTACKED BY "SOOTY BLOTCH."

written by those who are experts in the subject on which they write. There is a wholesome freshness about such books, and even the expert himself is sure to find some information which is new and useful.

That the author of "Daffodils," the Rev. Joseph Jacob, knows what he is writing about is beyond dispute, and as he also knows how to express himself tersely and clearly, he has produced a valuable volume. It is divided into sixteen chapters, each chapter dealing with some special section. The author gives a condensed history of the literature and position of the Daffodil from Gerard's *Herbal*, in 1597, to the present day. The condensed form in which this information is given will be appreciated in these strenuous days. But the chief charm of this volume is that it can be studied with advantage by skilled cultivators as well as by the merest tyro. The directions in Chapter IV, dealing with cultivation are excellent. In fact, all through the book the author places at the disposal of his readers valuable facts acquired by years of careful study and observation, and the record of failure as well as of success testifies to the candour of the writer.

* *Daffodils*, by Rev. J. Jacob, Vol. IV., in "Present Day Gardening" series. (T. C. and E. C. Jack.) Price 1s. 6d.

The chapter on cross-breeding contains, in the 12 pages devoted to it, facts which will save beginners a vast amount of unnecessary and profitless work, and to it the experienced breeder will frequently turn to save hunting through notebooks. This chapter alone would justify the appearance of the work.

When dealing with classification a more thorny subject has to be handled. There seems no reason why the author should be anxious about the opinions of the "strict botanist," as that individual will hardly trouble as to the classification of many-degreed mongrels. A much more serious matter is how the new classification of the R.H.S., published in Chapter X., will be received, and we are inclined to sympathise with the author in his doubts as to whether it will be received with general acclamation. The younger societies and exhibitors will be inclined to look askance at it, and to regard it as unnecessarily cumbersome and complicated. Why should Divisions II. and III. be separated? Similar shapes are "lumped" in Division IV. How long will the dividing line continue?

A valuable feature in the book is the chapter giving lists of varieties for various purposes. List No. I will for some time have interest only for the millionaire, but the others are of interest to every grower. There are some notable omissions, or rather exclusions, from these lists. For instance, from the list for gardens, Golden Spur, one of the best bedders in existence, is missing. It may further be submitted that Emperor, Empress and Sir Watkin may, without disadvantage, be included in all large groups on the show table. The list for pots is rather meagre, and those who have much decorative work to do with pot-grown Narcissus will wonder whether Emperor, Sir Watkin, Barrii Conspicuus, and Poeticus ornatus are inferior to some of those named in the list. The calendar of operations goes fully into details of all work necessary throughout the year, from August to July, and the author's oft-repeated advice to plant early cannot be too strongly recommended to the consideration of the reader.

The volume is nicely brought out, clearly printed on good, strong paper, and there are eight excellent coloured plates illustrating some of the choicer varieties, but Plate VI., illustrating Lord Roberts and Judge Bird, scarcely conveys a correct impression of these two fine varieties. *F. W. Moore, Glasnevin Botanical Gardens.*

MORPHOLOGY OF GYMNASPERMS.*

BOTANICAL students are already indebted to Messrs. Coulter and Chamberlain, of the University of Chicago, for an admirable treatise on the morphology of flowering plants, published in 1901, and their indebtedness will be considerably increased when the present volume on the morphology of Gymnosperms comes into their hands. Messrs. Coulter and Chamberlain have produced a work which is no mere compilation, but one which is, in a large measure, the outcome of investigations which have been carried out by themselves and under their direction.

In no branch of botanical science have investigations been more numerous during the past ten years than in that dealing with the Gymnosperms, and, as a result, our knowledge of the group has been not only increased, but consolidated. This extension of our understanding of an important group of plants has been the more striking owing to the fact that research work has been carried on along parallel lines. On the one hand, the existing species of Conifers, Cycads, Gnetum, and Ephedra have been subjected to a searching examination, and, on the other hand, many fossil forms, and particularly those connecting the Cycads and the Ferns, have been discovered or re-investigated in recent years, with the result that new light has been thrown on the relationships of existing Gymno-

sperms, both with one another and with other of the great groups of plants.

The story of this progress is admirably told by Messrs. Coulter & Chamberlain, and will be read with great interest by all students of morphological botany. The book, admirably printed and profusely illustrated, concludes with a chapter on evolutionary tendencies among Gymnosperms, in which it is suggested, on what appears to be strong evidence, that the Coniferous plants and the Cycads are descended from ancestors which were already widely separated in carboniferous times.

TREES AND SHRUBS.

VERONICA HULKEANA.

THIS is quite the most beautiful and delicate of all the Veronicas that can be grown in pots. The flowers are of the palest lavender colour, and are borne in short racemes ranged on shoots up to about 1 foot long. The habit of the plant and the floral arrangement are well shown in fig. 188, which is reproduced from a photograph,

FIG. 188.—VERONICA HULKEANA AS A POT PLANT.

for which I am indebted to Mr. E. J. Allard. I have always found this to be a very good pot plant, most lovely for the greenhouse. Mr. Bowles strongly recommends it to be planted out-of-doors in a sheltered corner, but I have had it, with a great number of others, in the shelter of plant-house walls, and have always found it most satisfactory as a pot plant. It is a native of New Zealand. *R. Irwin Lyell, Botanic Gardens, Cambridge.*

COLONIAL NOTE.

ERYTHRINA PARCELLII (Hort.).

IN the original description of this species, which is contained in the *Gardeners' Chronicle* for September 26, 1874, p. 592, fig. 82, the flower is described as "of a bright cinnamon-red colour." We have recently flowered this species, which appears to be very rare. The flowers in our specimen are white. The filaments are dull crimson, and there is a little of the same colour along the external margins of the buds. *J. H. Maiden, Director, Botanic Gardens, Sydney.*

FRUIT-TREE STOCKS.

MR. H. SOMERS RIVERS contributes the following information on this subject, thus supplementing his paper read at the Northern Fruit Congress, and published on p. 325.

It is, as we have seen, scarcely necessary for us to go to the frosty Caucasus for the original Paradise stocks. It may, however, be interesting to note what has been said as to this.

W. Lauche, *Handbuch des Obstbaues*, 1882, gives six families of the Apple, the sixth being: *Pirus pumila*, Mill. Stranch-apfel [Shrub-apple]. *P. Malus β paradisica*, L.; *P. praecox*, Pall.; *P. Sieversii*, Led.; *Malus praecox*, Borkh. South-east Russia, Caucasus, Tartary.

A bush, with elliptical leaves, woolly underneath. The reddish petals with a very short claw; style glabrous, not longer than the anthers. Fruit reddish or yellowish, austere.

He goes on to say that Koch distinguishes:

1. *Johannis-apfel*, which may be known by its being very hairy, the twigs having shining brown bark, and by its brittle roots. Generally found in Dutch nurseries, it throws up many more suckers than the following.

2. *Split* or *Suss-apfel* (Doucin of the French) has woolly hairs on the young shoots and on the undersides of the leaves. These are rounded at the base. Generally to be found in the French nurseries, where it is used as a stock for dwarf trees. The "englische Split-apfel" (common Codlin) seems to be only a variety of this.

The only variety mentioned in Loudon's *Encyclopaedia of Trees and Shrubs*, 1842, is *P. Sieversii*, under "Species of Which There are Only Very Young Plants in British Gardens,"

a bush, with many stems rising from the same root; with ovate leaves, rather tomentose; and umbellate flowers, succeeded by very acid fruit. A native of Siberia.

Koch, *Die Deutschen Obstgehölze*, 1876, seems to be the chief German authority on stocks. He says:—

It appears that the Doucin is of Italian origin and was first brought to notice by Agostino Gallo during the first Century following the middle ages. He mentions two forms, *Dolciano Nano* and *Dolciano Mezzano*, meaning the dwarf and the semi-dwarf sweet apple. We do not know when the Doucin was brought to France, but it was probably introduced soon after it became known in Italy.

If this is correct, possibly *Dolciano Nano* is the French Paradise, *Dolciano Mezzano* the Doucin, and Italy the birthplace of both. Koch says the French Paradise was known in France as early as the beginning of the 15th century. Is this earlier than the somewhat vague first century following the middle ages?

Quite a wrong statement may easily be made through misapprehension of names: thus E. G. Lodeman, in *Bulletin* 116 of the Cornell University, 1896, cites Parkinson as mentioning the Doucin in *Paradisus Terrestris*:—

The Deusan or apple John is a delicate fine fruit, well relished when it is greenish to be fit to be eaten, and endureth good longer than any other apple.

This obviously does not refer to the stock at all, but to the "Deux Ans" Apple, thus christened because it keeps longer than one year. Hogg gives John Apple as a synonym of Northern Greening and also of French Crab.

In Germany, Crabs are commonly called *Paradiesapfel*, as well as *Kirschapfel* (Cherry-Apples). It is also a synonym of several different Apples. Thus, in Simon-Louis's *Guide Pratique*, 1895, we find:—

1. *Paradies Apfel* (through error) = *Calville blanche d'hiver*, an old variety, much esteemed especially in France, but the fruit of which is apt to get spotted especially in wet years. The tree has a delicate constitution and is fit only for growing as a bush, espalier or on walls.

2. *Paradies apfel* = *Rambour franc* which makes a very vigorous and fertile tree suitable for standards.

Hogg, in the *Fruit Manual*, says:—

This is an old French apple which must have been long cultivated in this country, as it is mentioned by Rea so early as 1668. It is supposed to take its name from the village of Rembures, in Picardy, where it is said to have been first discovered.

3. *Paradies apfel* = *Rother Eiserapfel*, a very large tree, healthy vigorous and a great cropper.

I do not identify this as any variety we grow in England.

4. *Paradies* (of some) = *Thoule d'été* (Whorle Yippin, Hogg), a vigorous and fertile tree which flowers very late. An English apple, much grown in Scotland.

5. *Rother Paradies Apfel* [Red Paradise] = *Calville rouge d'automne*, a vigorous and fertile tree, suitable for orchards.

* *Morphology of Gymnosperms*: Coulter and Chamberlain, University of Chicago Press, and Cambridge University Press, pp. 458, with 462 figs.; 16s. net.

Of these, the last four are all distinguished by their highly-coloured fruit, vigorous habit, and great cropping qualities.

In England, judging by Hogg's *Fruit Manual*, we have only one Apple which is given this name:—

White Paradise (Lady's Finger; Egg; Paradise Pippin) a second-rate, but beautiful and handsome dessert apple; in perfection the beginning of October, but towards the end of the month becomes dry and mealy. It is, I believe, a Scotch apple and much grown in some districts, particularly in Clydesdale, where it is known by the name of Egg Apple, and where the fruit lasts longer than when grown in the warmer climate of the south.

André Leroy, *Dictionnaire de Pomologie*, 1873,

years before (1536) *Ru de Natura stipium* was of different opinion about this same fruit which he thought he recognised in the "Melimelles" or the "Mustées" also mentioned by Pliny, who confined himself to stating of the first, that their flesh "had a honey-flavour" and of the others "that they ripened early." If I had to judge between these two opinions, I would rather accept Ruel's as far as the "Melimelles" are concerned since our Paradise apples have a honeyed taste.

Without troubling ourselves further over a point which it is impossible to settle, I will pass on to less problematical assertions.

The present keeper of the Archives of the Seine-Inférieure, M. Robillard de Beauvais, whose work *Etat des campagnes de la Haute Normandie au moyen âge* contains valuable information about our ancient fruits, tells us "that in this country, in the time of Champier (1472) the Paradise apple, was with the

Paradise is not a name which has been given much to other fruits than the Apple. Leroy mentions two Pears: *Paradis d'Automne*, a synonym of *Beurre Bosc* (Thompson, *Catalogue of Fruits, Hort. Soc. Lond.*, 1842) and *Paradis d'hiver* or *Virgouleuse* (Mayer, *Pomona francoica*, 1776-1801).

The Plum tree of Paradise is spoken of by Leonard Mascall (*The Country-Man's New Art of Planting and Grafting*, 1652), as being one of the trees which

take root prick of branches,

but I find no other reference to this variety. It is curious that Apples on Paradise, Pears on Quince, and Cherries on Mahaleb give excellent and large fruits, but when it comes to a dwarfing stock for Plums or Peaches, the stock which reduces the size of the tree also affects the fruit and makes it much smaller. Such are the *Mirabelle de Nancy*, *Damas de Toulouse*, *Mariana*, &c., which have all been tried and found wanting. A good dwarfing stock for Plums has yet to be invented. H. Somers Rivers.

BIRMINGHAM BOTANICAL GARDENS.

NOVEMBER is certainly not an ideal time to see a garden at its best. Nor does one expect great floral displays in a botanic garden, though during recent years this phase of the subject has received greater attention than formerly. Hence, at Birmingham, as at Kew and other similar places, we see, even in winter, plenty of flowering plants in the glasshouses. Among noteworthy examples, I noticed at Edgbaston handsome bushes of *Salvia splendens grandiflora*; whilst *Chrysanthemum*, if one might judge of the evidence of bud and blossom, will hardly have passed out of flower before the end of the year. Varieties were numerous, and I was pleased to see that many single-flowered sorts are grown. A more unusual feature was seen in a batch of hybrid *Gesneras*, in which the richness and brilliance of their floral parts were emphasised by crimsoned leaves of sable-like softness. *Gesneras* are autumn flowering plants, which are easily raised from seeds, and they are certainly desirable in the warm greenhouse at this season; the hybrids had a compact, pyramidal form, and grew 12 to 13 inches in height. *Begonia Haageana* was in excellent bloom, as might well be said of it, indeed, at any time within three months of its starting to flower, so great and so profuse is the yield. Attractive in its leafage as well as continuous in flowering, it is a plant for those gardeners to note who require subjects of exceptional merit. The examples of richly coloured *Codiaeum* (*Crotons*) evidenced high culture. *Pandanus Sanderi*, as here seen, is an imposing plant indeed. Any exhibitor of fine foliaged plants might well desire such an acquisition, which, apart from high-class culture, only requires age to bring out its finer characteristics. The yellow flowered *Allamanda Williamsii* was interesting at the moment, because of its maturing seed-pods, the latter being copiously armed with spines 1 inch in length. Excellent specimen plants of the mottled-leaved *Draena Godseffiana* were noted, as were many other species of plants too numerous to mention in detail. The *Victoria regia* had commenced to decline, albeit a handsome flower in the mature stage was still to be seen.

One of the most interesting subjects noted was *Agapetes* (*Thibaudia*) *macrantha* (see fig. 62 in *Gardeners' Chronicle* for April 21, 1894, p. 501), in a good plant 6 feet in height, and bristling with flower-buds from base to summit. This hardy subject possesses the peculiarity of producing its flower buds from practically all its parts, the sides of the inch-thick stems within an inch or so of the soil being as freely studded with flower-buds as any other part of the plant. Its fully-developed flowers are shaped like a Chinese lantern, and are curiously veined with red. *Ducksonia Lathamii* (*D. arborescens* × *D. antarctica*), with its 11-foot-high trunk and 15 feet 6 inches wide spread of fronds, while reflecting the highest

FIG. 139.—FRUIT-CAPSULE OF ALLAMANDA.
See "Birmingham Botanical Gardens."

gives three Paradise Apples, all different to those previously mentioned, all large, highly-coloured fruits of very fertile trees.

Paradis d'hiver, a synonym of *Rouge de Stettin*, and *Paradis rouge* synonym of *Cœur de Bouff* and of *Roi Très Noble* (also called *Calleville rouge d'Automne* in error).

The following is his account of—

Pomme de Paradis. Synonymes—*Pomme*, 1 *D'Arbre Nain* (John Gerard, *The Herbal* 1597)—2 *Après de Lectier*, of Orleans, *Catalogue* 1728, and *Daleham*, *Histoire générale des plantes* 1643.

In the first century of our era Pliny mentioned in his *Historia naturalis* (book xv) an apple called *Petisienne* "recently introduced in Rome, small, but with a very agreeable flavour." Charles Estren's basin, his theory on this passage alone, thought in 1841 (*Seminarium*) that the variety we call *Paradise* must be identical or nearly so with this *Petisienne*. A few

Blanc-Dureau and the *Capendu* (or *Court-Pendu gris*) the most esteemed apple."

It also occurred in these olden times, in the Midi de la France, since Jean Bauhin, who wrote before 1613, alleges he received it from Lyon and from Montpellier. He says too it was grown in Switzerland at Bale and Geneva (*Hist. natur. Plantar.*).

It was, we think, towards the middle of the 12th century that the practice of grafting other apples on the *Paradise*, to obtain dwarf trees, began. . . . If I were asked why the fruits of this prototype of the dwarf apples were called *Paradise-apples*, I should quote, naturally with all reserve, the assertion of the naturalist Tragus of Strasburg, *Historia stipium* 1552, "The latin poets tell us that the apple which Adam and Eve bit into so covetously belonged to this variety, from which it follows that it was subsequently given the name of the place then inhabited by them, the terrestrial Paradise."

This is rather a curious method of reasoning.

credit on present-day cultivation, is a monument to the skill of the former curator (Mr. Latham) whose name it bears. The plant is not now the only specimen, for smaller examples were also noted. Nepenthes of many kinds were in excellent condition, and the same may be said of a choice collection of Orchids, of which *Sobralia Elizabethæ*, *Cypripedium grande*, *C. bellatulum*, and others were remarked.

To the noble examples of *Gleichenias*, however, belong the pride of place, not merely because of the giant proportions which render them practically, if not, indeed, absolutely, unique, but equally because of their rude health and luxuriance, qualities which none but growers of these rare Ferns could appraise at their worth. I have seen large examples of *Gleichenias*

PEARS AT LOTA LODGE.

THE photograph of Cordon Pear trees in fruit (see fig. 190) was taken in the gardens of A. F. Sharman Crawford, Esq., Lota Lodge, Glanmire, Co. Cork. The variety is Fondante de Thirriat, and in a length of stems totalling about 24 feet there were 120 fine fruits. The trees were planted five years ago when the garden was made, previous to that time the field had not been tilled for at least 60 years. The wall fruit trees were planted immediately afterwards. The soil was trenched 3 feet deep; this process involved bringing the subsoil to the surface, but the trees themselves were planted in loam of a good texture. Every season some of the trees have borne fruits, and this year all the

THE DESTRUCTION OF RATS.

ON account of the general desire to reduce the number of rats in this country, we reproduce the following information which has just been issued by the Board of Agriculture and Fisheries, in *Leaflet No. 244*.

Two kinds of rats are found in Great Britain, the Black Rat (*Mus rattus*), and the Brown Rat, sometimes called the Hanoverian or the Sewer Rat (*Mus decumanus*). The former, which has been longer established in this country, is the smaller of the two. It is more lightly built, but its ears are slightly larger, and it has a thin tail 8 or 9 inches long, or about 1 inch longer than the rest of its body. The upper part of its fur is of a grey-black colour, the under parts being a dark grey. The brown rat is generally longer in the body, but shorter in the tail, which is never as long as the head and body combined. It has a blunter muzzle, and its fur is grey-brown above and white below. The fur of the brown rat, moreover, is rather coarser than that of the black rat.

The females of both species breed at a very early age, and though they go with young for six weeks they have several litters in the year, each litter comprising from six to 14 young. Rats, therefore, increase in numbers very rapidly if sufficient food is available. It has been calculated that in India, where they breed all the year round, the offspring of a single pair would, if supplied with sufficient food and left unchecked, amount at the end of one year to 35,000. Fortunately such favourable conditions are never present.

Rats are omnivorous feeders, and when desperate with hunger are even cannibals, but they are by choice dependent on the food supplies which man prepares for himself and his domestic animals, or on the waste of such food. Many estimates have been made of the damage done by the rat population of Great Britain in a single year, but as these estimates are based on the assumption that the supplies consumed by rats would otherwise be available for human use or consumption the reasoning is unsound. It is, however, generally admitted that the damage done is incalculable. Rats frequent dwelling houses (generally only the lower floors), barns, granaries, poultry yards, slaughter houses, sewers, and other places where food supplies are stored, or the waste is thrown away. They also frequent rabbit warrens, and take to the fields when food is to be found there, returning to shelter and to breed in corn stacks in the autumn.

Apart from the food consumed by rats, much damage is done to buildings, floors, and other kinds of woodwork from their power of gnawing holes and passage ways. It is also known that the disease called plague may be spread to human beings by fleas from infected rats.

It is, therefore, highly desirable, both from an economic and a sanitary point of view, that rats should as far as possible be destroyed. It would, of course, be well if they could be entirely exterminated in Great Britain, but this is practically an impossibility. During the period of nearly 200 years that has elapsed since the Brown Rat was introduced into this country, it has penetrated to the remotest parts of the British Islands, and is to be found in many ruined buildings and other places from which it would be difficult to dislodge it. Since rats can live on garbage, travel over wide areas, and breed very rapidly, a few pairs allowed to remain alive would quickly re-stock the country, and even if every rat were destroyed, others would undoubtedly be imported in some of the vessels that call at English ports. The expense and inconvenience of exterminating the rat population of this country and preventing re-importation would far outweigh the economic gain to be secured by their destruction.

The destruction of rats is essentially a matter for local effort, and the occasion for the attempt to be made is when the danger of injury from their presence outweighs the probable cost and trouble of killing them. Local effort, however, does not necessarily mean isolated or unsystematic effort. In many places it is true that rats can be kept down by cats, traps, and occasional rat hunts, and this is true of most dwelling houses, especially if the kitchen and outhouses are kept in a clean and tidy state so that the rats find it difficult to procure an abundance of food. It is also true of many farms where the buildings are well kept, but in other cases on

FIG. 190.—CORDON PEAR TREES AT LOTA LODGE, GLANMIRE, IRELAND, THE VARIETY IS FONDANTE DE THIRRIAT.

before, but never such specimens as these at Edghaston. Difficult to successfully cultivate at all times, these plants are still more difficult to maintain in health and vigour when they reach to the specimen size. Of those noted, *G. Mendelii* was 4 feet across, and 6 feet in height. *G. Spencei* was about 4 feet each way, and *G. rupestris*, the giant of all, had a diameter and height of 6 feet. Cultivators of specimen stone or greenhouse collection plants would view such as these with admiration. Mr. Humphreys and his staff, who are responsible for such high excellence in plant cultivation, have reason to be proud of their handiwork. *E. H. Jenkins.*

Pear trees fruited freely, particularly those trained on the diagonal cordon system. Peaches and Plums have also carried heavy crops. The ripening of the Peaches was much impeded by want of sunshine in August, the rainfall for that month at Glanmire having been 6.00 inches, and the number of rainy days 25. The most prolific varieties of Pears in these gardens last season were Doyenne Bonsoch, Bonne Fournier, Marie Louise d'Ucle, Pitmaston Duchess, and Doyenné du Commerce as cordons, while Souvenir du Gargis, Bonne d'Amabilis, Durendean, Bonne Race, and Emile d'Heyst are very productive on trees trained on the horizontal system. *A. P., Cork.*

farms, or in mills, malhouscs, and other establishments where large supplies of food are stored especially where several such buildings stand close together, combined effort is essential. In these cases the formation of a Rat Club such as is described in Leaflet No. 84 is desirable. It is customary in such cases for all the large occupiers of land in a given district, generally comprising several thousands of acres at least, to offer a small reward for every rat killed within the district, the tail being produced as a proof of slaughter. Occasionally, however, it happens that for sanitary or other reasons, especially when rats have been allowed to breed undisturbed for a long time, it is considered important to attempt the extermination of rats over a much wider area, and in this case a more elaborate organisation is required. The following observations and suggestions may be found useful to those who propose to organise such a campaign.

There are three methods which may be employed in the destruction of rats:—(1) Hunting; (2) Trapping; (3) The use of poison or rat virus. There is not much to be said about the first of these methods. Most residents in the country are acquainted with the ratting instinct of terriers, and with the employment of ferrets, and a knowledge of the practice can better be obtained by experience than by description. As regards traps, the spring trap which kills the rat at once when the spring is released is the best, but care must be taken to see that no other animal is caught, and traps should therefore be visited frequently. Another kind is the wire trap, on the cel-basket principle, which the rat can enter easily when attracted by the bait but cannot leave.

Rat poisons are sold in all country towns by chemists, and several patent or proprietary poisons are advertised in agricultural and other newspapers. They are generally composed of phosphorus paste or arsenic, but strychnine may also be employed, while the use of barium carbonate has also been recommended.* Plaster of Paris is sometimes used mixed with flour, which sets into a hard mass in the rat's stomach. It must be remembered that rats are very suspicious, and if they find that any number of their fellows die after eating any kind of food they will avoid such food for some time. It will be as well, therefore, to vary the form and appearance of the poisoned bait at intervals. Thus, after using poisoned bread for a while, oatmeal similarly treated should be used.

Apart from the risk of a possible prosecution under the Acts which deal with the use of poisoned grain, meal, or meat, it is very necessary when using poisons to take precautions to avoid injury to other animals and human beings. (The Acts concerned are the Poisoned Grain Prohibition Act, 1863, and the Poisoned Flesh Prohibition Act, 1864.)

In any case poisoned baits should only be laid

by authorised and responsible people. Their whereabouts should be carefully recorded, and they should be visited regularly and destroyed if not taken within a short period. The strictest precautions should be taken to prevent the bait being eaten by domestic animals, and if necessary notices should be exhibited in places where baits are laid to warn people to keep dogs or other animals away from the place. When poisoned baits are laid by a Rat Club or other organisation, it would be as well to insist that each group of baits should be numbered, and its situation suc-

cess, or failure and ultimate destruction recorded in a book.

to the fact that, if only slightly infected, rats recover and thereafter become more or less immune to the disease. It cannot be too strongly urged, therefore, that if there is to be a successful attack upon rats in any district, reliance should not be placed in any one of the methods referred to above, but that as far as is possible under the circumstances all these methods should be employed. Rats are intelligent animals, and will soon learn to evade any one of these devices, and will even vacate for a time the district in which they are being harried. It, therefore, it is proposed to exterminate the rats in a large district, means should be employed whereby this intelligence can be used to compass their destruction. With this object combined efforts should be made over a wide area, and the attack made in a circle radiating from a given spot in which it is considered that the final work of destruction can be accomplished with least difficulty. Rat hunts should be organised simultaneously on the circumference of this circle, traps and poison should be laid on the outside and food supplies in the centre to which the rats should be driven. Every precaution should be taken to see that no rats escape outwards, and their holes should be closed, and their runs and nests destroyed as the circle is gradually drawn closer. Finally, when a broad band at the circumference has been cleared, poisoned food should be employed in the centre, and virus laid where the rats can take the disease.

UTRICULARIA PREHENSILIS.

AN aquatic plant with flower-shoots twining above the water is sufficiently uncommon in gardens to merit illustration in the *Gardeners' Chronicle*. *Utricularia prehensilis* (E. Meyer), which is now flowering freely in a warm greenhouse in the Royal Botanic Garden, Edinburgh (see fig. 191), is a species from Tropical and South Africa and Madagascar, and has been figured by Dr. Stapf in Hooker's *Icones Plantarum*, plate 2.798. Whilst not exactly a decorative plant, the profusion of yellow flowers upon it attract attention. To the botanist, however, and particularly to the teaching botanist, it is a plant of interest, since it offers him an easily-grown species of this interesting genus for the study of the curious morphological features which it exhibits. The plant produces riband-shaped leaves, which float on the water surface, and, from amongst them, as will be seen in the illustration, the flower-shoots rise in numbers. The growth is rapid, and the plant soon covers a large area. The crop in cultivation in Edinburgh has all come from a single seed obtained from a small South African collection of plants which arrived in the summer of 1909. I. B. B.

CORNUS CAPITATA.

ISOLATED specimens and groups of *Cornus capitata*, Wall., are to be found in many valleys in W. and N.W. Yunnan; in the Salwin Valley, lat. 27° N., it is fairly common, but in no part is it so abundant and free-flowering as in the Lichiang Valley and along the base of the eastern slope of the great Lichiang Range, 27° N., neither is it found at such an altitude, namely, 8,200—9,000 feet, in any other district. There, for a stretch of 10-12 miles, almost from the southern extremity of the valley, are colonies hundreds of acres in extent. One of the principal watercourses irrigating the plain is densely bordered with this plant, and, during the flowering season, the watercourse, as seen from the hills, appears as a line of yellow white from the dense masses of bloom. The average height of the trees is about 40 feet; occasionally a large specimen, generally isolated, may be seen of 50 feet or 60 feet; in most cases, when viewed separately, they are symmetrical in habit.

I know of no tree or shrub in Yunnan more prodigal of bloom; it forms masses of distinct colouring of a delightful soft shade of lemon-

FIG. 191.—UTRICULARIA PREHENSILIS IN EDINBURGH ROYAL BOTANIC GARDEN.

cess, or failure and ultimate destruction recorded in a book.

Rat viruses, on the other hand, of which there are several on the market, can be used without fear of direct injury to any animals other than rodents. These viruses are believed to be composed in every case of a culture of a microbe causing a specific disease of rats, which in some cases at any rate is contagious, so that the inoculated rat conveys the disease to his fellows. The uncertainty with which this method is attended is due partly to the difficulty of securing a successful infection in all cases, and partly

* A recent bulletin published by the United States Department of Agriculture discusses the relative merits of arsenic, phosphorus, strychnine, and barium carbonate as rat poisons. Arsenic is cheap, and, perhaps, the most popular poison for the purpose; but experiment showed that, measured by the results obtained, it is dearer than strychnine. It is variable in its effects. One part of arsenous acid may be mixed with 12 parts by weight of oat or maize meal and made into stiff dough with white of egg. Phosphorus is almost as commonly used as arsenic, and is effective when mixed in an attractive bait; but in the paste forms, which contain from 1 to 4 per cent. of yellow phosphorus in glucose and other substances, the lower percentage is too small to be always effective, and the larger amount is dangerously inflammable. Many fires have been caused by phosphorus paste in the United States, and the Biological Survey does not recommend its use. It is said that there is no foundation in fact for the statement that phosphorus dries up or mummifies the body without odour when eaten by rats or mice. Strychnine may be effectively employed in the open and round farm buildings, but it is too rapid in its action for use in houses, as the vermin would die on the premises. Dry crystals of strychnia sulphate may be inserted in portions of raw meat, sausage, or fish, and these placed in the burrows. Strychnine syrup may be prepared by dissolving 1 oz. of the sulphate in 1 pint of boiling water, and stirring in 1 pint of thick sugar syrup; this may be used to moisten a bait of oatmeal, while Wheat or Maize may also be soaked in it. In all cases it is advisable that baits containing one of the above poisons should be obtained ready prepared from a pharmaceutical chemist. Barium carbonate is considered one of the cheapest and most effective poisons for rats and mice. It is without taste or smell, has a corrosive action on the mucous lining of the stomach, and, causing thirst, induces the vermin to seek water in the open, where they die. In the small doses used it is said to be harmless to domestic animals. It may be employed in the proportion of one part of the carbonate to four parts of meal, mixed to a dough with water. A convenient bait is composed of one part by measure of the mineral to eight parts of oatmeal, mixed to a stiff dough. The carbonate may also be spread on fish or moist toasted bread. In 1905, large quantities of a poisonous food were set out by the Agricultural Botanical Institute at Munich for the purpose of destroying field mice, and it is stated that it chiefly contained barium carbonate.

yellow, the blooms being so large that in many instances little or no foliage is visible.

The fruits, which, when ripe, are dull yellowish-crimson, are edible, being largely partaken of by the natives. They are occasionally exposed for sale in the markets of Tengyueh, Tali, and Lichiangfa. The pulp is sweet, rather astringent, but not unpleasant. The local name for the species is "ghi suddtsa hua." *George Forrest.*

The Week's Work.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Lalia pumila.—This pretty species and its several varieties, such as *præstans*, *Gatton Park* var., and *Low's* var., are passing out of flower, and at this stage attention should be given to any which require fresh rooting material. Select small, shallow pans, and make them three-parts full with drainage, using only a small quantity of *Osmunda* fibre and *Sphagnum*-moss, which should be chopped up moderately fine, and well mixed together. After

their depth, then a layer of smaller ones over them, and lightly cover the drainage with rough *Sphagnum*-moss. The compost should consist of *Osmunda* fibre, *Polypodium* fibre, and *Sphagnum*-moss in equal parts, mixing with these materials a moderate quantity of small crocks. Press the compost firmly about the small, fine roots, keeping the base of the pseudo-bulbs slightly higher than the rim of the pot. Afford water very sparingly until roots push out from the new growths. There are many *Maxillarias* that are well worth including in any collection. Such are *M. fractiflexa*, *M. Lindonii*, *M. Amesiana*, *M. præstans*, *M. scurrilis*, *M. Turneri*, *M. nigrescens*, *M. Houtteana*, *M. lepidota*, *M. picta*, *M. fasciata*, *M. Sanderiana*, *M. luteo-alba*, *M. tenuifolia*, *M. stricta*, *M. s. grandiflora*, *M. variabilis*, *M. Mooreana*, *M. elegantula*, *M. ochroleuca*, *M. sanguinea*, *M. phœnicanthera*, *M. Hubschii*, *M. punctata*, and *M. acutipetala*. Established plants require liberal root waterings, and a moderately cool, moist atmosphere when making their growth. A cool, intermediate house will suit them the whole year round, and they will thrive in company with the *Odontoglossums* if they are placed at the warm end of the house, where they will be exposed to rather more light

Species which have bloomed recently, such as *C. Rossiana*, *C. Cumingii*, *C. graminifolia*, and *C. sulphurea* may be reported if they need this attention.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Eremurus.—The *Eremuri* are amongst the noblest of herbaceous flowering plants. They should be cultivated in a sheltered and warm position, but one that is fully exposed to the light. These conditions may generally be obtained in an herbaceous border, provided the border is of considerable width. The plants should be given prominent positions where the flower-spikes will have their full effect, it being usual to leave the spikes upon the plants until the flowers fade, as they are too large for use in a cut state, in ordinary schemes of decoration. Dig the soil deeply and give it a good dressing of decayed farmyard manure. *Eremuri* may now be replanted, but the work should be done at once, for after the turn of the year the crowns will soon begin to show signs of growth. Remove sufficient soil to allow of the large fleshy roots being laid out evenly and flatly. The crowns, when dormant, should be just covered with soil. As soon as growth commences, I make a practice of covering the crowns with sifted cinder ashes, increasing the size of the mound as growth continues, but care has to be exercised in removing these cinders at a later stage or injury would be caused by late frosts. *Eremurus robustus* and its variety *Elwesianus* are excellent plants; *Elwesianus* is a remarkably fine variety, and it flowers rather earlier than the type. *E. Bungei* has yellow flowers, *E. himalaicus* has massive spikes of creamy-white blooms. (An article on *Eremuri*, by Mr. Elwes, was published in *Gardeners' Chronicle* for August 22, 1910.—Eds.)

General remarks.—Beds containing plants which have been cultivated for providing winter effect, will now be bright with the variously-coloured shoots. The fallen leaves should be removed from the base of the plants in cases where this is possible, but where the growth is very thick they are best left until the plants are cut down again to the ground level in spring, just before the buds break into growth. Beds containing species of *Rubus* may now have the old wood removed; this will give them a neater appearance, and it will be of considerable cultural benefit to the plants. Many upright-growing species of *Rubus* have most attractive stems, which assume various tints of colour, but probably the most distinct sorts are those which are covered with white farina, such as *Rubus biflorus* and others of more recent introduction which closely resemble it. The Japanese Wineberry (*R. punicolasius*) is attractive at all seasons, and is a very fine plant for grouping near to the water. The winter effect of this plant is excellent; it is ornamental when in flower and fruit, and the silvery reverse of the leaves when stirred with the wind has an attraction of its own. Another very showy plant, when massed in a clump, is the Sea Buckthorn (*Hippophae rhamnoides*), the female plants being literally covered with coloured berries. This plant being dioecious, it is necessary that some pollen-bearing plants should be planted amongst them. These may be distinguished by the size of the buds.

The water-garden.—Where the water-garden is of artificial construction and the water can be regulated as desired, the present is a good time to give it a thorough cleansing, choosing open weather for the work. Let the basin be given a thorough brush out with bass brooms, wheel out the decayed leaves and other sediment, and place the material on vacant ground where it may prove of service. If there are pockets containing Water Lilies and other aquatic plants, these plants must be protected against frosts in the event of their remaining uncovered with water. Any cracks or other defects may be made good. In the cases of natural stretches of water, the surroundings should be made as tidy as possible, removing the leaves and other rubbish from the surface of the water. Let the planting of suitable subjects on the margins of water-courses be completed during favourable weather, exercising a careful choice in regard to the species employed for planting. Many of the willows make very imposing beds if planted in irregular masses; they should be pruned almost to the ground level each year.

FIG. 192.—*CORNUS CAPITATA* FLOWERING IN THE LICHANG VALLEY, CHINA.

affording the fresh compost, suspend the plants near to the roof glass of the intermediate house for the winter. So long as the plants continue to make roots, the compost should be kept just moist, but later, very little water will be needed to keep them from shrivelling. Newly-imported plants should be placed in shallow pans and suspended to the rafters, fixing them firmly in the pans with small crocks, and tying one or two of the pseudo-bulbs to the wire handles, in order to steady each plant in the pan. When the new roots start away, a thin layer of the compost should be packed moderately firm around the base of pseudo-bulbs. These dwarf-growing *Laelias* are very subject to white scale, and they should be examined frequently, otherwise these insects will increase rapidly.

Maxillaria.—Such plants as *M. venusta*, *M. caudiflora*, and its variety *Lehmairii* also require attention at this season. If any of the large specimens have become bare in the centre, they may be subdivided and the divisions placed compactly together in new pots or pans, or they may be repotted singly for increasing the stock. *Maxillarias* require exceptionally good drainage, therefore it is necessary to place large pieces of crocks in the pots to nearly half

than is needed for the other inmates. At the same time, they should be shaded rather heavily during hot, direct sunshine. *M. Sanderiana*, owing to its flower-spikes pushing in a downward direction through the soil should be grown in shallow, teak-wood baskets, using no crocks over the bottom for drainage, as a free passage for the flower-spikes is essential.

Calogyne cristata.—Plants of *Calogyne cristata* and its several varieties, which have completed their growth are now pushing up flower-spikes. Whilst these are in course of development, the plants must be watered very carefully. Elevate them well up to the roof glass in the intermediate house, fully exposing them to the light. The pure white *C. cristata hololeuca*, a later-flowering variety than the type species, will still need plenty of water until the new pseudo-bulbs are completed. Occasional waterings with weak cow manure water may be applied until the flowers commence to open. *C. elata*, and *C. ocellata maxima* are also developing their flower-spikes, and they need a plentiful supply of water. *C. flaccida*, *C. tomentosa*, and *C. Massangeana*, now resting in the *Cattleya* house, will not require much water until the flower-spikes appear or new growth commences.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSEL,
G.C.B., Moulton Paddocks, Newmarket.

Vine eyes.—The propagation of Vines from what are termed "eyes" may be commenced towards the end of the present month. For this purpose, select strong, well-ripened shoots and cut them into pieces about 1½ inches in length, taking care that each piece contains a bud. Pare off the bark on the opposite side of the shoot to the bud, and carefully insert each piece in a small pot containing sandy loam. The pots should be clean, and they should contain material for drainage. The buds must not be buried in the pot, but, on the contrary, they must be so placed as to be clear of the soil. Plunge the pots to the rims in a frame or propagating case where there is a bottom heat of from 65° to 70°, keeping the frame closed for some time, but wiping the inside of the glass each day to remove any moisture that may have condensed upon it. The atmospheric temperature of the house containing the propagating frame should be 60° to 65° at night. When the eyes or cuttings have made roots about 1 inch long they may be inured gradually to the atmosphere of the house by tilting the lights. In the early stages the growth is very tender and easily injured, therefore the cultivator must be exceedingly careful in his treatment of them until they have made growths a few feet long. The young Vines require full exposure to the light, and should be kept near to the glass, but it is undesirable to place them on shelves, as shelves are usually too dry for their well-being. Keep the small pots plunged, and spray the young plants gently once or twice each day until they are in a fit condition for being repotted into large pots. Details of repotting and the subsequent treatment young vines require, have been given in previous calendars.

Propagation of Figs.—Although Figs may be propagated by various means, the method that may be recommended is that of taking cuttings of the ripened wood. In gardens where numbers of Fig trees are grown in pots, it is advisable to raise a few young plants each year to replace any which have become exhausted or misshapen. The cuttings are formed from the tops of the shoots, selecting straight, short jointed pieces of wood that are firm and well ripened. Remove a few of the lower buds from these cuttings, and cut them square across the base of the cutting. The cuttings may be about 4 inches long, and they should be dibbled into small pots, putting one cutting in each pot, and using a compost of loam, sand, and leaf-mould. Place the pots in a frame which is provided with bottom heat in the same way as recommended above for the Vine eyes, and treat the cuttings in a similar manner until the young plants are fairly well advanced in growth.

Strawberries in pots.—Place batches of plants indoors as required to provide a succession for forcing, always selecting the strongest plant's first, thus leaving those which are less vigorous until a later date when less forcing will be necessary to induce the plants to start into growth.

THE HARDY FRUIT GARDEN.

By A. R. SEABLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Espalier and cordon trained trees.—In training these forms of trees, those specimens which have already filled the space allotted to them should have their leading shoots pruned to within two or three eyes from the base, and the lateral shoots should be shortened in a similar manner. In the case of any aged trees which have been neglected, it may be desirable to thin out some of the long straggling spurs, removing first those which are longest and most weakly looking. It is not possible to obtain fruits of the best quality from trees which are allowed to become a crowded mass of shoots that offer obstruction to sunlight and air. If the trees are attended to each season with respect to pruning, one of the chief essentials of cultivation will have been carried out. Any tree that showed signs of exhaustion from carrying a heavy crop last season should be given a top-dressing consisting of good loam with a liberal addition of bonemeal. Such a top-dressing may be supplemented with frequent waterings with liquid manure. If any of the trees are growing excessively strong this condition must be modified by root pruning.

Bush and pyramid trees.—Trees trained as bushes and pyramids are frequently selected for growing in the kitchen garden near to the paths or on borders where the space is somewhat limited. In some cases the trees are subjected to hard pruning each year, in order to prevent them from outgrowing their positions. Such pruning, if persisted in, has the effect of producing an abundance of strong growths, but few fruit spurs, and it becomes necessary to prune the main roots. The leading shoots should be pruned to 6 or 8 inches in length according to the space available for them, and all other shoots should be cut back to two or three eyes from the base.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH POKESGILL, Esq.,
Bardon Hill, Westwood, Yorkshire.

Solanum.—Amongst berried plants for the conservatory and dwelling rooms none is more effective at Christmas than *Solanum Capsicastrum* and *S. Pseudo-capsicum*. During their growing season both these species succeed best in an intermediate temperature, but in summer they can be cultivated freely in unheated frames with the lights removed in warm weather. In the cultivation of *Solanums* for general decorative purposes I do not recommend planting them out for the summer months in out of door borders. In most cases it is essential that plants used in the dwelling house should be in pots of small sizes, and if the plants are grown in borders it is impossible to get them into small pots in the autumn without causing the roots a very serious amount of curtailment. Again, in northern districts or exposed situations, I have found that the berries do not set so freely out of doors. If the plants are grown to their best they are capable of retaining their berries for a considerable period, indeed, well into January. When the last stage is reached and the berries fall, the plant should be pruned back to the hard wood, and be kept somewhat drier at the roots until the branches commence to break into growth again, when they can be potted on for forming larger specimens in the following season. In places where seedlings are raised each year, it is best to sow the seeds as soon as a supply of new seeds is available.

Humex elegans.—Plants of this fragrant species which were raised in autumn may now be transferred into pots 7 inches or 8 inches in diameter. The plants must not be allowed to suffer from a restricted root area at this stage, or the injuries will be irreparable. Place them in a light, well ventilated position in a warm greenhouse and water them with extreme care, as any error in respect to the supply of water will have disastrous results. Examine the leaves occasionally for insect pests, and fumigate the plants with a nicotine vaporising compound or syringe them with a very weak insecticide should any pest be found upon them. Fix a neat green stake to the main stem, and loop up the axillary growths with raffia-tape. Do not attempt to feed the plants with manures until the pots are well filled with roots.

Forcing house.—Introduce successional batches of retarded crowns of Lily of the Valley and *Spirea astilboides*, *Narcissus Van Sion* and *Narcissus Golden Spur* may also be introduced to the forcing house after the present date with prospects of success. Batches of Tulips if introduced into heat now will provide a display of flowers early in the new year.

General work.—Examine specimen plants now resting with a view to watering any that really require moisture, remembering that excessive dryness at the root causes the wood to shrivel, which is injurious to the well-being of the plants. Great care must be given to the heating of the plant houses just now, preventing sudden fluctuations of temperature as far as possible and high temperatures during dull, dark days. Re-arrange the plants in the stove occasionally with a view to brightening the effect, and remove any ill-looking specimens which may have lost some of their leaves through the exposure of the conditions of dwelling rooms. These may be used for stock purposes in the propagating department. In urban districts where deposits of soot and smuts are found under the glass, the glass should be thoroughly cleansed as often as it becomes necessary.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Plants in pits.—Air should be given freely to all plants in pits, such as Lettuces. The decayed leaves should be removed and the ground between the rows stirred with a small hoe.

Parsley and Radishes.—All leaves affected by frost should be removed and a slight dressing of soot given. Radishes may be sown now on a gentle hotbed. It is better practice to sow these by themselves than to mix them with Carrots or other crops.

Skakale.—From this date Skakale roots will force freely, and batches should be introduced to the forcing quarters each week in order to maintain an unbroken supply. It is much better practice to keep up a small, regular supply in this way than to place a large number of roots into heat at one time. Complete darkness and a moist atmosphere are necessary to produce good results with this crop.

Tomatos for fruiting in spring.—Plants intended for fruiting in spring should be kept as near to the glass as possible, by so fixing the shelves that the tops of the plants are brought within a few inches of the roof. Do not allow the roots to become dry, but take care that water is not afforded unnecessarily. As soon as the first flowers show colour, shut the plants into their final pots, using a compost consisting of fibrous loam, two-thirds, and rough leaf-mould, one-third. Provide ample drainage in each pot, and cover the drainage materials with tuffy loam. Make the soil moderately firm round the roots, and allow sufficient space at the top for affording a liberal top-dressing later in the season. Provided the soil is in a moist condition at the time it is used, it will not be necessary to afford water until the plants are making fresh roots. After that stage the soil should be thoroughly moistened at each watering, nothing being more injurious to freshly-potted plants than frequent dribbles of water. The best place to cultivate these plants is in a pit where there is a gentle bottom heat, but in this case sufficient air must be admitted to prevent the plants from becoming drawn. The atmospheric temperature at present should be 55° at night and 66° by day with ventilation.

Tomatos in fruit.—These plants should be given occasional waterings with guano water or weak liquid manure from the farmyard. Thin out the side shoots in order to expose the fruits to the light. If the atmosphere of the house should get too moist the fruits will be liable to split.

French Beans.—The batch raised from seeds sown a month ago will now require a top-dressing with a compost consisting of fibrous loam and leaf-mould in equal proportions. Make this top-dressing firm over the roots, and place a few sticks around each pot to keep the slender plants in an upright position. French Beans require full exposure to the light, and they should not be more than a few inches from the glass. An atmospheric temperature of 60° at night and 70° by day with sun heat and ventilation are sufficient. If the atmosphere should become excessively dry, red spider may become troublesome, therefore means should be taken to prevent this. Any plants now in bearing should be watered occasionally with manure water, and the foliage should be syringed twice each day in favourable weather.

Lettuces.—If the stock of Lettuce plants for spring planting is insufficient to meet the requirements a sowing should be made at once, selecting a well-tried variety, such as Golden Queen. The seeds should be sown in a slightly heated pit, as near to the glass as possible; when the seedlings are well above the soil ventilation should be employed. In planting out this variety a distance of 9 inches should be allowed between the plants each way, and some protection should be given them against cold weather. Lettuces now in cold frames, and which are expected to turn in during January or February should have the decayed foliage removed from them. If slugs are troublesome, sprinkle a little hot lime around the edge of the bed. Admit air freely, and stir the soil between the plants occasionally.

Endive.—Plants in pots should be kept as free from damp as possible; they may be easily blanched by placing sheets of clean paper over the plants and a covering of dry fern over the paper to exclude light.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, DECEMBER 20—

Nat. Dahlia Soc. Annual Meeting, Carr's Restaurant, Strand.

SUNDAY, DECEMBER 25—

Christmas Day, Quarter Day.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—38.6°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, December 14 (6 P.M.): Max. 52°; Min. 49°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 15 (10 A.M.): Bar. 29.2; Temp. 53°; Weather—Dull.

PROVINCES.—Wednesday, December 14: Max. 50° Cambridge; Min. 44° Ireland N.

For Sales for the Ensuing Week see p. 460.

1912.

The issue of the first provisional schedule for the International Horticultural Exhibition, 1912, marks a step in organisation that the public will appreciate. After a somewhat prolonged period of uncertainty and doubt, for which it is impossible to exonerate completely those who were responsible for the initial proceedings, the schedule affords definite information upon the kind of exhibition that the promoters are hoping to realise, and it will help intending exhibitors to determine upon the classes in which they individually may enter. So far as the number is concerned there is no lack of choice, for the aggregate is 431 classes.

The Executive Committee has found it impossible as yet to apportion the prizes, but these details will be published in the next edition of the schedule. In view of the discussion which has taken place with respect to the desirability of excluding money prizes altogether, it may be pointed out that the Committee has adopted the following resolutions. That the system of prizes shall consist in a combination of silver (or silver-gilt) cups and money, together with a diploma; that there shall be a uniform type of cup made in a variety of sizes to suit the larger and smaller classes and merits, and that the cup shall, in all cases, be engraved with the seal or other official badge of the Exhibition Committee. These resolutions will commend themselves to most of our readers as affording means for providing appropriate rewards in all cases. There can be little doubt that the honour of winning a medal or cup at such an exhibition will be the greatest recompense amateurs can wish to obtain for the trouble they incur, but, in many cases, exhibitors who are not amateurs would be deterred from competing unless there were some prospect of winning money prizes to compensate them for the expense.

Division I. is devoted to 51 classes for stove plants and two for cut flowers. The largest miscellaneous groups in this division will be arranged on spaces of 400 square feet, and, in this case, stove and greenhouse plants in and out of flower may be intermixed. Smaller spaces of 200 and 100 feet are reserved for stove-flowering plants in flower, stove foliage plants, Caladiums, Hippeastrums, Gloxinias, Gesneras, Achimenes, and allied plants in flower; Nepenthes, Sarracenias and other insectivorous plants, Anthuriums and other species. There are also classes for

specimen stove and greenhouse plants of the species already named and others.

Division II. is devoted to Palms, Cycads and Agaves, and includes a class for groups of Palms arranged in spaces of 400 square feet. Orchids will be shown in the next division, which includes nearly 30 classes. The compilation of the Orchid section is to be commended, for the classes in some instances are framed to encourage exhibits possessing high demonstrative value, a system that might very well have been extended to the other sections. After provision is made for the usual groups of Orchids arranged on spaces of 500 square feet and 200 square feet for nurserymen and amateurs exhibiting separately, there are classes for groups of species and varieties of species, and again for Hybrids, also for White-flowered Cattleyas, Lælias, and Brassavolas, (but including those with coloured labellums). The latter classes will be arranged in groups not exceeding 100 square feet. Cypripediums are allotted spaces of 100 square feet and Dendrobiums 200 feet, whilst Lælias, Cattleyas, and Brassavolas will be shown in three classes. There are separate classes for Masdevallias, Miltonia vexillaria and its hybrids and varieties, Odontoglossum species and varieties, Odontoglossum hybrids, a class for Vanda, Aërides, Saccolabium, Phalenopsis, Renanthera, Angraecum and similar stove Orchids, and one for hardy terrestrial Orchids. The influence of the scarlet-flowered *Cochlioda* will be seen in a class set apart for hybrids in which this species was one of the parents.

Division IV. is devoted to Ferns and Selaginellas and Division V. to greenhouse plants: the provision for greenhouse plants being very comprehensive.

Roses can only be shown from indoor culture at such an early date of the season, but the annual displays we are accustomed to see at the Temple Shows afford sufficient evidence that our growers can make a glorious exhibition of pot Roses in May. These are provided for in Division VI., the largest class being one for a group of Roses arranged in a space not exceeding 500 square feet. Then follow Carnations and Pinks in Division VII. and hardy plants in Division VIII. The section for hardy plants is sufficiently comprehensive to illustrate the great measure of appreciation these flowers now enjoy, and the spaces allotted for the exhibits are liberal. There are four classes for rockeries planted with Alpine species, and it may be hoped that every effort will be made to render the rockeries as natural in their setting and in the species selected for planting as circumstances allow.

A few classes devoted to Tulips should have the effect of demonstrating to the public the peculiarities which distinguish the various types of the florist's Tulip, and the excellent garden qualities of the late-flowering and Darwin Tulips. There is a division for new plants of various kinds, in some cases for plants recently introduced into commerce, and in others, for species and varieties still undistributed. In addition to the specialized classes for new plants, exhibitors are invited to show novelties of any description, for which medals or certificates will be awarded at the discretion of the judges and committee.

The remaining classes are devoted to fruits and vegetables, for which valuable products

ample provision is made. If we may judge by the few fruits and vegetables usually contributed to the Temple Shows, cultivators are not particularly disposed towards showing them in May, but "1912" will be a special occasion, and we have every confidence that exhibitors will do their very best to surpass any efforts they have yet made. There are classes for 12 dishes and 9 dishes of fruit, and for a table arranged with 12 dishes of dessert fruit. Eight classes are devoted to Grapes, and even Muscat of Alexandria is enumerated amongst the varieties which are given a special class at this early show. In the principal competition for Grapes, as many as 12 bunches are required to be shown, including not more than 3 bunches of one variety.

A special section for fruit trees in pots or tubs will sure to be worthily represented. Specimens are always exhibited at the Temple Show, and Orchard-house cultivation has become of commoner practice during the past few years. Exhibitors of vegetables are called upon to contribute collections arranged in spaces not exceeding 100 square feet and 50 square feet, whilst an open class for a specified number of dishes is arranged for 25 dishes in not fewer than 12 kinds. Most of the smaller classes are for forced vegetables of various descriptions.

We do not find any information in the schedule as to the nature of the buildings that will be erected to accommodate the exhibits, but we hope it may be assumed that on this occasion, at least, we shall be spared the suffocating tents, and that the main buildings will not only be as large as the nature of the site permits, but that they will be provided with wooden sides and ends. If the main structures are sufficiently large an opportunity will be afforded for a landscape gardener to lay out the exhibition according to a general scheme and so produce effects which are as novel in this country as they are common at the best Continental shows.

It is satisfactory to know that an international jury will be constituted, and that this jury will be divided into sections, with a president and secretary for each section. The secretary for each section will be responsible for a report of the judging being handed into the Executive Committee—a custom which will enable the exhibition authorities to publish a list of awards at the earliest moment possible. The jury will meet at eight o'clock on the morning of May 22. We are glad to observe that endeavours will be made to obtain from the railway companies concessions whereby visitors to the Exhibition may travel at reduced fares.

This is as far as the present schedule informs us, except that in a paragraph inserted on the last page it is stated that it is desired to organise a horticultural education exhibition and to hold a conference. On several previous occasions, we have pointed out that these objects are certainly not less important than the exhibition itself, and we share the disappointment expressed by some of our correspondents that their importance was not sufficiently appreciated at an earlier stage. However, we have reason to know that a committee has at last been appointed to deal with the subjects, as we hope, in a thoroughly satisfactory manner, so that the records of the exhibition will be not less valuable than the report of the memorable congress of 1866.

THE VICTORIA MEDAL OF HONOUR.—We have received official information that the President and Council of the Royal Horticultural Society have decided to confer the Victoria Medal of Honour upon Messrs. THOMAS COOMBER, JOHN

proposed him for the R.H.S. Fruit Committee. Since that period, he has done great service for fruit culture, both in lecturing for the Nottinghamshire County Council and assisting with schedules. He prepared the little pamphlet *Fruit for Cottagers*, and was identified with other R.H.S. work, serving for some years on the Council of the R.H.S., and as a vice-president of the Fruit Committee until the extension and development of his business, on its removal to Lowdham, prevented his attendance.

Mr. JOHN JAMES CYPHER.—Mr. JOHN CYPHER, who is 56 years of age, was trained in horticulture at the Cheltenham Nurseries by his uncle, the late JAMES CYPHER, who built up for the establishment a world-wide reputation. Mr. JOHN CYPHER took a prominent part in the business for many years before his uncle died nine years ago, and since that time he has taken the lead in the management of the firm of J. CYPHER & SONS in conjunction with Mr. FRANK CYPHER. Specimen show plants were always a speciality of the firm, and they have gained numerous gold medals and cups at most of the leading exhibitions. Their success has depended very largely on the fine culture of their plants, and especially the Orchids, but beyond that Mr. JOHN CYPHER

series. Beyond this, he has rendered service to horticulture, having been a member of the Floral Committee for over 20 years, chairman of the Narcissus Committee eight years, and member of the Council 10 years. Mr. MAY has laboured

MR. ALFRED H. PEARSON, V.M.H.

JAMES CYPHER, C. R. FIELDER, A. H. PEARSON, and HENRY B. MAY. The Victoria Medal, it will be remembered, was instituted in 1897, on the occasion of Queen Victoria's Diamond Jubilee to commemorate that occasion by the award of Medals to distinguished horticulturists and others associated with horticulture. The number originally was 60, but on the death of Queen Victoria the number was increased to 63. The present elections are to fill the places of five Victoria Medallists who have passed away during the year.

ALFRED HETLEY PEARSON, J.P.—Mr. A. H. PEARSON is a worthy son of a worthy father, and

MR. HENRY B. MAY, V.M.H.

has the reputation of being one of the most skilled men in the artistic arrangement of plant groups. The magnificent group staged by him at Gloucester last year was one of his best efforts. Orchids have gradually displaced many other subjects at Cheltenham, and as a hybridist Mr. CYPHER has done good work, especially with Dendrobiums, which are cultivated up to the best. Mr. JOHN CYPHER has extended and improved the Cheltenham nurseries, and is a member of the Orchid Committee of the Royal Horticultural Society, and the Committee of the Manchester and North of England Orchid Society.

Mr. HENRY B. MAY.—Mr. MAY, who has for many years occupied a prominent position in the horticultural trade as proprietor of extensive nurseries at Edmonton and Chingford, has won a very large number of gold and other medals for his exhibits of Ferns, foliage and flowering plants at the Society's shows, and certificates and awards for new and beautiful novelties. Many of the most beautiful plants, now the common property of gardeners, such as, amongst others, the finest developments of the crested and plumose *Nephrolepis*, *Crotons*, *Dracenas*, and other foliage plants, have originated in his nur-

MR. C. R. FIELDER, V.M.H.

assiduously for the charities. He joined the committee of the Royal Gardeners' Orphan Fund 20 years ago, and on the retirement of Mr. WILLIAM MARSHALL, V.M.H., some 11 years ago, he was elected chairman of that body. During these 11 years the fund has continued to grow in usefulness and strength, enjoying as it does the full confidence of the public. The chairman sets an excellent example to the younger men, for he has never been known to be late at the committee meetings. Such a record of public service is well deserving of recognition.

Mr. C. R. FIELDER.—Mr. FIELDER is another practical gardener of rare abilities, who, on

MR. JOHN J. CYPHER, V.M.H.

the best traditions of the former Chilwell Nurseries are maintained by him. After working steadily and gaining experience at Chilwell, he first came into notice as a fruit expert at the Chiswick Conference in 1885, where he attracted the attention of a co-expert, Mr. GEO. BUNYARD, who

MR. THOMAS COOMBER, V.M.H.

several occasions, has contributed a weekly Calendar to these pages, Mr. FIELDER's subject being "Plants Under Glass." He commenced his gardening career at Hampton Court Palace in 1875. In 1888 he was appointed gardener and steward to the late Sir EDWARD NEWDIGATE,

Abury Priory, Warwickshire. Four years later, in 1892, he was appointed gardener to the late Dowager Lady HOWARD DE WALDEN at West Malvern, and completed the laying out of the gardens at that place. On Lady HOWARD DE WALDEN'S death in 1899, Mr. FIELDER was engaged by his present employer, Mrs. BURNS, at North Myms Park, Hatfield, and in this place, just as at West Malvern, he was called upon to continue and complete the remodelling and extending of the gardens. Mr. FIELDER has been a member of the Royal Horticultural Society's Floral Committee since 1893 and an examiner in the R.H.S. examination for public park employes since its institution. He is a member of the committee of the Gardeners' Royal Benevolent Institution and of the Executive and Schedule Committee of the International Horticultural Exhibition, 1912.

MR. THOMAS COOMBER.—The distinguished gardener at The Hendre, Monmouth, is well known to our readers, not alone for his marvellous Pine-apples exhibited at the Royal Horticultural Society's meetings, but also for his contributions to the Calendar which appeared week by week in these pages during 1908. Mr. COOMBER was born in East Grinstead, of Kentish parents. He commenced his gardening career at Crimmo-gate, Aberdeenshire, and later served for varying periods at Krole Park, Sevenoaks (at that time the seat of the late Earl DE LA WARR), Woburn Abbey, Bedfordshire, and Pencarrow, Cornwall, where he filled the position of foreman. On leaving Pencarrow, he was recommended by Messrs. JAS. VEITCH & SONS as general foreman at Rendlesham Hall, Woodbridge, Suffolk. Mr. COOMBER was next employed by Messrs. VEITCH, and later he was recommended by the late Mr. ARTHUR VEITCH as head gardener to LORD LLANGATTOCK. Mr. COOMBER has occupied his present situation for 36 years, and during that long period he has greatly improved the gardens. They are amongst the finest in the West of England, and are most celebrated for fruit cultivation, The Hendre being one of the very few establishments where Pine-apple culture is still practised. At the Royal Horticultural Society's meeting on November 22, Mr. COOMBER exhibited a magnificent fruit of the Queen variety weighing 9 lbs.

PETER BARR MEMORIAL FUND.—Bearing in mind the considerable sum of money that would have to be invested for the purpose of providing a gold Peter Barr Memorial Medal annually, to be awarded in connection with work among Daffodils, the Executive Committee of the above fund recently resolved to obtain a Peter Barr Memorial Cup, to take the place of the proposed medal, and to be held for one year by the person honoured. This will still carry out the principle of the original idea, it will prevent the necessity of forming a Memorial Trust, and will permit of a larger sum being handed over to the Royal Gardeners' Orphan Fund. The Barr Memorial Fund will not be closed just yet, therefore any who have not yet done so are invited to send subscriptions to the treasurer, Mr. H. B. MAY, V.M.H., Chingford, Essex.

INTERNATIONAL EXHIBITION.—Copies of the first provisional schedule for the 1912 exhibition can be obtained gratis from the hon. secretary, Mr. EDWARD WHITE, 7, Victoria Street, Westminster, London.

CHRYSANTHEMUM SHOREHAM PINK.—At the meeting of the Floral Committee of the National Chrysanthemum Society held on December 5, it was decided that the single Chrysanthemum which received a First-class Certificate on November 21 under the name of "Pink Delight" should be known as "Shoreham Pink."

SCHOOL GARDENING IN SURREY.—The Continuation School Gardens held in connection with the Egham Technical Institute have received favourable comment from the County Inspector. The gardens had been discontinued for two years, and the instructor Mr. RECORD, and his pupils were somewhat handicapped in having to restore the gardens to working order. The average merit marks obtained were 160, which is 54 marks above the average for the county. Each of the 12 pupils obtain a "Distinguished Worker's Certificate."

TRAPPING BIRDS.—We have received a letter from Lord LINDLEY on the subject of Mr. THOMAS ANDREW KNIGHT'S method of trapping birds, which was illustrated in the first volume of the *Gardeners' Chronicle* (1841). Lord LINDLEY says that "among the old wood blocks published in the *Gardeners' Chronicle* was a very simple and good trap for catching small birds without injuring them. Now that there is an effort all over this part of the country, and, I suppose, other parts also, to destroy sparrows, a reproduction of the cut, with the description accompanying it, would, I think, be useful." The illustration reproduced in fig. 198 represents the trap in the act of springing up. It consists

FIG. 198.—BIRD TRAP INVENTED BY THOMAS ANDREW KNIGHT.

of a wooden box, open on the upper side, and placed on a staff about 3 feet high. A strong wire is carried across it from e, and is so contrived as to move freely from b to c. To one side of this wire is attached a net, which is secured on the other side to the back of the box. Connected with the ends of the wire is a piece of line, to which weights are attached (brickbats or stones do very well). The purpose which they serve is to pull the wire forward to the front of the trap, the moment it is sprung, and so to enclose the bird in the net. When set, the wire is drawn back to the space between b and d; the catch (d) is turned over the edge of the wire and applied to a notch in a movable block at b; the block communicates with the tiler (a), on which the bait is placed, the pressure upwards of the wire upon the catch, in consequence of the weight of the stones attached to it, keeps it firmly applied to the notch (b), until the tiler is disturbed; but the moment a bird touches the point (a), the apparatus is disarranged, b and d separate, and the wire is instantly brought over to c in the direction of the dotted line, thus taking the bird prisoner.

A PROFESSORSHIP OF PLANT-PHYSIOLOGY. Dr. FRIEDRICH CZAPEK has been invited to accept the professorship of plant physiology, which has been established in the Imperial College of Science and Technology. The foundation of this chair marks, in a practical manner, the recognition of the fact that it is no longer possible for any one individual to deal effectively, in respect of teaching and research, with the whole of the vast subject of botany. Deplore it as we may, specialisation is a necessity, and the man of science who refuses to identify himself with a definite branch of a particular science runs grave risk of failing to obtain recognition of his work. Fortunately, although Dr. CZAPEK is a distinguished physiologist, he is one of the most versatile of men. Thus, after having made notable contributions to our knowledge of plant sensitiveness, and finding himself incapacitated for a time from research in the laboratory, he devoted himself to writing an exhaustive work on plant-chemistry, and succeeded, during the intervals between his special researches, in producing a work which is already a classic. All who know Dr. CZAPEK'S pre-eminence will welcome him to this country and will look forward with confidence to his conferring on the Imperial College no less distinction than that which, in the past, he has brought to the University of Prague, of which he is a member.

BEES AND "COLOUR-CHOICE."—Attention was drawn in our issue for April 30, 1910 (p. 281), to the conclusion reached by Professor Plateau that bees are guided to flowers by their sense of smell rather than by vision. The most recent experiments, however, appear to vindicate the older idea that bees possess a colour-sense, and that they use it in their quest for nectar and pollen. Thus Mr. J. H. LOVELL, experimenting with different coloured glasses smeared with honey, reaches the conclusion (*The American Naturalist*, November, 1910) that bees easily distinguish between different colours; that they visit a coloured glass in preference to an uncoloured one; that they form colour-habits readily, and having become habituated to a certain colour they return to it rather than to another; but that their obedience to habit is not absolute, for they forsake one colour for another which offers superior attractions in the direction of food. In short, it would appear that bees behave in an extremely sensible manner in looking after their own interests.

NATURAL HYBRIDS.—Mr. F. HAMILTON DAVEY records in a note published in the *Journal of Botany* (December, 1910), the rediscovery, after a period of 50 years, of a natural hybrid between *Erica vagans* and *E. cinerea*. The hybrid, found in the neighbourhood of the Lizard, looks like a plant of *E. vagans* bearing flowers of *E. cinerea*. In the same journal is an account by Mr. S. R. PRICE of the occurrence, near Wellington, Somerset, of the not uncommon pink hybrid *Campion*, a natural hybrid between *Lychnis alba* and *L. dioica*. The cross-breeds were present in a series of forms and occupied positions between the two parent forms. Some of the hybrids had pale pink, others deeper pink, and others, again, pink-flushed corollas, and thus showed a series of colour-forms similar to those which have been produced artificially by crossing white *L. alba* with red *L. dioica*.

FORCING HYDRANGEAS.—The "warm-bath" method of forcing (see *Gard. Chron.*, December 4, 1909, p. 378) has been applied with success by Mr. OSKAR SCHWERTSCHLANGER, of Nizza, (South of France), to "Hortensias," which by treating in this way may be caused to flower in February. The

process employed (Moller's *Deutsche Gartner-Zeitung*, No. 47, November 26) succeeds best with well-matured plants, but may be used also on plants which have not finished their growth. The specimens to be forced are immersed in water at a temperature of 57° to 61° F. for 18 to 20 hours. They are then brought into a house of a temperature of 68° F., and all shading is avoided. After three weeks the buds begin to burst. To stimulate leaf formation occasional waterings with Chili saltpetre (a teaspoonful to 2½ gallons of water) are given. When the inflorescences are showing the plants are hardened off in a cool-house and placed as near the glass as possible. The question remains whether we have in England enough winter sun to make the process a success.

RAINFALL IN CORNWALL.—MR. FRANK J. CLARK, Tehidy Park Gardens, Camborne, Cornwall, states that the rainfall at Camborne during November amounted to 6.59 inches; in October, the fall was 7.78 inches, and during the first 11 days of December, the amount was 5.75 inches, making a total rainfall since October 1, of 20.10 inches. Our correspondent, who has only removed to Cornwall during the present year, states that the neighbourhood is very much more rainy than any in his experience, but older inhabitants inform him that such a wet period as the past few weeks is very rare, even in Cornwall.

PUBLICATIONS RECEIVED.—*Board of Agriculture and Fisheries*: Leaflet No. 231, Cheese-making for Small Holders; Leaflet No. 232, "Corky Scab" of Potatoes; Leaflet No. 236, Thatching; Leaflet No. 239, The Pear Leaf Blister Mite; Leaflet No. 244, The Destruction of Rats. (London: Board of Agriculture and Fisheries, 4, Whitehall Place.) Free on application to Board of Agriculture and Fisheries.—*The Estate Magazine*, December, (London: Spottiswoode & Co.) Price 6d.—*Transactions of the Edinburgh Field Naturalists and Microscopical Society*. (Edinburgh: William Blackwood & Sons.) Price 4s.

LABURNUM CARAMANICUM.

THE two best-known species of *Laburnum* are the common species, *L. vulgare* and the Scotch *Laburnum*, *L. alpinum*. Both of these species are very distinct from the subject of this note, which flowers in autumn. It is found growing wild in Asia Minor and Southern Greece. In habit *L. caramanicum* is more like a *Cytisus* or a *Genista* than a *Laburnum*, as it forms a loose-habited specimen, 4 feet to 6 feet in height. It is no doubt largely for this reason that the plant is known better on the Continent by the name of *Cytisus caramanicum*.

The trifoliate leaves are small and dull green in colour. Undoubtedly the most important feature is the flowering season, August and September. The yellow blossoms are borne in large, loose panicles at the ends of the shoots. Flowering rather late in the season, the seed pods, to reach maturity, must in most seasons be protected at night. Its cultivation presents no difficulties, the plants thriving in loamy soil, either of a sandy, or moderately heavy nature. Although introduced to our gardens, according to Nicholson's *Dictionary of Gardening*, nearly 30 years ago, *L. caramanicum* is by no means a common plant, nor easy to obtain from nurseries. J. O.

THE BULB GARDEN.

CHIONOSCILLA.

SOME 15 years ago I was much interested by reading in the *Gardeners' Chronicle* of the existence of hybrids between *Scilla* and *Chionodoxa*, and by an illustration of one of these (*Chionoscilla* Allenii) in the issue for March 20, 1897, fig. 57. This was received with *Chionodoxas* sent from Smyrna by Mr. Edward Whittall, to the Royal Gardens, Kew, and it appeared, from a note by the late George Nicholson, that similar hybrids had been raised by Mr. James Allen, of

Shepton Mallet. This led to my communicating with the latter gentleman, and to the acquisition, from time to time, of several of the *Chionoscillas* raised in his garden by natural or artificial hybridisation. The one now illustrated, Mr. Allen called "The Queen," but there appears to be no record of its parentage, although it is probably derived from *Scilla bifolia rubra* and *Chionodoxa Lucilia*. It is one of the most distinct and one of the prettiest of these interesting hybrids, the flowers being large, borne on good racemes, and of a delicate pink colour on first

ALPINE VALLEYS.

BRIGA.

ALMOST exactly opposite the Miniera Valley, the valley of Briga diverges from the bed of the Rija at right angles. It is said, by Ball's indispensable Alpine guide, to "abound in rare species": a fact which adds to my annoyance in having nothing to chronicle from there except *Saxifraga cochlearis*. Nothing more than this did a long and broiling day of search disclose; but this, indeed, occurs in such abundance as to make it

FIG. 199.—LABURNUM CARAMANICUM.

opening, but passing to white. This plant is free flowering, and superior to either of the supposed parents.

It will no doubt be distributed, but it increases very slowly by off sets. The *Chionoscillas*, probably, occur more frequently than is understood, and several have been brought under my notice; but "The Queen" is the only one of its colour I have seen. It may be added that seedlings vary greatly, some being true *Scillas*, others *Chionodoxas*, and a few only *Chionoscillas*. S. Arnott.

proper to speak of the Saxifrage in connection with the Briga Valley rather than with any other of the slopes and gullies in the district of the Col de Tenda, where it may be seen. The plant especially abounds in the little glen of Rio Secco at the back of Briga village, where every boulder, whether in sun or shade, and every rock-wall is hung with tufts and masses of it. *Saxifraga cochlearis* is the smallest of the three great Silver Saxifrages, and, from the gardener's point of view, holds an intermediate position between *S. kantscana* and the smaller species, *valdensis* and

diapensioides. Unlike *lantoscana* and *lingulata*, *S. cochlearis* varies almost infinitely in size of leaf and rosette. Like them, though, it is peculiar to the mountain limestone, and, like them, proves rather more floriferous in the garden than it appears to be in nature. In cultivation, *S. cochlearis* shares with *S. valdensis* the quality, so valuable to Southern gardens, of tolerating gladly and gratefully any amount of torrid sunshine. It is even on the hottest cliffs round Briga that the plant seems most to luxuriate, contrasting strangely with the shade-haunting propensities of *lantoscana*. When I saw it, the flower had passed completely over, and I was only able to collect varietal forms of foliage (though I did not succeed in coming across that minute leaved variety which, in so many English nurseries, passes under the name of *S. valdensis*), though these foliage-forms will probably yield as many forms of flower. For, even in blossom, *S. cochlearis* is more variable than either *lingulata* or *lantoscana*, some forms being thin and poor and starry, the others round and solid and pure.

Nevertheless, I persevered along the sunny face, and turned a corner into a more shaded gully. Here the slope became arduous and even faintly perilous, up over shelves of limestone that were very rotten and had an awkward angle. Suddenly I was heartened in my climb, for I looked up, and there, very high and unapproachable on a sun-baked crag, were three or four huge and tumbled tufts of what could only be *Saxifraga lingulata*. These, indeed, were unattainable; but where one plant is, there seedlings must have fallen. And, sure enough, upon my slope young plants of *lingulata* began to occur, and with them odd pieces of that easterly form of *lantoscana*, which Burnat calls *Bellardii*. However, in this gully, still unsummed at mid-day, the plants were small and of no great note; clearly it was not the centre of *lingulata*'s distribution, and the great tufts were isolated occurrences on that hot cliff.

Lingulata, however, was wiped from my thoughts in another minute by my discovery of a *Saxifrage* that during very many years I have searched for in vain, and in places entirely un-

I did not, in my search, even come on the cochlearis form from which his confusion clearly arose. I was surprised, however, to find a plant or two of *Aizoon*: until, far down on the other side of a stream, I saw dark primary rocks, and realised that *Aizoon* must have seeded across from its chosen home on to these limestone banks. But it will always be a puzzle to me why it is that *Saxifraga Aizoon*, in our gardens the most indestructible of its race, and no less vigorous on limestone than on any other rock, should, in nature, appear to have so marked a preference for the primary formations.

At the top of the steep slope there was a little rocky saddle between two looming peaks; just at the foot of this I came upon *Iberis Garrexiana* and *Asperula hexaphylla*—the latter peculiar to these crags—and just above, in the solid rock, one impregnable piece of *Phyteuma Balbisii*, a characteristic and very rare rock-plant, which, in the Maritime Alps, represents *Phyteuma comosum*. I then slung myself across the rocky neck, and came upon a stony slope in full sunshine; and there, all down among the rubble and among the grass, *Saxifraga lingulata* was growing in vast and splendid tussocks, with a luxuriance and abundance I have never seen equalled. *Diapensioides* still occurred in the cliffs, but as clearly left *lingulata* supreme on this side of the range, as it had vindicated its own supremacy on the other. I have already described *Saxifraga lingulata*; when all is said and done it promises to be the greatest of its race, even eclipsing *lantoscana*, if that be possible. It is little short of a scandal that we should have had to wait so long for the introduction of a plant so splendid and so distinct. It was, of course, the unpardonable confusion among botanists between *lingulata* and *lantoscana* that prevented us from realising this superb species. So long as *lantoscana*, in all its forms, passed as the substitute of an almost mythical *lingulata*, so long was recognition denied to the genuine species with which *lantoscana* has, to all intents and purposes, nothing in common.

Saxifraga lingulata seems to thrive equally well whether in sun or shade, so long as it has limestone rock; its habit is inimitably robust and vigorous, and it is far more floriferous in a wild state than any other of its kindred. On the other side of the Col de Tenda I have seen it in rocky gorges, making tangled sheets of foliage 2 feet across, with the remains of half-a-dozen sweeping flower spikes, which, in their time, must be a glory. It climbs upon the hills, too, higher, for instance, than *cochlearis*, which prefers the low hot valleys. If you cross the pass that leads from Limone over to the Certosa di Pesio, on the northern side of the range, after you have traversed the Col de Tenda, you will find on the rocks along the summit *Saxifraga lingulata* occurring with *Bellardii*, *diapensioides*, *casia* and *Aizoon*. And there is this much to be said for the old confusion, that *lingulata*, *Bellardii* and *lantoscana* may well all have had a common origin. Though you never find short, blunt leaved forms of *lingulata*, you do occasionally come across long-leaved forms of *lantoscana*, even though these never, at their wildest, could really be confused with the wiry narrowness of *lingulata*. At the same time, their likeness is both obvious and strong; and young seedlings are absolutely indistinguishable. The question of hybrids is interesting, and needs exhaustive examination. I certainly possess, from St. Martin, plants of true *lantoscana*, whose rosettes have more regularity than the type, and whose flowers, on stocky spikes, are small and of a dull colour. This tone and the rosette make me suspect the influence of *Aizoon*, and on the Pesio Pass I came on another ugly form with the same uninteresting flower, whose rosette seemed to me to be modified *lingulata* rather than *lantoscana* or *Bellardii*. Yet, of course, *Aizoon* is only coming into bloom when the others are passing over; but that stodgy yellowness of colouring is never proper to the big silver *Saxifrages*, but is

FIG. 200.—CHIONOSCILLA "THE QUEEN": FLOWERS PINK, LATER BECOMING WHITE.

Nothing further did the Briga Valley yield; for better rarities we must advance up the Roja Valley, to where the town of Tenda lies on a slope at the foot of three gigantic crags of naked limestone. Not, probably, to be recommended as a place to sojourn, Tenda is perhaps the most picturesque town in the Maritime Alps; it is girt in by hills on which you may find *Iberis Garrexiana*, *Asperula hexaphylla*, *Phyteuma Balbisii*, *Moeringia papulosa*, and no fewer than five of the silver *Saxifrages*—*Aizoon*, *cochlearis*, *Bellardii*, *diapensioides* and *lingulata*. And on the citadel that dominates the town still stands the wreck of the castle in which, by some accounts, the last sovereign Lady of the Alps, Beatrice Lascaris, Countess of Tenda and Duchess of Milan, was strangled by order of the Duke, her husband.

Up the foot of one blazing cliff I crawled, over torrid slopes aglow with *Tunica*, *Linum salsoloides* and *Lavender*. When I reached the rocks, however, nothing did I see but the *Saxifrage potentilla*, of which, by that time, I was heartily weary.

suitable to its habits. Of all its section, *Saxifraga diapensioides* is the smallest, hardest, neatest, most compact, and charming. It is also reckoned difficult to grow; largely, I think, because many people have, like me, been misled as to the condition it loves. I, for my part at least, had always thought of it as a species of sunny cliffs. Yet here, in this shady corner, it was growing and seeding abundantly in the crevices of very rotten rock, exactly like the scarp-limestone under Ingleborough. Even among the grass and moss on the ledges it throve, and young plants were everywhere coming on to take the place of the old ones, which do not seem, as a rule, to develop a span of more than 6 inches. The flower was over, of course, nor do I think that *diapensioides* ever varies, although in artificial conditions—pressed under a stone, for instance—its leaves occasionally elongate until the plant comes to look like a very tiny *valdensis*. These crags, by the way, are those from which Maw mistakenly quotes the rare granite-loving *valdensis* itself.

restricted to *Aizoon*, *crustata* and *longifolia*, with their derivatives.

The Col de Pesio gave me also two pictures, which those who have not been there may care to see. The one, a long, steep slope of grass, aglow with a hundred thousand flowers of *Dianthus neglectus* in every shade of gorgeously; and, on the other side of that same saddle, looking down an incline as steep as a house, one carpet of *Arnica montana* in full bloom, and amid its golden suns stood up in dense ranks the long purple spikes of *Gymnadenia odoratissima*. A glorious harmony exactly like one of Mr. Flemwell's pictures. From the top of the pass, too, one has wonderful views; ours was a day of broken clouds and tenderest colours; the whole range lay stretched before us—from *Enchastraye* and *Argentera* in the farthest distance to the terrible *Rocca del Abisso*, towering over the Col de Tenda. On the near side of the pass the Maritime Alps merge into the Ligurian Apennines, fading away towards the Gulf of Genoa. The last of the Alps towers over the Pesio Pass, the gaunt, inhospitable white crags of *Marguareis*, where, they say, *Ranunculus alpestris* resumes its sway. For the high Alpine Buttercups are very rare in this region. *Glacialis* occurs (only) between *Enchastraye* and *Argentera*; *alpestris* is not found at all until you get on to the pure limestone of *Marguareis* and *Montgioie*; and here it is that *R. acutifolius* hybridises with *R. pyrenæus* and gives *Ranunculus lacerus*, which, however, I was not lucky enough to see. *Reginald Farrer.*

LATE-ROOTED CHRYSANTHEMUMS.

At the recent Chrysanthemum Conference (see p. 437), a paper entitled "Late-Struck Japanese Chrysanthemums for Exhibition" was read by Mr. Thos. Stevenson, Woburn Place Gardens, Addlestone. The following extracts are taken from Mr. Stevenson's remarks:—

During the few years that I have been exhibiting I have cut a greater percentage of first-rate exhibition flowers from plants rooted in March and April than from those rooted early and grown on in large 16's or 12-inch pots.

To obtain good blooms the plants must be kept growing freely from the time of striking the cuttings, never allowing them to receive a check or become pot-bound in the intermediate stages of growth, and always aiming to have them in their flowering pots as early as possible. This is one of the main points to be observed, and another important detail is the watering. From the outset the plants will take more water in proportion than will those rooted earlier without it in any way tending to make them sappy or gouty. I also find that taking the buds may be delayed from seven to ten days after the older plants, as they open or develop their blooms rather more quickly, and it is astonishing with what accuracy the buds can be timed on these single-stemmed plants.

Some of the varieties may be grown straight away, the natural break occurring at just the right time to take the resulting first crown bud, whilst others will require stopping (in most instances some time during June) to ensure the buds being secured about the right time. If the plants are growing freely, as they should be during June or early in July, the stopping will not check them greatly as they will break into fresh growth within a few days. I have practised stopping the plants twice, once immediately after they have become established in 60-sized pots, and again as may be necessary for the timing of the buds; this double stopping keeps the plants very dwarf, but it is at the expense of the flower. The first stopping tends to check root action, and the plants never recover the lost ground.

In the past season I purposely stopped some of the strongest plants of several varieties in March for comparison, and though the weaker plants of the same varieties were stopped in June for the purpose of timing the buds, they grew

faster than those stopped early in every instance, and produced much finer flowers.

Another point is this: these late-struck plants, if kept in fairly small pots, say, large 32's and 24's, may be given more manure than the others right up to the time the florets begin to expand, without any signs of damping showing in the petals, and this late feeding ensures the flowers opening quickly and finishing well, without any indication of staleness. Late-struck plants have several advantages. First, their short season of growth, as compared with those struck in December, and the small amount of frame room required till the middle or end of April. Secondly, the greater accuracy of timing the buds and the subsequent easy opening of the same; and thirdly, their dwarfness.

So far I have dealt with the cultivation of the plants up to the time of potting them into their flowering pots. As soon as the roots begin to grow in the new soil the plants should be placed out-of-doors for the summer in rows a yard apart and about 18 inches apart in the rows.

The tying of the shoots and the removal of the side growths must be regularly attended to; watering is an important matter, for the soil must on no account be allowed to become dry. Syringing should be done both morning and afternoon on all fine days, though not after 4 p.m. During dull weather syringing should be suspended and towards the end of the season it should be gradually lessened.

I prefer to commence feeding as soon as the plants are in good growth and the pots fairly full of roots, affording them a little liquid manure. I employ very little manure in the potting soil beyond bonemeal, but before the plants show signs of exhaustion, I give them a little artificial manure, and continue to apply this every week or ten days until the flowers are expanding freely. Two or three times during the growing season I apply a light top-dressing of soil, which is watered in with a rose, and not pressed down.

I strongly advise early housing, as I am sure the flowers will not be any earlier in opening. Admit all the fresh air possible during fine weather, but as soon as the flowers begin to open a little fire heat must be given to keep the atmosphere inside the house dry and circulating. During very wet or foggy weather it is wise to stretch tiffany over the ventilators, but under no circumstances close the top ventilators. Though no hard and fast rule can be laid down as to the temperature of the Chrysanthemum house, it should not be lower even on cold nights than 43°.

There are a few varieties, such as *Edith Jameson* and its sports, that require pinching in April, i.e., as soon as they are established in 60's. There are also a few varieties, such as *Madame Paolo Radaelli*, *Hen. Mrs. Lopes*, *Mrs. D. Thornton*, and *Captain Mitford*, that require stopping during the early part of May to procure really good exhibition flowers; beyond these there are very few, but what may be left until after they are in their flowering pots before being stopped.

Bessie Godfrey, *Frank Payne*, *Chrysanthemiste Montigny*, *Madame G. Rivol*, *Mrs. W. Iggulden*, *W. Gee*, *Mrs. C. Penford*, *Duchess of Sutherland*, and *Master David* are among the varieties that should be stopped during the first ten days of June, whilst most of the other popular varieties, such as *F. S. Vallis*, *Reginald Vallis*, *James Lock*, *Sir Frank and Lady Crisp*, *Mrs. G. Mileham*, *Lady Talbot*, *Valerie Greenham*, *Master James*, *Superbe*, *Walter Jinks*, *Miss A. Nichols*, *Algeron Davis*, *Rose Pockett*, *Purity*, *W. Mease*, *Sir A. Rollitt*, *Harry Wood*, *Bessie G. Payne*, and *Francis Jolliffe* give the best flowers when stopped between the 10th and 20th of the month. There are a few sorts that may be stopped even later than this, such as *White Queen*, *J. H. Salisbury*, *Mrs. W. Knox*, *O. H. Broomhead*, *Miss H. Rowley*, *Maud Jefferies*, *Mrs. L. Thorne*, and *Splendour*.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

MONTBRETIAS.—In the *Gardeners' Chronicle* for December 10, p. 432, Sir Herbert Maxwell speaks of the effectiveness and floriferousness of the Montbretias as plants for woodland walks. As I also have had experience of Montbretias naturalised in the same part of the kingdom from which Sir Herbert Maxwell writes, I cannot say that they impressed me with their freedom of flowering or height of flower stems. The soil there was light in texture, overlying a substratum of sand and gravel, or in the local vernacular "till." Although there was no necessity to lift the corms as far as climate was concerned, I made it a practice in the garden to lift a few clumps in the late autumn and store them intact in a frost-proof shed until February or March, when the largest corms were planted in the positions they were intended to flower, putting them at distances of 6 inches apart each way, although the only varieties grown were *Pottsi* and *Etoile de Feu*, they were much superior in height of flower-stem and in size and brilliancy of colour to those left alone. Where cut flowers are in demand this annual division is to be recommended. In a narrow border on the north side of a low, retaining terrace wall in these gardens, where the soil is adhesive, Montbretias have succeeded well for three years. They have formed clumps of about 2 feet across; and in the late summer and early autumn of the present year they bore on an average two dozen tall flower-spikes. When I say that this border is over 70 yards long, and that each alternate group was composed of *Anemone japonica alba*, it will be imagined what a very pretty effect they produced. *P. Street, Verdley Gardens, Sussex.*

CHARLES ROSS APPLE.—No hasty judgment should be passed upon this Apple. Hitherto, its fruits have been produced on comparatively young trees, and these have yielded fruits of large size. When such is the case the influence of one of the parents namely *Peasgood's Nonesuch*, becomes too apparent. I think it will be found that, as the trees age they will become more productive, and if the fruits are smaller they will possess better flavour. It does seem as if the common characteristic of the famous *Blenheim Pippin* Apple, that of cropping sparsely in youth, but freely in old age, is likely to be repeated in *Charles Ross*. As to flavour, it may not be forgotten that at the R.H.S. Fruit Shows in 1907 and 1908, *Charles Ross* won in the class "for any other variety of dessert Apple for flavour." The fruits in both cases were not the largest shown, but they won the prize for flavour easily. It would be interesting if next year fruits could be presented for taste from the original seedling tree, which is presumably at *Welford Park*, now in the charge of Mr. W. Pope, for comparison with fruits obtained from a much younger tree. If large fruits reproduce the poor quality of *Peasgood's Nonesuch*, smaller and firmer fruits may reproduce the rich flavour and excellence of *Cox's Orange Pippin*, which, when the fruits are not too large or highly coloured, must still be regarded as the richest flavoured and best of all dessert Apples, even though its constitution is not all that could be desired. *A. D.*

CEDARS AT PEPPER HARROW PARK.—Having noticed in your issue for December 3 some notes by Mr. Wright on Cedars at *Eastbury Manor*, I was induced to measure the fine old specimens in the pleasure grounds here. There are 11 large trees of a great age, but, unfortunately, two look as if decay has set in and they may collapse shortly, as the bark has already begun to peel off, but all the others look healthy and vigorous, and may live for another generation. There are several young trees planted near to them to take their places, and these are about 20 years old. In years gone by when the snow-storms were more serious the trees of long standing were damaged considerably, many large branches being broken. I shall never forget the grand spectacle they presented on April 25, 1908, when we had a heavy downfall of snow. The trees were practically covered over, and the boughs were resting on the ground with their heavy burden. I was afraid we should lose

several large limbs then, but as the sun had already some power at that period we were very fortunate to escape losing a specimen. Sometimes a very heavy rainstorm will make them snap. There are several old trees in the park that have been more exposed to the wind, and so are not so presentable. The measurements are taken at a point 3 feet from the ground, with the exception of the largest and most peculiar specimen, which is exactly 29 feet, as near to that point as one could take the measurement. The others have more of a trunk and are not so spreading, but have a large circumference, viz., 25 feet, 22 feet 6 inches, 22 feet, 21 feet, 20 feet, 19 feet 9 inches, 19 feet, 17 feet (two specimens), 16 feet 6 inches. The soil is of a very light nature where the Cedars stand, but no doubt it suits the trees. I should be interested to hear if any of your readers know of any Cedar trees with larger trunks at 3 feet from the ground. We have several Beech trees here 19 feet in circumference. *E. J. Quinton, Peper Harrow Park Gardens, Surrey.*

ABUTILON THOMPSONII AND OTHER SPECIES (see p. 427).—Mr. N. E. Brown states that there is a plant cultivated at Kew under the name of *Abutilon Thompsonii* var. *flora pleno*, and that the leaves are not variegated. It would be interesting to know the name of the *Abutilon* with much smaller leaves than the one known in gardens as *Thompsonii*, having mottled leaves and double flowers, the corolla being orange coloured with darker veining. I have known a variety of *Abutilon* with mottled yellow and green foliage under the name of *Darwini* *tessellatum*, but I have not seen it in flower growing, besides others with variegated leaves. The *Abutilon* known to me as *Thompsonii* seems to correspond with the one sent to Mr. Brown from Bicton. It is strikingly attractive as a bedding plant. *F. Street, Verdley Gardens, Sussex.*

REV. J. H. PEMBERTON.

THE new President of the National Rose Society, whose portrait we have pleasure in reproducing, is well known whenever Roses are grown or exhibited. It was an excellent rule, made on the death of the first President, Dean Hole, that future presidents should hold office for two years only. The new rule has worked admirably, and each President that has passed the chair in the last eight years has left his mark in the history of the Society. Wherever Roses are grown and shown Mr. Pemberton's name is a household word. He tells us, in his book, *Roses, Their History, Development and Cultivation*, that, from his earliest childhood, he has been associated with the flower, and, in fact, was nurtured in an atmosphere of Roses. His love for the flower has never ceased growing, and, through all the changes that he has seen take place in the Rose world, he still has a place in his heart for the old Roses of long ago—"Grandmother's Roses," as he once labelled a collection of them that he staged at an exhibition. Mr. Pemberton started showing Roses in 1874; he was one of the exhibitors at the first show of the National Rose Society, held at the St. James's Hall, and has, we believe, never missed exhibiting at a metropolitan show of the Society. Of his triumphs in the exhibition tent, from the amateur championship downwards, most readers are aware, for he has won more prizes than any other amateur in the kingdom.

And yet he by no means confines his interest in the Rose to the exhibition flower, for no one takes a keener interest in the decorative or garden Rose, and its place in the Rose world to-day owes a great deal to the efforts of Mr. Pemberton. Only those who know him best realise how many are the phases of the subject in which he is interested. His book before referred to is probably the best all-round work on the Rose; whilst his articles to the horticultural Press bear the imprint of a master hand. He has travelled far and wide, lecturing on all phases of Rose culture. As one of the leading "counsellors" of the National Rose Society, he has been responsible for many

a reform and wise innovation. As a judge, he has few equals. Notwithstanding his love for the Roses of long ago, he has a knowledge of new Roses that few can equal. He also is interested in Rose hybridisation, and has raised more than one new variety. In paying him the compliment of electing him their President, the members of the National Rose Society recognised the sterling worth of the man and his love of the Rose. We feel sure that, under his presidency, the Rose Society will continue to prosper.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

DECEMBER 6.—*Present:* E. A. Bowles, Esq., M.A., F.L.S., F.E.S. (in the Chair); and Messrs. W. C. Worsdell, A. Worsley, G. Gordon, J. T. Bennett-Poe, J. Fraser, J. Odell and F. J. Clutenden (hon. secretary).

Fruits of Eucalyptus and allied plants.—Mr. WORSDELL showed the fruits of *Eucalyptus ficifolia*, in which they are quite simple; *E. cornuta*, where they are partially united; *Syn-carpia*, where they are formed from five or six fused flowers; and *Agonis flexuosa*, where they are very densely aggregated. The fruits, which had been collected by Mr. WORSDELL in South

REV. J. H. PEMBERTON.

The new President of the National Rose Society.

Africa, showed in an interesting fashion the variation in fruits which may be seen in nearly allied plants.

Stachys ambigua.—Mr. J. FRASER showed specimens of this plant, a hybrid between *S. sylvatica* and *S. palustris*, and commented upon the characters wherein it differed from its parents.

Kale with surface outgrowths.—Mr. BOWLES showed a leaf of Scotch Kale from Mr. COWAN, of Penicuik, with outgrowths from its upper surface, somewhat like those often seen in Cabbage, and termed *ascidia*. In the present case, however, the growths were fringed at their edges and considerably crisped.

Tar-water and plants.—Mr. F. KITLEY, of Bath, sent two plants of *Coffea*, one of which had been watered with tar-water a few times, the other not. The former showed much more vigorous growth, the latter had apparently not been quite equal to the former at the start and had been stopped. While it is probable that tar-water would have some such effect as was shown, the Committee thought that the particular specimens were hardly comparable with one another.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

DECEMBER 1.—*Present:* Messrs. E. Ashworth, R. Ashworth, Thorp, Ward, Cowan, Keeling, Ashton, Holmes, Cypher, Sander, and Weathers (hon. sec.).

O. O. WRIGLEY, Esq., Bury (gr. Mr. Rogers), made a fine display with *Cypripediums*, the exhibit occupying about 160 square feet. The range of variety was large, many of the best known hybrids and choicer varieties being represented.

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), staged a group of plants, principally *Odontoglossums* and *Cypripediums*. (Silver Medal.)

A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), exhibited a collection of *Odontoglossums*, some fine forms of *O. crispum* being prominent. The most notable specimen was a plant of *O. c. var. Inotiens*. (Silver-gilt Medal points in the "Robson" Cup were awarded.)

R. ASHWORTH, Esq., Newchurch (gr. Mr. Gilden), exhibited an interesting collection of Orchids, consisting mainly of *Odontoglossums*. Awards of Merit were made to the following:—*O. × Lambeanianum* var. *Triton*, *O. × L. var. Mars*, *O. × Baecheus*, *Calanthe × George*, and *Cypripedium × Victoria*. (A Cultural Certificate was awarded for the quality of the *Odontoglossums*.)

S. GRATRIX, Esq., Whalley Range (gr. Mr. Brown), received an Award of Merit for *Cypripedium × Beacon magnificum*, the parentage of which was not recorded.

REV. J. CROMMIEHOLME, Clayton-le-Moors (gr. Mr. Marshall), exhibited a distinct form of *Cypripedium × Lord Ossulston*.

W. R. LEE, Esq., Heywood (gr. Mr. Woodhouse), staged a superb group of plants, *Odontoglossum × Rouge Dragon*, *O. cirrhosum × O. × ardentissimum*, and *Cypripedium × Sunrise* received Awards of Merit.

R. LE DOUX, Esq., West Derby (gr. Mr. Fletcher), received Awards of Merit for *Cypripedium × R. Le Doux* and *Odontoglossum × eximium* var. *Mme. Augusta d'Abren*.

MESSRS. J. CYPHER & SONS, Cheltenham, staged a fine group of *Cypripediums*, for which they were awarded a Silver Medal.

F. A. HINDLEY, Esq., Gt. Horton, Bradford, was awarded a Bronze Medal for a small group of miscellaneous plants. Other exhibitors were Messrs. SHACKLETON, Bradford; E. V. Low, Vale Bridge; CHARLESWORTH & Co., Hayward's Heath; J. ROBSON, Altrincham; W. SHACKLETON, Bradford; STANLEY & Co., Southgate; J. H. CRAVEN, Keighley; and J. BIRCHENALL, Alderley Edge.

SCOTTISH HORTICULTURAL.

DECEMBER 6.—The monthly meeting was held in the Goad Hall, 5, St. Andrew's Square, Edinburgh, on this date. Mr. Whytock presided, and there was an attendance of 100 members.

A lecture entitled "The Scottish Horticultural Association: A Retrospect" was delivered by Mr. M. Todd, Edinburgh, an ex-president. Photographs of past presidents and other officials of the association were shown by means of lantern slides. The association, he said, had a small beginning, starting in 1877 with about 100 members and an income of about £30. At the meeting at which the association was formed, and which was held in the same building in which the monthly meetings are still held, the late Bailie Methven occupied the chair, and the late Mr. Dunn, of Dalkeith Gardens, was elected president, with the late Mr. Hugh Fraser as vice-president, Mr. John Methven as secretary, the late Mr. A. Milne as assistant secretary, and the late Mr. D. P. Laird as treasurer. The following gentlemen alone remain of the 15 councillors who were then elected:—Messrs. R. Lindsay (late of Royal Botanic Gardens, A. McKinnon (Scone Palace), D. W. Thomson, James Grieve, and Geo. McClure (now in the United States).

The Society's first Chrysanthemum Show was held in Dowell's Rooms in 1886; in the two following years it was held in the larger Music Hall; and in 1889 a great International Centenary Show was held in the Waverley Market, where the show has been held annually ever since. At this international show more than £1,200 was taken at the gates. The receipts for entrance to the Society's shows since then has amounted to over £20,000, of which sum £8,000

has been awarded in prizes, over £5,000 has been spent on music, and £1,000 given for charitable purposes. At the monthly meetings papers on horticultural subjects are read and discussed, and new and interesting plants exhibited. The annual excursions were started in 1895, and they prove popular with the members.

Mr. Massie was unanimously nominated for election as president in succession to Mr. Whytock, and Messrs. J. Phillips and W. G. Pirie were nominated as vice-presidents.

The annual meeting will be held on January 17, 1911.

It was decided to hold a three days' Chrysanthemum show in 1911, the dates being fixed for November 16, 17 and 18.

NATIONAL ROSE.

DECEMBER 8.—The 34th annual general meeting of the National Rose Society was held on this date, at the Westminster Palace Hotel. The Rev. F. Page-Roberts presided. The notice convening the meeting was read and the minutes confirmed, after which Messrs. B. Cant and Dr. Williams were appointed scrutineers of the ballot. The Rev. F. R. Burnside referred to the removal of vice-presidents, and urged his claim for reinstatement to the meeting.

The President called upon the secretary, Mr. Edward Mawley, to read the annual report, from which we extract the following paragraphs:—

EXTRACTS FROM THE REPORT.

For the first time in the history of the Society the number of new members has reached 1,600.

EXHIBITIONS.

The Metropolitan Exhibition was again held by the kind permission of the President and Council of the Royal Botanic Society in their Gardens in Regent's Park on July 8, and proved the largest but two the Society has yet held. The most noteworthy feature of the Show was the great interest taken in the new seedling Roses, for the exhibition of which a separate tent had been for the first time provided.

The provincial show was held at Salisbury on July 13. This was also a successful exhibition, for although it was not as extensive as many previous provincial shows, the average quality of the blooms was very good. The arrangements for the exhibition were admirably managed by the members of the local committee, under the able direction of the hon. secretary of the Wilts. Horticultural Society, Mr. L. J. Sly.

The autumn exhibition, the seventh of the series, again took place in the Royal Horticultural Hall, Vincent Square, Westminster. The average quality of the exhibition Roses was not quite as good as at some previous autumn shows, but there were several striking displays of decorative Roses, and the large representative groups have never before been better or more tastefully arranged.

RULES FOR JUDGING NEW ROSES.

Early in the year fresh rules for judging new seedling Roses and distinct sports were drawn up and appear to have given greater satisfaction than any previously framed.

THE INTERNATIONAL HORTICULTURAL EXHIBITION IN 1912.

The Council have not only promised a donation of £50 towards the prizes offered in the Rose section of that important exhibition, but at the request of the committee submitted a schedule of the Rose classes they considered most suitable considering the time of year when the show will be held.

THE PUBLICATIONS.

The 1910 edition of the *Enemies of the Rose* and the *Rose Annual for 1910* were distributed to the members in April, while the 1910 edition of the *Hint on Planting Roses* was sent them in September.

THE DEAN HOLE MEMORIAL MEDAL.

At the last annual general meeting the Dean Hole Memorial Medal was presented to the Rev. J. H. Pemberton, vice-president of the Society, for his services extending over more than 30 years, on behalf of the Rose and the National Rose Society.

The Council record with regret the death of Mr. John Cranston, one of the original founders of the Society. He was for many years a mem-

ber of the General Committee, and in the early days of the Society was the most frequent winner of the first prize in the leading class for nurserymen.

FINANCE.

The receipts from all sources during the past year, including a balance from the previous year of £436 10s. 6d., amounted to £5,404 14s. 4d., and the expenditure to £5,040 1s. 6d., leaving a balance at the bankers of £364 12s. 10d. after £250 had been placed to the Reserve Fund. The lower balance at the end of the year is due principally to two things, the smaller amount received in gate money at the Royal Botanic Show, owing to the previous unfavourable weather and other temporary causes, and to the unusual number of publications that had to be paid for during the year. The Reserve Fund now stands at £1,000.

MEMBERSHIP.

During the past 12 months 1,050 new members have joined the Society, or 150 more than in 1909. Allowing for the losses by death and resignation, the total number of members is now 4,584. Taking the year as a whole, nearly three new members a day have been, on an average, added to the list of membership.

INCREASE IN MEMBERSHIP SINCE 1905.

	1905.	1906.	1907.	1908.	1909.	1910.
Number of members	1,637	2,034	2,484	3,150	3,797	4,584
Net increase since previous year ...	329	397	450	666	647	787

ARRANGEMENTS FOR 1911.

The Metropolitan Exhibition will take place in the Royal Botanic Gardens, Regent's Park, on Friday, July 7. The provincial show will be held at Ulverston, in conjunction with the North Lonsdale Rose Society, on Wednesday, July 19.

Arrangements have been made with the Royal Horticultural Society to hold the autumn show in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday, September 14.

The balance-sheet showed a debit account of £3,404 14s. 4d., including balance at bankers, £427 8s. 8d.; subscriptions, £2,299 16s. 6d.; proceeds of shows, £320 6s. 6d.; affiliated societies, £76 13s. 6d.; advertisements in Society's journals, £120 14s. 4d.; and sale of Society's publications, £92 4s. 6d. The Reserve Fund invested in Consols was valued at £951 10s. 8d. The principal items of expenditure were publications, £725 10s. 9d.; printing, stationery and advertising, £197 3s. 9d.; postages, telegrams and sundry expenses, £244 7s. 3d.; honorarium to hon. secretary, £100; assistant secretary and assistant treasurer (£80 and £60), £140; expenses at shows, £469 16s. 6d.; prize monies, £689 12s.; purchase of plate, medals, &c., £153 2s. 9d.; and purchase of Consols Reserve Fund, £250; leaving a balance at the bankers amounting to £364 12s. 10d.

The financial statement was read and explained by the treasurer, Mr. G. W. Cook, who gave a very lucid statement of the various items of expenditure. Mr. Cook said the cost of the shows, after deducting the receipts incidental to the exhibitions, amounted to £961. The various publications of the Society entailed a net cost of £580. At the exhibitions, 575 prizes were offered in competition.

The President moved the adoption of the report and financial statement. He congratulated the members on the flourishing condition of the Society, and stated that it was still on the upward grade.

Mr. Molyneux seconded. He said that Mr. Cook was rightly proud of the position of the Society, for the work had been carried out in a most efficient manner. The Society had a reserve fund of almost £1,000; he thought the time would shortly arrive when the Finance Committee should consider some further specific method of expenditure with a view to encouraging the development of the Rose.

Mr. C. E. Shea, chairman of the Finance Committee, stated that, in his opinion, it was for the Council to consider the form of expenditure, and for the Finance Committee to advise as to the feasibility of the proposals. There were, at the present time, additional expenses ahead; the Royal Botanic Society, which had, in past years, given the use of its gardens for the metropolitan exhibition free of charge, were next year to receive the sum of £50; whilst a donation of £50

had been promised to the funds of the International Horticultural Exhibition, 1912.

Mr. Hammond considered that a reserve of £1,000 was not too much, and advised that it well becomes any society to be careful when prosperous.

It was unanimously resolved that the report and financial statement be adopted, printed, and circulated.

In proposing an honorarium of £100 to the secretary (Mr. Edward Mawley), Mr. G. W. Cook referred to the great services the secretary had rendered to the Society. The proposition was seconded by Mr. C. E. Shea, who referred to Mr. Mawley as being the mainspring of their success. The proposal was carried with acclamation, and the gift suitably acknowledged by Mr. Mawley.

The proposed alteration of Rule 10, which appeared on the agenda in the name of the Rev. J. H. Pemberton, was not proceeded with. Mr. Pemberton explained that it appeared owing to a misunderstanding on his part, and he moved: "That the matter be taken in hand during the coming year, in time to become operative at the next annual meeting." This was seconded by Mr. C. E. Shea and carried.

Mr. George Bunyard next moved, "That the thanks of the Society be given to the officers and other members of the Council for their services during the year." Mr. R. Pinches supported the vote of thanks, which was carried with acclamation, and suitably responded to by the secretary.

The result of the ballot was reported by the President, who announced that the house list had been carried, with the addition of the Rev. F. R. Burnside as vice-president.

A pleasing duty of the President was the presenting of the Dean Hole Medal to Mr. Edward Mawley. In making the presentation, the President said that no one had deserved this recognition more than "our incomparable secretary." He, personally, was astonished at the amount of work which Mr. Mawley did, and hoped he would long live to inspire others in the welfare of the Society.

Mr. Mawley, in reply, thanked the members heartily for presenting him with the medal, which is the most-coveted prize in the Rose world.

Mr. George Gordon moved a vote of thanks to the retiring President and Chairman. This was seconded by Mr. H. R. Darlington, and carried with enthusiasm.

The Rev. F. Page Roberts, in reply, said that, though the time had come to say farewell as president, yet it was not a sad farewell, for it had proved a most pleasant term of office. He now desired to introduce the President-elect, who, he was sure, needed no introduction, and he therefore vacated the chair.

The Rev. J. H. Pemberton thanked the members for electing him to the position of President, and stated that he would do his best to merit the confidence reposed in him. His first duty as President was to announce that a meeting of the Council would be held on December 15, to elect the standing committees.

THE CONVERSAZIONE.

After the annual meeting, members and friends met together in an adjoining room, at a conversazione, which was again held in place of the annual dinner. Although there was a considerable number present, many felt that a dinner was to be preferred, and the hope was freely expressed that a dinner might be again held on future occasions.

An excellent introductory speech was made by the President, who briefly reviewed the progress of the Rose, and advanced the reasons which, in his opinion, were largely responsible for its increasing popularity.

A musical programme was ably rendered at intervals during the evening.

WATFORD AMATEURS AND GARDENERS'

DECEMBER 9.—The monthly meeting of the society was held at St. Andrew's Schools, on the above date. Mr. Hodgins occupied the chair, Mr. R. Davis enumerated some difficulties of amateurs in flower gardening, and invited professional gardeners present to supply information that would help them. Owing to Mr. A. E. Davies being unable to give his paper on "Amateurs' Difficulties in Vegetable Culture," Mr. W. B. Kettle gave an essay on "Soils and Subsoils and the Process of Growth in Vegetation."

PERPETUAL-FLOWERING CARNATION.

DECEMBER 15.—The winter exhibition, forming the ninth show of the Society, was held on this date in the Royal Horticultural Society's Hall, Vincent Square, Westminster. Taking the exhibition as a whole, it was very attractive, the masses of cut blooms as grouped together presenting a dazzling display of colours.

OPEN CLASSES.

The chairman, Mr. J. S. Brunton, offered a challenge cup, to be held by the winner until the next show, for three British-raised varieties introduced since January 1, 1908, shown in three vases containing 12 blooms. It was awarded to Mr. C. ENGELMANN, Saffron Walden, who showed Rex, a large flower with dentate edge to the petals that are coloured old rose; Carola, a large, crimson-coloured variety; and Harlequin, a yellow ground variety flaked with crimson. 2nd, Mr. W. H. LANCASHIRE, Guernsey, with Carola, Rose Doré, and Empire, a flower of good form and having a white ground.

The American Carnation Society offered a Challenge Cup in a similar class for three vases of 12 blooms each of American-raised novelties. This cup is also held by the winner for one year. It was won by Mr. W. E. WALLACE, Eaton Bray, Bedfordshire, with the varieties Dorothy Gordon, a flower of deep-rose tint; May Day, bright rose; and Pink Delight. 2nd, Mr. C. ENGELMANN.

A trophy known as the Covent Garden Bowl, together with a Silver-gilt Medal, was offered as the 1st prize in a class for two varieties of market Carnations, 60 blooms of each variety, 36 to be shown in two vases and 24 in two boxes each, as packed for market. Mr. WALLIS was successful, having Pink Delight and White Perfection; 2nd, Mr. ENGELMANN, who showed Carola and Regina.

COLOUR CLASSES.

Several classes were provided for certain named varieties or others of similar shade.

Enchantress, Melody, Fair Maid, Mrs. Chas. Knopf and similar colours.—The 1st prize was won by Mr. W. E. WALLACE with Enchantress, who received, in addition to the highest prize, the Society's Silver-gilt Medal; 2nd, Mr. G. LANGE, Hampton, Middlesex, with the same variety.

Mrs. H. Burnett, Pink Delight, May Day and similar colours.—1st, Mr. W. E. WALLACE, who also took a prize for the best vase in Classes 5 to 16. The 2nd prize fell to Mr. C. ENGELMANN for seedling A1, a flower of old rose colour; and Mr. W. H. LANCASHIRE was 3rd for Mrs. Burnett.

Rose Pink, Winsor, Winona and similar colours.—1st, Mr. W. E. WALLACE, with Rose Doré; 2nd, Mr. LANGE, with Pink Enchantress; 3rd, Mr. W. H. LANCASHIRE, with the same variety.

Lawson, Afterglow, Alcina Aristocrat and similar colours.—1st, Mr. LANGE, with Mrs. W. C. Ward; 2nd, Mr. C. ENGELMANN.

Any white variety.—1st, Mr. G. LANGE, with perfectly fresh-looking blooms of Perfection; 2nd, Mr. W. E. WALLACE.

Any scarlet variety.—1st, Mr. W. E. WALLACE, with perfect blooms of Britannia; 2nd, Mr. W. H. LANCASHIRE, with Beacon; 3rd, Mr. LANGE, with Scarlet Glow.

Crimson or Clove.—1st, Mr. C. ENGELMANN, with Carola in first-class condition; 2nd, Mr. W. H. LANCASHIRE, with President.

Any other self colour.—1st, Mr. W. H. LANCASHIRE, with Mikado; 2nd, Mr. C. ENGELMANN, with the same variety.

Any fancy variety.—1st, Mr. C. ENGELMANN, with the brightly-coloured Harlequin; 2nd, Mr. W. H. LANCASHIRE, with Emperor.

Twelve blooms of any variety not in commerce.—1st, Mr. H. BURNETT; 2nd, Messrs. W. WELLS & Co. Special prizes in this class were presented by F. Blake, Esq., Lee-on-the-Solent, Hants.

Twelve blooms of J. Whitcomb Riley.—1st, Mr. W. E. WALLACE, with fairly full blooms of this canary-coloured variety.

Twelve blooms of Scarlet Glow.—Special prizes were offered by Messrs. F. DODNER & Sons Co., La Fayette, Ind., U.S.A. 1st, Mr. W. E. WALLACE; and 2nd and 3rd prizes were divided between the exhibitors Mr. G. LANGE and Mr. C. ENGELMANN.

One vase to contain 72 blooms arranged for effect, any foliage allowed.—1st, Mr. W. E. WALLACE, with a vase filled with May Day and Carola; 2nd, Mr. H. J. DUDNEY, Erith, Kent; 3rd, Mr. H. BURNETT. The 1st prize in this competition included a piece of plate given by Messrs. Felton & Sons, Hanover Square.

In the decorative classes the best basket of Carnations arranged for decorative effect was shown by Messrs. FELTON & SONS, Hanover Square, with a basket painted white and furnished with a gilt edging, which was filled with scarlet and white Carnations; 2nd, Mrs. K. F. HAMMOND, 116, King's Road, Chelsea, with a rose-coloured variety. Messrs. FELTON & SONS were the winners of a competition in bouquets, arranging one of Pink Perfection.

Mrs. A. ROBINSON showed the best decorated dinner table.

For a collection of Carnations in old and new varieties, shown as cut blooms, Sir RANDOLF BAKER, Bart. (gr. Mr. Usher), Blandford, Dorset, was 1st. The blooms were arranged gracefully in small glasses. The Society's Gold Medal was awarded to this exhibit.

For the best six Carnation plants a special prize was added to the 1st prize by Mr. W. H. Page, of Hampton, Middlesex. This was awarded to Sir R. L. BAKER, Bart., for well-grown plants carrying several flowers each; 2nd, Lord HOWARD DE WALDEN, Saffron Walden (gr. Mr. J. Vert).

In this section there were many small competitions, in which C. F. RAPHAEL, Esq., Sir R. L. BAKER, Bart., Lord HOWARD DE WALDEN, GEO. WEST, Esq., Mrs. F. NORMAN, Lord BURHAM, and E. T. JOHNSTONE, Esq., took part.

For six blooms of the variety Carola, Sir R. L. BAKER, Bart., received the Society's Silver Cup. The same exhibitor was 1st for the pretty variety Vinca, a flower of moderate size and bright purple tint not common in Carnations.

A good group of Carnations was shown by Sir DANIEL GOOCH, Bart. (gr. Mr. P. Wilkinson), Hylands Park, Chelmsford. It received an award of the Howard de Walden Vase.

NON-COMPETITIVE EXHIBITS.—Messrs. STUART LOW & Co., Bush Hill Park Nurseries, showed Carnations of the finest varieties. (Gold Medal.) Mr. G. LANGE, Hampton, was awarded the Society's Silver-gilt Medal for a collection of Carnations. Mr. C. ENGELMANN made a large display with Carnations against the end wall; his collection—an admirable one—received the award of the Society's Gold Medal. CEIL F. RAPHAEL, Esq., Porter's Park, Shenley (gr. Mr. A. Grubb), staged a group of pot plants of Carnations. (Gold Medal.) Mr. H. BURNETT, Guernsey, was awarded a Gold Medal for a display of Carnation blooms.

ANNUAL MEETING.

The annual dinner was held at Anderson's Hotel, previous to the annual general meeting. Mr. J. S. Brunton presided, and about 30 members and friends were present.

After dealing with the ordinary business, the Report of the Committee was presented.

EXTRACTS FROM THE REPORT.

"It is with regret that your Committee have to record the death of the Society's patron, H.R.H. Prince Francis of Teck.

"Your Committee view with satisfaction the steady rate of increase in the number of new members joining the Society.

"From reports received, the Year Book of the Society, which was published early in 1910, appears to have proved useful to members, and your Committee will endeavour to make the 1911 edition of equal if not greater value.

"The membership roll of the Society at October 31, 1910, was 271.

"The Committee report with deep regret that a serious breakdown in the health of the hon. secretary, Mr. Hayward Mathias, who has filled that post with great credit since the formation of the Society, necessitated his tendering his resignation in March. Your Committee approached Mr. Mathias with a view to

his continuing in office with an assistant. Mr. Mathias agreed, and Mr. E. F. Hawes was appointed joint hon. secretary. With this arrangement, the secretarial work has been efficiently discharged. At the Society's show in June, Mr. J. S. Brunton, on behalf of a large number of subscribers, presented to Mr. Mathias a piece of plate, with a suitable inscription recording appreciation of his services to the Society.

"The thanks of the Society are tendered to those, both in America and in this country, who so kindly offered special prizes, and to place on record its appreciation of the kindness shown by Mr. J. S. Brunton and Mr. C. Engelmann, and also by the subscribers of the Covent Garden Bowl, by placing additional challenge trophies at the disposal of your Committee. The number of challenge trophies now held by the Society is six.

"A practical working arrangement has now been matured between the hon. secretary of the Perpetual Flowering Carnation Society and the secretary of the American Carnation Society, with a view to preventing the duplication of names in either country, and of affording mutual information of interest to growers on both sides of the Atlantic."

The adoption of the Report was moved by the Chairman, Mr. J. S. Brunton, who spoke of the great advance made with the perpetual-flowering Carnation since the inception of the Society. Mr. S. Mortimer and several other members supported the proposition that the report be adopted. A paragraph concerning the offer of £20 made by the Society to the International Exhibition, 1912, was added to the Report, and with this amendment it was carried unanimously.

Lord Howard de Walden was again chosen as president, and the vice presidents were also re-elected. The other officers were re-elected.

The six vacancies on the committee were settled by ballot, the result being the election of Messrs. A. F. Dutton, C. Engelmann, F. W. Harvey, A. Smith, F. Fitch, and J. Vert.

At a General Committee meeting held at the close of the annual meeting, the Floral Committee, with Mr. W. H. Page as chairman, were all re-elected.

LEEDS PROFESSIONAL GARDENERS' FRIENDLY BENEFIT.

DECEMBER 6.—The annual meeting was held at the Green Dragon Hotel, Leeds, on this date. Mr. Preece presided over a well-attended meeting. The progress made by the society continues to be satisfactory. The funds, which are invested in City of Leeds Corporation Stock, have been increased during the year by £200. The sum of £750 has been expended on sick benefits and £30 for death claims. None but gardeners are admitted as members. The following were elected officers for the coming year:—Chairman, Mr. John Donoghue, Bardon Hill Gardens, Leeds; vice-chairman, Mr. A. Allinson, Roundhay Park, Leeds; treasurer, Mr. John Franklin; and secretary, Mr. George Carver, Chapel Allerton, Leeds.

NATIONAL CHRYSANTHEMUM.

DECEMBER 10.—Members of the Floral Committee paid a visit to Messrs. H. Cannell & Sons' nurseries, Swanley, on this date, to inspect the trials of late-flowering single Chrysanthemums, which this firm has conducted on behalf of the Society. Owing to the damp autumn, few varieties were seen to advantage. The following members were present:—Messrs. D. B. Crane, Riding, Prickett, Wells, Oliver, Bevan, Ballantyne, T. W. Sanders, F. Ladds and E. F. Hawes. Three marks were awarded the following varieties:—Caledonia, Cannell's Crimson, Mrs. Robert Cannell and Cannell's White. Two points were awarded to the varieties Kathleen, Mrs. F. A. Collett, and Rosalind. The committee afterwards visited Mr. Philip Ladds's nursery, where many thousand Chrysanthemums were seen in bloom.

At the meeting of the Floral Committee, held on December 5, First-class Certificates were granted to the varieties Mr. Gilbert Drabb (ivory-white Japanese), shown by Mr. J. Bryant, Gothland Lodge, Sandown, and Lady Fungus (bright terracotta single), shown by Messrs. W. WELLS & Co., Merstham.

DEBATING SOCIETIES.

BRITISH GARDENERS.—The monthly meeting of the London branch of the association took place at Carr's Restaurant, Strand, on Thursday, December 8. Mr. W. H. North occupied the chair. It was announced that the entertainment held on November 26 was attended by nearly one hundred members and friends. The business of the evening having been dealt with, Mr. V. Cockran opened a debate upon the subject of starting a small holding as a Market Garden.

WARGRAVE AND DISTRICT GARDENERS.—At the last meeting of the association, a paper on "Gardeners and Garden Management" was read by Mr. J. A. Hall, gardener to R. H. C. Harrison, Esq., Shiplake Court, Henley-on-Thames. Advice was given respecting many points affecting gardeners, their employment and methods of managing their gardens.

BATH GARDENERS.—A well attended meeting of the society was held on Monday, November 25, at the Forester's Hall; Mr. S. Parrott presided. Mr. H. Roper read a paper on "Onion Culture." The lecturer advised sowing the seeds under glass, and transplanting the seedlings during April in a well-prepared bed. By this method the plants are almost immune from insect pests, and the crop is larger.

CHELMSFORD & DISTRICT GARDENERS.—At the meeting held on Friday, December 6, at the County Laboratories, Mr. C. H. Wallis presiding, Mr. A. Turner, Assistant-Instructor in Horticulture to the Essex County Council, gave a lecture on the "Alpine Garden." Numerous dried, mounted specimens of Alpine plants were handed to the audience for inspection.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD of the weather throughout the British Islands, for the week ending December 10, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather.—Over the kingdom generally the conditions were dull and rainy, and often rough and squally. In many districts, however, the amount of precipitation was less heavy than of late. Along the north-east and east coast of England there were some days without rain.

The rainfall varied a good deal, being more than the average in some districts, less in others. In Scotland E., the deficit was nearly an inch, while England S.W. had an excess of 1.3 inch. In the south-west of England some of the falls exceeded an inch in 24 hours; at Collington 1.18 in. on the 8th, at Falmouth 1.33 in. on the 5th, and 1.18 in. on the 9th. At Sheepstor the total for the week was 6.67 in., the heaviest falls being 1.64 in. on the 5th, 1.85 in. on the 8th, and 1.37 in. on the 9th.

THE WEATHER IN WEST HERTS.

Week ending December 11.

A persistently warm, wet, and gloomy week.—The last 10 days have been all warm, both during the day time and at night, and more particularly at night. In fact, four consecutive nights were as warm as would be seasonable in the warmest part of the day at this time of year. The day temperatures were remarkably equable, the highest maximum reading during the 10 days in question being 52°, and the lowest maximum 48°, a difference of only 4°. The ground is now 3° warmer at 2 feet deep, and as much as 5° warmer at 1 foot deep, than is seasonable. Rain has fallen on all but one of the days in the last fortnight, and to the total depth of over 3½ inches, which is 1½ inch more than the average rainfall for the whole of December. During the same fortnight 19 gallons of rainwater, or the whole of the rainfall of that period, has come through the bare-soil gauge, and 18 gallons through that on which short grass is growing. Both gauges are a yard square. The sun shone on an average for only eight minutes a day during the past week, which is more than an hour a day short of the average duration of bright sunshine in the middle of December. On four days no sunshine at all was recorded. Taking the past fortnight the sun shone for altogether only 1½ hours, and there were nine days which were altogether sunless. The winds were, as a rule, rather high during the week, and in the windiest hour the mean velocity reached 19 miles—direction S.S.E. There was about a seasonable amount of moisture in the air at 3 p.m. E.M., Berkhamsted, December 11, 1910.

SALES FOR THE ENSUING WEEK.

MONDAY—

Dutch Bulbs, at 11; Roses, Flowering and Herbaceous Plants, at 1.30; at 67 and 68, Cheapside, E.C., by Protheroe & Morris.

WEDNESDAY—

Dutch Bulbs, at 11; Roses, in all varieties, at 1.30; Palms and Plants, at 12; at 67 and 68, Cheapside, E.C., by Protheroe & Morris.

ENQUIRY.

CATALPA SPECIOSA.—I can hear of no place in Great Britain where any of the numerous trees of this species, which have been raised and distributed at various times by the Royal Horticultural Society and others, show any signs of becoming a timber tree; and, as the only tree of any age we know of is at Kew (raised in 1830), I shall be glad if any readers of the *Gardeners' Chronicle* can give a better opinion of the species than that of Mr. Bean (*Kew Bulletin*, 1907, p. 45) in which I entirely agree. H. J. Elwes.

Obituary.

JOHN GARRETT.—We regret to announce the death on the 9th inst., at the age of 70, of Mr. John Garrett, late gardener to the Rt. Hon. A. J. Balfour, Whittingehame, East Lothian. Mr. Garrett retired from his duties at Whittingehame in January last, after 36 years service, taking up his residence at Scotstoun, Glasgow. He was a native of the north of Ireland, and after serving under the late Mr. David Thomson at Archerfield, he was appointed gardener at Culzean. When Mr. Thomson was appointed to Drumlaig in 1868, Mr. Garrett again joined his staff. Later, after a short period in the gardens at Wrotham Park, Barnet, he returned to Scotland as gardener at Whittingehame. Mr. Garrett was a very successful grower of indoor fruits. The funeral took place at Whittingehame on the 10th inst. He leaves one son and two daughters, the elder of whom was one of the first girl graduates of Edinburgh University.

* * * The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as *Supplementary Illustrations* in this Journal.

APPLE COX'S ORANGE PIPPIN: J. O. The shoots are affected with scab, caused by the fungus *Fusicladium dendriticum*. Thoroughly drench the trees now with a solution of copper sulphate at the strength of 1 lb. in 25 gallons of water, and, when the foliage appears next spring, spray with Bordeaux mixture at half strength, repeating the spraying at intervals until the Apples are about the size of Hazel Nuts.

BLACK CURRANT WITH SWOLLEN BUDS: W. A. The trouble is due to big bud caused by a mite. If the bushes are only slightly affected, gather and burn the affected buds. In the case of badly-attacked specimens, grub up and burn them and plant the variety Buskoop Giant in future, as this sort is almost immune from attacks of big bud.

CEDRUS LIBANI: Rev. T. A. H. The Cedar may be attacked by fungous parasites at the root, as frequently happens with old trees, in which case nothing can be done to save the specimen. If this is not the case, it is probably suffering from starvation at the root, and a top-dressing will have a good effect upon the growth. This top-dressing should consist of 4 inches of good loam, but the turf under the tree should first be taken off and the ground lightly pricked over—not deep enough to injure any roots—slightly beyond the extent of the branches. We do not think *Pernettyas* would thrive underneath the Cedar, but Ivy, Periwinkle, or *Ruscus hypoglossum* would succeed. The fallen needles should be left, but fresh ones would fall between the leaves of any of the above mentioned evergreens if they were planted.

CHRISTMAS BOXES TO GARDENERS: M. J. S. You will find an article dealing with the subject in the issue for December 8, 1906, p. 394.

CODIUMS (CROFONS) SPOTTED: H. G. G. The fungus *Homodendron hordei* has caused the spotting. Sponge the leaves with a rose-red solution of permanganate of potash.

FERN: J. K., Ilford. The fronds of the Fern are badly infested by eelworm. The brown "scorched-like" patches on the fronds contain numerous eelworms, which may easily be seen under the microscope. This eelworm lives in the soil and roots and works upward into the fronds. Destroy the plants by burning.

GARDENING EMPLOYMENT IN AMERICA: *Journeymen.* The information to which you refer was given by T. E. R. in the issue for February 10, 1906, as follows:—"There is no difficulty in young, well-trained gardeners getting good situations in this country. Head gardeners

and superintendents experience some trouble in securing good men, and New York seedsmen are always glad to hear of men coming from England, and are ready to answer all inquiries, although they offer no temporary employment. March and April are the best two months to arrive. The general wages for journeymen (or assistants, as they are termed) is about \$50 to \$55 per month, without board, or \$30 to \$35 with board, board and lodging being worth about \$20 per month. It would be useless to attempt to advertise in the American papers, because such advertisements are contrary to the law of the U.S.A. for anyone to become engaged before landing, and the parties who do so are subject to a very heavy fine, besides the probability of being deported.

GRAPES SHRIVELLING: J. C. S. No fungus disease is present. The injury is due to the loss of balance between the work done by root and stem, due to a difference of temperature and moisture inside and outside the house. Admit more fresh air to the vinery, and lower the temperature.

HELLEBORE UNHEALTHY: J. S. K., Gillingham. The leaves of the Christmas Rose show no fungus or insect pest likely to cause the death of the leaf. If the crown of the stem or the root appears to be unhealthy, send examples for inspection.

NAMES OF PLANTS: J. Hill. *Nephrolepis exaltata.*—F. L. 1. *Cryptomeria japonica pendula*; 2. *Maxillaria picta.*—F. F. 1. *Blechnum corcovadense*; 2. *Lastrea aristata*; 3. *Adiantum hispidulum*; 4. *Cheilanthes elegans*.

VIOLAS: J. R., Ilford. Viola "Mrs. J. H. Rowland" was sent out by Messrs. Dobbie & Co., Edinburgh, in 1906. Seedling No. 1 is of no value; seedling No. 2 is very distinct, and if the flowers can be grown large enough the variety is exceedingly promising.

WOODLICE IN ORCHID HOUSES: C. N. B. We believe the preparation you mention would be harmless to the Orchids. Write to the manufacturers.

WORKS ON THE ORANGE AND OTHER SPECIES OF CITRUS: F. B., Rio de Janeiro. *The Cultivated Oranges and Lemons, &c., of India and Ceylon*, by E. Bonavia; one volume of text and one of plates. Published by W. H. Allen & Co., 13, Waterloo Place, Pall Mall, S.W. The volume of text consists of 384 pages; that of plates of 259 plates, uncoloured. Date 1890. *Histoire et Culture des Orangers*, par A. Risso et A. Poiteau; 4to, 228 pages and 109 coloured plates. Paris: Henri Plon, Éditeur, 10, Rue Garancière; G. Masson, Éditeur, 17, Place de l'École et Médecin; 1872. *The Orange: Its Culture in California, with a Brief Discussion of the Lemon, Lime, and other Citrus Fruits*, by Wm. A. Spalding; 8vo, 97 pages. Riverside: Press and Horticulturalist Steam Print: 1935. *Citrus Culture*, by Albert H. Benson. Ed. 2; 8vo, 54 pages. George Arthur Vaughan, Government Printer, William Street, Brisbane: 1903. *Gum Disease of Citrus Trees in California*, by Ralph E. Smith and O. Butler; 8vo, pages 255-270; being *Bulletin* No. 200 of College of Agriculture, Agricultural Experiment Station, Berkeley, California: 1903. The following works are quoted by Bailey in the *Encyclopædia of American Horticulture*, page 1,154:—*Orange Culture in California*, Garey, San Francisco, 1882; *Treatise of Orange Culture in Florida, Louisiana, and California*, Moore, New York and Jacksonville, Ed. 3, 1883; *Practical Orange Culture: Including the Culture of the Orange, Lemon, Lime, and other Citrus Fruits as Grown in Florida*, Manville, Jacksonville, 1883. We fail to recognise the pest to which you refer as being destructive to Tomatos in Mexico. Perhaps Dr. L. O. Howard, of the United States Department of Agriculture, Washington, D.C., might possibly be able to assist you in the matter.

"JOURNAL OF GENETICS."

WE extend, on behalf of horticulturists, a warm welcome to the new *Journal of Genetics*, the first number of which was issued last month.

The time has arrived when the detailed results of scientific experiments in plant- and animal-breeding should find a natural and congenial home in the pages of a British journal, and we are grateful, therefore, to Messrs. Bateson and Punnett, the editors, and to the Cambridge University Press, the publishers, for their enterprise.

It is significant that the opening number of the *Journal* deals not with out-of-the-way things, but with such homely plants as Potatoes, Peas, Primulas, and Petunias. There is, indeed, no necessity for the student of heredity to go far afield for his material. He recognises that, since we do not yet know the laws which govern the inheritance of the various characters possessed by any single organism, the commonest of our cultivated plants provide an inexhaustible supply of problems.

Before considering the chief of the contributions above referred to, it will be well to indicate what are the services which the horticulturist may well ask of the scientific investigator of Genetics.

In the actual production of new varieties, the florist and seedsman can "carry on"

very well. They have induced, by their own industry and skill, veritable transformations in many kinds of flowers—Sweet Peas, Roses, Carnations and the like; and it is to the florist and seedsman, and not to the Mendelian or other schools of experimenters, that the gardener will continue to look for improved races of cultivated plants. Nevertheless, the enterprising commercial plant-raiser is already making use of Mendelian facts. These facts have helped the florist and nurseryman in the past, and they will assist him more in the immediate future. To give but one example, Miss Saunders's study in the inheritance of Doubleness of Petunias, published in the first number of the *Journal of Genetics*, shows that the character of "doubleness" is due in these plants to the constitution of the plant, and is not due to methods of cultivation. Therefore, any attempt to produce a race of Petunias which comes true with respect to doubleness or which throws more than about 50 per cent. of doubles is foredoomed to failure. The only way to cause a batch of seed to throw doubles exclusively is to devise a process, which, in our opinion, should not prove impossible, whereby "single" seed is killed off and "double" seed left uninjured.

Beyond, however, this task of facilitating the constructive efforts of the professional plant-breeder, lies another and more important work for the Mendelian investigator. In spite of years of labour, acute observation, and endless trials, certain problems of the highest practical importance have baffled altogether the ingenuity of the horticulturist. To give examples chosen not only because of their importance, but also because one, at all events, of them is treated of by Dr. Salamon in the *Journal* under review—the disease-resistance and the "running-out" of cultivated varieties of the Potato present problems which, could they be solved, would lead to results of the greatest economic value. Though Dr. Salamon would be the last to claim that he has elucidated all the mysteries of the behaviour of the capricious tuber, nevertheless the trend of his researches seems to us to point to the conclusion that the "running out" or "degeneration" of a given variety is due primarily not to methods of cultivation, nor to old age, but to internal changes of constitution. Dr. Salamon, it is true, is properly cautious not to commit himself to a statement on the subject; but, nevertheless, it appears to follow from his observations that an ordinary variety of the Potato carries both pairs of a large number of separate characters; in Mendelian parlance, it is heterozygous for these characters. Being heterozygous, its apparent quality of shape, flavour, &c., conceals, though it does not exclude, other and opposite qualities. An example may make this clearer. A typically kidney tuber may be carrying not only the character (or characters) which make for oval, but also the character for round. It is known that Potatoes "sport" from time to time; that, for example, a long tuber may throw a round. If a plant can sport with respect to one character, it can do so with respect to others. If such characters, e.g., of quality, are not visible to the eye, how is the grower, no matter what his expert knowledge may be, to be sure that he is always, in selecting his immature tubers for "seed," picking out the

heterozygotes, which alone carry the characters on which the quality of that race depends? Again, with respect to disease-resistance, growers will watch with interest the experiments, begun originally by Mr. Arthur Sutton, and carried on subsequently by the Rev. J. Aikman Paton and by Dr. Salamon, with Lindley's *Solanum etuberosum*. Dr. Salamon's observations on this species or hybrid of uncertain origin are of the greatest interest. He confirms the conclusions reached by Mr. Sutton, who has kept *S. etuberosum* under observation for 20 years, that this species (!) is not susceptible to attack by *Phytophthora infestans*; but he adds the further remarkable observation that, now that Lindley's *etuberosum* has ceased, after 20 years' cultivation, to be sterile, it is giving rise to seedlings, some of which are susceptible to, and others immune from, late blight disease. Thus, of 40 seedlings of *S. etuberosum*, grown side by side with domestic varieties of Potato, 33 suffered from the attack of *Phytophthora* and seven resisted the fungus; whereas all the domestic varieties succumbed to it. The practical aspect of these facts will be evident when it is mentioned that the immune seedlings remained immune in the following year. Though it is premature to make a confident statement, Dr. Salamon's work is strongly suggestive of the hypothesis that immunity from late blight is a recessive character, and that this character will be found to breed true, inasmuch as crosses have now been made between *S. etuberosum* and domestic varieties, we shall not have long to wait before knowing whether the problem of raising a disease-resisting Potato of culinary value has at last been solved.

THE MONT CENIS IN JULY.

I hope that readers of the *Gardeners' Chronicle* are not yet tired to death by envy combined with boredom at hearing the Mont Cenis so persistently advertised. In any case, I did not begin it. But after my radiant experiences in June, I felt that I must certainly return a month later to see what sort of a summer flora it could be that there replaced the wonderful galaxies of spring. So full had the meadows then been that it seemed hardly possible that any second show could rival the first. However, after I had finished all my explorations in the Maritime Alps, I returned to the Mont Cenis on July 29.

All the Gentians, Pansies, Potentillas were gone; gone was *Ranunculus pyrenicus*; the Alpine sward had been eaten by the cows as bald and bare as any mown lawn. But in revenge, the meadow flowers were blazing with a richness that certainly equalled, if it did not actually surpass, the glories of the earlier display. The long grass was a jangle of *Campanula rhomboidalis*, visible in stretches of blue from far away; in herbage, less rank, tall spires of *C. barbata* made a paler note, amid the golden suns of *Antica* and dark violet bells of *Campanula linifolia*. Here and there among the herbage, still hinged *Anemone alpina*, but it was hardly less beautiful thus than as big, ferny bushes on warmer slopes, each carrying half-a-dozen huge heads of towzled, silvery fluff. And everywhere towered high above the hay the stems of *Lilium Martagon*, brilliant and splendid here as I had never seen it. In more open places, *Aster alpinus* abounded, together with *Linum alpinum*, *Trifolium alpinum*, Purple *Polygala* and *Dianthus neglectus*, which, however, did not seem so fine in form as on the Col de Pesio.

On the stone-dumps in front of the hotel, *Dryas*

* *Journal of Genetics*, Vol. I., No. 1, November, 1910. Edited by Mr. W. Bateson, F.R.S., and Professor Punnett. (Cambridge University Press.) Price per number, 10s.; per volume (4 parts), 35s.

was now in full beauty, with *Viola biflora* golden in the hollows. Here, too, *Hugueninia* was in full splendour, and showed me that I had never known it or appreciated it before. It is so fine a thing that the wonder is it is a Crucifer: the flowers, though small, are produced in such packed myriads that the general effect is of a close, golden cloud carried aloft on a tall stout stem. Then, over all the ridges, *Campanula pusilla* was in sheets of blue, and the three rare *Oxytro-*

foliage had been so specially remarkable in spring; and the whole northern slope, that before had been snowed under by *Ranunculus pyrenæus*, was now white with an even denser snowfall of *Anthericum Liliastrum*. And in the upper bogs *Ranunculus aconitifolius* was now in full bloom.

In the high mountains there was much to see. Not even at the end of July was *Campanula cenisia* in bloom on the stone slopes going up to

running up to join *C. cenisia* in the high stone slides. It was nearly in full flower, and the size of the bell, I must confess, disappointed me; there are fine, special forms to be found of *C. Allionii*: on the Mt. Cenis I only discovered one, with larger bells than usual, and of a soft pale lilac. On the upper stone slopes, both *Thlaspi rotundifolium* and *Petrocallis* were passing over; *Ranunculus glacialis* occurred, in a roseate form, occasionally, on these arid and unlikely banks, and *Anemone baldensis* was frequent. But the glories of this acclivity were *Gentiana brachyphylla* in slabs of sky all down the slope wherever there was grass, and in the stone-scrée among *C. Cenisia*, the abundant laughing faces of the Cenisian Pansy. And I must still declare that, apart from their different root systems, and the very different levels they inhabit, I cannot see any solid distinction, and certainly no horticultural distinction, between *Viola cenisia* and *V. Valderia*.

For a long time I could not find the Clear Lake: there was still an astonishing quantity of snow about. The upmost shingle was utterly barren, except for an ugly tussock or two of *Saxifraga biflora*. The *Thlaspi* was discoverable, but rare; nor was it much in evidence when at last I topped a ridge of snow and found the little lake lying clear in its tiny hollow. But this is one of the loveliest corners among all the high places of the world: the pool was still half embedded in a snowfield; the *Thlaspi* was only just beginning to flower, and *Gentiana brachyphylla* on the grassy ridge was still in bud. Other high places, too, I visited: I mean that pass which, in deference to Mr. Stuart Thompson, is never to be named. (But I can tell him that there is a good deal less *Eritrichium* there than there was!) Yet, though the King of the Alps shone azure on the rocks, *Ranunculus glacialis* was only beginning to send up bronzy buttons from the shallow waters that were molten ice, and *Androsace glacialis* was so draggled with glacier mud that its still flowerless mats could hardly be discovered. A little lower, and *Saxifraga retusa* continued in glory, and there were also *Primula viscosa* (née *latifolia*), and *Ranunculus pyrenæus* in fine form on that grassy plain which once had been full of snow *Crocus*, and now was starved, in its rills, with *Gentiana bavarica*. (Higher up, by the Savine Lake, this, of course, had given place to *G. imbricata*.)

Nor, for a final word, must I omit *Cortusa Matthiæi*, brilliantly blooming in its gorge, and *Aquilegia alpina*, forming such sheets of blossom at the lower end of the Mont Cenis Lake, that the effect was that of Bluebells in an English wood. *Reginald Farver.*

ORCHID NOTES AND GLEANINGS.

POLYSTACHYA PANICULATA.

In fig. 202 we give an illustration of *Polystachya paniculata*, Rolfe, a pretty, new species from Uganda. The species was first imported with a few other curious plants by Sir Trevor Lawrence, Bart., K.C.O.V. (gr. Mr. W. H. White), who was awarded a Botanical Certificate for this species at the Royal Horticultural Society's meeting on August 16 last. At the two succeeding meetings it was finely shown by Sir Jeremiah Colman, Bart. (gr. Mr. Collier), and it was shown again on November 3, 1910, by Messrs. Charlesworth & Co., from whose plant the present illustration was sketched by Mr. Worthington Smith. It is said that the larger specimens which died coming over were three times the size of the plant illustrated, and bore proportionately larger heads of bloom. The colour varies in tint from coppery-yellow to reddish-orange, and a lens shows some fine purplish lines. In growth, too, it is peculiar, the pseudo-bulbs being flattened and the young growths handsomely blotched with purple, giving the plant a very ornamental appearance even when not in flower. It is a free grower when suspended in an intermediate house. It is not so

FIG. 202.—POLYSTACHYA PANICULATA: FLOWERS A SHADE OF REDDISH-ORANGE, SOMETIMES LIGHTER.

pidis shared the stony places with *Dianthus neglectus* and *Gypsophila prostrata*. All along the roadsides, where *Geums* and *Alyssums* had been so brilliant, now lay wide violet stretches of *Calamintha alpina*. Down by the lake, in place of *Phanula farvesea*, the ground to the south was a red sheet of *Santon*. *Gentiana bavarica* occurred in the marshes, together with the long purple spikes of those *Orchis latifolia*, whose spotted-dog

the Lac Clair: but, anyhow, these slopes were all clear of snow by now, and a little lower, on a minor slide, we found half-a-dozen tufts of that most lovely plant, so thickly set with deep-cleft cups of pale steely-blue that the foliage was hardly visible. As for *C. Allionii*, which is reported as occurring "here and there," it was not only here and there, but literally everywhere, beginning quite low down in earthy banks, and

easy to ascertain what purpose is served by the upright, flattened stems of *Polystachya paniculata* as it is in *P. bracteosa*, whose dwarf, compressed pseudo-bulbs clip the branches of the trees, and enable the plant to escape the effects of the burning heat of the sun in the arid season and extract some moisture from the tree on which it is growing.

POLYSTACHYA GOLUNGENSIS.

This singular little *Polystachya*, probably not previously recorded as flowering in Europe, is blooming with W. E. Balston, Esq., Barvin, Potter's Bar. The plant is about 4 inches in height, the short pseudo-bulbs bearing narrow leaves of very firm texture on the upper part. The branched inflorescence bears many small, light-yellow flowers, resembling, in general appearance, those of the widely-distributed *P. luteola*. It was imported from the inland border of Uganda, and appears to be distributed over a considerable range in the same latitude, extending westward, although it does not seem to have been previously imported alive.

of a cross from *O. cirrhosum* × *O. crispum*, and *O. ardentissimum* (*O. Pescatorei* - *O. crispum*). It is curious to note that while the two parts *O. crispum* dominate the flower with respect to size and shape, *O. cirrhosum* appears in the somewhat apiculate termination of the segments, and *O. Pescatorei* in the lip, especially in the constriction of the middle part. In colour it is like a good *O. ardentissimum*, white blotched with rose-purple.

THE ROSARY.

ABOUT SOME DIFFICULT ROSES.

WHEN there are some glorious Roses, as undoubtedly there are in every rosarian's knowledge, that are not generally grown, they are not generally grown for a very good reason—they won't grow. One constantly sees enthusiastic amateurs who have accidentally succeeded with a difficult subject, writing to the gardening Press and recommending everyone to grow "this"—

loom upon a thin bed of clay, and was very well drained, almost too well, in fact. Of the Dijon-Teas I grew pairs of the following, Bouquet d'Or, Mme. Chauvry, Duchesse D'Auerstadt, Comtesse de Turenne, Souvenir de Mme. Metral, E. Veyrat Hermanos, and some others. Of all these, only the first and the last were of any real good as arch Roses. Bouquet d'Or grew fairly well for a year or two, but when the young wood got worn out it never put forth any strong growths in later years: it did better with me as a Standard. The first year after planting, Mme. Chauvry gave me two or three beautiful flowers, and then ceased to do anything at all, except gradually die out. Duchess d'Auerstadt was a secondary sort of success: it did at first almost cover its arch, and for a year or two it threw a few of the loveliest yellow (really yellow) Roses I have ever grown or ever seen—deep, orangy, butter-yellow, self-coloured to the edge of the petal. In a few summers it gradually weakened away, refusing to make new growth or to open the buds it produced. I should like to hear of anyone having this on a wall. I wish I had wall space to give it a trial myself. Comtesse de Turenne did little or no good upon my arch: it grew very little; it would make a shoot or two a foot long and then bloom; it never got more than about 4 feet high. When you can get this Rose to grow, it is, perhaps, the very finest of all the autumn Roses; it seems little good early in the season. I remember a bloom of it being shown in Vincent Square at the autumn Rose show some years ago, one of the largest and most refined flowers ever exhibited. An excited amateur, a distinguished exhibitor, hurried me to see it, as he had never even heard of it. I damped his ardour by telling him I had grown it for years, but only got a decent bloom every two or three seasons: there were good blooms, but they were generally so late they got spoiled by the weather. I have here (in west Kent) now planted this Rose against a south wall, and it promises by the growth it has made to do very well. Souvenir de Mme. Metral was the very worst of the whole lot (it had a Mme. Carnot, I believe, as a sharer of that "bad eminence") and was dug up and burnt after the third season. E. Veyrat Hermanos is a Rose of another class, with me at all events, as the difficulty was to keep it anywhere within bounds; it grew rampantly, and made buds by the hundred, five out of six of which had to be cut off. Its one sin is that, except in hot weather, it will not open its buds; sometimes there was a single good Rose in the season, but when you did get a perfect flower you at once made up your mind you would never be without a plant of it. At its best it is as good as that most difficult and most glorious of all Roses, the Comtesse de Nadailac, which no one can grow except Mr. Prince, of Oxford, and he seems to grow it like Buttercups. As this Rose has beautiful foliage and grows freely, it is worth keeping on the chance of a warm summer coming again. I have it here on a south wall, and it opened some blooms even in our late wretched season, the worst Rose year I have ever had.

There was one other Dijon Tea I grew to which I should like to refer, for it seems now to have disappeared from even the nurseryman's list, viz., Madame Lacharme; this Rose did very badly, but it threw me one or two of the very brightest lemon-yellow Roses of large size.

Of course, others may succeed with some or all of the above varieties, but I take my own experience with them to be an average one, and therefore maintain that it is extremely hazardous to recommend them in an off-hand way to the inexperienced. By the way, I was extremely surprised to see someone recently including *Gloire de Dijon* and *Madame Herard* among the "best half dozen yellow Roses." It wants a good deal of magnification or a good deal of hardihood to include either of these among yellow Roses at this late day. R. P. S., *Flower U Group, Hovehurst, Kent.*

FIG. 203.—ODONTOGLOSSUM "ROUGE DRAGON": PETALS AND SEPALS BLOTCHED WITH REDDISH-CRIMSON.

BRASSIA FORGETIANA.

BRASSIA FORGETIANA (see fig. 209, p. 471) was exhibited by Messrs. Sander & Sons, St. Albans, at the meeting of the Royal Horticultural Society held on December 6 last, and gained a Botanical Certificate. It is one of a very interesting collection sent to Messrs. Sander by their collector, Mr. Forget, from Peru. Some of Mr. Forget's plants have proved to be new, whilst others are not yet identified. The present species is of the *B. maculata* section. The plants are very floriferous, and the flowers whitish with chocolate-purple markings, the crest of the lip being of orange colour.

ODONTOGLOSSUM ROUGE DRAGON
(*PHOEBE* × *ARDENTISSIMUM*).

THE illustration in fig. 203 represents this showy hybrid *Odontoglossum*, for which the exhibitor, W. R. Lee, Esq., Plumpton Hall, Heywood, Lancashire (gr. Mr. Woodhouse), received an Award of Merit at the Royal Horticultural Society's meeting on December 6 last. It is of complex parentage, *O. Phoebe* being the result

"even if you have but room for half-a-dozen Roses, mind you include this." As a rule, they do not even tell us in what part of the kingdom their garden is located, what is the nature of the soil, the situation, or even the summer they are referring to, so that a prospective follower of their advice does not know whether he is able to command even the elements of success. Quite recently I saw someone writing to the papers and recommending that old Dijon-Tea Mme. Chauvry as a pillar or arch Rose. It is a glorious bloom, if you ever get one, but anyone following this advice is courting disaster.

As an old hand, may I give a little of the cold water of experience, which, after all, is more useful than columns of rhapsody, about some of these fine, old, little-grown Dijon-Teas? Some years ago, in my old garden in South Hampshire, not very far from Winchester, I erected a series of arches 6 feet wide and 8 feet high—there were about a score of them—and set about growing pairs of the finest Dijon-Teas, among others, upon them. I may premise by saying my garden had a very fair Rose soil, a stiffish

WICHURAIANA ROSES AND THEIR HYBRIDS.

THESE beautiful Roses, originally brought from Western China, and distinguished by a trailing, rather than climbing, habit, and intensely glossy and attractive foliage, have been greatly developed and improved by hybridisation. Many of the finest hybrids have come from North America, and especially from Philadelphia. They include varieties of supreme fascination, one of the loveliest being *Gardenia*, which I saw in great perfection in Sir Mark J. Stewart's picturesque garden at Southwick, in Kirkcubrightshire, in the beginning of July. As the opening buds were a rich, apricot yellow, and the expanded flowers almost white in their complexion, the combination of colours on the same exquisite Rose trees was, with the glistening foliage, striking in the extreme. In the gardens of Mr. Carrick Buchanan, at Corsewall, in Wigtownshire, such Wichurianas as *Lady Gay* and *Dorothy Perkins* were at least equally reflective, when I had the gratification of seeing them there, environed by masses

beautiful derivative from *Dorothy Perkins*; *Evangeline*, a strikingly-effective Picotee variety, with fragrant flowers; *Jersey Beauty*; *René Aubé*; and *Mimihaha*. *Paul Transon*, a highly-interesting hybrid between *L'Idéal*, one of the finest of the climbing Noisettes, and a Wichuriana variety, *Lady Godiva* (raised at Cheshunt), and the *White Dorothy*, a graceful native of Colchester, are invaluable acquisitions. *David R. Williamson*.

BANANA CULTURE IN ENGLAND.

THERE are few plants of so noble an appearance as the *Musa*, the massive leaves being almost unqualified for size in the vegetable kingdom. A stately plant of Banana has few rivals for effect in the sub-tropical garden, and specimens are cultivated in many gardens in this country for associating with Palms and other fine-leaved exotics in the ornamental grounds in summer time. Banana fruits are now imported in such great numbers that they form one of the most

gross feeder. They need some kind of artificial manure about every 10 days, as soon as they become root bound. Water must be given in abundance at all stages of their growth, otherwise the bunches of fruit will be stunted and not set well. It usually takes from 13 to 15 months from the rooted suckers before the inflorescence begins to push from the centre of the plant. When the bunches of fruit, which frequently weigh from 50 lb. to 70 lb., are forming, they will require supporting by cord attached to the rafters, and another five months are required to develop the fruits, making in all from 18 to 20 months before they are perfected. During the last month it is advisable to limit the amount of manure and water. The number of "fingers" to a bunch varies according to the vigour of the individual plant. As soon as the fruits turn yellow they should be removed from the plant, otherwise the skins crack and spoil the appearance. One large house would produce fruits at all seasons, provided successional plants were grown. A slight shading during the hottest weather is better than excessive ventilation. The syringe must be used frequently to keep red spider in check, but too much water must not be allowed to reach the heart of the plants or the fruits will be liable to rot. Thrips sometimes attack the plants and spoil the appearance of the fruits; because of this an occasional fumigation of the house is necessary. *S. Ely, Lavington Park Gardens, Petworth, Sussex.*

FIG. 204.—BANANAS FRUITING AT LAVINGTON PARK GARDENS.

of radiant Sweet Peas, in the autumn of last year. Previously to that memorable visit, I must confess I was almost ignorant of their marvellous capability of floral and artistic effect. During last season, the special varieties of this character that created the finest pictures here were *Hiawatha* and *Christian Curle*, both of which produced, during the month of August, when other precious Roses were conspicuous by their absence, an immense number of exquisite flowers. *Hiawatha*, which is of an intense crimson colour, with an almost white centre, has an aspect at once fascinating and unique. *Christian Curle*, which was raised by Messrs. Cocker, of Aberdeen, is pale salmon-pink in complexion, and has proved itself, at least in my own garden, capable of splendid and impressive effects. It has also revealed what the French rosarians would describe as a "remontante" habit; but its numerous flower-buds in October, produced like a floral afterthought, come much too late for any hope of successful development. Other very striking Roses of the Wichuriana race are *Alberic Barbier*, which is early flowering and coloured like *Gardenia*; *Dorothy Pennison*, a

popular of fruits, not excepting the Apple or the Orange. But few have enjoyed the exquisite flavour and soft, melting flesh of a hothouse-grown specimen, as it is only occasionally that Bananas are grown for their fruits which can be had in perfection at any season of the year. A home-grown Banana is a useful addition to the rather limited number of dessert fruits obtainable during the early months of the year, and is to be preferred to a second-rate Peach, Nectarine or Pear. When grown under suitable conditions and properly matured on the plant, they are far superior to the imported fruits. The Chinese Banana, *Musa Cavendishii*, is the best for fruiting purposes. A glass-house with an internal height of about 12 feet will accommodate the tallest plants. The temperature of the house in winter should be maintained at 60° to 70°, and in summer time from 70° to 80°. The plants can be either grown in large tubs or in borders. The soil should consist of a good strong loam with sufficient sand to keep it porous, and some coarse bonemeal well mixed together. Plants grown in tubs require an abundance of water and food as the Banana is a

NOTES FROM A "FRENCH" GARDEN.

THE Lettuce plants are in a splendid condition, with the exception of a few which have been attacked by mildew. These latter have been dusted with flowers of sulphur, and the cloches in which they are growing have been kept closed.

The "Passion" Lettuces are not so forward this year as usual, as it has been necessary to give ample ventilation to keep them healthy. The Cos Lettuces are well established after their second transplanting. We intend to transplant 1,000 plants a third time (five to each cloche) as soon as the bell-glasses are available in January. This extra trouble will be repaid in having strong and sturdy plants for forcing late in February, as it is better to plant good plants late than to start too early with thin and drawn specimens.

The Cauliflowers are receiving ample ventilation to promote a sturdy growth and prevent too great a check when transplanting them in their final quarter in March.

All the frames and lights are ready to be placed on the ground intended for "cold work." They are generally set in position on a frosty day when the soil is hard.

The materials intended for the making of the hot beds are ready. The manure collected in August and September will now be brought between the ridges of soil. If frosty weather sets in after Christmas, it will be spread over the ground. The hot-beds will not be started this year before January 20, for, although we started earlier last season, the Lettuce crop was better and more even in the last beds than in the first.

The quantity and quality of the seeds used in the hot beds are important items in success. It is advisable to test their germinating powers previous to their insertion, especially as the last two summers have been unfavourable for seeds maturing properly. A known number of seeds should be placed between two pieces of felt or thick cloth in a room or greenhouse, and kept sufficiently damp to cause germination. The proportion of good seeds can be found, and the sowings arranged accordingly.

The festivities of the Coronation should cause a demand for choice fruits such as Melons, and those responsible for the management of a "French" garden should arrange accordingly.

A greenhouse will be absolutely necessary for the rearing of the seedlings from late in January, as it is difficult to grow young Melon plants in frames at that time. *P. Aquatics.*

NOTICES OF BOOKS.

TOWN GARDENING.*

It may be wondered for whom many of the so-called gardening books published every year are really intended. Large numbers are ostensibly written in the interests of the amateur, who, if he wades through a tithe of the literature provided for him, must indeed be a long-suffering individual. The work under notice is designed to serve as a guide for those having to do gardening in towns, but whether intended for amateurs or for such as make gardening their calling, it is difficult to judge. On the one hand, it deals with matters quite outside the purview of the ordinary amateur, while, on the other, it goes into minute details of work with which any garden apprentice is thoroughly familiar.

The book might have been edited with more care than has been expended upon it. The following extract is an illustration of the diction adopted by the author:—

Plants hate dirt; it is poison to them; and where a man can live and be in health for fifty years or more an oak tree may die in a year or two and all from dirt in one shape or other.

Take, for instance, a potful of rooted cuttings where a nice clean pot has been used, clean crocks carefully put in, over that a little Moss, and filled up with nice sweet soil that will scarcely dirt one's fingers. When reversed and turned out on the hand how nice it looks! how the clean white roots coil neatly and strongly among the soil and crocks! and how healthy the leaves above appear! above all how they grow! Now take one where an unwashed pot has been used, a lot of messy soil crammed in, and the cuttings poked in anyhow, as some people do, and what is the result? Why failure and disappointment, of course. (Page 5 et seq.)

After the perusal of this, we are left wondering wherein lie the connections between man, Oak, and pot of rooted cuttings!

The author's idea as to the most suitable way of utilising a lawn does not commend itself to us any more than the haphazard method he recommends for the formation of designs. Under the first head he writes (p. 18):—

A few beds cut out of turf look nice if filled with bright flowers in summer; and if you can manage it, a fountain, with a basin as large as possible and a few gold-fish is very pretty and entertaining.

Under the heading of "Designs for Flower-beds" (p. 24) he says:—

Regarding designs for flower beds, any one possessing a fairly correct eye and average amount of taste can design and cut out suitable shapes. We always merely measure and peg out the principal points, corners, &c., of the beds on the turf, take a sharp spade and cut the design out straight away without any bother of plans or patterns, and no assistance but a line for straight edges, perhaps. . . . A visit to Battersea Park or the Crystal Palace will give one a better idea of what may be done in this way than almost any amount of description.

One can imagine what sort of designs would be likely to be produced after a visit to either of these places and a disregard of plans or patterns.

Perhaps the least trustworthy advice contained in the whole book is that given under the heading of "Hints on Planting Trees," more especially with reference to street planting. For whose benefit this is given it is hard to tell, but it is difficult to imagine where the author obtained experience to justify the advice which he gives. Thus on p. 61 we read:

Dig the hole for each tree as wide as you can—depth is not of much importance, 5 feet is sufficient—and we think it best to make a pretty hard bottom by ramming in 1 foot or more of gravel for tap roots should be prevented or at least checked. If you must use any of the old soil work it up well, and we should recommend its having been excavated some time previously and turned over frequently in heaps exposed to frost or sun. Use this more round the sides of the hole, which should be certainly 6 feet in diameter and as much larger as possible, and use the fresh stuff round the roots of the tree. Make the soil firm and leave a hole for the tree. These should be strong saplings of 6 or 8 feet high, but we do not recommend their being much larger as the

check is sometimes fatal to large trees. . . . Now if it can possibly be managed, do not shut out the roots from the healthy influences of the sun and air, but leave the soil exposed for as long a space as possible and put a light iron or wooden railing round to keep off enemies or intruders. A space at least 5 feet or 6 feet in diameter should be left and railed in in this manner.

Imagine anyone excavating holes in a London street for trees in the manner described, or allowing the material excavated to lie on the side of the road till it is weathered! What practical man would ever suggest fencing in a space of 6 feet in diameter around 6 feet saplings in a public thoroughfare?

Faults such as these detract very considerably from the value of the book as a guide to town gardening. W.

SCOTLAND.

THE WAVERLEY MARKET, EDINBURGH.

In reference to the note on the proposed heating and ventilating of the Waverley Market (see p. 442), Mr. H. N. Ellison, West Bronwich, writes as follows:—As a regular exhibitor at the Edinburgh Chrysanthemum Society's Show in Waverley Market, I am pleased to learn that the Edinburgh City Council are at last considering the advisability of heating the building. There is not the least doubt but that the coldness of the building (especially in the last two years) has been the principal cause of the very large falling off in the attendance, and also, in a great measure, for the few trade exhibits staged, especially this year. Last year, Ferns worth £10 were completely spoilt in my exhibit through the cold, many being so badly damaged that I instructed my assistant not to pack them to send home. Now that the matter of heating the building has been raised, the Scottish Horticultural Society should endeavour to press it forward so that it may not get shelved as on previous occasions.

SUGGESTED REMOVAL OF EDINBURGH VEGETABLE MARKET.

At the recent annual meeting of the Edinburgh Market Gardeners' Association, the proposed removal of the vegetable market from the Waverley Market was discussed. The step has been advocated for some time by members of the Town Council, the intention being to remove the market to the site in New Street, formerly occupied by the Corporation gas-works. The market gardeners are opposed to this, and they presented to the Council a petition against the proposal. Mr. David King, the chairman at the meeting, referred convincingly to disabilities that would be entailed by the proposed removal, and Councillor Chessier, the convener of the Corporation Markets' Committee, also spoke, his remarks being of a re-assuring nature. Another suggestion has been made that a new fruit, flower and vegetable market should be established at Gorgie, where the new meat market is established. But in either case—at New Street or at Gorgie—the market gardeners would be put to great inconvenience, and their trade would be dislocated. It is to be hoped that the scheme of removal will be finally dropped, although the party on the Council in favour of removal is a strong one. On the other hand, the interests of the market gardeners are of great importance, and the proposed removal would be most inconvenient to the public as well as to the wholesale and retail dealers.

BLAIRGOWRIE AND RATTRAY FRUIT-GROWERS' ASSOCIATION.

A satisfactory statement of the year's work was submitted at the annual meeting of the association held in Blairgowrie recently. The quantity of fruit sold had been slightly less than last year, although it exceeded by about 100 tons the sales

of the previous season. The larger proportion of the Strawberries realised £30 per ton, the average prices for these being £1 8s. 1½d. per cwt. The average returns for Raspberries showed 15s. 5½d. per cwt., the lowest price realised being £10 per ton, and the highest £20. The average price for Black Currants was £1 17s. 4d. per cwt. Office-bearers were appointed for the year, ex-Baillie Adamson being elected president, and Mr. Jno. Stewart vice-president.

CHAIR OF AGRICULTURE AT ABERDEEN.

A conference took place on Friday, 9th inst., between representatives of the Aberdeen University Court and the Aberdeen and North of Scotland College of Agriculture, to consider the question of the proposed Chair of Agriculture, towards which Lord Strathcona has given £10,000. Principal George Adam Smith presided. The question was considered, with reference in particular to the method of appointment in view of the proposal that the new professor, whilst remaining a member of the University staff, should also conduct the work of his department in the Agricultural College. The principal had circulated a memorandum dealing with the system of professorial appointments by joint bodies, as in Glasgow and elsewhere, and there was also submitted to the meeting a memorandum prepared by Mr. James Hendrick, of the Aberdeen College of Agriculture, in the following terms:—(1) The University Court and the Governors of the College of Agriculture might agree to depute the selection of a person suitable for the appointment to a joint committee. (2) It might be an understanding between those bodies that under present conditions, and while there is only one Chair in Agriculture, the professor appointed should also be the chief official of the Agricultural College, and have general oversight and control of the work of the college, for which he would be responsible to the Governors of the College. (3) The central classes of the Agricultural College at present form a University department, and the lecturers in agricultural subjects are University lecturers. After the appointment of a professor, the Senatus and University Court would continue to exercise similar control to that which they exercise at present over the education and discipline of the central classes and the granting of degrees and diplomas. The main change affecting the college would be that the chief teacher of the college staff would have a seat on the Senatus, and the college staff would thus have direct representation on that body. (4) The Chair in Agriculture should not be confined to one professing agriculture in any restricted sense of the term, but should be open to distinguished specialists and teachers in any of the chief branches of agricultural science. The conference was adjourned for a week.

ABERDEEN NATURAL HISTORY AND ANTIQUARIAN SOCIETY.

Under the auspices of this society, a lecture on "The Senses of Plants" was delivered in the Aberdeen University Buildings by Dr. James W. H. Trail, Professor of Botany in the University, on Friday evening, 16th inst. There was a crowded attendance, and Mr. Alexander Mackie, Principal of Albyn Place School, Aberdeen, the President of the Society, occupied the chair. Professor Trail gave an interesting account of recent investigations with plant-sensitiveness, and showed that all members of the vegetable kingdom possess the power of responding purposefully to the stimuli of light, &c.

LEGACY TO A SCOTTISH GARDENER.

Mr. W. Harvey, gardener to the late Mr. J. H. Houldsworth, Rozelle House, Ayr, has been left a legacy under the terms of his employer's will.

* *Town Gardening*, by B. C. Ravenscroft. (London: J. Murray, publisher.) Price 2s. 6d.

HOAR FROST IN THE ALPINE GARDEN.

ONE of the charms of the Alpine garden is found in its beauty and interest at all seasons of the year. How neat and pretty are the clumps of encrusted Saxifrages during the winter, and how fresh and luxuriant the appearance of the banks of the mossy species—giving no sign of the decay and desolation which pervade the border containing herbaceous plants. But the small Alpine garden, is, perhaps, never so pretty

FIG. 205.—SEED-PODS OF SEDUM SPECTABILE WITH HOAR FROST.

during the winter as when the fairy fingers of the hoar frost have descended upon it, and with their magic touch produced beauty of form unattainable at any other time of the year.

The most untidy fragments of withered foliage become ropes of glittering crystals, while the lime pores of the encrusted Saxifrages have a special attraction for the hoar frost, and take upon themselves an incrustation greater far than in their heyday of growth, in May. Old seed pods especially, assume the daintiness of flowers from another world, and many of the decumbent fruit-stalks of the Sedums, which would be passed unnoticed in mild weather, resemble, after a night's hoar frost, pieces of coral, rather than remnants of the past season.

In my own garden I make a special point of leaving seed-vessels on many plants for this purpose, such, for instance, as the strong stems of *Sedum spectabile*, *Sedum Turkestanicum*, and *Artemisia* with its tall, nodding seed-heads, which droop so gracefully under the weight of the hoar frost. Many of the pinnules of Saxifrages are also left upon the plants, but these are very liable to decay before the coming of the hoar frost.

Anyone who has not seen an Alpine garden under a thick hoar frost will find it hard to believe how beautiful and fairy-like it is, with every chink and cranny filled with plants mantled in crystals, and affording a remarkable contrast to the dull and forsaken appearance of the ordinary villa garden in winter-time.

Snow also adds greatly to the beauty of the alpine garden, although it is hardly so delicate and graceful as the hoar frost. Still, it has the advantage when melting—of disclosing many little treasures just emerging from their winter rest, and ready to spring into flower in a marvellously short space of time. The accompanying illustrations (see figs. 205-208) are from photographs taken by myself, and represent the effects of snow and hoar frost in my Alpine garden in Essex. *Reginald A. Malby.*

CHRYSANTHEMUMS.

DIRECTLY the last blooms are removed from the plants, a start should be made in preparation for next season's display. The procuring of suitable cuttings is of the greatest importance, as success depends largely upon the manner in which the plants grow from the start, and in this respect the condition of the cuttings is an item of much concern. When the plants have finished blooming, cut those varieties that produce plenty of shoots suitable for rooting, down to within a few inches of the soil. Some, however, amongst the Japanese as well as the incurved varieties do not form many basal growths, in which case do not cut the main shoots lower than 2 feet from the soil, as more opportunity is then afforded for the plant to break and produce cuttings, although they are not so good for the purpose as those that develop from the base, for the reason that those growing out of the hard stem are much more likely to show flower-buds prematurely. This type of cutting should be avoided as much as possible, although in some cases it is the only one that can be had. Stand the stock plants as close to the glass as possible in a cool house in order to induce a stocky growth. No place is better for the purpose than a vinery or Peach house where the trees are at rest, for there is plenty of light in such a structure. A cold frame is also suitable, but protection must be afforded during frosty weather, or the young growths, being tender, will be spoilt. Some varieties will develop shoots at the base so freely that they are in danger of becoming weakened through overcrowding. When this occurs, thin out the weak shoots in good time, to give space to the stronger. Water the plants sparingly, as too much moisture at the roots is apt to induce a yellow, sickly growth. Green and black aphids occasionally attack the points of the young shoots; Tobacco powder is the best specific to use for destroying these pests, and sometimes it may be necessary to dip the young shoots in Tobacco water, as the leaves may be curled, shielding the insects from the powder. Different growers hold different opinions as to the best time for inserting the cuttings, but generally the early days of December give the best results. Chrysanthemum plants intended for the production of large, high-quality blooms, require a long season of steady uninterrupted growth in a cool temperature. Growth thus produced has the best possible chance of becoming solid through the proper maturation of the shoots. The wood of late-struck plants never ripens thoroughly, and this is

FIG. 206.—THE SEED-PODS OF SEDUM SPECTABILE COVERED WITH SNOW.

especially a disadvantage to growers in northern counties. The proper maturation or ripening of the wood is an important point; plants immature cannot produce blooms of great depth although they may be wide, but depth is perhaps the most important quality in an incurved Chrysanthemum. Another objection to late propagation, and a serious one for the small

grower, is that the old plants occupy valuable space for two months longer than is necessary. Cuttings obviously occupy much less room than is needed for accommodating the old plants, and at a time of the year when indoor space is valuable. There are probably more diverse opinions as to which is the best method of propagation than upon any other phase of Chrysanthemum culture. Cool treatment is the correct method, no matter how the cuttings are inserted. Were it not that frost

FIG. 207.—HOAR FROST ON SEMPERVIVUMS.

often checks the growth for weeks, although it will not kill the cuttings when growing, cold-frame treatment would be the best. To overcome all the difficulty, insert them in a hand-light or propagating box in a cool house, where frost can be kept out easily. A single cutting in a small pot is better than several in the same pot, box or pan, for the reason that when it is ready for transferring to larger pots, it receives no check through damage of the roots. Some persons will say this is too small a matter to heed, but success is made up of attention to minor details, and the fewer checks a plant receives the better. Shoots taken some distance away from the stem, about 3 inches long, and cut square, below a joint, should be inserted firmly in sandy soil. Place the pots on a base of ashes inside the case or hand-light, and the cuttings will make roots in about three weeks, provided they are prevented from flagging. Remove the lights every morning, to dissipate the condensed moisture on the glass, and wipe the inside of the glass every evening. This will assist to keep the inside of the propagating case drier, and the cuttings will be less liable to damping. As soon as the roots show through the soil near the pot, admit air for a few hours during the daytime at first, increasing the supply gradually, until the lights are removed altogether. This will induce a stocky growth, thus laying a thorough foundation for the plant. In the case of the decorative varieties, of which the single-flowered sorts are so important, the first week in January will be early enough to insert the cuttings. *E. Molyneux.*

INCURVED CHRYSANTHEMUMS.

At the recent conference of the National Chrysanthemum Society, a paper on Incurved Chrysanthemums was read by Mr. Wm. Higgs. We make the following extracts:—

I propose to give, as far as possible, my own experiences in the culture of incurved Chrysanthemums. On looking back to the old varieties, the Queen family, the Princess

of Wales and its sports, the Teck family, Venus, Refulgence, Princess Beatrice, John Salter, Lady Talfourd, and White Globe, one cannot help noticing the great strides which have been made in size and colour, although, for colour, we have not yet beaten Refulgence as a dark variety, or Jardin des Plantes as a yellow.

As regards shape, the members of the Queen family of 14 or 15 years ago were models of what an incurved flower should be. No variety could be considered nearer perfection than a well-grown bloom of Lord Alcester or Empress of India. Amongst all our varieties of incurved Chrysanthemums we have not one resembling Lord Alcester. Taking everything into consideration, Clara Wells is the best variety we have at the present time.

Varieties that fail in producing sufficient cuttings need special treatment. This is best carried out in the following manner: Take some good-quality loam and sift it through a coarse sieve. Mix this with the same quantity of sifted, decayed leaf-mould and apply it lightly as a top-dressing. Plants treated in this manner not only produce more cuttings but the shoots are considerably stronger and are more likely to develop into good plants.

same pot it is not only possible, but very probable that the growth of the cuttings will be checked at the first repotting.

Prepare a frame with a bed of sifted ashes for the reception of the 'thumbs,' a frame where heat can be turned on in severe weather, and the temperature kept fairly constant. Plunge the pots to some little depth in the ashes, and give the cuttings a light syringing to prevent them from flagging. For the first potting, equal parts of sifted loam and decayed leaf-mould should be used, with some silver sand to keep the soil open. No manure of any description should form part of the compost, for at this period the chief thing to guard against is having the plants too strong. One of the most important reasons why some growers fail to produce the smooth, round buds which are necessary to make the perfect flower can be traced to this source. If manure is included as a constituent of the soil, the growth becomes too rank, hollow stems are produced, and, generally speaking, the flower which follows the hard, badly-shaped bud, does not open freely.

The earliest plants will be ready for the first repotting in large 60's from the middle to the end of January, while the repotting of those of slower

careful and regular attention until the end of May, when the most important stage is reached. This is the final shift into the flowering pots, 9 inch or 10 inch, according to the characteristics of the growth of the plant. The weaker varieties, originally in 5-inch pots, will now require 9-inch pots. All other varieties can be moved into 10-inch pots.

The composition of the soil at this potting is of the utmost importance. It is best to prepare it two or three weeks in advance. The best method is to mix up the soil in two separate heaps, the chief difference in the composition of the heaps being that one contains manure, while the other does not. It is necessary to have two different strengths of soil, for some varieties, if grown in strong soil, would produce very coarse flowers, which no amount of dressing would make fit for an exhibition board. We may roughly classify all kinds of incurved blooms into two divisions—those which naturally come with a true, narrow incurved floret, and those which, unless specially treated, would probably resemble a small Japanese variety. In the true incurved varieties, the chief aim is to obtain a big bloom, for in nearly every case the flower produced will not be rough and uneven. Hence manure is included in the constituents of the compost for the weak varieties. In the case of the strong sorts, the chief aim must not be size alone, it must be the biggest flower than can be obtained, and at the same time the best formed, smoothest, and most incurved. Where before we could almost ignore the shape of the floret, here it becomes the chief factor, and when growing 'strong' varieties we must fine them down, as it were, and produce as fine a floret as possible.

For the weaker sorts, the following compost is suitable: Twelve barrowloads of good turfy loam, three barrowloads of horse manure, which has been treated in the same manner as when preparing soil for a Mushroom bed, two barrowloads of decayed leaf-mould, and one barrowload of wood ashes. To this add $\frac{1}{2}$ cwt. of bone-meal, a 10 inch pot full of soot, and the same quantity of Velthea.

In mixing the soil for the stronger sorts I leave out both the horse manure and the bone-meal, substituting in equal proportions leaf-soil and wood ashes. The soil is well rammed with a piece of wood, shaped specially for the purpose. This ramming is most important, and on no account must it be neglected, as it induces short-jointed growth, followed by deep, well-formed flowers. It is necessary to leave room at the top of the pot for two top-dressings of finely-sifted loam and leaf-mould in equal proportions with the addition of a little Ichthemic guano. The first top-dressing should be given at the middle of August, and the second after the plants are housed at the middle of September. Having completed the final potting, the plants are stood out in the open in a favourable position.

Watering at this stage needs special care. Excessive saturation of the soil causes the leaves to turn yellow. Rain water produces the best results, and should be used if procurable.

After a hot, dry day, a good syringing overhead during the evening will be beneficial. It also helps a great deal to keep down thrips which do much damage to the young shoots and buds. Beside thrips, the grower has to guard against attacks of mildew, fly, and Chrysanthemum rust. As a preventive and a cure for mildew, potassium sulphide has no equal. When dissolved in water, in the proportion of $\frac{1}{2}$ ounce of sulphide to one gallon of water, it is very effective. The best method of applying this solution is to stand the plant in an oblique position, so that the pot rests on a stool, then none of the specific falls on the surface of the soil.

I find guano, sheep manure with an addition of soot, and fresh blood from the slaughter-house all of great value in improving in many ways the condition of the plants and flowers. I begin to apply sheep manure early in August, starting with

FIG. 208.—EFFECT PRODUCED BY HOAR FROST IN THE ROCK-GARDEN.

When inserting the cuttings, the late varieties must receive the earliest consideration. I always insert these as early as the first week in December. Frank Hammond, Mrs. E. Judson, Mrs. J. Hygate, C. H. Curtis, W. Pascoe, Mrs. J. Wynne, Duchess of Fife, H. Hearn, Egyptian, and Miss Nellie Southam, may all be classed as late sorts, and must be started early.

Varieties which require a second crown bud should be inserted during the third week in December. A list of these would include such varieties as Lady Isabel, Mrs. G. Denyer, H. W. Thorp, Mrs. Barnard Hankey, Pantia Ralli, Iolene, W. J. Higgs, Romance, Le Peyrou, Amber Beauty, Emblème Poitevine, Topaze Orientale, Triomphe de Montbrun, May Phillips, Miss F. Ashworth, Doris Rayner, G. F. Evans, W. Biddle, Calypso, and Hanwell Glory. Other varieties which require a late crown bud might be inserted about the same time. Amongst these are Clara Wells, Buttercup, Daisy Southam, and Frank Trestian.

I always insert the cuttings singly in thumb pots. If three or four cuttings are placed in the

growth will follow later. After they are potted, place the plants back in the frame just as before, except that they should be given a little more room. When ventilating the frames, a little more air may be allowed after the plants have been potted for two or three days. In the beginning of March, when the worst of the winter frosts are over, the plants may be transferred to cold frames. Some effective covering must always be kept near at hand in case of severe cold at night, for a very low temperature is fatal to the young and tender plants. An excellent protection can be made by first covering over the frame with stout garden mats, and then placing a layer of straw over these.

The next shift into 6-inch pots should take place towards the end of March, the composition of the soil being the same as before, but the loam should be a little coarser. Six or seven days after this second repotting has been completed, select the varieties which require second crown buds, and carefully take out the point of each plant.

Special care will be needed in watering, and a light spraying each day will be found beneficial. The plants can now be allowed to grow on with

a fairly dilute solution and increasing the strength as the plants get stronger. Waterings with diluted blood or guano should be substituted sometimes for the sheep manure. Care must be taken not to make the former too strong, or the plants will receive a check, and even, perhaps, be spoilt altogether. A normal mixture is obtained if half a gallon of coagulated blood is mixed with 25 gallons of water; that is, a two per cent. solution.

Housing the plants should be commenced about the middle of September and a dry, fine day should be chosen. It will be easy to pick out the plants on which the best blooms will probably develop, and these may occupy the best places under glass. As the flowers expand, a slight shade will be necessary to protect the newly-opened petals from the rays of the sun. The shading should be such that it is easily put up and readily removed, according to the vagaries of the October weather. An even temperature should be aimed at in the houses, for if the thermometer rises too high the petals will become reflexed. A temperature of 55° Fahr. during the daytime falling to 50° at night will be suitable. As regards ventilation, a little fresh air should be admitted at the front and top of the house at night, the amount varying according to the outside temperature. The air must always be kept circulating, so that moisture does not condense on the petals.

"Dressing" often overcomes the great difficulty of procuring 36 flowers at their best at the same time. Take, for instance, a big flower which is not perfectly developed. All the short florets in the centre should be carefully taken out with the long forceps, then, turning the flower upside down, the florets should be gently pressed to fill up the hole in the centre. The badly-shaped florets must be taken out if they have not already been attended to while the flower was growing on the plant. Then with the small tweezers commence arranging the florets in position from the centre downwards. Some flowers require an hour's work spent on them, others much less, the time depending upon how perfectly the bloom has been grown.

A selection of the best 36 incurved varieties at the present time includes Clara Wells, Buttercup, Ethel Thorp, Lady Isabel, Mrs. G. Denyer, Mrs. Barnard Hankey, Duchess of Fife, Emblème Poitevine, Daisy Southam, J. Wynne, Romance, Frank Hammond, Topaze Oriental, C. H. Curtis, Triomphe de Montbrun, May Phillips, Frank Trestian, W. Pascoe, Pantia Ralli, Fanny Lemon, Miss Nellie Southam, W. D. Parkins, W. Higgs, G. F. Evans, Boccace, Mrs. J. Wynne, Souvenir de Wm. Clibran, W. Biddle, Godfrey's Eclipse, Le Peyrou, Calypso, H. Heau, Amber Beauty, Egyptian, J. Agate, and Iolene.

The Week's Work.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PRICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

Hippeastrum (Amaryllis).—Some of the bulbs which ripened earliest and do not require repotting, should be started into growth for flowering in the New Year. Place them in a light position, maintain a moist atmosphere and a temperature of 50° to 55°. The bulbs will not require much water until the flower-spike is well advanced, as comparative dryness will have the effect of retarding the growth of the leaves until the flowers have developed. If any of the plants commence to make their growth before flowering, it will be better to cut the flower-spikes, and use them as cut blooms rather than to employ such plants for house decoration which would cause them to suffer a harmful check. Previous to starting the bulbs into growth, treat them with some insecticide, to destroy any insect pests present; also, overhaul the drainage material. When the plants have finished blooming, some of the surface soil may be removed, and replaced with good, lumpy, fibrous loam. Keep these plants

separate from the main batch, and feed them regularly with some artificial manure to strengthen the bulbs for flowering another season.

Gloxinia.—As the autumn-flowering batch of *Gloxinias* passes out of bloom, the pots containing the tubers should be placed on a shelf in the intermediate stove, for the plants to mature. They will require very little water, but considerable ventilation. When the tubers are well-ripened, the withering foliage may be removed, and the plants stored in a dry place, where the temperature does not fall below 45°. Another batch may be started into growth, selecting those tubers which have rested the longest time. A gentle spraying will afford all the moisture necessary at the start, as great care must be exercised not to apply too much water until the roots are active. This batch should produce an excellent display of bloom early in the spring. It is best to allow the corns to remain in the same pots undisturbed, as they appear to start into growth earlier under this treatment. When growth is active, dilute liquid manure may be given at alternate waterings; bonemeal used as a top-dressing will also prove beneficial.

The forcing house.—A further batch of *Lilacs* may be started into growth. Forcing should be gentle at the start, moving the plants to a warmer structure later, but bearing in mind that the less artificial heat is employed, the better, as blooms developed under cool treatment last much longer than those produced in excessive warmth. *Rhododendron molle (Azalea mollis)* may also be brought into heat. The imported plants are usually better ripened than home-grown ones, and they give the best results. *Prunus triloba* and some of the *Spiraeas*, such as *S. confusa* and *S. Van Houttei*, are excellent subjects for forcing. The Snowball tree (*Viburnum plicatum*) is another useful shrub that forces well, and a well-flowered specimen makes a fine subject for conservatory or greenhouse decoration. In the case of *Rhododendron Cunninghamii*, it is imperative not to submit the plants to strong heat at the start, or the buds will almost certainly refuse to expand. A few plants should be placed in a warm greenhouse, until the buds begin to swell, when they may be transferred to a house having a temperature of 50° to 55°. They will need plenty of moisture in the atmosphere, and frequent syringings.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir TREVOR LAWRENCE, Bart., Burford, Surrey.

Dendrobium.—As the deciduous and semi-deciduous *Dendrobiums* are always a feature in the Orchid houses during the late winter and early spring months, it is a wonder that more amateur growers do not form collections. Besides such well-known species as *D. Wardianum*, *D. crassinode*, *D. nobile*, *D. aureum*, *D. chrysanthum*, *D. Pierardii*, *D. tortile*, *D. transparentes*, *D. crystallinum*, *D. Devonianum*, *D. lituiflorum*, *D. superbum*, and its varieties *Burkei*, *Dearei*, and *Huttonii*, and *D. regium*, there are numerous hybrids that are well worth growing. Among them a few may be enumerated, namely, *D. splendissimum*, *D. micans*, *D. Cybele*, *D. Juno*, *D. melanodiscus*, *D. Dominicanum*, *D. Dalhousienum*, *D. Chessingtonense*, *D. Thwaitesiae*, *D. Venus*, *D. Wigamie*, *D. Wiganianum*, *D. Melpomene*, *D. Ophir*, *D. illustre*, *D. Sibyl*, *D. Clio*, and *D. Lady Colman*. Many of these plants which have been rested properly will now be showing their flower-buds, and when the buds are well out of the sheath in which they are enclosed, the plants may be removed from their resting quarters into an intermediate house, where the atmospheric temperature at night is kept at about 55°. Let them remain there until the flowers are about to expand, when they should be again removed to the lightest position available in the warmest house or plant stove. From the present time, water should be afforded only at long intervals, as any undue disturbance, either in the atmosphere or at the root, will not only cause the new growths to break prematurely and thus prevent the flowers from coming to perfection, but it will also damage the constitution of the plants. In placing the plants in houses where the air is moist and warm, they may make sufficient progress without any water being afforded, but it is advisable to examine them every day, in order

that the pseudo-bulbs may be prevented from shrivelling. When the plants are arranged in the warmest house, lightly spray them overhead with tepid, soft water on sunny days till the flowers open. Such *Dendrobiums* as *D. Wardianum*, *D. crassinode*, and all the hybrids which have been obtained from these species, have a tendency to produce new breaks from the base of flowering growths of the current season, as soon as the flower-buds form. Such plants require very careful treatment. Keep them in a moderately dry condition in the cool resting-house, in order that the new growths may remain almost stationary for some time. When the flower-buds are about half-grown, the plants may be afforded more genial treatment, and the flowers will develop vigorously. There are a number of species, as *D. albo-sanguineum*, *D. Bensonie*, *D. Parishii*, *D. rhodopterygium*, *D. nodatum*, *D. secundum*, *D. crepidatum*, *D. cretaceum*, *D. pumilinum*, *D. crumenatum*, and *D. adnucum*, that should be kept in the *Cattleya* house during their season of rest, and if their growths are properly matured, they will need but very little water while at rest, but they should be prevented from shrivelling. Plants of *D. Phalenopsis*, *D. bigibbum*, and others of that section which have recently flowered should be treated likewise. *D. Hookerianum*, suspended to the roof of the *Cattleya* house, has started to push up new breaks, and will now require liberal growing treatment. *D. Falconeri* and the hybrid *D. Venus* should be treated similarly to *D. nobile*, but the plants should not be subjected to severe drying while at rest, as, although such treatment results in abundance of bloom, the after growths are generally thin and weak. *D. Falconeri giganteum* is probably a natural hybrid between that species and *D. Wardianum*, and it should be afforded such treatment as is suitable for the last-named species. Such evergreen kinds as *D. thyrsiflorum*, *D. densiflorum*, *D. Farmeri*, and *D. sulcatum* should be kept slightly moist at the root while at rest in a cool part of the intermediate house, while *D. chrysotoxum* and *D. suavissimum*, if kept moderately dry at the root, are quite at home in the plant stove the whole year round. Those of the nigro-hirsute section, as *D. Lowianum*, *D. eburneum*, *D. formosum*, *D. cariniferum*, and the rare hybrid *D. formosum-Lowii*, should be kept slightly moist at the root while at rest, and be suspended on the shady side of the East Indian house. The tall-growing sorts, as *D. Dalhousienum (pulchellum)*, *D. fimbriatum*, *D. f. oculatum*, *D. moschatum*, *D. dixanthum*, *D. clavatum*, *D. binoculare*, and *D. amethystoglossum* should be placed in the cool, dry house while at rest, but as soon as the flower-spikes have pushed well out from the pseudo-bulbs, the plants may then be taken back to their growing quarters. *D. Dearei* and the new *D. Sanderae* thrive best in a shady part of the *Cattleya* house, and should be kept moderately moist at all times.

THE FLOWER GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

Spanish Iris.—Bulbs of Spanish *Iris*es may now be planted at any time, in ground that has been deeply dug, and enriched with well-decayed manure. The Spanish *Iris* is very suitable for planting in clumps in the mixed herbaceous border, where it provides a fine display of flowers early in the season. The blooms of these plants are very suitable for use as cut flowers, their delicate and wide range of colours being much appreciated for indoor decoration. The mixed varieties, which can be obtained very cheaply, are suitable for this purpose. Plant the bulbs moderately closely in rows, on an open border, either in drills or holes made with the dibber.

English Iris.—There is a great resemblance between the English and the Spanish *Iris*, but the former have larger flowers, and are later in blooming. Like the Spanish *Iris*es, they will succeed in almost any position, but they prefer an open situation. The bulbs must be placed a little further apart than those of the other kind. These also can be obtained as mixed varieties, but for planting in borders it is preferable to use named sorts. A few of the choicer sorts include *Mont Blanc* (white), *Prince Imperia* (bright blue), *Lord Roberts* (dark blue), *Celestial* (sky

blue), Queen Victoria (pale blue), Vulcan (dark purple), Charles Dickens, and Duke of York.

Summer bedding plants.—At the earliest opportunity, if not already done, draw up the scheme for next year's summer bedding, so that it may be known what stocks of the various subjects are required, as the propagation of any particular plants required in great numbers may be commenced. About Christmas time, many decorative plants are removed from the plant-houses, and this will afford opportunity for re-arranging the bedding plants. Rooted cuttings may be removed from the pots or boxes in which they were struck, and potted up singly into large 66-pots. Plants of Heliotrope, Swainsonia, Fuchsia, Streptosolen, and similar subjects, that were rooted in the autumn, and are intended to be trained as standards, must be kept growing steadily, and, if necessary, afforded larger pots. But on no account use larger receptacles than are necessary. Watering must be done with care, and, whilst occasional dampings are beneficial, do not overcharge the atmosphere with moisture, or many of the plants will damp off. Whenever possible, ventilate the frames and houses, if only for a short time in the middle of the day.

General remarks.—The continuous rains have interfered with all outside work, and, on our heavy soil, such work as tree-planting and turf-laying has been impossible. Many evergreen shrubs and conifers are benefited by the removal of superfluous branches, and as there is often a demand for evergreens for Christmas decorations, this could be done now. The sparrow is a troublesome and destructive pest in the flower garden, and during dark nights of winter many may be captured in clap-nets. Dense-growing evergreens are favourite roosting places of this bird, but avoid damaging the bushes when knocking them with the pole. Any other kinds of birds captured in the net should be released.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Garden Foreman,
Royal Gardens, Windsor.

Winter Broccoli.—In consequence of the mildness of the winter, these plants have made soft growth, and they may be expected to suffer injury from the first severe frost. Provision should therefore be made for protecting them during very cold weather. Our practice at Frogmore is to lift as many plants as possible, when the heads have begun to develop, and to plant them in double rows, in a slanting position, care being taken to retain as much of the soil about the roots as possible. Broccoli treated in this manner may be easily protected, whenever frost is imminent, by mats. The mats are raised above the plants on strong string stretched from stout stakes. If further protection is necessary, some dry Fern or litter of any description may be shaken over the mats. Where a limited number of Broccoli plants are grown, they may be lifted and placed in cold frames or other cool structure, where they will be secure from frost.

Winter Spinach.—Decaying leaves should be removed from the plants, and the soil between the rows stirred whenever it is dry enough to allow of the hoe being used. The plants grow better in soil that is broken up and allowed to remain rough than in ground that has been trodden and consolidated. A dusting of soot will be advantageous to the plants, and assist in destroying slugs and other insect pests.

Late Celery.—If the earthing-up of the latest plants is still unfinished, take advantage of the first dry weather to place sufficient soil about the stems to blanch them, and afford protection from frost.

Stored vegetable roots.—Onions that have been stored should be overhauled during wet weather, and any decayed bulbs removed. Spread the remainder as thinly as possible over the floor or shelves, and admit plenty of fresh air during favourable weather. The stock of Potatoes should also be examined, and this will afford opportunity for selecting the "sets" for next year's planting. Seed Potatoes are best stored in some safe place where air can be freely given in mild weather. As many of the early varieties are already commencing to sprout, the sets should be placed in single layers, so that the shoots may develop stout and sturdy—a matter of great importance in early varieties of Potatoes. The

stores of Carrots should also be inspected, and, if any roots are still in the ground, they should be lifted and stored before very cold weather sets in. Parsnips keep best in the ground, and it is only necessary to lift at one time a quantity sufficient for immediate use. During severe frosts, Parsnips still in the ground may be protected with mats or other material. Jerusalem Artichokes can be treated like Parsnips.

Mint.—Further quantities of roots may be placed in heat, and planted either in boxes or in beds of leaves. If a small supply of leaves only is required, boxes will do very well; but where there is a large demand for this herb, it is best forced on a gentle hotbed, covering the roots lightly with soil. Tarragon may be grown in the same manner; very little heat is necessary to force this herb.

Salads.—Radishes should be sown at frequent intervals from this date to maintain a supply of young roots throughout the spring months. A gentle bottom heat, rich soil, and liberal supplies of water are necessary for this crop. Make frequent small sowings of Mustard and Cress in finely-sifted loam and leaf soil, placed either in boxes or on the bed of a forcing pit.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of NORTHAMPTON, Castle Ashby, Northamptonshire.

Cobnuts and Filberts.—Generally, the pruning of Nut trees is best deferred until the spring, when the male and female flowers are developed. But in the case of neglected bushes that have a mass of unfruitful wood, the work should be undertaken at once. All suckers should be removed entirely and the branches thinned, especially those in the centre of the trees, which should always be kept well open to allow a free access of both sunlight and air. In very bad cases, the bushes should be cut hard back to induce them to form young growths that can be thinned and regulated next season. By this method good, well-balanced heads may be obtained in about three years. When the weather is favourable the ground under the bushes should be cleared of weeds and rubbish, and a little of the surface soil taken away, replacing it with a dressing of good loam and a liberal sprinkling of soot, finishing with a mulch of partially-decayed farm-yard manure. All Nut bushes will be benefited by a similar dressing applied at this season of the year.

General work.—When the weather is fine, clean out the liquid manure tanks and apply the contents to wall trees that have borne heavy crops of fruit: the surface soil should first be loosened lightly with a fork to allow the liquid to reach the roots. Orchard trees may be treated in a similar manner, but the manure water must not be applied at too great a strength. Remove all prunings and other rubbish as the pruning operations proceed and burn them on the garden fire. The ashes will be valuable for various purposes in the garden. When pruning Apple trees, watch for the presence of American blight, and should the least trace of it be found, means should be taken at once to destroy it, as advised in a previous Calendar.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir ERNEST CASSEL, G.C.B., Moulton Paddocks, Newmarket.

The orchard-house.—Make preparations for the coming season by giving the house a thorough cleaning, and, if any painting of the wood-work is contemplated, let this be undertaken at once. Before the trees are placed indoors, wash the outside of the pots and soak the soil in them with clear lime-water. If pinching and disbudding were carefully attended to during last season, little pruning will be necessary at this stage. In arranging the trees on the floor or staging, it may be necessary to elevate some of them on pots turned upside down. See that these latter are thoroughly clean, so that everything is in good order, prior to starting the trees into growth. The time to commence forcing will depend upon the date at which ripe fruits are required, but in any case it is better to commence in good time, so that the trees may be allowed to develop steadily. Use fire heat sparingly: a temperature of 40° to 45° with a rise of 5° during the daytime will suffice until the flowers open,

when the temperature may be raised another 5°. Syringe the branches freely on bright days, and close the ventilators early in the day to allow the temperature to increase about 10° by sun-heat. At other times, maintain a moist atmosphere by damping the paths and stagings as may be necessary. Admit air freely during mild weather, and endeavour to change the atmosphere of the house daily. During inclement weather this may be done by allowing extra fire-heat, sufficient to raise the temperature about 5°. At the same time open the upper ventilators slightly, preferably about noon, for an hour or so. If the house is a span-roof structure, open the ventilators on the side that is sheltered from the wind.

The early Peach-house.—When the flowers on the earliest Peach trees are expanded, raise the temperature 5°, and maintain a fairly dry, buoyant atmosphere. Great care will be necessary to ensure the fruits setting, and the pollination of the blooms must be carefully attended to. A rabbit's tail attached to a pliable wire will serve for dusting the flowers, but particular care should be taken to see that the fur is dry and clean before it is used. Do not drag the tail across the blooms, but lightly dab each flower that is open. The temperature of the house may be raised to 55° at night, with a proportionate increase by day. High temperatures must not be permitted until January is well advanced, as growth will be slow until the days lengthen. Even in the case of the very earliest houses, it is safer to afford a minimum warmth of 55° or 60° until growth is fairly well advanced. The temperature may be increased gradually as the days lengthen, but hard forcing should not be practised until stoning is completed. In the case of later Peach-houses, less care is necessary to ensure a good crop, as growth takes place under more natural conditions.

Succession Peach-house.—The trees may now be started according to the directions given in a previous Calendar in the case of the early Peach-house.

Late Peach-house.—Push on with the work of pruning and cleansing of the trees as fast as possible, so that the ventilators may be thrown open and the trees rested thoroughly for a few weeks before being started. The trees may be allowed to break into growth naturally, only employing fire-heat to ward off frost. See that the roots of all trees are well supplied with moisture, particularly those in the neighbourhood of the hot-water pipes.

THE APIARY.

By CHLORIS.

The visiting bee expert.—I find there is a growing dislike among ignorant beekeepers to the visits of experts. This is unfortunate, because visits among this class are most needed. It is from the hives of the careless and ignorant that contagion spreads. The complaint by these people is that the travelling expert carries disease to healthy hives. Sometimes a beekeeper says that before the visit of the expert he had a clean bill of health. On further questioning the grumbler, one finds that his hives have never been carefully overhauled, and that disease was not discovered until one or more colonies had perished. Further, they have no idea whether hives within a reasonable distance are infected. At the present time, none of us can speak with absolute certainty on every matter concerning the management of apiaries. If the expert tells of his own experience exactly, and expresses a doubt in his advice, he is put down as one who does not know his work. What is the consequence? The expert only speaks of those things about which there can be no uncertainty, and further advice is withheld. Another complaint one hears is that the expert calls at the wrong time. The season during which inspection can take place is a very short one, and, when it is borne in mind that one man has often a whole county to inspect during that period, it is evident that some apiaries must be visited at awkward times. The last expert I met had been out four months, visiting apiaries every day for six days a week, and had cycled about 150 miles per week in order to traverse one of the largest counties. He was very discouraged and disappointed with the result of his visits. Disease was too frequent, and beekeepers showed little disposition to accept advice.

EDITORIAL NOTICE

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unacknowledged communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations. The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last Fifty Years at Greenwich—38.8°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, December 27 (6 P.M.): Max. 51°; Min. 49°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 22 (10 A.M.): Bar. 30.3; Temp. 43°; Weather—Foggy.

PROVINCES.—Wednesday, December 27; Max. 49° Cambridge; Min. 42° Yorkshire.

Christmas Trees.

The Christmas tree as an institution will surely survive as long as children are young. Originally a German invention, the Christmas tree is stated by some to have been introduced into this country by the German colony in Manchester; though it is said by others that Prince Albert, Consort of Queen Victoria, who brought us much that is good from Germany, gave England her first Christmas tree. It required no acclimatisation. Like so many introduced plants, it at once struck its roots deep and wide, and now flourishes—sometimes without roots—wherever it finds the congenial environment of a happy household. Not only does it flourish in these surroundings, but it bears more surprising fruit than any other member of the vegetable kingdom. Illumined by many a candle and bearing its whimsical burden of presents, with here and there a hint of woolly snow to remind those who join hands round it of the rigours of the weather outside, the Christmas tree is the worthy representative of Father Christmas himself. Nor is it only in the countries of its origin and of its first adoption that the Christmas tree finds a welcome home. For, according to the *Journal of the Society of Arts*, which recently made a detailed study of the subject, the United States of America has given the Christmas tree a wide and enthusiastic welcome within its hospitable borders. So much so, that, year by year, four million Christmas trees twinkle with jolly light in as many American homes. But, whereas, in England, and, if we mistake not, in Germany also, the Christmas tree is generally the same species, in America it is the most variable of plants, and, curiously enough, becomes indistinguishable from that kind of evergreen tree which flourishes in a particular neighbourhood. If he can have it so, the American's Christmas tree is a Fir; failing that, it is a Spruce. In New York and Phila-

delphia it often becomes a Black Spruce, sometimes a Norway Spruce, and, occasionally, a Cedar or a Lodge Pole Pine. But in whatever guise it appears, the Christmas tree is always evergreen, and so bears throughout the cold of winter the promise of return of spring. In America, moreover, as in this country, the Christmas tree is not only variable as to type, but also as to size. In modest households it may grow no more than 5 feet high; in the homes of the wealthy it has been known to tower full 30 feet and more. But symbols are not measured by size, and the only estimate of the worth of a Christmas tree is the number of children it makes happy and the number of "grown ups" it makes kind. According to the authority we have quoted, the prosaic eye of the United States Department of Agriculture is directed somewhat coldly on the Christmas tree. The Department holds it guilty of assisting in the depletion of the timber supply. It fears that, if we have more Christmas trees, we shall have fewer newspapers, for there will be less wood pulp available. If we had any fear that, by its action, the number of Christmas trees would be reduced, we should demand—were we Americans a Referendum on the question, and make every child a plural voter—for every year below 10, a vote. But the Agricultural Department does not really wish to check the spread of Christmas trees: it wants, instead of seedlings, the tops of felled trees to be used. Suppose, however, the fraud were discovered! Suppose—a terrible thought!—that the tree, borne down by its heavy, string-tied fruit and the weight of snow upon it, were to topple over and show that it was only a branch, and not a tree at all! The United States Department of Agriculture would not like that. No; it must teach us wisdom on 364 days—we will not listen on the remaining one.

The British Christmas trees are for the most part of alien origin, and come to us from Norwegian forests; but native-grown are to be had by those who look with disapproval on alien immigration. Just as the trees of our countryside are of more modest dimensions, though not a whit less shapely, than those of North America, so the Christmas tree in London rarely attains to the dimensions reached by that of New York or Chicago. On the other hand, even the most ambitious millionaires in Broadway cannot produce more beautifully symmetrical or truly spruce Christmas trees than British children may receive from our nurseries for theirs. But the nursery-grown tree has one drawback: it is less easily moved than its more adventurous Norwegian relative. Unless three or four half-crowns are forthcoming, a 5-foot high, nursery-grown Christmas tree, of the most perfect form, refuses to change its place; whereas, for one of those sumptuous coins, the Norway Spruce of equal size will exchange its quarters in the chilly northern forest for a home in the humblest household here. As to the age of Christmas trees we refuse to be inquisitive; nor do we care how many may be grown to the acre; what profit the vendors receive does not interest us just now; what does interest us is to know that in New York and New England States the Christmas tree grows, least. At Christmas time they are to be met with there to the extent of 11 million, and great or small, Spruce or Fir, each gives perfect happiness.

INTERNATIONAL CONFERENCE ON GENETICS.

—In accordance with the decision arrived at during the Conference in London, 1906, the next International Conference on Genetics will be held in Paris on September 18-23, 1911. Just as the London conference was held under the auspices of the Royal Horticultural Society, so the Paris conference will take place under the auspices and in the rooms of the Société Nationale d'Horticulture de France. The president of the 1911 conference will be Professor IVES DELAGE, Member of the Institute, and one of the most distinguished French biologists. Dr. VIGER, President of the National Horticultural Society of France, has undertaken to preside over the Organisation Committee, which includes the names of the most prominent French horticulturists, and of which Mr. PHILIPPE L. DE VILMORIN is secretary, and Mr. A. A. MEUNISSIER, assistant-secretary. The member's subscription, which should be sent to Mr. P. DE VILMORIN, 66, Rue Boissière, Paris, is £1; honorary member's subscription, £4; and the benefactor's subscription, £20. It is to be hoped that British horticulturists will attend the Conference in large numbers. All correspondence should be addressed to the secretary at the address given above.

LA SOCIÉTÉ FRANÇAISE D'HORTICULTURE DE LONDRES.

—The annual dinner will be held on Saturday, January 21, at the Café Royal, 63, Regent Street. Mr. PHILIPPE DE VILMORIN, who was to have occupied the chair on the last occasion but was prevented by the Paris floods, will preside. The President, Mr. G. SCHNEIDER, 17, Iseld Road, Fulham Road, S.W., will be pleased to hear from those intending to be present.

KINGSTON AGRICULTURAL COLLEGE.—Dr W. GOODWIN, M.Sc., Head of the Chemical Department at the South-Eastern Agricultural College, Wye, has been appointed Principal of the Midland Agricultural College, Kingston, Derbyshire.

ROSE PROFESSOR C. S. SARGENT.—Respecting this new Rose, which formed the subject of our Supplementary Illustration on November 12, we observe from a note in *Horticulture* (America) that, on account of the existence of another Rose of that name, the title of the new one has been changed to "The Sargent Rose."

SUGAR BEET IN NORFOLK.—MR. WALTER E. SAWYER, who superintended during the present year the commercial experiment of growing Sugar Beet for export, gives an interesting account of his experience in the *Journal* of the Board of Agriculture (December, 1910). The trials were made on 53 acres of land in Norfolk, and sufficed to satisfy the farmers that they can grow Sugar Beet of as good quality as can be raised in Europe, and that in favourable seasons they may expect a yield greater than the European average. But when the commercial results are added up, it appears that the growing for export is not a financial success. Lifting and carting so eat into the profits that many of the farmers found themselves out of pocket. On the basis of this testimony it would, therefore, seem essential, if Sugar Beet is to be cultivated profitably in this country, that, as we have insisted in these columns, factories should be established in the neighbourhood of the ground under the crop, for in this way only can the cost of carriage be reduced; moreover, cheap by-products, Beet-slices and saturated lime, are then at the disposal of the farmer. We should like to see the investigation of the problem of Sugar Beet cultivation in this country entrusted by, let us say, the Development Commissioners, to some competent man or men, it being laid down as a condition that a careful study of methods, and particularly of machinery, should precede the actual experimentation.

FIG. 209.—BRASSIA FORGETIANA: FLOWERS WHITISH WITH CHOCOLATE-PURPLE MARKINGS.
(See p. 463.)

INDIAN FRUITS.—We are indebted to Mr. T. H. STOREY, Superintendent of Sajjan Niwas Gardens, Udaipur, India, for the photograph of tropical fruits reproduced in fig. 210. The specimens were gathered in the gardens at Sajjan Niwas, and include two examples of the Jack-Fruit (*Artocarpus integrifolia*), which is very nearly related to the Bread-fruit. Mr. STOREY informs us that the Jack-fruit is largely used by the natives for making pickles, being much appreciated by them for that purpose. When the fruits are ripe they possess rather a strong smell, which is anything but pleasant. The large Mangos in the centre of the picture are gathered from grafted trees, whilst the two groups of smaller Mangos nearer the foreground are gathered from wild trees. The Mango also is much appreciated as a conserve, and is largely employed in the making of chutney. Ripe Mangos are a great delicacy, and by many regarded as the best of all tropical fruits. The Grapes are of the well-known variety, Duke of Buccleuch, and are apparently fairly good bunches. The Bananas, or Plantains as they are known in the East, and Jamans (*Eugenia Jambolana*) complete the collection.

FLOWERS IN SEASON.—Mr. R. W. NORMAN, Heligan Gardens, St. Austell, Cornwall, sends flowering shoots of *Eucalyptus cordata* cut from a tree growing out-of-doors. A flowering shoot of this species formed the subject of the Supplementary Illustration in the issue for March 12, 1910, the specimen being furnished us from Mr. A. J. MORGAN's garden at Porthgidden, Cornwall. Although this *Eucalyptus* survives the winter in the open in the south-west, it is doubtful whether the plant would stand the cold in most places; some discussion took place on this subject in our issue for December 19, 1909. Mr. NORMAN writes:—"The fine tree of *Eucalyptus cordata* in these gardens has, owing to the heavy gales of Wednesday, 7th inst., been greatly reduced in size; this is a great loss to us, for the tree was of great beauty and flowered invariably at this season of the year. But its greatest charm is when the young leaves and growths are developing, contrasting finely with the deeper metallic hue of the older leaves. The tree is situated in a sheltered dell, and does not get injured by the little frost we experience here." With the *Eucalyptus* from Heligan Gardens came exceptionally well-fruited shoots of *Cornus capitata* (syn. *Benthamia fragifera*) (see illustration in *Gard. Chron.*, February 6, 1909, p. 82, fig. 43). "The shoots of *Benthamia fragifera* show how beautiful the tree is when in fruit. It was on this estate that the species first flowered and fruited in this country, and it still continues to do so regularly. Seedlings appear most freely among the fallen leaves along the sides of the carriage drives here."

THE APPOINTMENT OF A HEAD GARDENER.—It will interest our readers to know the method employed in the selection of a head gardener for the grounds of the Natural History Museum, in Paris. Although this famous institution is under the control of the State, neither the Chambre nor the Senate undertook to divine which of the candidates was most suitable for the post. Nor did it occur to the authorities to invite applications from ranks other than those of horticulture. Strange as it may seem to Londoners, the appointment was confided to a committee of experts. Practical gardeners (for example, the head gardener to the town of Paris), and horticulturists of world-wide repute, like Mr. MAURICE DE VILMORIN, were also placed on the committee, and even the experience of the Director of the National School of Horticulture, at Versailles, was utilised in the same manner. The procedure which followed would doubtless appear yet more

droll to those who are responsible for the methods employed in similar appointments by, let us say, the London County Council. The Appointments Committee actually proceeded to determine by definite tests the horticultural knowledge of the several candidates. They asked them "what scheme of floral decoration they would advise for the Museum grounds"; they required them to name no fewer than 20 plants, the cultivation of which the successful candidate would be required to supervise; and they even demanded practical evidence that the candidates knew what grafting and budding meant. All this for a horticultural post! Who now can say that "they order these things better in France," when, as the outcome of such fantastic procedure, an experienced horticulturist, Mr. BONYER, received the appointment, and particularly when it is remembered that a similar method of appointment would undoubtedly be adopted were it a question of electing a man to undertake the supervision of the parks and open spaces of Paris itself.

A CHAIR OF TROPICAL ENTOMOLOGY.—The movement set on foot by the Liverpool School of Tropical Medicine, says the *Times*, in commemoration of the work of Dr. J. E. DUTTON, who lost his life on the Congo through contracting spirillum fever whilst on the Twelfth Research Expedition of the School in 1905, has now been completed. The school has offered Liverpool University the sum of £10,000 for the establishment of a Chair in Tropical Entomology. At a meeting of the Council of the University it was resolved gratefully to accept the offer. This, it is believed, will be the only Professorship in Tropical Entomology in any University in the world. It is the second Chair given to the University by the Liverpool School, the first being the Sir Alfred Jones Chair in Tropical Medicine.

ARTIFICIAL MANURES FOR TREE-NURSERIES.—In the provision of a suitable soil to serve as seed-bed and nursery for trees, the intelligent and cautious use of artificial manures should not be overlooked. In the course of an interesting and strikingly illustrated article in *Die Gartenwelt* (xiv., 47), Dr. BREHMER, of Altona, summarises the results of experiments made in the artificial manuring of young tree-plantations. Where animal manure is costly, the best plan to adopt is to clear the land intended for the nursery, and after manuring with lime, potash manures (Kainit) and phosphates to take a crop of Lupins, which is ploughed or dug in. If this course cannot be adopted, the soil, if it is deficient in one or other of lime, potash and phosphates, should be supplied with these food materials. Lime is best applied in the form of a mixture of chalk and quicklime, taking care that the quicklime is not in such quantity as to burn the roots. The rate recommended (chalk and lime) is about half-a-hundredweight to the acre. Potash may be applied in autumn in the form of Kainit (14 lbs. to 100 square yards), and phosphates more sparingly, say, 10 lbs. to the 100 square yards. With respect to nitrogenous manures, if green manure has been added, none will be needed for some time. But if the soil is poor in humus, it is advisable to add nitrogen in the shape of slow-acting materials such as horn and hoof scrapings or dried blood. Quick-acting nitrogenous artificial manures such as nitrate of soda or sulphate of ammonia must be applied with caution, otherwise burning of the roots and non-ripening of the wood result. Of the two, sulphate of ammonia applied as a light dressing in late autumn is to be preferred.

FOREIGN CORRESPONDENCE.

DEVELOPMENT OF THE BANANA INDUSTRY IN THE CANARY ISLANDS.

THERE is a tradition that Bananas were first introduced into the Canaries, or Fortunate Islands, from the Gulf of Guinea on the west coast of Africa. It remains, however, to be shown how they got there from the Far East, their true home. They were taken to Santo Domingo from Grand Canary in 1516, and from there to the other West Indian Islands and Central America.

Oviedo, who wrote on the natural history of the West Indies, saw Banana plants in the orchard of a monastery at Las Palmas in 1520. The botanist Martiniere, who accompanied Lapeyrouse in his celebrated voyage, sent from the Canaries to the Minister of Marine of France two cords that he had made out of the bark of the Banana tree, copying, no doubt, what local peasants had done long before him. He prophesied that there would be a great future for this plant as a textile.

Oddly enough, Bananas are known in the Canaries and Central America by the Spanish word *Plátano*, a most unfortunate corruption of the original and appropriate name, namely, *Plantano* (plantain in English), which has now become obsolete. The botanical name of the Banana, *Musa sapientum*, was given in the old belief that it was the fruit of the tree of knowledge of good and evil.

Of the many species which have long been known in the Canaries, the Banana that has survived for the special purpose of the trade with Europe is the Chinese Banana (*Musa Cavendishii*), the least tropical and therefore the most suitable for cool climates. Its cultivation is now at the height of its prosperity, and good irrigated land near the coast commands the almost fabulous rent of £40 per English acre. So far as I am aware, there is no part of the world where the price of land for agricultural or horticultural purposes attains anything like this figure. The other day a small plantation of 10 acres was let to an English firm exporting Bananas, and the total rent stipulated for that period was £450 sterling or £45 per acre.

The part of the Canary Islands where most of the Bananas are cultivated is the well-known Valley of Orotava, owing to the comparatively abundant and never-failing supply of water, which, no doubt, filters down from the high and extensive plateau of the Canadas, nearly 7,000 feet high, and surrounding the famous peak of Teneriffe, which is over 12,000 feet. During the

winter months there are abundant rains and snow, and the water gradually percolates to the region of the coast, where it is tapped by long, horizontal tunnels; in one case the tunnel is over a mile in length, and, although it does not rain for six months (May to October) the several water galleries show very little difference in their supply summer or winter. In one of these tunnels the output is three million gallons daily, and this water is carried along an aqueduct for a great distance to irrigate the land lying below it. In another instance a large supply of water (about one million gallons daily) that formerly ran to waste into the sea, falling from the cliff where it first made its appearance, has been pumped up nearly 1,000 feet high by steam, at a cost of over £40,000. It is then conducted by an aqueduct across the Valley of Orotava from W. to E., a distance of six miles.

It is owing to these circumstances and to the favourable geographical position of the Canaries for navigation and cheap freights that such developments have occurred in the Banana trade. A further increase of plantations will certainly take place, at any rate in the neighbourhood of the Valley of Orotava, when more water is procured, and this will undoubtedly be the case, as several new tunnels are being bored in search of water with very good prospects of success. There still remain large supplies going to waste at the coast, where they first appear, as in the previously named instance, and these await the necessary enterprise to have the water pumped up and made available to irrigate land which still remains unplanted with Bananas, for which crop an abundance of water is an absolute necessity. The irrigation of land in this country makes an enormous increase in its value, for even if it is planted with ordinary crops, such as Potatoes or Tomatoes, the proprietor can get three such crops instead of a single crop each year, to say nothing of the enormous profits made from the cultivation of Bananas which are unequalled by any known crop. *George V. Perez, Puerto Orotava, Teneriffe.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

HARDY FRUIT EXHIBITIONS.—The primary lesson for hardy fruit growers to learn from the recent Colonial Fruit Show is the potency of quantity in producing striking exhibition effects. That the British Columbian Government should have concentrated its efforts to create such a wonderful display of Apples from its highly-favoured country showed how well its energies were directed. Never in Britain has there been presented as a single exhibit at a show such a marvellous collection of Apples. It dominated all else in the show, and it left little else of note or interest. The British Columbian Government has millions of acres of good land it wishes to see settled and planted. No such conditions exist at home, as our Government has no land to sell. Having here the greatest market in the world at our own doors, and not, as from the Pacific coast, thousands of miles distant, our growers may, if they wish, through the aid of their organisations, do all that is possible in promoting fruit culture and sale without Government interference. But we seem incapable of acting on the lesson the Colonial Government provided for us. We show individual varieties in baskets or dishes in a conglomerate form, no one variety creating striking effects. The Columbian Government, realising the grand effects to be obtained from colour, massed their Spitzenbergs or Jonathans or King of Tompkins County Apples, or used their bright yellow-golden Pippins with striking effect. They are evidently artists in colours. Whatever may have been the merits of the Apples which these brilliantly-hued skins enclosed, certainly the eye was both arrested and fascinated by them. Of course it will be pleaded that our fickle climate

does not develop colour. That is not true. Those who would grow for colour may find Spitzenberg fairly rivalled by Red Victoria, and Worcester Pearmain, Duchess's Favourite, Baumann's Reinette, Gascoyne's Scarlet Seedling, Ben's Red, and some others even in this country run the reddest of Columbians hard for colour. But whatever may be the market value of colour, it does seem that, in home-grown fruit, the best cooking or table quality is to be looked for in the more pallid or russety fruits rather than in those aglow with colour. Could we induce some of the greatest of Apple-producing counties, such as Kent, Sussex, Surrey, Hampshire, Berkshire, Essex, Middlesex, Worcester, and Hereford, to enter into a competition, county against county, by staging at the Royal Horticultural Hall collections of say 500 specially-prescribed baskets, there being not more than 100 varieties and not fewer than 50 in each collection, then we should see a display of home-grown Apples which would resemble in its effect the effort made by the Columbian Government. Cannot the British Fruit-growers' Association, with the co-operation of the Royal Horticultural Society, organise something in this way? Every good grower in a county should be required to send so many baskets with his name attached to them. But each collection should be dealt with as that of a county, and a great honour indeed would attach to that county which had the finest collection. The public, the Press, and the myriads of Apple consumers then would be able to see what Old England is capable of doing in home fruit production. *A. D.*

THE RED-BERRIED MISTLETO.—Considering how popular our native Mistletoe is with most people, it is strange that the red-berried Mistletoe is so rare that very few people have heard of it. *Viscum cruciatum* is parasitic on the Olive, and is found in such widely-separated places as Spain, Syria, and North-east Africa. Some little while ago I was reading in an account of a journey from Cape to Cairo of a red-berried Mistletoe being seen in great profusion in a tract of country north of the Transvaal. Beyond this bald statement no particulars were given, and it would be futile to make guesses at its identity or that of the host plant, for it may prove to have been "an error of observation" on the part of the writer, who apparently had barely a smattering of botanical or horticultural knowledge. Whilst at Little Petherick, near Padstow, Mr. Athelstan Riley had a very fine red-berried Mistletoe luxuriating on a standard Thorn, which grew in a large flower-pot. When Mr. Riley left Cornwall for Jersey he gave the plant to Mrs. Ford, and I had it fetched to Pencarrow, Cornwall, but by that time the Mistletoe had nearly killed the Thorn, and although the parasite was heavily berried and healthy, its host showed unmistakable signs of decay. Last spring the Thorn died, and this event was soon followed by the death of the Mistletoe, but I had previously "sowed" some seeds on such plants as Thorns, seedling Apples, and the Paradise Apple stock. These seeds nearly all germinated and promised to do well. I found that I was most successful when the host plants were kept in a shady and moist corner of an intermediate-house. The Mistletoe berries were very large, and, when fresh, bright, shining red in colour; the flowers, which appear while the berries are still plump, were red-tipped, thus making the plant very bright and attractive. This Mistletoe is not hardy; it should be grown out-of-doors during the summer and brought into a warm house on the approach of cold weather. *A. C. Bartlett.*

SAXIFRAGA LANTOSCANA.—It turns out that I made a mistake in my penultimate letter. I thought I had not any plant or form of *S. lantoscana* from M. Corveon. My manager, however, points out that I did purchase some plants three or four years ago, and that he was filled with such doubts in regard to them that he had them all labelled as coming from M. Corveon under the name of *S. lantoscana*. He was perfectly right, and so is Mr. Robinson; that plant is no more *lantoscana* than it is *florulenta* or *Bursieriana*. It is an obvious secondary *Aizoon*, very close to *S. Churchillii*. I shall be glad to send him a piece of this doubtful *lantoscana*, and at the same time to state that plant came from his garden under the name of

lantoscana. Of course, it is clear what happened: the owner of a nursery, be he never so great a botanist, cannot personally supervise the sending of every plant that is ordered. And his underlings are occasionally liable, being human, to error. And thus, even from so authoritative a source as Floraire (to say nothing of the Craven Nursery) a plant may sometimes get into general cultivation under a name to which it has no shadow of a right. The plants are in the same frame here as the genuine specimens from the Gorge of the Vésudie—the contrast is terrible. *Reginald Farrer.*

APPLE MILLER'S SEEDLING.—I was pleased to read in the report of the Wye Fruit Congress (see p. 436) the remarks concerning this Apple. It is a variety which deserves to be better known, and one which I had several times wished to bring before your notice. My acquaintance with it extends over a period of four years. I have found it a regular and heavy cropper, and each year it has proved its value as a market Apple, for the returns have always exceeded those anticipated. Last season the trees were laden with fruits, and they are now covered with fruit-buds. Grown on a light, well-cultivated soil, the light, straw-coloured appearance of the fruit makes it as pleasing to the eye as Worcester Pearmain, a variety which Miller's Seedling will eventually supersede for market purposes, chiefly owing to its flavour, which is piquant, juicy, crisp, and in marked contrast with the tough and flavourless qualities of Worcester Pearmain. Another point of interest in the report is the remark that Stirling Castle must be grown on the Crab stock; this cannot be too strongly emphasised. From practical experience, I know this to be true, for if the crop is not so heavy, the fruits are cleaner, larger, and by far more valuable than those from trees worked on the Paradise stocks; moreover, the trees grow cleaner, they are freer from canker, and live long. *H. R.*

POISONS AND PHARMACY ACT, 1908.—On the 14th inst. a doubtful point in connection with the above Act was settled by the judges in the Divisional Court. Their decision was as follows:—Under the Act of 1868, only a qualified pharmacist could sell poisons, and not an unqualified assistant, and it therefore followed that, under the amended Act of 1908, only a person licensed by the local authorities could sell poisonous compounds for horticulture and agriculture. Managers and assistants were not entitled to sell unless they held a separate licence. It is to be hoped that nurserymen and seedsmen holding licences under this Act will now take special warning from this decision, and take care that their assistants conform to the requirements of the Act. It is quite clear that all the representatives of the Pharmaceutical Society who have been able to make purchases were strangers to the employees who sold them, and, if only known persons had been supplied, none of these vexatious prosecutions would have arisen. I am sorry to say that, only within the last 10 days, several agents have been threatened with penalties for not affixing their name and address on the bottles, and in these cases also the purchasers were strangers, and should not have been supplied for this reason. The "Traders in Poisons Society" intend to approach his Majesty's Privy Council asking for greater facilities for obtaining licences and at less expense, so that assistants can obtain licences to sell (under the head licensee) at a nominal charge. *G. H. Richards.*

MONTBRETIAS.—I make it a rule to lift these plants each year directly the growing season is finished, replanting them 4 inches apart and afterwards giving a slight mulch. Mr. Beckett states (p. 432) that his plants were once killed through leaving them in the ground during the winter. I presume the cold must have been very severe, as in November of last year our entire stock was replanted, when frost set in for a week, but although there were 19° of frost no harm resulted. Contrary to the experience of Sir Herbert Maxwell, I find here that Montbretias planted in the grass become crowded at the roots if left undisturbed for more than two years, producing a number of small bulbs, and consequently weakly foliage with scarcely any flower-spikes that cannot be compared with those produced by plants which have been transplanted bi-annually. *J. Smith, Mulroy, Co. Donegal.*

THE BLACK CURRANT IN AN EXPOSED GARDEN.—There are some good bushes of Black Currant in a very exposed garden on this island. Some of the plants are rather old and have been severely thinned by pruning during recent years. The young growths are remarkably strong and healthy, and show promise of a good crop of fruit. These are growing in a garden quite open to the sea, with no protection from the heavy gales which are experienced here. The soil is a dark vegetable loam. The plot has been under cultivation many years, and was formerly allotted to the coastguards, who were stationed here until a few years ago. Most of the Brassicas, and Parsnips, Beet, and Celery are grown successfully. Onions and Carrots are not so satisfactory. Nursery beds of Quick "Whit-thorn" are fairly strong. The same may be said in respect to Sycamore and the Mountain Ash; but the Sweet Chestnut and Birch are almost failures. The common Elder loses the tips of the young shoots; while the Sea Buckthorn grows very slowly. The island lies in N. lat. 55° 20', W. long 6° 15'. *C. Rose, Lambay Island, Rush, Co. Dublin.*

SOCIETIES.

ROYAL HORTICULTURAL.

DECEMBER 20.—The Floral, Fruit and Vegetable, and Orchid Committees of this Society met in the Vincent Square Hall on Tuesday last merely for the inspection of novelties, other exhibits than these were not invited. The ORCHID COMMITTEE found a moderate number of exhibits to adjudicate upon, but the members of the FLORAL and FRUIT COMMITTEES had scarcely sufficient work to justify their attendance.

Floral Committee.

Present: Henry B. May, Esq. (in the Chair); and Messrs. James Walker, T. W. Turner, G. Benthley, George Gordon, James Hudson, W. Howe, J. F. McLeod, Chas. Dixon, J. W. Barr, H. J. Cuthbush, J. T. Bennett Peck, W. P. Thompson, E. H. Jenkins, A. Kingsmill, E. A. Bowles, and R. Hooper Pearson.

The exhibits before this Committee included a variety of *Primula sinensis* with variegated foliage, a crimson-scarlet *Hippocastanum* and a vase of blooms of the pale-yellow, single-flowered *Chrysanthemum* "Peter Barnes."

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the Chair); and Messrs. Jas. O'Brien (hon. sec.), A. Dye, Henry Little, J. Charlesworth, C. H. Curtis, F. J. Hanbury, A. A. McBean, W. Cobb, W. H. Hatcher, H. G. Alexander, W. H. White, Gurney Wilson, de B. Crawshaw, and Harry J. Veitch.

Twenty-four plants were submitted to the Committee for awards, one First class Certificate, four Awards of Merit, and one Cultural Commendation being granted.

Lieut. Col. Sir GEORGE L. HORTON, K.C.V.O., Westonsbury (2r. Mr. H. G. Alexander), showed four fine hybrids, two of which received awards. The others were *Cypripedium A. Leus* var. *Undine* (insigne *Sanderia* × *Leucum Prospero*), with fine yellow flower, three-fourths of the dorsal sepal being pure white (the plant carried nine flowers), and *C. Rossetti magnificum*, the finest variety of this handsome yellow and white flowered *Cypripedium* yet shown.

SAMUEL LARKIN, Esq., The Ridgeway, Hammersmith (2r. Mr. Hale), showed a good white variety of *Miltonia Bleuana*, a fine plant of *Odontoglossum crispum Harryanum*, and a light flowered variety of *Laelio-Cattleya Bella*.

FRUITS GROWN IN SAJJAN NIWAS GARDENS, UDAIPIUR, INDIA.

FIG. 210.—THE LARGE SPECIMENS ARE JACK-FRUITS (*ARTOCARPUS INTEGRIFOLIA*); IN THE CENTRE ARE MANGOES (*MANGIFERA INDICA*), WITH BANANAS AND GRAPES; AND, IN THE FOREGROUND, JAMANS (*EUGENIA JAMBOLANA*).

(See p. 473.)

PANTIA RALLI, Esq., Ashted Park (gr. Mr. Hunt), exhibited a good white form of *Cattleya Dusseldorfiana* Undine.

R. G. THWAITES, Esq., Streatham (gr. Mr. J. M. Black), showed *Sophro-Cattleya Saxa* and a fine variety of his white-petalled *Cattleya Maggie Raphael*.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), displayed *Cypripedium Waterloo*, *C. etoniense*, and *Laelio-Cattleya Ophir* "Westfield variety," having pretty, canary-yellow flowers with rose colour on the lip.

Messrs. CHARLESWORTH & Co., Haywards Heath, showed *Cypripedium Victor Hugo* (variable \times *Lathamianum*), a fine hybrid with large, white dorsal sepal, marked with a purplish band through the centre; a grand plant of *Laelio-Cattleya Sunray* (*L. cinnabarina* \times *C. superba splendens*), and two others, which received awards.

Messrs. J. & A. A. McBEAN, Cooksbridge, showed *Sophro-Cattleya Doris*, having rich scarlet flowers $4\frac{1}{2}$ inches across.

Messrs. ARMSTRONG & BROWN, Tumble Wells, showed four interesting *Cypripedium Fairreanum* crosses, viz., *C. Dauphine* (\times *Cassandra* \times *Fairreanum*), *C. Ambroya* (*Goultsmanum* \times *Fairreanum*), *C. Coruna* (*Leeannum* \times *Fairreanum*), and *C. Bayonne* (*Prewettii* \times *Fairreanum*).

A. HARRISON, Esq., Lyndhurst, Watford, exhibited *Laelio-Cattleya Ethelreda Harrison*, a small-flowered but distinct hybrid.

Messrs. JAS. VEITCH & Sons, Royal Exotic Nursery, King's Road, Chelsea, showed *Cypripedium Clonia* (*Acteus* \times *insigne* *Harefield Hall*), a fine variety showing the influence of *C. insigne* *Harefield Hall* in a marked degree; *C. insigne* *Crusader* (*insigne* *Sandrae* \times *Harefield Hall*), a large and finely formed flower, with even purple spotting on the dorsal sepal; and *C. Gertrude* (*glaucophyllum* \times *Euryades*), which will be a pretty flower when matured.

F. J. HANBURY, Esq., showed a flower of a cross between *Laelia autumnalis* and *Cattleya labiata*.

AWARDS.

FIRST CLASS CERTIFICATE.

Cypripedium Ceres magnificentum (Rossii rubescens \times *Rolfca*), from Messrs. CHARLESWORTH & Co., Haywards Heath.—The finest variety of this pretty hybrid yet shown. The large flowers partake strongly of *O. Rossii rubescens* in the fine claret-red bars on the sepals and petals, the tips of the latter being tinged with rose, like the broad, ovate labellum. The column is purple-coloured.

AWARDS OF MERIT.

Laelio-Cattleya Pauline (L.C. Ophir \times *C. labiata alba*), from Lieut. Col. Sir GEORGE L. HOLFORD, K.C.V.O. (gr. Mr. H. G. Alexander).—A distinct hybrid, with flowers as large as those of *C. labiata*. The sepals and petals are white, tinged with canary yellow; the lip has a yellow-coloured disc and rose-purple veining.

Cypripedium Dante rotundiflorum (Euryades \times *Charlesworthii*), from Lieut. Col. Sir GEORGE L. HOLFORD, K.C.V.O.—A model flower of fine substance, with pure white dorsal sepal and rose-purple leaves. The petals and lip are gamboge yellow, tinged with purple.

Cypripedium Gaston Bullé, from Mr. E. V. Low, Vale Bridge, Haywards Heath.—Although this fine *Cypripedium* has been frequently shown at the R.H.S. meetings, the Committee has never recognised its merits before. The variety shown had a fine, flat, rose-coloured dorsal sepal, with purplish lines and a white margin, the rest of the flower being dark-coloured.

Miltonia Warszewiczii leucocila, from Messrs. CHARLESWORTH & Co.—A charming variety, with pale-purple sepals and petals, white and crimped at the margins; the lower half of the large lip is ruby-purple, the middle portion being semi-transparent when seen with the light behind it.

CULTURAL COMMENDATION.

A Cultural Commendation was awarded to Mr. J. Collier (gr. to Sir JEREMIAH COLMAN, Bart., V.M.H., Gatten Park), for a plant of the scarlet *Odontodia Bradshawia*, raised at Gatten Park, the specimen bearing a four-branched spike with 56 flowers and flower-buds.

Fruit and Vegetable Committee.

Present: J. Cheal, Esq. (in the Chair); and Messrs. C. G. A. Nix, O. Thomas, A. Dean, G. Reynolds, J. Davis, and G. Wythes.

The attendance did not constitute a quorum.

A seedling Apple was shown by Mr. A. TRIMM, of Chichester, which in form, size and colour bore some resemblance to *Hollandbury*. The flesh is soft white, juicy and of a pleasantly acid taste. It was said to have been produced on a four-year-old tree. The exhibitor was asked to submit fruits at some future meeting.

Seven diverse stocks of Dandelion heads partially blanched, grown under trial at Wisley, were submitted. Three marks were awarded Broad-leaved (JAS. VEITCH & Sons), showing exceptionally stout, dense heads of leafage and two marks to the same variety (BARR & Sons). There were two other stocks of the Broad-leaved type, also the Moss-curl and the Cabbage-leaf varieties, both of dwarf habit.

NATIONAL SWEET PEA.

ANNUAL MEETING.

DECEMBER 15.—The annual general meeting of members took place on this date, at the Hotel Windsor, Westminster. The proceedings were presided over by the President, Mr. N. N. Sherwood, and there was a good attendance of members. When the minutes of the last meeting had been adopted, the President formally moved the adoption of the report and balance-sheet for the current year.

EXTRACTS FROM THE ANNUAL REPORT.

The membership of the Society shows no great increase upon that of 1909, because the accession of 166 new members is heavily discounted by the losses. In many instances it would seem that if members do not pay their subscriptions early in the year, they ignore subsequent reminders of their indebtedness, and so fall out of the ranks. Remembering how wide-spread is the love for and culture of Sweet Peas, it cannot be allowed that the Society has yet reached the high-water mark of membership. The Committee feels that, considering the good work the Society has done and is capable of doing, the members should make a point of securing new adherents to the Society. There are now about 1,600 members. Fourteen societies have ceased to be affiliated with us; but 27 new societies have joined, so that there are now 109 societies in affiliation.

Financially, the Society is in a very satisfactory position. Fifty pounds were placed on deposit early in the year, out of the balance from 1909, and it has not been necessary to touch that sum. Indeed, a further sum of £10 has been placed on deposit, every liability has been discharged, and a substantial balance is carried forward.

The experiment of holding a two days' exhibition at the Royal Horticultural Hall proved most successful. The display was a particularly fine one, competition being keen and the flowers good. Every vase was filled up with water at the close of the first day, and, as a result, the flowers remained in excellent condition throughout the second day. The takings at the doors exceeded expectations, therefore the Committee has felt justified in arranging for a two days' show at Westminster in 1911, and the dates fixed are July 11 and 12.

Following the annual meeting held on December 10, 1909, a very successful Sweet Pea Conference was held at the Hotel Windsor, under the presidency of Mr. Horace J. Wright.

After winning it at Dublin in 1908 and at Saltane in 1909, Mr. Thos. Stevenson won the Provincial Cup (pre-

sented to the Society by Mr. Ernest J. Edwards), at Luton, in 1910, and so the handsome cup has passed into the possession of his employer, E. Mocatta, Esq., while Mr. Stevenson has three gold medals to prove his success.

Beautiful weather favoured the Society on the occasion of the outings. One trip was to Peering, where, at the invitation of the President, Mr. N. N. Sherwood, V.M.H., a large number of members inspected the extensive trials of Sweet Peas and other flowers grown by Messrs. Hurst & Son. Mr. Sherwood's delightful private garden at Pested Hall was a further attraction. Later in the day the members visited Messrs. Dobbie & Co.'s grounds at Mark's Tey, and inspected another fine lot of Sweet Peas. On July 11 numerous members of the Society proceeded to the Times Experimental Station, Sutton Green, Guildford, to inspect the Society's trials. The Sweet Peas were in grand condition, and the trials of intense interest. The trials were conducted by Mr. Chas. Foster, at Guildford, to the great satisfaction of both the Floral and the General Committee. There were 242 novelty trials and 70 purity trials. All these who sent stocks for trial were furnished with a copy of the Proceedings of the Floral Committee, and similar copies have more recently been sent to every member of the Society.

The members of the Floral Committee accomplished a large amount of good work. The thanks of the Society are hereby tendered to them. The result of their labours is already in the hands of the members.

The following Awards were made by the Floral Committee in favour of novelties grown in the trials at Guildford:—First-class Certificate and Silver Medal to *Stirling Stent* (Trial No. 92), from Mr. J. Agate, Havant; Award of Merit to *Masterpiece* (Trial No. 3), from Messrs. Dobbie & Co., Edinburgh; to Mrs. Hugh Dickson (Trial No. 90), from Messrs. Dobbie & Co.; to Arthur Green (Trial No. 141), from Messrs. Dobbie & Co.; and to Cherry Ripe (Trial No. 201), from Messrs. Gilbert & Son, Lyke, Bourne.

At the dinner held on the first day of the exhibition in 1910 there was a very general and hearty expression of opinion that the members should recognise in some tangible fashion the many services already rendered by Mr. Chas. Foster in his capacity of superintendent of the Society's trials, and also the many gracious acts of kindness and hospitality extended to members by Mrs. Charles Foster, both at Reading and at Sutton Green. To give effect to this opinion, a small committee was formed, consisting of Messrs. N. N. Sherwood, W. Cuthbertson, W. P. Wright, Rbt. Swinham, and T. Stevenson. A substantial sum has been voluntarily subscribed, and a canteen, fitted with silver, purchased for presentation to Mr. and Mrs. Foster on the occasion of the annual meeting.

The horticultural world is looking forward with keen expectation to the great International Horticultural Exhibition, to be held in the grounds of the Royal Hospital, Chelsea, in May, 1912. The National Sweet Pea Society has offered £25 to the promoters of this exhibition, and will guarantee a further £25 in the event of a financial loss on the undertaking. Mr. N. N. Sherwood has promised a fine silver cup for Sweet Peas, and the Society has further offered one of its gold medals. Messrs. Walter P. Wright and Chas. H. Curtis are the Society's representatives on the General Exhibition Committee.

The resolution was seconded by Mr. Alexander Dean, who rejoiced that the Society had so far restrained itself in the season 1910 as to make but five awards to new varieties of Sweet Peas. He said that gardeners, some little time ago, were afraid that the whole literature of gardening would be upset by a plethora of Sweet Pea names. It was reassuring, therefore, to find that so few varieties were added to the lists. He referred to the sum which the Society intended to contribute to those charged with the responsibility of promoting the International Exhibition of 1912, and he said that, although it was impossible to show many Sweet Peas from out-of-door culture in May, nevertheless, if cultivators did their best, they would be able to make a very effective display of Sweet Peas grown under glass. The report and balance-sheet were then accepted without discussion.

FINANCIAL STATEMENT FOR THE YEAR ENDING NOVEMBER 30, 1910.

Audited as per Vouchers and Bank Pass Book and found correct.

December 1, 1910.

RICHARD GUYAS,
Union of London and Smiths' Bank,
9, Cornhill, E.C. 4.

Mr. George Gordon afterwards proposed a vote of thanks to the Society's officers and committees, this resolution being seconded by Mr. W. B. Cranfield. The President returned thanks on behalf of himself and the other officers. He (Mr. Sherwood) said that he was one of those who were responsible for the inauguration of the Society, and he felt that the progress the Society had made was in every way satisfactory, and that it might be trusted to continue in a prosperous condition.

Mr. S. B. Dicks next moved that Lady Northcliffe be elected President for 1911, and after the motion had been seconded by Mr. Collingridge, it was accepted unanimously, as was also the next resolution, that Mr. Edward Sherwood should be appointed hon. treasurer.

Mr. Horace J. Wright next proposed that Mr. G. W. Leak be appointed chairman of the General Committee for the ensuing year, and this resolution was adopted. After the re-appointment of Mr. Glynas as auditor, Mr. W. Cuthbertson proposed the re-appointment of Mr. C. H. Curtis as hon. secretary. He stated that the honorarium the Society gave to Mr. Curtis last year amounted to 50 guineas. He would now suggest that, in making the re-appointment, the honorarium should be increased to 60 guineas. This step, said Mr. Cuthbertson, was all the more justified by the fact that the Society had never recognized, in a financial sense, the work imposed upon the secretary in editing the *Sweet Pea Annual*, in conjunction with Mr. Horace J. Wright. The motion was seconded by Mr. J. S. Brunton, and carried unanimously.

The next proposition, by Mr. Thomas Stephenson, was to the effect that, in future, the General Committee should consist of 36 members, elected at the annual general meeting, and eight corresponding provincial members, and that the corresponding provincial members should be exempted from the condition that applies to the other members, namely, that they must attend three or more meetings of the Society's committees during the year. The resolution was adopted.

The balloting for the members of the General Committee then took place.

During the counting of the ballot the presentation of a canteen of silver was made to Mr. and Mrs. Foster, being the result of a subscription from the members in recognition of the valuable services Mr. Foster has rendered the Society in the management of the Sweet Pea trials for some years past, first at the Reading University College, and now at the *Times* Experimental Grounds at Sutton. It was much regretted that, owing to Mr. Foster's severe illness (from which we are glad to say he is now recovering), it was not possible for him to be present. In the circumstances, the presentation was made to Mrs. Foster, who attended the meeting on her husband's behalf.

Mr. Walter P. Wright called attention to the work of the Floral Committee, and referred to criticisms which had been made in regard to the composition of that body. He claimed that the work of the Floral Committee was performed satisfactorily. At the same time, he felt that there might be less ground for criticism if the number of members was raised from 12 to 18, 9 to be representatives of the trade, and the remaining 9 amateurs. Eventually it was decided that Mr. Wright's resolution should be recommended as an instruction to the General Committee. After this instruction had been decided upon, a proposal was made that it also be an instruction to the General Committee that the amateur members of the Floral Committee should be such as have had nothing to do with the raising of Sweet Peas for the trade. This instruction was carried by 29 votes against 23.

MEETING OF THE GENERAL COMMITTEE.

A meeting of the General Committee was held directly after the annual meeting, under the chairmanship of Mr. G. W. Leak, the newly-elected chairman. Mr. Walter P. Wright proposed that the Floral Committee should consist of the following 18 members:—Messrs. E. H. Christie, G. F. Drayson, Robert Hallam, Commandant Humphreys, Thomas Jones, H. H. Lees, A. Malcolm, H. A. Perkin, Thomas Stevenson, R. Bolton, John Bridgeford, W. Deal, S. B. Dicks, George Herbert, A. Ireland, Herbert Smith, A. J. Stark, and W. J. Unwin. It was proposed by Mr. Breamore that there should be a chairman in addition to the 18 members, and that the chairman should

be an amateur. This was accepted by Mr. Wright as part of the original resolution. Discussion arose upon the question of defining what constituted an amateur member, and during this discussion several motions for adjournment were made and rejected. Eventually, Mr. Wright's resolution was accepted, and the Floral Committee for 1911 will be composed of the names already given.

Mr. Walter P. Wright was then elected to the office of chairman of the Floral Committee.

The balloting for the Executive Committee resulted as follows:—Messrs. C. W. Breamore, W. Cuthbertson, William Deal, S. B. Dicks, Charles Foster, E. F. Hayes, E. W. King, R. Hooper Pearson, Herbert Smith, Thomas Stevenson, W. J. Unwin, Horace J. Wright, G. F. Drayson, and H. A. Perkin.

DINNER AND CONFERENCE.

A dinner was arranged for 5.30, at which Mr. Edward Sherwood presided. The company numbered about 50, including several ladies.

The conference commenced at 7 p.m. Mr. G. W. Leak presided for a short time, when he was compelled to leave, and the chair was then taken by Mr. Horace J. Wright, the members present numbering considerably over 70, and most of them stayed until the finish, which did not come until after 10 o'clock.

JUDGING SWEET PEAS.

The first paper was upon the judging of Sweet Peas, and, in the absence of the author, Mr. Walter P. Wright, it was read by the secretary, and was as follows:—

A judge of Sweet Peas has a different, and, in my opinion a more difficult task than a judge of Roses, Chrysanthemums, Dahlias, Carnations, or indeed any other popular florists' flower.

In the first place, it is customary to set up Sweet Peas in vases, each variety being represented by a number of stems. In the case of the other flowers named it is usual to show one flower only of each variety. It is true that sprays of garden varieties are sometimes shown, but they are in minor classes, and as a rule the number of specimens is so small, and the arrangement such, that all the flowers can be seen at a glance.

There is certainly no parallel amongst other leading florists' flowers to the Sweet Pea, with its 20 or so stems per vase, and its three or four flowers on each stem. For this reason, we who specialise in what from the exhibition point of view is a new flower cannot turn for guidance to the rules or principles of other florists; we have to work out our own salvation.

There is another reason why the judging of Sweet Peas is different from that of other flowers. In practically all the principal colours we have two types: the plain or grandiflora, and the waved or Spencer. Many of the varieties are identical in colour; they differ only in form.

Given 24 varieties of Roses or Chrysanthemums, a judge has 24 specimens to examine in order to make sure that there are no duplicates. Given 24 varieties of Sweet Peas, he has, in the ordinary way, 480 specimens to inspect. Any one of the 20 sprays in any one of the 24 vases may be a plain where it should be a waved, and if there is one, the exhibit is liable to disqualification.

The difficulty of giving correct awards is increased by the absence of guiding principles as to (1) length of stem; (2) allowance of haulm or otherwise; (3) disposition of the flowers on the stem; (4) size; (5) freshness. Judges follow a go-as-you-please course, and are swayed by individual tastes and preferences. One attaches paramount importance to length of stem and size of bloom, another to freshness. Another never troubles to see whether there are plain and waved flowers in the same vase. One of our friends told me that on disqualifying a competitor for mixing plain and waved flowers, the latter smiled sweetly and, quite unabashed, remarked that as he had "tried it on" successfully with several judges previously, he thought he might as well take his chance again!

The greater the difficulty in judging Sweet Peas, and the greater the confusion as to principles, the more necessary it is that the problem should be faced, and I think the time has come for the National Sweet Pea Society to take action, with the object of establishing an authoritative code. In order to further this, I propose to set out the principal points, and give opinions

thereon, with a view to evoking discussion. I suggest that when the debate closes a set of rules for judging be drawn up, representing the collective wisdom of the Society, and that they be printed in the Society's publications and pressed on the attention of affiliated societies.

(1) HAULM.—In my opinion, one of the first rules laid down should be that stems are really to be flower stems, and not haulm. The inclusion of haulm attached to the stems should disqualify.

(2) NUMBER OF STEMS.—In exhibiting a given number of Roses, Chrysanthemums, or Carnations it is usual to use perforated boards, so that it is a simple matter to get in the right number of blooms and no more. It is wholly different with Sweet Peas. The use of movable vases on tables or stages makes the task of counting more onerous, and if to this is added the obligation of counting, say, 20 sprays into each vase, the task is a serious addition to that of choosing stems and arranging vases. For this reason I believe in stating 20 sprays as an approximate number, with the warning that crowded vases will be passed over. Few, if any, judges pretend to count the contents of vases. In judging a show, it is my custom to state at the outset that I do not intend to count, as this would waste valuable time that ought to be given to judging alone. Time devoted to counting is time taken from judging. As things are, if a mistake is discovered it is generally at the instance of another competitor, and inasmuch as it is almost impossible to count the contents of a vase without handling the stems, the way is open for substitution, subtraction, or addition. For these reasons, I am opposed to a fixed number being stated. Nor do I think that a rigid rule is necessary in order to prevent awards being influenced by quantity rather than quality. A judge who has a good code to work upon, and a mind of his own, is not likely to be influenced by mere numbers.

(3) WIRING.—The use of wire to mount the stems should disqualify.

(4) MIXED TYPES.—Judges should be warned to look out for cases of plain and waved flowers being mixed in a vase of one variety, and to disqualify when found.

(5) LENGTH OF STEM.—Inasmuch as stems are sometimes staged 2 feet long, with the flowers straggling along them, and showing wide gaps, it might be wise to consider a suggestion that stems 18 inches in length are quite long enough to make an effective vase.

(6) NUMBER AND DISPOSITION OF THE FLOWERS.—The stems should carry three or four, the flowers should face one way, and should be near enough together to form a homogeneous set. Long stems with large flowers widely separated should be discountenanced. This is not a case for disqualification, but for showing, by the choice of neater, more refined specimens for the prizes, that coarse examples are not appreciated. At present, judges are at variance with respect to this particular, and many, who at heart disapprove of coarseness, are afraid to ignore the giants because of the criticisms of the crowd. The public, however, would soon become educated up to an appreciation of genuine quality.

(7) FRESHNESS.—Great stress should be laid on staging young, fresh flowers. Judges should be instructed that old flowers, however large, ought to be passed. If some vases are young, and some old, points should be deducted from the latter.

(8) SPOTTED FLOWERS.—Speaking broadly, clean flowers are desirable, but I think that young flowers which are merely spotted by a shower should be penalised less severely than blooms that are curling and discolouring from age.

(9) BLENDING OF COLOURS.—Judges might be taught with advantage that as the artistic arrangement of colours is desirable, a stand in which the colours are well blended might, other things being equal, carry the award over one in which the colours were not well arranged. Colour-blending should not, however, carry inferior flowers to victory.

(10) DOUBLE STANDARDS.—I think that double standards should be regarded as defective, on the ground that they mar the symmetry and harmony of the flower.

PROCEDURE FOR JUDGES.—I think that the following might be suggested as good procedure for judging Sweet Peas:—

- (a) When starting, count the exhibits in each class with the secretary's assistant, to make sure none is omitted.
- (b) Count the number of vases.
- (c) See that the exact number of varieties specified in the schedule are present in each exhibit.
- (d) Make a preliminary survey, and rule out those stands that are palpably defective, in order to be able to concentrate attention on the eligibles.
- (e) Look through the vases in the selected stands for mixed types.
- (f) Make the awards on freshness, number of flowers per stem, size of flowers, disposition, and blending of colours. Compare vases of the same varieties side by side.
- (g) Take a final look over, to make sure that there is no oversight.
- (h) Mark 1st, 2nd, or 3rd on the back of the exhibitor's card.
- (i) Be blandly unconscious of the subsequent comments of the defeated competitors and "the Man in the Street," but give courteous attention and explanation to any inquiry made through the executive.
- (j) Invest your fees in new varieties for the following year.

As a concise summary, I would suggest the following scale of points:—

QUALITIES.	POINTS.
Freshness and good colour	6
Number of flowers per stem (three to four)	4
Length of stem (approximately 18 inches)	4
Arrangement of flowers on stem	4
Size of bloom (approximate width of standard 1½ inch)	4
Colour-blending	2
Total	24

Mr. Thomas Stevenson supported the paper and passed in brief review the chief points raised by Mr. Wright. There followed a discussion engaged in by Messrs. A. Malcolm, J. Fraser, J. Merrill, T. A. Weston, A. E. Usher, R. F. Felton, C. W. Broadmore, S. B. Dicks, W. Cuthbertson, E. H. Christy, and W. J. Unwin. Considerable diversity of opinion was evidenced, but the most debatable point appeared to be whether double standard should or should not be regarded as a fault, as suggested by Messrs. Cuthbertson, T. Stevenson, Walter P. Wright and Horace J. Wright. In order to obtain the views of the meeting on the question, it was put as a motion, and resolved, that in judging double standards should not be discontinued.

Arising out of Mr. Wright's paper, although it was not dealt with until later in the evening, came the matter of pointing. A standard of 24 points had been suggested, but this number was deemed unwieldy, and Mr. Cuthbertson proposed, and it was seconded by Mr. Bolton, that rules of a more simple, but equally comprehensive, nature should be adopted by judges who desired loyally to support the wishes and opinions of the members of the Society. It was therefore unanimously resolved that Mr. Wright's propositions under the headings A, B, C, D, and E should be adopted, and that F, G, H, and I be as follows:—

- (f) Be prepared to make awards on freshness, number of flowers per stem, size of flowers, disposition, and blending of colours. Compare vases of the same variety side by side.
- (g) Give a maximum of six points per bunch, this maximum to be allocated to the best bunch or bunches in the stands, and then point the other bunches, by halves if necessary, working downwards. In awarding these points, due regard must be had to freshness, quality and size of flowers, as referred to above.
- (h) It is also recommended, where necessary (that is when the bunch pointing brings an equality or nearly so), that six points extra be taken as a maximum for arrangement and blending of colours, the points so obtained being added to the total bunch points.

- (i) Double standard flowers shall not be discounted.

The second paper, by Mr. George Herbert, was on "The Culture of Sweet Peas," especially from the exhibition point of view. From a man who has repeatedly proved his ability as a grower, it was expected that the information would be essentially sound and practical, and such proved to be the case. The discussion was animated and protracted.

NATIONAL DAHLIA.

(ANNUAL MEETING.)

DECEMBER 20.—The annual general meeting of this Society was held at the Hotel Windsor on Tuesday last. Mr. Edward Mawley, V.M.H., President of the Society, presided.

Mr. E. F. Hawes (hon. secretary) read the annual report and financial statement.

EXTRACTS FROM THE REPORT.

A conference on Dahlias was held on Friday, March 4. The meeting was well attended and papers were read as follows:—*Dahlias for Garden Decoration*, by Mr. George Gordon, V.M.H.; *Growing Dahlias for Exhibition*, by Mr. J. Stredwick; and *Methods of Exhibiting Dahlias*, by Mr. J. B. Riding. A full report of the papers and subsequent discussion was published in the *Annual Supplement and Conference Report*, and was issued free to all members of this Society.

Two exhibitions were again held during the month of September, the first at the Crystal Palace, on September 8 and 9, which was arranged a week later than in former years. Owing to the lateness of the season, this arrangement was a fortunate one, as, even at that date, several finer exhibits were unable to show. The second show was again held at the Royal Botanic Gardens, Regent's Park, on September 26 and 27. A first-class show resulted.

Four meetings of the Floral Committee were held for the purpose of granting awards to seedling Dahlias, one in conjunction with each of the Society's shows, and two additional ones, on September 13 and 27, in the Royal Horticultural Hall.

A large and comprehensive trial of single Dahlias, consisting of 86 varieties, was conducted for the Society by Messrs. J. Cheal & Sons, Lowfield Nursery, Crawley, Sussex. This was visited by members of the Floral Committee on September 12, and three marks of excellence were given to the varieties considered most suitable and effective for garden decoration.

Your Committee have had much pleasure in enlarging and bringing up to date, during the present year, the list of varieties of Dahlias contained in the *Official Catalogue and Culture Guide* of 1904. The Conference papers, with discussion, were also included, and this supplement improved a welcome addition to the literature of the Society.

Notwithstanding the energetic policy pursued by the Society during the past year, your Committee are glad to report that the liabilities are nil, and that they have a small balance on the right side, and, although the reserve fund has been apparently reduced, the increase of assets over liabilities has been distantly increased.

During the year the Society has made considerable progress, and your Committee feel that it is well on the way to a more satisfactory position than it has occupied for many years. Twenty new members have been enrolled during the year.

The policy of holding two shows during the present year has proved successful, and your Committee has arranged to hold two similar shows during 1911, at the Crystal Palace and the Royal Botanic Gardens, on similar dates to last year.

On moving the adoption of the report, the president stated that he considered the members of the Society should congratulate themselves on the excellent work done during the year. They had increased their expenditure by publishing the supplement to the official catalogue, which, together with the conference papers, was a welcome addition to their publications. They had paid all the prize money and other debts, and the only liability against the Society was that of two subscriptions paid for 1911 in advance. The adoption of the report was seconded by Mr. John Green, the hon. treasurer, who said the committee were glad to know that their efforts were being backed up by the members.

Mr. George Gordon, V.M.H., whilst endorsing what had been said previously, as to the excellent work achieved during the past year, including the conference, and trial of Single Dahlias, felt that a determined effort should be made to increase the income of the Society.

Mr. J. Cheal said that careful consideration had been given to this matter by the general committee at a meeting held previously.

The report and balance sheet were adopted. The thanks of the meeting were cordially given to the retiring officers and committee on the proposal of Messrs. G. Davidson, seconded by Mr. R. Hooper Pearson, who stated that it was evident from the report that there was no reason for the Dahlia Society to be despondent, but that there was a good prospect of the Society attaining to a success equal to the most flourishing of the floral societies. The president made a suitable reply.

On the motion of Mr. John Green, seconded by Mr. J. Harrison Dick, the meeting amended by law 3 by adding "a chairman of committees" to the officers. In order to bring By law 6 into

accord with this alteration, the words "and a chairman" were deleted. By-law 6 was also further amended by increasing the numbers of the Executive Committee from 12 to 18. The date of the annual meeting was, on the motion of Mr. C. H. Curtis, altered by substituting for "the third Tuesday in December" the "last R.H.S. show day in November."

Mr. Edward Mawley was re-elected president.

Owing to the enforced retirement of Mr. Thos. Hobbs from the list of vice-presidents, Mr. John Green was elected in his place. Mr. George Gordon was appointed chairman of committees, Mr. John Green hon. treasurer, Mr. E. F. Hawes hon. secretary, and Mr. W. Stephens honorary auditor.

After the conclusion of the business, the General Committee met for the purpose of electing the Executive Committee as follows:—Messrs. H. L. Bronsson, Baxter, Cadman, J. Cheal, C. H. Curtis, E. Doncaster, W. Lockyer, S. Mortimer, J. B. Riding, J. Stredwick, A. Turner, J. T. West, W. Stephens, C. Lucking, W. F. Laurie, J. Harrison Dick, G. Davidson, and J. Emberson. It was decided to hold the committee meetings at 4 p.m. instead of 2 p.m.

STIRLING HORTICULTURAL.

DECEMBER 9.—The annual general meeting of the society was held on the above date. Mr. Geo. Petrie presided. The report and balance-sheet for the year were read and adopted. The past year has proved satisfactory, the large financial deficit of two years ago being considerably reduced. The future promises well for the society, as the affairs are in the hands of a capable management. The secretary is Mr. James McArthur, 15, Murray Place, Stirling.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

DECEMBER 12.—The monthly committee meeting was held at the Royal Horticultural Hall, Vincent Square, Westminster, on this date. Mr. Charles H. Curtis presided.

Three new members were elected, making a total of 70 for the year. Various cheques were passed for members entitled by age to draw from their account.

NATIONAL CHRYSANTHEMUM.

DECEMBER 19.—A meeting of the Executive Committee was held on this date at Carr's Restaurant, Strand. Mr. Thomas Bevan occupied the chair. The Secretary, Mr. R. A. Witty, gave an interim financial report showing the receipts to date of £526 7s., and expenditure amounting to £431 2s. 5d.

Mr. D. B. Crane reported on the Floral Committee's visit to Swanley to inspect the trial of single Chrysanthemums undertaken by Messrs. H. CANNELL & SON (see p. 459).

It was resolved that an audit of the varieties exhibited at the November show should be incorporated in the new schedule. Upon the question being raised as to including a report of the recent conference, a discussion took place on the subject of providing literary matter generally for the benefit of the members.

The dates of the Executive and Floral Committee meetings were provisionally fixed. The Floral Committee dinner will take place at Carr's Restaurant following the Executive Committee meeting on February 20.

Several new members were elected.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Ophion Fund, it will be thankfully received, and an acknowledgment made in these columns.]

MR. ALAN McCALLUM, for more than 3 years Foreman in the glasshouses at Gallowhill, Parslo, N. B., as Gardener to R. B. McGROGK, Esq., Cardale, Wemyss Bay.

MR. H. BAKER, late Gardener to G. H. HURST, Esq., Croft House, Southall, Brixley, Yorkshire, as Gardener to H. W. WILKINSON, Esq., Carhead Hall, Cross Hills, Kingley, Yorkshire.

MR. S. HORSBURY, for the past 8 years Gardener to A. J. NOBES, Esq., Longshaw, Chipstead, Surrey, as Gardener to the same Gentleman at Court House, Bantstead, Surrey. (Thanks for 1s. for the R.G.O.F. box.—Eos.)

MARKETS.

COVENT GARDEN, December 21.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Anemones, Arums, Azaleas, Bouvardia, Camellias, Carnations, Chrysanthemums, Gardenias, Hyacinth, Impatiens, Lilium auratum, longifolium, laurifolium, rubrum, album, Lily of the Valley, Marguerites, and various yellow flowers.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and plants in pots, including Adiantum, Asparagus plumosus, Ferns, and various plants in pots like Aralia Sieboldii, Euonymus, and Begonia.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Aralia Sieboldii, Euonymus, Ferns, Araucaria excelsa, Asparagus plumosus, Aspidistra, Begonia, Chrysanthemums, Cocos Weddelliana, Crotons, Cyclamen, and various other potted plants.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples (American, Nova Scotian), Grapes, and various other fruit varieties.

Fruit: Average Wholesale Prices (continued).

Table listing various fruits and their prices, including Apples (California, Newtown Pippin, etc.), Grapes (English, Almetia), Lemons, Medlars, Nuts, Oranges, Pears, and various other fruit varieties.

Christmas Fruits and Preserves.

Table listing various Christmas fruits and preserves, including Figs, Nuts, Dates, and various other festive items.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Mushrooms, Mustard and Cress, Onions, Peas, Potatoes, and various other vegetable varieties.

REMARKS.—Large quantities of Apples have been received from California, Oregon and Washington States, U.S.A. The English consignments consist mainly of Bramley's Seedling, a very popular market culinary variety. The second shipment of Californian Seedless Oranges arrived last Tuesday in splendid condition and well graded. St.

Michael Pines of fine quality are on sale at reasonable rates. Canary Island Tomatoes are a shorter supply and are meeting with a better demand. Winter Nels, Doyenne du Comice, and Easter Beurré Peas from California are meeting with a very moderate demand. Prices all round for vegetables are moderate. The first consignments of Cape fruit for the season reached the market this week; they consisted solely of Apricots, the fruits being sound but very small. Trade generally shows a slight improvement on last week. The markets will be closed on Monday and Tuesday, December 26 and 27. E. H. K., Covent Garden, December 21, 1910.

Potatoes.

Table listing various potato varieties and their prices, including Kents, British Queen, Bedford, Lincoln, and Dunbar.

REMARKS.—Trade is slightly better, on account of the holidays, but the Potato market promises to be very quiet after Christmas for a week or two. Prices remain about the same. The stocks in London are still fairly heavy. Edward J. Newborn, Covent Garden and St. Pancras, December 21, 1910.

COVENT GARDEN FLOWER MARKET.

During the past week there has been but little improvement in trade or prices. This morning (Wednesday) large specimen blooms of Chrysanthemums could be purchased at 2s. to 3s. per dozen, whilst the smaller flowers were offered cheaper than earlier in the season. It is difficult to estimate what their value may be later in the week; but the salesmen are expecting further large consignments. Richardias (Callas) are well supplied. The price, 2s. to 3s. per dozen for good quality spathes, is an indication of their quantity. Lilium longifolium is selling at rather less than its usual value for December. L. spectosum and L. s. album are making rather better prices, yet supplies of these also are large. Lily of the Valley is cheaper. Gardenias are scarce, and their prices uncertain. Timpis are good, though rather short-stemmed. Poinsettias are good and cheap. Carnations are fairly well supplied, if dull weather is experienced they will be scarce. Violets, both home-grown and French, are plentiful. Other flowers are arriving in large quantities from France, including Anemones, Ranunculus, and Mimosa (Acacia dealbata). Cut foliage is well supplied, including long trails of Asparagus plumosus. There is a considerable difference in the length and size of the growths of this Asparagus; the large flat sprays are most in demand. Large quantities of hardy Evergreens are seen. Good Mistletoe and Holly are not very plentiful, and they have been making rather higher prices than usual.

POT PLANTS.

Trade has not been over brisk, and prices are not exceptional for Christmas. Lilies are a great feature; the plants being well flowered, especially E. hyemalis. Cyclamens are better flowered than those seen earlier in the season. Begonia Gloire de Lorraine varies in quality considerably, some are of poor quality, whilst others are abundantly flowered. Poinsettias are good, but those with the largest heads of bracts are rather tall. Lilium longifolium (or L. Harrison) is procurable in plants of various heights. There is but little variation in foliage plants. A. H., Covent Garden, December 21, 1910.

DEBATING SOCIETIES.

NEWBURY GARDENERS'.—There was a well attended meeting of the society on Monday, the 12th inst., when Mr. Walter F. Giles, of Messrs. Sutton & Sons, Reading, spoke on "British and Continental Salad Plants." The lecturer described methods of growing lettuces in hot-beds under cloches. He also dealt with Radishes, Cabbage and Cos Lettuces, Tomatoes, Cucumbers, Celery, Beet, Endives, Onions, Watercress, Mustard and Cress, Cichoria, Dandelion, Fennel or Florence Fennel, Land's Lettuce, Kampton, American and Austrian Cress, Celeriac, Tarragon, Orache, Swiss Chard, and others.

LEE, BLACKHEATH, AND LEWISHAM HORTICULTURAL.—A meeting was held on December 16, at the Church Street Schools; Mr. Judge presided. The lecturer for the evening was Mr. F. Phillips, honorary secretary of the Regate Cottage Garden and Horticultural Society, his subject being "Vegetables." At the meeting to be held on January 27, a lecture will be given by Mr. R. C. Pullen, on the subject of "Chrysanthemums."

ALTON (HANTS) HORTICULTURAL.—At the fortnightly meeting of the society, held in the Me Home's Institute, on Thursday, December 15, a lecture on "The Making of a Kook Garden" was given by Mr. T. Down, gardener at Basing Park. The lecturer dealt with his subject in a very able manner, and an interesting discussion followed the reading of the paper.

STIRLING & DISTRICT HORTICULTURAL.—The last monthly meeting of the session was held in McKillop's Temperance Hotel, Stirling, on December 13, Mr. George Peirce presided. The subject for the evening was "Over Sea and Land to the Malay Straits." This was the record of a journey undertaken by Mr. A. Cowburn, late foreman at Keir, to the rubber plantations in Penang. Eleven nominations were made for membership at the next meeting.

BRISTOL AND DISTRICT GARDENERS'. The fortnightly meeting was held on December 15, at St. John's Parish Rooms; Mr. E. T. Parker was the chairman. A paper on "The Herbaceous Border" was read by Mr. Thomas, of Lanshen, Catliff. Mr. Thomas advised grouping different plants having flowers of the same colour, rather than massing a large number of plants of one variety. On dry soils planting could be undertaken in the autumn; but on wet, heavy soils, it is best deferred till the spring.

Obituary.

ROBERT R. MAWSON.—Mr. Robert R. Mawson, proprietor of the well-known firm of landscape gardeners, Lakeland Nurseries, Windermere, died, at the age of 46, at his residence, Windermere, on the 8th inst., after an illness extending over a year. Mr. Mawson was the second son of the late Mr. John William Mawson, seed merchant and florist of Ingleton, Yorkshire, who left three sons. The three brothers opened a nursery at Windermere 26 years ago, and five years later the two younger brothers, Isaac and Robert, became sole owners of the business. They extended their connection, not only in this country, but on the Continent and in America. The younger brother died nine years ago, and the business passed into the hands of Mr. R. R. Mawson, who possessed a close acquaintance with every phase of garden construction. Not only did he carry out much of the work designed by his brother, but he also built up an extensive connection amongst architects, for whom he carried out numerous important works. Many of the gardens which he designed have been illustrated in these pages. Amongst the more important gardens laid out by the firm are Wych Cross, Sussex; Chelwood; Wood, North Tawton, North Devon; Hamford, Ashburton, South Devon; Walmer Lodge, Walmer, Kent; The Hill, Hampstead; Rushton Hall, Kettering, Northamptonshire; Little Omi Hall, Staffordshire; Dunchurch Lodge, Rugby; and High Head Castle. The great esteem in which the late Mr. Mawson was held was seen in the large number of mourners who attended the funeral at the Bowness Cemetery, Windermere, on Saturday, December 17. The business at Lakeland Nursery will be carried on by Executors under the management of two nephews, who have been closely associated with the firm for many years past. Mr. Mawson leaves a widow, a son and two daughters.

WILLIAM KENNEDY.—We learn from *Horticulture* of the death of Mr. William Kennedy, a well-known landscape gardener and florist, at Greenfield, Mass. Mr. Kennedy, who was 69 years of age, was in his younger days employed on the estates of the Duke of Argyll in Scotland, and Sir Richard Wallace, Ireland.

ANSWERS TO CORRESPONDENTS.

ABNORMAL MUSHROOMS: *H. T. Oldown.* Abnormal Mushrooms such as those you send are not uncommon; in the issue for July 26, 1875, pp. 1,016, 1,017, will be found a series of 11 figures illustrative of various monstrosities found in Mushrooms; one of these, which somewhat resembles your specimens, is reproduced in fig. 212.

BEGONIA GLOIRE DE LORRAINE AND CYCLAMEN: *T. W. O.* The so-called "rust" on both the Begonia and the Cyclamen is not due to fungous or insect pest. The trouble is usually due to excessive moisture in the atmosphere of the plant-house.

CINERARIA DYING: *W. B.* The plant has been injured by mining larvæ that have eaten into the collar. There has evidently been an epidemic of the flies, and these have deposited their eggs at the base of the stem. Nothing can be done now to save the infected plants.

CYANIDING AN ORCHARD HOUSE: *Old Hand.* As the trees are at rest the cyaniding may be done at the following strength per 1,000 cubic feet contents, 2½ ounces of sodium cyanide, five fluid ounces of sulphuric acid, and 15 ounces of water. Allow an exposure of 30 minutes and have the house at a temperature of 50° to 55°. Repeat the operation after an interval of 24 hours.

CYANIDING VINES: *Y. Z.* There is a certain element of danger in using hydrocyanic gas as a fumigant unless the greatest care is exercised. The machines which are sold for this purpose admit of the cyaniding being done without the person who is operating them being in the house at the commencement of the fuming. Hydrocyanic gas being a deadly poison, it must, of course, be used only by a responsible person, the house must be securely locked until the following day and ventilation given before it is entered. See note in *Gardener's Chronicle*, December 4, 1909, p. 588.

EMPLOYMENT IN CANADA: *Canadian.* Apply to the Canadian Emigration Offices, Whitehall. There is no list of addresses such as you require.

HORTICULTURAL INSTRUCTOR: *H. C.* A horticultural instructor should possess a good, general knowledge of the theory and practice of all branches connected with horticulture, and be able to express himself clearly before an audience. A knowledge of the sciences connected with gardening, such as botany, chemistry, physics, and economic entomology, will prove useful. A good general education, and satisfac-

THE LATE ROBERT R. MAWSON.

tory references as to conduct and abilities are required. Some diploma, such as the First-class Certificate in the examination held by the Royal Horticultural Society, or the advanced course of the Science and Art examination in domestic economy and rural hygiene, would be a recommendation.

LATE ROOTED CHRYSANTHEMUMS: *A Lover of Mums.* We have submitted your questions to Mr. Stevens, the writer of the paper on p. 456, and his reply is as follows:—"I never stop the plants except when necessary for the proper timing of the buds. Many varieties break naturally at or about the proper dates, and

FIG. 212.—ABNORMAL MUSHROOM.

they are allowed to develop what may be termed the first natural crown, and the bud is then taken. If the plants require stopping, the first bud that develops after this should be taken. The following dates are suitable for stopping the varieties you mention, but it must be borne in mind that they will then be in their flowering pots and growing freely. Plants in a less vigorous condition of growth would require to be stopped earlier, as the weaker the plants the longer the flower takes to develop

properly. J. H. Silsbury, Mary Inglis, June 25; Mrs. W. Knox, July 1; Leigh Park Wonder, June 12; Mrs. F. W. Vallis, June 15; F. S. Vallis, H. Perkins, Rose Pockett, Valerie Greenham, June 20; Mrs. R. H. B. Marsham, June 12; Walter Jinks, June 15; Mme. Paola Radaeli, May 20; Reginald Vallis, June 12; and W. A. Etherington, June 27. The varieties Mary Inglis, Leigh Park Wonder, Mrs. F. W. Vallis, Henry Perkins, Valerie Greenham, and W. A. Etherington are not to be recommended for inclusion in a small or medium-sized collection of Chrysanthemums intended for exhibition."

NAMES OF FRUITS: *Cornishman.* 1, Washington; 2, Taunton Golden Pippin.—*A. M. K.* 1, Broad Eye Pippin; 2, Herefordshire Pearmain; 3, Winter Hawthornden; 4, Bedfordshire Foundling.—*A. B. Earle.* The Pear was smashed in the post.—*J. Coombes.* 1, Beauty of Devon; 2, Bitter Sweet; 3, Hanwell Souring; 4, Annie Elizabeth.

NAMES OF PLANTS: *P., Horsham.* 1, Cotoneaster Simonsii; 2, Cryptomeria elegans; 3, Thuya orientalis; 4, Berberis vulgaris; 5, Thuya occidentalis var.; 6, Juniperus chinensis albo-variegata; 7, Holm Oak (Quercus Ilex); 8, Cupressus pisifera plumosa; 9, Distylium racemosum variegatum; 10, Cupressus Lawsoniana var.; 11, Cupressus (Retinospora) squarrosa; 12, Juniperus virginica.—*J. M. T., Truro.* Escallonia floribunda.—*H. H.* Ornithogalum lacteum.—*L. S., Dumfries.* 1, Duranta Plumieri variegata, so far as can be determined without flowers; 2, Polypodium sub-anniculatum; 3, Dieffenbachia Seguine; 4, Elaeodendron orientale (syn. Aralia Chabneri); 5, Hoffmannia Ghiesbreghtii variegata; 6, Aralia gracilis.—*O. R. I.* Oncidium sphacelatum; 2, Odontoglossum gloriosum; 3, Celia Baueriana; 4, Stelis ophioglossoides.—*T. S. N.* 1, Cypripedium Lecanum; 5, C. insigne; 3, C. i. Chautinii.

PEAR SHOOTS DISEASED: *T. W. O.* The Pear shoots are attacked by "canker" fungus, Nectria ditissima, and also by the "scab" fungus, Venturia pirina. Cut out all the "cankered" wood down to the healthy green bark, and then paint over the wounds with Stockholm tar. Avoid over-manning the trees, as excessive nitrogenous manuring encourages "canker." To reduce the "scab," spray the trees in February with the copper sulphate solution (1 lb. dissolved in 25 gallons of water). If the fruits have been "scabby," spray the foliage with Bordeaux mixture just before and just after blossoming.

POISONOUS TREES AND SHRUBS: *Doubtful.* Some of the Rhododendrons are reputed to be poisonous, for example, R. maximum. Andromeda polifolia is poisonous to sheep, and so are the species of Kalmia (often called Laurel), hence the common name in the United States of "Lambkill." Yew is undoubtedly poisonous, but its effects are remarkably variable, and seem only to be shown when the animal takes it on an empty stomach. Possibly it is the same with the other plants. The common Laurel is poisonous. Although poisonous, these plants are largely planted, and from the fact that poisoning cases are very seldom recorded, there would seem to be very little danger from them. The Yew affords the commonest instance of animal poisoning in this country. The others are so unpalatable that probably animals would only eat them when pressed by hunger. At the same time it is not advisable to plant them extensively near sheep runs.

ROSE GROWING THROUGH A FUNGUS: *H. S.* The fungus is Polyporus spumosus. It is in not a parasite, but it has sprung from a buried bit of wood and accidentally enveloped the Rose stem.

STERILISED SOIL AND EELWORMS: *W. B. R.* If you will send us examples of the Beans and some of the soil we will examine them.

FLORENTINE FLOWERS.

FLORENCE in springtime well deserves its epithet of "the City of Flowers." The picturesque old town, its quaint streets, magnificent palaces and churches all seem wrapped in a mantle of flowers. Everywhere grows the Judas Tree (*Cercis Siliquastrum*), a beautiful thing with an unpleasant name, suggesting by its pink, pea-shaped blossoms a sunrise on the mountains. Great purple plumes of Wistaria, and, later, pendulous bunches of Grapes bedizen every loggia and cover every pergola. Pink and purple—what more is needed? White certainly, and perhaps yellow, not a bright golden-yellow, but a soft deep cream. That would complete the picture in the mind's eye. Look around—there are the Banksian Roses. They are rampant everywhere; they climb the highest houses, the tallest Cypresses. Even their own bright leaves are hidden by masses of tiny flowers like fairy foam.

If the town itself is so full of flowers, what of the country in the neighbourhood? The general visitor does not stop to consider. He is "doing" the place whilst on his way to Rome or the Riviera. There are certain pictures he has been advised to see in the Uffizzi, the Pitti and the Belli Arti galleries. He will certainly see those, but he will not go into the country for the pleasure of gazing on Nature's own pictures. The former are "to be done," the latter to be left unseen.

I have admired the Ghirlandaios, the Filippo Lippis. I have seen Botticelli's curious figures in "Springtime," and the gold backgrounds of the Fra Angelicos. I can now spare time for a holiday, so will go to look at Nature's own gallery.

From the Ponte a Mensola to Fiesole is a very beautiful walk. The most beautiful route is by the Castle of Poggio, which was the way I went to-day.

During my travels in Italy, it has seemed to me that every farm and every villa has its

own Lognat tree. "It is the same here," I thought as I wandered by the stream which is spanned by the Ponte a Mensola. On each side of the road were the high walls of the Olive yards, over which the grey leaves of the

FIG. 213.—ORCHIS FURFURCA (FUSCA) BEARING A FRESH INFLORESCENCE AND SEED-PODS FROM THE PREVIOUS YEAR.

gnarled trees peered. Those walls even were things of beauty. They were draped from base to summit with Ferns—mostly the Rusty-backed Fern (*Ceterach officinarum*), with its dull green upper surface and rusty-brown scales beneath. Equally common, too, were the Spleenwort (*Asplenium trichomanes*) and the ever-common *Polypodium vulgare*.

In the fields, the Anemones were nearly over. Can Anemones be as fine anywhere as they are in the Florentine fields? They are like Poppies in the fields at home, but great, strong Poppies, which blossom just as the Corn is above the ground, so that the little green shoots show off the multi-coloured flowers to the best advantage. The colouring appears to vary very much according to the locality in which they grow. At Settignano, near d'Annunzio's villa, they are mostly soft blue; out at Certosa, by the monastery, blossom the scarlet ones; in another place, they are nearly white, and, in still another, deep rich purple. Not only do the Poppy Anemones vary in colour, but also others. Up in the high woods, amongst the Primroses, the soft-blue *Anemone apennina* is frequently pure white, and might almost be mistaken for *A. nemorosa* of our own woods, with which it grows. The purple *Anemone pratensis*, which is in size about half-way between the other species, has finished flowering. Down in the Mugnone Valley, on rocky banks, it has been a gorgeous sight.

The Hellebores, both *Helleborus viridis* and *H. foetidus*, are over, but traces left beside the stream show that they have flowered splendidly. The Grape Hyacinths are too swifly following their example, so are the Tulips.

Until I first saw Tulips growing wild I did not admire them in the least. I had always considered them stiff and ungraceful. Yet how splendid they are in their native state among the sprouting Wheat! Three kinds grow here. My favourite is the dainty little Lady Tulip (*T. Clusiana*). The plant is now seldom to be met with here, though it is still occasionally seen in rarely-trodden paths.

The fields are past. We are now up in the woods, the beautiful Cypress forest of Vincigliata. Mrs. Browning described the Cypress as resembling "black flames." That, too, was an apt description, but I think "black spears" is more apt, for the Cypress branches seem to pierce the sky.

Under the Cypress, the Orchids are happiest, just as they are under the Aloes on the Mediterranean coast. There is a thick, matted scrub of Heather, Myrtles and Juniper, in the clearings of which the Orchid's blossom freely. There are masses of the Spider Orchid (*Ophrys aranifera*) with long flower-stalk and conspicuous ripening seed-pods. Here the Spider Orchids flower in early April, so that in May they appear as it quite overcome by the heat. That pale yellow one is *Orchis provincialis*. The flowers seem to have followed out the colour scheme started by the

FIG. 214.—CEPHALANTHERA ENSIFOLIA BEARING FLOWERS AND SEED-PODS.

oblong, pointed leaves, for they have the same little brown spots over them. *Orchis purpurea* (*fusca*) (see fig. 213) looks very boldly. The flower-stem, bearing blossoms with mulberry-coloured hoods and bright pink tongues, rises high above the glistening green

leaves. The little *Orchis Morio*, with its flower-head suggesting a deep purple Hyacinth, though the hoods are streaked with bright green, looks most humble by its side.

The flowers are not at their best near Temple Leader's mock-medieval castle. Too many parties of Cook's tourists drive there to see the interior, which is full of models of Cinque Cento furniture. We will not turn off to the left, as the smart carriages do on their way to Fiesole, but will go on past the real old

FLORENTINE FLOWERS.

FIG. 215.—SERAPIAS LINGUA.

Castle of Poggio and reach Fiesole by the longer and infinitely more beautiful road. But little traffic goes that way: just a few carts drawn by calm, cream oxen, and little dark-eyed children of the *contradimi*, who dash up demanding "Un soldo, signor."

Up to Poggio, from whence the many towers of Florence, the Duomo, Giotto's Campanile, the Palazzo Vecchio, with the silver thread of the Arno flowing between, are plainly visible in the valley, backed by the green hills. There the Orchids are at their best.

Has it ever struck the reader what a particularly horrible combination are purple and yellow? Let him try it in any paint or material he likes and see for himself. Yet look at those flowers there, the Meadow Orchid and the Orchid of Provence, deep purple and bright primrose-yellow. How well they look growing in the great drifts. They teach us a lesson as to the marvellous way in which Nature mixes the colours on her palette, and we realise how seldom she makes an error in the colouring of her groups. Ere they fade they are followed by crowds of *Serapias lingua* (see fig. 215), which the Ligurians appropriately call Hen's Mouth, though the botanical books name it the Tongue Orchid.

But what is that? An *Ophrys* certainly—but which? The flowers are large, though they are but few, and their colour is bright rose. The lip, too, is large—almost too big for so small a plant—oval, with three velvety lobes of a dull, greenish brown, spotted and striped with purple, with here and there a faint suggestion of cobalt-blue; the appendix is very small. It must be *Ophrys Bertolonii*. A distinctly interesting discovery, more interesting indeed than those delightful little Bumble-bees (*Ophrys bombylifera*), which I found in the park of Petraja. Later on come *Ophrys Arachnites* (see fig. 216), which somewhat resembles the Bee Orchis, but possesses a larger and very conspicuous appendix.

A little further along in the deep shade is another species, but this is easy to identify. The Monkey Orchis (*Orchis Simia*) can be distinguished because the flowers commence to open at the top of the stem instead of at the bottom. The petals are much finer and more curving, and it has several other points which vary, but the point of the opening of the flowers is the simplest. The lovely white spike of *Cephalanthera ensifolia* (see fig. 214), often mistaken for *C. pallens*, a common species at home, yet rarer here, appears from the mass of green.

A little further on, the forest has been cleared for some distance, for the people, with short-sighted policy, cut down the big trees which gave so much shelter, and in their place planted Olives. Many flowers are blossoming happily under the gnarled bowls of the Olives. The double Daffodils are over, but the bunch and the Poet's Narcissus (*N. Tazetta* and *Poeticus*) scent the air. The tasselled heads of *Muscari comosum* are in perfection, but *M. botryoides* is over, as are the Stars of Bethlehem. The Scillas are looking lovely; in the grass, shine the little lilac-blue heads of *S. verna*, and with them the somewhat coarse pyramids of *S. italica*, which now and then covers whole fields. Irises are blossoming on the wall-tops, but the Snake's Head Iris (*I. tuberosa*), which delighted me so much in March, has gone with the winds.

As we reach the Cypress forest and the main road again, the flowers diminish, and soon we arrive in Fiesole, with the straw-platters strolling about busy at their work, or sitting in the courtyards at the quaint old booms, the villas of the wealthy English and Americans, draped in Wistaria and Roses, and the gaily-dressed crowds taking tea outside the Aurora, looking down into Florence, from whence the electric trams climb the hill. W. Herbert Cox.

SOUTH AFRICA.

PHYLLOXERA.

In the issue for October 22 there appeared the following paragraph regarding the Phylloxera restrictions at the Cape: "We cite this example, not because of its intrinsic importance, but because it happens to be the most recent." This statement is somewhat misleading, seeing that the regulation referred to was promulgated over 20 years ago, when Phylloxera was first discovered here and endeavours were being made to eradicate the pest. It is still in force. The Government, however, reserves to itself the right to import vines from overseas at any time. *Eustace Pillans, Department of Agriculture, Cape of Good Hope.* [In speaking of the Phylloxera restriction as the most recent example of prohibition of importation of plants, we intended to refer not to the enactment of the law, but to the recent notification of its existence.—Eus.]

VEGETABLES.

EXTENSIVE CULTURE OF SEAKALE.

As showing how much the cultivation of Seakale has extended, it may be stated that Messrs. S. Bide & Sons, Ltd., Farnham, have 36 acres of land devoted to this crop at Farnham and in Lincolnshire. I remember, some years ago, seeing an acre of Seakale at Frogmore, and I thought how extensive was the growth of this vegetable for forcing purposes in the Royal gardens. Just imagine what 36 acres mean in the number of roots that area will produce: 20,000 plants are required to plant one acre, making a total of 720,000 for 36 years! This is an enormous quantity from one grower, and its cultivation entails much care and labour, a great amount of manure, and land specially adapted for its successful growth. Men of experience are required in the grading of the five classes of roots into which they are drafted, namely, Extra Selected, First Forcing, Ordinary Forcing, First-size Planting and Second-size Planting. Thorough preparation of the land is an important point in cultivation. Behind the plough a subsoiler is employed, which loosens the pan of soil below, rendering the percolation of water from heavy rains much easier. Planting is done in April. The thongs or pieces of root 6 inches long are first tied in bundles of 50 and laid in the ground,

FLORENTINE FLOWERS.

FIG. 216.—OPHRYS ARACHNITES.

being made airtight to induce the crown to callus. When the purple hue next the skin on the top of the root is visible, then is the time to plant, which is carried out by means of a dibber, just burying the crowns under the surface. As soon as growth is well started, the shoots are disbudded to one on each crown, reserving, of course, the most promising shoots. The ground is kept scrupulously clean during the summer, and the surface is stirred repeatedly. The varieties number three, the ordinary purple Seakale, Lilywhite, and Beddard's Improved or Solid Ivory. *E. Molyneux.*

CALYSTEGIA DAHURICA.

THOUGH not commonly cultivated and very little known, this species is a beautiful plant, and is as easily grown as the common Bindweed, to which it is closely related, though I have not discovered that it spreads to the same extent. It will grow up a wall many feet high, and a few years ago, at a spot near Cambridge, known as "Paradise," it formed a beautiful covering over the whole side of a house. *Calystegia dahurica* is figured in the *Botanical Magazine* as *Convolvulus dahuricus*, vol. 53, tab. 2609, and in the *Flore des Serres* (tab. 1075) under its present name. It is of the same habit as its beautiful white ally, the common White Bindweed, and, when not in flower, might be mistaken for it, but there is a coloration of the stem which often accompanies coloured blooms. The species is conspicuously distinct in its rose-pink flowers, the throats of which are white with five white radiating lines; but it is distinguished also by having the bracts of the flower proportionately broader and less acuminate, and by the possession of slightly hairy petioles and peduncles. Beside these differences, the nerves below are also very slightly hairy. The peduncles, further, are four-angled, and this character is the most absolute point of distinction. The leaves of the two species indeed are similar in appearance, but those of *C. dahurica* are usually narrower and more definitely pointed, being in fact acute or even acuminate, while those of *C. sepium* are usually obtuse though sometimes acute. I am indebted to Mr. E. J. Allard, now of the John Innes Horticultural Institute, for the photograph (see fig. 217), which was taken in the Botanic Garden, Cambridge. *R. Irwin Lynch.*

THE ALPINE GARDEN.

SAXIFRAGA CRUSTATA.

It is not surprising that the above name should have been given to one of the encrusted Rockfoils, but several species belonging to the section are much more encrusted with lime than this one. The linear leaves are slightly widened and very blunt at the tips, and this portion, extending downwards, sometimes for half the length of the leaf is free from lime and of a rich, glossy, dark green, except at the edges which are correspondingly bright and silvery, thus producing a pleasing contrast. The plant has a cheerful appearance during the winter months, when evergreen subjects on the rockery are highly desirable, particularly those with the neat habit of the encrusted Saxifrages. As a species, its position lies between *S. cochlearis* and *S. aizoon*, or some of the narrow-leaved forms of the latter, notably *S. A. pectinata*. The latter has very grey foliage at the present time, so that *S. crustata* may readily be distinguished from it by the characters above given, and by the fact that the leaves are finely crenate on the margins, whereas *S. A. pectinata* belongs to the group having serrated leaves. The rosettes have very short stems in the species under notice, and for that reason make very compact tufts of foliage. The flowers are white and marked with a variable number of red specks, but they are not numerous, by comparison with those of *S. cochlearis*. *J. Fraser.*

HORMINUM PYRENAICUM.

WHILST looking through a fairly reliable work on Alpine plants the other day, for the purposes of review, I was startled to find a remark made about *Horminum pyrenaicum* to the effect that it is "not a plant of easy culture." This is exactly contrary to my experience of well-nigh 30 years of the cultivation of this Alpine plant. But I am in entire accord with the accompanying remark in the work referred to that it is "not a plant of much value or interest." Yet it is so frequently offered in catalogues, that those

who observe the name may like to know something about it and its ways, and how it can be cultivated. To begin with, it is by no means specially pleasing with its spike of sparsely-arranged labiate flowers, about 9 inches or a foot high, raised from among a dense plant composed of longish, rough, wrinkled leaves, the spikes being even less plentiful than the dull-purple flowers. This is, indeed, one of the most marked deficiencies of the plant, and it is one which cannot be overcome. Yet it does produce flowers if cultivated in a place which is not too dry, yet not soaked with water. Nowhere does it do so well with me as on a level spot at the base of the rock garden. Probably, a good deal of the disappointment experienced with *H. pyrenaicum* is due to the fact that its preference for calcareous matter in the soil is not satisfied, although this is easily supplied by means

FIG. 217.—CALYSTEGIA DAHURICA: FLOWERS ROSE-PINK, WHITE IN CENTRE.

of some old mortar if limestone is not available. Yet it will shrivel up if this calcareous material renders the place too dry—at least, this is my experience.

But even with all the care we can give it, I confess that I cannot well understand the statement of an eminent Continental authority on Alpine flowers, who informs us that it bears "un épi de fleurs grandes." "Fleurs grandes" they are not, and I must demur to this enthusiastic estimate of their size.

The white-flowered variety of *Horminum pyrenaicum* is not a whit better, although scarcer, and I care little for it. Propagation is effected by means of division or seeds. Division may be performed at any time, and the seeds should be sown under glass in spring. *S. Arnott.*

CULTURAL MEMORANDA.

SCHIZANTHUS.

THE *Schizanthus* is one of the most useful of flowering plants for greenhouse and conservatory decoration on account of its light, graceful habit, its wonderful floriferousness, and the wide range of colours in the blooms. Plants may be had in flower nearly all the year round, but they are especially valuable in spring time. The cut blooms are valuable for dinner-table decorations. August is soon enough to sow seeds for plants intended to flower in spring. They should be sown in pans or boxes, and placed in a cold frame to germinate. The seedlings should be transplanted when large enough to shift, placing four in a 3-inch pot. The pots in which they are grown should be placed on a shelf in a cool house. As soon as the seedlings are well rooted they should be snifted into 6-inch pots, using a compost consisting of two parts loam and one part leaf-mould, with the addition of a little silver sand or road grit. Endeavour to promote a sturdy, vigorous growth, and pinch out the tips of the shoots to induce a bushy habit. Dwarf sorts, such as *Wisetonensis* and *retusus*, will not need larger pots than those of a diameter of 6 inches, but such free-growing kinds as *pinnatus* may be potted into 10-inch pots to form specimens 8 feet high. Large plants such as these are especially useful for placing in corridors. Do not pot the plants too firmly, as this is detrimental to their free growth. When the plants have been freshly potted afford water with care, it being advisable to keep them a little on the dry side until they are well rooted. Although it is desirable to allow plenty of ventilation, the plants are liable to attacks of mildew if fresh air is carelessly admitted. Should mildew appear, fumigate the house with sulphur. It is beneficial to syringe between the pots on bright days, and a light spraying overhead in the afternoon is often advantageous. When the pots are filled with roots a light dressing of some suitable fertiliser should be given occasionally. Soot water and farmyard liquid manure are valuable stimulants, and they may be mixed together. The *Schizanthus* makes an excellent basket plant. *J. Gardner, Batsford Park Gardens, Moriton-in-Marsh.*

TREES AND SHRUBS.

THE EUROPEAN BLACK POPLAR.

THE *Populus nigra*, of Linnaeus, is a very scarce tree at the present time in British gardens and plantations, where its place has been usurped by the Black Italian (*P. serotina*), reputed to be a hybrid between the European and the American Black Poplar (*P. deltoides*). Being the result of a first cross, the Italian Poplar possesses enormous vigour, and grows with remarkable rapidity. This fact weighs with many people, who plant it in situations, where it has to be severely lopped or even topped in the course of a few years. It is really a first tree, and should be planted only for timber or in large parks, where there is plenty of room to develop. The European Black Poplar grows more slowly and produces a wealth of twigs and foliage by comparison with its congener. For this reason, I would give it the preference, where Poplars are desired in confined areas. Many people are fond of this class of tree, judging from the frequency with which the Black Italian occurs in gardens of quite limited dimensions. This taste could well be served by the European Black Poplar, because, although the leaves are smaller, they are twice as numerous in a given space, especially on young trees, and equally so at the extremities of the branches of old trees. In the course of observations in four counties during the past season, I have noted only four patriarchal trees of *P. nigra*, and one of them at least was *P. nigra* var. *betulifolia*, and seven or eight trees of smaller dimensions, most of them being relatively young. *J. Fraser.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By A. R. SEARLE, Gardener to the Marquis of Northampton, Castle Ashby, Northamptonshire.

Hardy vines.—If Grape vines are grown out-of-doors for the production of Grapes, or for the effect of the highly-coloured foliage in autumn, an annual system of pruning is necessary. This pruning may now be carried out by means of a very sharp knife. The lateral growths should be cut back to two buds, and the leading growths required for extension or for replacing older rods should be cut back to within 2 or 3 feet from their base. In order to prevent bleeding, a little painters' knotting should be applied on the cut surfaces. Whilst the canes are loosened from the supports, they should either be washed with Gishurst Compound, or painted over with a mixture of flowers of sulphur and soot, using equal portions of each, as a preventive of both red spider and mildew. The walls should be syringed with a similar mixture. If it is desired to propagate any of the varieties, it will be necessary to select well-ripened shoots for this purpose. These shoots should be cut into short lengths, holding three or four buds each. Remove the lower one with a clean cut, and insert the cuttings singly into 4-inch pots filled with good loam and a liberal sprinkling of sharp sand. Make the cutting quite firm in the pot, and plunge the pots in the open border about 1½ inch below the level of the surface soil. They may remain there until next planting season, and, at that time, they may be planted in the requisite positions.

Raspberries and Blackberries.—If the old fruiting canes were cut out soon after the last crop was gathered, the best of the new canes may now be fastened securely to the wires or stakes, cutting out all the weak canes and any above the number required to thinly furnish the supports, taking every care to prevent overcrowding. When the training is completed, the surface soil should be lightly pointed over with a fork, then apply a liberal mulch of decayed farmyard manure. Loganberries and Blackberries may be treated in a similar manner.

General work.—Examine the grease bands on the tree stems occasionally, and smear with fresh grease any that require this attention. The cleansing of trees should be pushed forward without delay, so that it may be completed early in the New Year. All trees affected with mussel or brown scale should be sprayed with the caustic soda solution, choosing a calm day for the operation, and taking care to wet every part of the branches. Ventilate the fruit-room on all favourable occasions, examine the fruit frequently, and remove any that show the least signs of decay.

THE KITCHEN GARDEN.

By JOHN DUNN, Kitchen Gardener Foreman, Royal Gardens, Windsor.

Mushrooms.—Collect sufficient horse-droppings for making successional beds and place the droppings in a dry, open shed, where they can be turned frequently before they are removed to the Mushroom house. They should be allowed to remain in the house for a few days before they are made firm by ramming. The beds at this season should be at least 15 inches in depth, so that they may retain heat for as long a time as possible after spawning, which should take place when the temperature of the bed is at about 80°. The atmosphere of the house from which supplies are being gathered should be kept as near 55° as possible; very little water will be necessary beyond dampening the floor and walls of the house when the surfaces become dry.

Cauliflower.—A sowing of some early variety of Cauliflower may be made as soon as possible, especially if the stock of autumn-sown plants is limited. The seed may be sown either in boxes and placed in a greenhouse, or on a prepared bed in a pit. In the latter case the bed should be near to the glass, and the seed should not be sown too thickly or spindly plants will result. When the seedlings are large enough to be handled, they may be transplanted into boxes or frames, putting them at 2 inches apart. A little later, they may be potted into large 60 pots (3 inch pots), this being the best means of prevent-

ing a check occurring when the plants are put out in April. Early Market and Magnum Bonum are good varieties for this sowing.

Seakale.—The present is a good time to make preparations for raising next season's plants by making cuttings from portions of the roots which should be selected when the crowns are lifted for forcing purposes. These cuttings should be 6 or 7 inches long and as clean and straight as possible. They should be laid on the ground in a horizontal position and covered with 6 inches of sandy soil until the beginning of April, when they will have made sufficient growth to enable the cultivator to plant them in their growing quarters. Seakale delights in a deep, rich soil, and this should be trenched and prepared as soon as possible for those plants intended for forcing in pits or houses. A distance of 2 feet should be allowed between the rows and 15 inches from plant to plant.

Rhubarb.—The ground for this crop should be trenched as soon as possible, and a good dressing of farmyard manure thoroughly mixed with it as the work proceeds. Planting may take place in the month of March, if the weather is favourable at that time.

Potatos in pits.—The first planted Potatos will now be showing above the ground. The pits should be freely ventilated during mild weather to keep the plants from becoming drawn; the temperature should not exceed 45° at night with a little air. Another plantation should be made at once, so that an unbroken supply may be obtained from the time when lifting begins. Water should be applied only very sparingly, and the first watering should not be necessary until the plants are a few inches high, provided the soil is moderately moist at the time of planting.

Early Peas.—A sowing of some approved early variety may be made at once. The best and safest way is to sow the seeds in small pots, placing the pots in a cold pit until March, when the young Pea plants should be carefully planted on a warm, south border. In the meantime, care must be taken that they do not become drawn, owing to insufficient ventilation. Where large supplies are necessary, a sowing may be made on a south border as early in the year as the state of the weather will permit.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower to Sir Trevor Lawrence, Bart., Burford, Surrey.

Calanthe, Phaius and Phaius Calanthe.—The early-flowering varieties of the *Calanthe* *vestita* section, and their hybrids form the principal attraction in the Orchid house at this season. When the plants have done flowering and the flower-spikes are removed each pseudo-bulb should be thoroughly cleared of the white and brown scale insects which frequently infest them. As these plants require a period of rest, they should be placed close to the roof glass on a dry shelf, free from drip, and they will not need any water until after they are again repotted in the spring. As they come from very hot countries, the plants should be kept in a warm house or pit during the resting period. The late-flowering varieties, as *C. Regneri*, *C. Stevensii*, *C. Sandriana*, and others like *C. Turneri* and *C. nivalis*, are sending up their flower-spikes, and will require to be kept moderately moist at the root till the flowers open. *C. veratrifolia*, *C. Sandriana*, *C. Masuca*, *C. Celsii*, and *C. Dominiana* are now in full growth, and should be given a rather shady position in the Cattleya house. Afford the plants plenty of water at the root, damp well between the pots several times each day, and apply an occasional spraying overhead with tepid rain-water. The Japanese sorts, as *C. japonica*, *C. citrina*, *C. discolor*, and *C. tricarinata*, which are now making growth, succeed better in the extra warmth of the Cattleya house during the winter months, but in summer they prefer a cool, intermediate-house temperature. Such species as *Phaius bicolor*, *P. Sandriana*, *P. Wallichii*, *P. Mishmonensis*, *P. Blumei*, *P. grandifolius*, *P. flavus*, *P. maculatus*, and the new *P. Cooperi*, also the hybrids *P. Cooksonii*, *P. Normanii*, *P. Martini*, *P. anabilis*, *Phaius Calanthe Arnoldii*, *P. C. irrorata*, *P. C. Sedeniana*, and *P. C. Colmanii*, should also be grown in a shady position

in the Cattleya house the whole year round. These evergreen plants, being in full growth at the present time, require liberal supplies of water. Some few are already showing their flower-spikes, and after these fade, the plants will need a short rest, but even then the compost must not be allowed to become very dry. The plants may be potted when they recommence to grow, if this is necessary; they require a well-drained compost of fibrous, yellow loam, *Osunda* fibre, and *Sphagnum*-moss cut up moderately fine and mixed well together, potting them like any ordinary greenhouse plant.

Vanda.—*V. Watsonii* grows well at the cool end of the Cattleya house, and is now in bloom with fine spikes of pretty white flowers, which last a long time in perfection. During the growth of this species, the surface moss should be kept in a freely-growing condition, but after the spikes are cut the water supply should be lessened, but not greatly so, or the lowermost leaves will shrivel and fall. *V. Kimballiana* should receive similar treatment. *Vandas* of the *V. tricolor* section now growing fast should be kept well supplied with water, principally on the surface of the moss, and any recently-potted plants that show flower-spikes before they are well rooted should have the spikes removed. Admit plenty of fresh air. Keep their surroundings always moist, and entice as many of the new roots down into the compost as possible.

Catasetum, &c.—Such deciduous Orchids as *Catasetum*, *Cycnoches*, and *Mormodes* require a decided rest in the warm house, and as soon as the leaves turn yellow and begin to fall, the plants should be kept well on the dry side; if the pseudo-bulbs have been properly ripened, they will need only a very little water for several months.

Chysis.—The different species of *Chysis* and their hybrids rest well in the Cattleya house if kept moderately dry at the root. When growth recommences, do not afford water too soon, but keep the compost rather dry till the flower-spikes are seen pushing up with the new growths.

Thunias.—Keep the *Thunias* at rest with the *Dendrobiums* in the cool resting-house. These plants have now lost their leaves, and the old pseudo-bulbs being shrivelled and useless, they should be cut down at the base or pulled out of the pot; then tie the stems of the current season clear of each other, so that each will be exposed to the light. At the present time there is very little potting to be done, therefore a good opportunity is afforded for the grower to overhaul the entire collection, and to clean and re-arrange the plants. Clear the remains of old flower-spikes from each plant, tie up any loose or straggling growths, wash the leaves, and remove mealy bug and scale from the pseudo-bulbs. In re-arranging the plants, see that the larger specimens are not allowed to shade the smaller ones.

Odontoglossum.—The *Odontoglossums* are now sending up many flower-spikes, and the plants should be constantly examined for slugs. Wrap a piece of wadding around the spikes of valuable plants, and set baits of Potato, Apple, or green vegetable. Apply beetle poisons in the warmer houses for cockroaches and crickets.

FRUITS UNDER GLASS.

By B. GOODACRE, Gardener to Sir Ernest Cassel, G.C.B., Moulton Paddocks, Newmarket.

Late Grapes.—The Grapes should now be cut from the vines, and those not required for immediate use preserved in the usual method by means of bottles of water, placing a few pieces of charcoal in each bottle. Arrange the bunches so that they hang clear from each other and the glass. The fruit-room in which they are stored should be dry, free from draughts, and not colder than 40°. Directly the Grapes are cut, the vines may be pruned, cleaned, and made ready for starting afresh.

Pot vines.—When the plants show signs of growing, raise the temperature of theinery, and, when the leaves begin to expand, maintain a night temperature of 55° to 60°. The warmth of the house should, to a certain extent, vary in accordance with the weather conditions outside, remembering that it is better to avoid using excessive fire heat, especially at night time, as it

tends to weaken the growth and encourages insect pests. When the shoots have made a growth of about 2 or 3 inches, unfasten the canes, and arrange them in their proper positions on the trellis. Continue to spray them freely once each day with tepid water whenever the weather is favourable, until the vines are in flower. Do not disbud many of the shoots until it can be determined which are carrying the best inflorescences. On every opportunity, when the conditions permit, admit a little fresh air, as a confined and close atmosphere would cause the young shoots to become weak and flabby.

Early vinery.—Vines which were started last month will soon be breaking into leaf. Add fresh materials to the hotbed occasionally, so that it may continue to give off a gentle heat and moisture until the vines are well started.

Cucumbers and Melons.—Seeds of Cucumbers and Melons may be inserted for raising batches of plants for early fruiting. Sow the seeds singly in small pots, and plunge the pots in a brick bottom heat. The houses in which early crops of

THE FLOWER GARDEN.

By E. BECKFITT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Hertfordshire.

The shrubbery.—I would again urge the inclusion of some of the choicer shrubs instead of duplicating uninteresting clumps of such sorts as Yew, Box, and Laurel, although these species should be given their place in proper proportion, being specially serviceable for planting in sunless positions, or in the shade of trees, or for screening unsightly buildings. There is a wide selection of hardy shrubs that will succeed in any part of the country, and they may be procured at a reasonable cost. Straggling plants of any common shrubs should be cut down, and the roots grubbed up, taking the opportunity thus provided to improve the soil by trenching it, and, if it is of a heavy nature, working in plenty of decayed leaves, and other vegetable refuse. In soils of a cold, retentive nature it is desirable to form beds above the level of the surroundings, and carry out the planting only when the ground is in a suitable condition. It is essential to observe this when

including *B. v. magnifica*, *B. v. Veitchii*, and *B. v. Wilsonii*.

Hamamelis mollis.—This beautiful shrub is now unfolding its delicate, yellow flowers. It is much the best garden species of *Hamamelis* that I know, for it possesses the largest and finest-coloured flowers, whilst the large leaves are very attractive in summer time. Being of somewhat slow growth, the plant should be given a favoured situation, although it is quite hardy.

General work.—Get in a state of readiness plenty of dry litter or other material suitable for protecting tender plants from excessive cold, as the weather is almost sure to set in frosty after the turn of the year. In the event of snow falling, see that it does not accumulate on the choice evergreens, or the weight may cause some of the principal branches to break. Violets in frames should be examined, removing dead or decaying leaves and loosening the soil. Afford water to the plants with care, but in most cases moisture will be necessary in the case of those plants nearest the hot-water pipes. Ventilate the house freely on every suitable occasion, and see that the glass is thoroughly clean. It frequently happens that, when frames containing plants are covered up for some time, rats and mice become troublesome, for, when pressed by hunger in cold weather, these rodents will devour plants and almost anything else.

PLANTS UNDER GLASS.

By JOHN DONOGHUE, Gardener to JOSEPH PICKERSGILL, Esq., Bardon Hill, Westwood, Yorkshire.

The Conservatory.—Cyclamens are now effective, and the flowering may be prolonged if a light dressing of some fertiliser is applied to the roots. The paper-white *Narcissus* has furnished a bright display of flowers, and this batch may be followed by the variety *Cervantes*, which is one of the best sorts for flowering at Christmas time. The blooms resemble those of an early type of *Trumpet major*, but the plants are more reliable, and flower with greater freedom. Another useful *Narcissus* for forcing is the variety *Golden Spur*, which generally comes into bloom about the second week in January, thus providing a succession. The forced Tulips such as *Duc van Thol* have been very successful, and *Proserpine* and *Montesor*, which is almost ready for cutting, will be succeeded by *Vermilion Brilliant*.

Schizanthus.—Plants of *Schizanthus* should now be ready for their final potting, using receptacles according to the size and strength of the individual plants. In most cases those of 8 or 9 inches in diameter will be large enough. They should be thoroughly cleansed and dried before being used, and each should be provided with ample provision for drainage. The compost should be rather lumpy in texture, and it may consist of fibrous loam mixed with leaf-mould, some manure from a spent Mushroom bed, and a little charcoal and sand to keep it porous and sweet. Afford the plants a light position, where they can be freely ventilated, as the *Schizanthus* is a sun-loving plant growing sturdy and robust, and producing blooms of the brightest colours when exposed to sunshine. Some of the varieties, including *S. retusus* and *S. Grahamii*, are useful for furnishing cut blooms.

Lilium Harrisii.—Bulbs of this Lily imported from the Cape are producing an excellent display of showy flowers. Successional batches may be introduced into heat and gently forced. The pots may be filled with a top-dressing of fibrous loam and peat, with which is mixed some dried cow manure. When the flower-buds appear the plants may be further assisted by applications of liquid manure from the farmyard.

Lilium speciosum.—The varieties of *L. speciosum* known as *Melpomene* and *Kraetzleri* should be selected for potting, placing the bulbs low in the pots, as previously recommended in the case of *L. Harrisii*. Place the pots in a cool greenhouse until the bulbs commence to grow. Take measures to destroy aphides, which are a troublesome pest to most species of *Lilium*.

THE SAXIFRAGAS OF THE MARITIME ALPS.—

In a note from the well-known French botanist, Dr. A. ARBOST, he states that *S. lingulata* var. *Bellardii* grows naturally in wet situations, and that *S. lantoscana* loves dry and hot places.

[Photograph by John Gregory.]

FIG. 218.—CYPRIPEDIUM "GASTON BULTEL": A RICHLY-COLOURED VARIETY WITH ROSE-COLOURED DORSAL SEPAL.

(Received R.H.S. Award of Merit, December 21. See p. 475 ante.)

Melons and Cucumbers are grown are often utilised during the winter for the housing of stove and greenhouse plants: these must now be removed. When the houses are empty, give them a thorough cleansing, paying particular attention to joints in the trellises and other places likely to harbour insect pests. As the scrubbing brush will not reach such places, paraffin should be worked into them by means of a small brush. Prepare the materials for the hotbeds, turning the leaves and manure a few times, at intervals of five days or so, before treading or beating them firmly into beds. Place the soil in position to become warmed to the same temperature of the house, before the plants are inserted.

Tomatos.—Sow seeds from this date, at intervals, for successional batches, using pans filled with light soil and placing them in a temperature of 65°. Do not allow the seedlings to become drawn or spindly which commonly occurs with seedling Tomatos that are neglected.

planting small specimens. In the case of large shrubs, holes should be made sufficiently large to accommodate all the roots. Directly planting is done, see that proper stakes are provided such as will keep each specimen in a rigid condition.

Choice shrubs.—The following shrubs have been added to the collection at Aldenham during the past few years, and, until the present, all have proved hardy and satisfactory:—*Berberis Wilsonae*, *B. Gaucapanni*, *B. acuminata*, *Cotoneaster humifusa*, *C. rugosa*, *Henryi*, *C. applanata*, *Davidia involuerata*, *Deutzia discolor major*, *Hydrangea alba grandiflora*, *Hex Pernyi*, *Cocculus heterophyllus* (a climbing species), *Clematis nutans*, *C. Armandii*, *Spiraea Wilsonii*, *S. Henryi*, *S. Veitchii*, *Stranvesia undulata*, *Viburnum coriaceum*, *V. rhytidophyllum*, *V. Henryi* (very effective when in fruit), *Decaisnea Fargesii*, *Lonicera Maackii*, *L. pileata*, *Populus lasiocarpa*, *Symphoricarpos mollis*, *Rosa Morzesii*, and many beautiful forms of *Buddleia variabilis*,

EDITORIAL NOTICE

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITORS, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but they cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

SALES FOR THE ENSUING WEEK.

MONDAY AND FRIDAY—

Herbaceous and other Plants and Bulbs, at 12; Roses, Azaleas, &c., at 1.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

WEDNESDAY—

Border and other Plants and Bulbs, at 12; Roses, at 1.30; Palms and Plants, at 5; Japanese Lilliums, at 2.30; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY—

Imported and Established Orchids, at 67 & 68, Cheapside, E.C. by Protheroe & Morris.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich—39.2°.

ACTUAL TEMPERATURES:—

LONDON.—Wednesday, December 28 (6 P.M.): Max. 39°; Min. 28°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 29 (10 A.M.): Bar. 30.2; Temp. 45°; Weather—Fair.

PROVINCES.—Wednesday, December 28; Max. 45° Ireland West; Min. 37° England East.

The Passing Year.

The publication of the present issue marks the close of a year memorable to this country for the death of its greatly-beloved sovereign King Edward VII.—the Peacemaker. We recall the fact that this national calamity happened at the commencement of the season, with a suddenness that convulsed the whole Empire. Horticulturists, in common with other loyal subjects of his late Majesty, were led to cancel certain public appointments and postpone others, for his death cast a gloom over all. King Edward's memory will be held in affection by gardeners, for the personal interest he showed in the management of his private gardens at Sandringham and the State gardens at Windsor. His general interest in horticulture was testified also by his patronage of the Royal Horticultural Society, and particularly by his gracious act in opening the Society's new hall at Westminster in the presence of Queen Alexandra and other members of the Royal family.

THE HARDY FRUIT CROPS.

In some respects the horticultural crops of the year 1910 have not been altogether satisfactory. The reports upon hardy fruits furnished us by correspondents in all parts of Great Britain and Ireland were amongst the most disappointing we have published for many years. Apples, Pears, Plums, and Cherries, but particularly Apples and Pears, were greatly deficient, and cultivators generally experienced something very nearly approaching a fruit famine. The only crops that amounted to average yields

were those generally termed small fruits, such as Currants, Gooseberries, Raspberries, and Strawberries. The summer was characterised by dull, sunless weather and low temperatures, and these conditions must certainly have had some influence in determining the crops. At the same time, the unfavourable conditions which obtained in 1909 must be borne in mind, for the summer in that year was not remarkable for much sunshine. In our issue for December 25, 1909, we had occasion to refer to this aspect of the season, expressing the opinion that the failings of the season of 1909 would have a bad effect on the fruit crops in the following year, owing to the trees and buds being less well-ripened than usual. The fruit crops are, in this respect, very different to the annual vegetables of the kitchen garden, which, to a much larger extent, are merely dependent upon the atmospheric conditions of the season in which they are cultivated. In view of these facts, it should afford cultivators some consolation that the weather in September and October was drier and brighter than that which prevailed during the summer months; therefore the conditions prevalent in the early autumn were such as are calculated to produce fruitfulness next season. Most of the vegetable crops were satisfactory, particularly the root crops and the various sorts of Brassica, but the unusually moist atmosphere caused disease to develop in Potatoes early in the season.

ROYAL HORTICULTURAL AND KINDRED SOCIETIES.

The Royal Horticultural Society has not only held its usual fortnightly meetings, but also large summer exhibitions in the Temple Gardens and at Holland Park, Kensington. In connection with the latter event, it may occur to our readers that the Society was allowed the use of the Holland Park grounds last July, on the understanding that the privilege could not be granted in the future. In these circumstances, the thanks of the Fellows will be accorded to Mary Countess of Hechester for the great kindness and favour she has shown the Society for some years past. The ample room available at Kensington has enabled the Council to arrange for exhibitions which were remarkable for larger groups than are possible in the restricted spaces at the Temple, whilst the privilege of inspecting the private gardens has always been an additional attraction of these shows. In the autumn, the Royal Horticultural Society revived the annual exhibition of British-grown fruits by holding a display which was satisfactory for such a season as 1910, and this was followed first by an exhibition of vegetables and later by a show of Colonial fruits in which British Columbia exhibited such a magnificent display of Apples as London has never before witnessed. Various improvements have been carried out at Wisley, including the building of an Orchid house and the making of proper provision for housing the young gardeners. Three volumes of the Society's *Journal* have been published, and the Narcissus Committee has issued a revised system of classification for Daffodils to supersede a scheme which, published in 1909, failed to obtain the general approval of those most interested in this popular flower. The number of Fellows has in-

creased, and the Society continues to enjoy a most satisfactory measure of prosperity. On behalf of our readers we offer congratulations to the esteemed President, Sir Trevor Lawrence, who celebrated his 79th birthday yesterday.

Turning from the premier horticultural society to the special societies, we find that the efforts of the parent society for spreading horticultural interests have been supplemented by a great amount of strenuous work. The National Rose Society has again increased its prestige and power by enrolling nearly 800 new members and by adding £250 to its reserve fund, notwithstanding the large amount of money now expended upon publications and upon three competitive exhibitions. The National Sweet Pea Society has added £50 to its reserve fund. Its various committees have done useful work in judging and classifying new varieties and in offering advice to Sweet Pea cultivators upon the important question of discarding certain sorts which are no longer desirable, owing to the advent of novelties possessing superior qualities. The National Chrysanthemum Society has held two successful exhibitions and a conference, and there are indications that those responsible for the management of the affairs of this old-established Society will succeed in improving its prospects. The National Dahlia Society, National Carnation and Picotee, National Auricula and Primula, and the Perpetual Flowering Carnation Societies have held exhibitions of the various flowers in which they are interested, and the National Vegetable Society has held its first annual show. The report of this new Society, presented at the annual general meeting, showed that a large measure of support has been obtained for the purposes the Society seeks to promote; various trials have been conducted, and, if these have been subjected to some criticism, nevertheless, they are sufficiently valuable to indicate that the general lines on which the Society is managed are such as will commend it to the favourable consideration of the public. The exhibition was a very satisfactory display for a first effort, and it may be improved upon when the Society is placed in a position of greater independence. One new "National" has been promoted during the year. This is termed the National Hardy Plant Society, but its purposes appear somewhat indefinite. The title is sufficient to include every flowering tree or plant possessing sufficient hardiness to succeed in this climate, but, seeing it has been announced that all annuals are to be excluded from the Society's interests, it may be necessary to modify the title when it is shown that the movement is likely to gain public support.

THE PROVINCES.

Most of the provincial societies have succeeded in maintaining public interest in the exhibitions, particularly those at Shrewsbury, York, Edinburgh, Dublin, Belfast, and Wolverhampton. The horticultural show held in conjunction with the exhibition of the Royal Agricultural Society's exhibition at Liverpool was one of the brilliant displays of the year.

The proposed union of the two leading Scotch societies has not yet been accomplished, but we have reason to hope that the movement

is gaining increased support. Increased horticultural interest has been noticed in the northern counties of England, and the great fruit exhibition and conference held at Hexham, under the auspices of the four most northern counties, was so successful that it is proposed to hold similar events next year, and in 1912 at Carlisle and Newcastle. The Rev. J. Bernard Hall deserves the thanks of all hardy fruit cultivators in those districts for his successful efforts to spread reliable information amongst those directly concerned in the cultivation of the soil.

Our own columns have borne testimony to the desire of the Yorkshire gardeners to possess a powerful society having its headquarters at Leeds. According to present information, every effort will be made to realise this ambition. A committee has been appointed, and steps have been taken to obtain a suitable secretary.

INTERNATIONAL EVENTS.

Amongst the chief events on the Continent, there have been the charming exhibitions of the Dutch Bulb Growers' Association at Haarlem in celebration of the society's jubilee, the horticultural displays at the Brussels International Exhibition, the two international exhibitions at Paris, the Louis van Houtte centenary celebrations at Ghent, and the unveiling of Mendel's monument at Brünn. Horticultural and botanical congresses have been held at Brussels, and Rose and Chrysanthemum congresses in Paris. All these important functions were attended by visitors from this country, and in some cases the Royal Horticultural Society was represented by deputations.

It is a matter for satisfaction that, during the present year definite steps have been taken for holding an international exhibition in London in 1912. On that occasion it is hoped that we may have the privilege of welcoming numerous visitors from all parts of the world, and of showing them the development of horticultural practice in this country. Having written at some length on the subject in a recent issue, we may now merely express the hope entertained by British gardeners that the congress which is to be held in connection with the exhibition will obtain the sympathetic support of horticulturists from every part of the globe.

Reference must be made to the opening of the John Innes Horticultural Institute at Merton, where Professor Bateson is expected to carry out researches which may have a great influence on the future of British horticulture. Such problems as, for example, inheritance, require much time for their elucidation, but they are closely associated with the aims of the breeder and cultivator, and any definite information that is gained concerning them will be welcomed by practitioners.

NEW PUBLICATIONS.

The output of horticultural literature appears to increase each year. Amongst the new journals may be mentioned the *Orchid World*, issued in October last, and the *Journal of Genetics*, referred to in our last issue. The Duke of Bedford and Mr. Spencer Pickering continue to issue valuable reports of the experiments at the Woburn Experimental Fruit Station. The twelfth report possesses unusual interest to cultivators, owing

to the light it sheds on the disease known as "silver-leaf." The most notable amongst the new books is the sumptuous work *The genus Rosa*, issued by Miss Willmott; this has but few equals in gardening literature; but, unfortunately, its cost will prevent the work getting into the hands of the general public. Amongst other notable books may be mentioned the concluding volume of *The Book of Nature Study*, edited by Dr. Bretland Farmer; a history of *Gardening in England* by Miss Amhurst; Volume V. of *The Trees of Great Britain and Ireland*, by Mr. H. J. Elwes and Dr. Henry; *Agricultural Bacteriology*, by Professor John Percival; *A Handbook of Tropical Gardening and Planting*, by Mr. H. F. Macmillan; *Alpine Flowers and Gardens*, by Mr. S. Flemwell; *Rock Gardens: How to Make and Retain Them*, by Mr. Lewis B. Meredith; and the *Present-day Gardening* series of horticultural books, including volumes on Sweet Peas (H. J. Wright), Pansies, Violas and Violets (Mr. W. Cuthbertson), Daffodils (Rev. J. Jacob), Orchids (James O'Brien), and Root and Stem Vegetables (Alexander Dean).

OBITUARY.

The obituary list is unusually heavy, and it includes the name of Baron Schroder, whose memory will be very jealously kept by every horticulturist in this country. It will be remembered that the Royal Horticultural Society has established a perpetual pensionship in the Gardeners' Royal Benevolent Institution to be known as the "Schroder" pension. Then there are the names of Sir Charles Strickland and Dr. C. B. Plowright, two of our oldest contributors, also such scientists as Dr. J. B. Carruthers, Dr. M. Treub, Professor Hillhouse, George Sharp Saunders, Max Leichtlin, Dr. Theodore Cooke, and William Rogers Fisher.

Ernest Calvat, whose death is a great loss to French horticulture, was one of the most renowned raisers of seedling Chrysanthemums.

The ranks of practical gardeners and nurserymen have been thinned by the deaths of such well-known men as John Simpson, J. McIndoe, R. Wilson Ker, W. J. Nutting, John Garrett, William Culverwell, W. Denning, Henry Cannell, Jun., H. A. Tracy, and Robert R. Mawson.

OUR ALMANAC.—We shall shortly issue a *Gardeners' Chronicle Almanac* for the year 1911. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents, will send us **IMMEDIATE INTIMATION** of all fixtures for the coming year.

OUR SUPPLEMENTARY ILLUSTRATION.—Japan and Japanese gardens have been prominently before the public notice during the year that closes to-day, and on more than one occasion in 1910, we have given views of Japanese gardens in their full glory in summer time. The present Supplementary Illustration shows a portion of the YOKOHAMA NURSERY COMPANY'S ground after a snowstorm. Japan being often referred to as a land of sunshine, people are apt to forget that the country enjoys a climate somewhat similar to our own, with frost and snow in winter. For this reason most of the introduced plants from Japan succeed in British gardens. A reference to the picture shows that the snow has not entirely obliterated the characteristic

scenes in this Japanese garden, for it is easy to recognize the stepping-stone path, stone lanterns, pendulous trees, old and gnarled specimens in porcelain pots, the pool of water with rock-lined margin, and the native building.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees of this Society will take place on January 3 at the Society's hall, Vincent Square, Westminster.

"THE BOTANICAL MAGAZINE."—The issue for January contains illustrations and descriptions of the following plants:—

DENDROBIUM BARTOISIANUM, tab. 8352.—This species was originally described in the *Gardeners' Chronicle*, by Mr. WILDEMAN in the issue for June 16, 1906, p. 330. The illustration in the *Botanical Magazine* presents a very showy-flowered plant, the blooms being palest yellow, tinged with rose, and with streaks of purple on the lip. The species is a native of the Indo-China region, but the exact locality has not been determined, although it is said to occur about 1,750 feet above sea level. The plant is grown in the tropical house at Kew under conditions such as are afforded *D. nobile*.

CLADOTHAMNUS PYROFLORUS, tab. 8353.—This shrub is a native of Alaska, and although it is said to flower several weeks in succession in summer time it is seldom met with in gardens. The blooms are a suffusion of red on yellow, with bright red stamens. The plant is said to succeed under conditions suitable for *Rhododendron hirsutum*, and it attains a height of from 4 feet to 10 feet.

AQUILEGIA FLABELLATA VAR. NIVEA, tab. 8354.—As represented in the illustration not only the flowers, but the leaves also are very pale in colour. By some authorities the plant is regarded as a variety of *A. siberica*, but as it has shorter stems, larger cauline leaves, and the limb of the petal not much shorter than the sepal, it has been made a distinct species. The plant from which the illustration was prepared was grown in a mixture of loam and peat in Canon ELLACOMBE'S garden at Bitton, Bristol.

ASTER FALCONERI, tab. 8355.—This species was figured and described in *Gardeners' Chronicle*, June 18, 1910, p. 399, fig. 179, from a specimen grown by Mr. WILLIAM MARSHALL, chairman of the R.H.S. Floral Committee, and from a plant growing in the rock garden at Kew.

PHAEDRANASSA CARMIOHII, tab. 8356.—The *Phaedranassas* are not often met with in cultivation, although *P. chloracta* is sometimes grown in gardens, where it shows considerable difference in the size and colour of the flowers. To this rather variable species, *P. Carmiohii* has close affinities. The scape, which grows about 2 feet high, bears about half a dozen drooping, tubular flowers. The funnel portion, representing about two-thirds of the bloom, is scarlet, and the remaining third greenish, with yellow margins. The plant from which the *Bot. Mag.* figure was prepared, flowered in Mr. GUMBLERON'S garden at Queenstown, Ireland, and is said to thrive in a cool stove. The plant is deciduous, and needs resting after the leaves decay; when growth commences afresh, the flower-spike opens first, although the leaves develop while the plant is still in bloom.

THE SCOTCH RAILWAY DISASTER.—We regret to learn that Mr. ANDREW MAIR, son of Mr. GEORGE MAIR, of the firm of Messrs. G. MAIR & SON, nurserymen, Prestwick, Ayrshire, lost his life in the railway accident which occurred at Aisgill on the morning of December 24. The unfortunate gentleman was 29 years of age.

MENDEL'S MONUMENT AT BRÜNN.—In the issue for October 15, p. 282, we published an account, by Professor BATESON, of the proceedings at the unveiling of the memorial to GREGOR MENDEL, at Brünn. We now reproduce in fig. 219, a photograph of the actual monument.

MRS. G. W. PIPER.—We regret to record the death of Mrs. PIPER, wife of Mr. G. W. PIPER, nurseryman of Uckfield, Sussex, at the age of 77 years.

CALCIUM CYANAMIDE AND NITRATE OF LIME.—From comparative trials of the manurial values of these newer nitrogenous fertilisers made at the Aberdeen and N. of Scotland College of Agri-

ing cut flowers, either for large bouquets or for vases. The flowers are very large, reaching, indeed, the great size of 3 inches in diameter, and are borne on stalks from 16 to 20 inches in length. The flower-stem, moreover, is so sturdy that it holds the flower upright, and the cut flower has good lasting qualities. The semi-double varieties are rampant growers, but they flower early and prolifically. They are raised easily from seed, and about 50 per cent. of the plants so raised come true to character. The remainder are single, but are of as good quality of flower as the ordinary single strains. The cultural methods recommended are similar to those in vogue for other classes; sowing in late March to middle April, raising the young plants singly in

12 were borne on as many shoots deprived of leaves and 12 were borne on shoots with their leaves intact. They find (*Journ. de la Soc. Nat. d'Hort. de France*, Nov., 1910) that the removal of the leaves resulted in the production of smaller and lighter fruits. Thus the 12 fruits borne on defoliated spurs weighed 1,265 grams, whereas the 12 borne on intact spurs weighed 1,560. The former also contained less sugar and were slightly more acid. Thus, as might be expected, the leaves in the immediate neighbourhood of a fruit contribute not inconsiderably to the sugar and other materials stored in that fruit, though the bulk of these substances are produced by the manufacturing activity of more distant leaves and pass through the stem, as elaborated sap, to the ripening fruits.

PUBLICATIONS RECEIVED.—*United States Department of Agriculture: Bureau of Plant Industry.* Bulletins: Experiments in Blueberry Culture, by Frederick V. Coville; Field Studies of the Crown-Gall and Hairy-Root of the Apple Tree, by George G. Hedgecock. *Bureau of Entomology.* Circulars: Insects which Kill Forest Trees, by A. D. Hopkins; Insects in their Relation to the Reduction of Future Supplies of Timber, and General Principles of Control, by A. D. Hopkins. Bulletins: Tests of Sprays against the Fruit Lecanium and the European Pear Scale, by P. R. Jones; Life History of the Codling Moth in North-Western Pennsylvania, by A. G. Hammar; The One-Spray Method in the Control of the Codling Moth and the Plum Curculio, by A. L. Quaintance, E. L. Henne, E. W. Scott, and R. W. Braucher. (Washington: Government Printing House.)

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

ABUTILON THOMPSONII.—In regard to Mr. Brown's exceedingly interesting article in the issue of December 10, p. 427, the most important point is that it can now be made quite clear, independently of my information, what the true *A. Thompsonii* really is. Mr. Brown quotes the *Florist and Pomologist* that it "is evidently a sport from *A. striatum*." Evidence of the same kind is obligingly pointed out to me in the *Floral World* of 1871, p. 519, by one of my assistants, Mr. Melles, where there is a long quotation from Shirley Hibberd's *Beautiful Leaved Plants*, in which it is referred to *A. striatum*. We may rely upon observers of that early time, when there was nothing with which *A. Thompsonii* could be confused, therefore *A. Thompsonii* may be defined as the only one of the five or six *Abutilons* with golden variegation that possesses the precise characters of *A. striatum*, plus the variegation, the spurious *A. Thompsonii*, distinct as it is with flowers of different shape (I believe) and colour and venation, and with leaves really quite different, cannot be mistaken for the true plant. With regard to the point of rarity, and whether the true *A. Thompsonii* has been used for sub-tropical planting during these many years, I would simply remark that over a long period there was only this true *A. Thompsonii*, and that it was to be found practically in every garden. It was used generally for bedding, and although it was not sent me when recently I made enquiry for it, I am quite sure that it must still be cultivated in various parts of the country. I do not remember when it was absent in this garden, and I know it to be in two other gardens near by. Mr. Brown enquires whether the commonly-cultivated plant is a more condition of the true *A. Thompsonii*, owing its pubescence and change in the colour of the flowers to having been annually subjected to an open air treatment for several years? To this I think there may be a very definite answer. The spurious *A. Thompsonii* may be a hybrid with the true *A. Thompsonii*, as Mr. Harry Veitch has suggested, but otherwise it has little or perhaps nothing to do with the very clearly-defined species to which *A. Thompsonii* belongs. The two plants are somewhat similar, as may be the case in any two of the same genus, but the spurious *A. Thompsonii* has characters that could not have come direct from the true *A. Thompsonii*. I am anxious to point

FIG. 219.—MONUMENT ERECTED TO GREGOR MENDEL AT BRÜNN.

culture, and published in leaflet form (Leaflet No. 9), it appears that both calcium cyanamide and nitrate of lime are suitable nitrogenous manures for Potatoes, and may be used instead of the older fertilisers, sulphate of ammonia and nitrate of soda. Nitrate of lime serves as well as either of the latter manures for top-dressing Hay, but calcium cyanamide is not suitable for grassland.

SEMI-DOUBLE DAHLIAS.—Mr. G. BESOKE contributes an interesting article on semi double or Peony-flowered Giant Dahlias to *Moller's Deutsche Gartner Zeitung* (No. 48, December 3, 1910). According to Mr. BESOKE, the semi-double varieties are most serviceable for supply-

ing pots, and planting out after hardening in a cold frame. Of the varieties recommended by Mr. BESOKE, *Delice* appears to be a valuable novelty, both for garden decoration and for cutting purposes. Its flowers are of a silky texture, and light rose colour, shading off on the reflexed edges into a whitish lilac. From the excellent illustrations of this new French hybrid Dahlia, it would appear that the flower has all the charm which Mr. BESOKE ascribes to it.

LEAVES AND FRUIT.—With the object of determining the extent of the contribution made by the leaves borne of fruit-bearing spurs of Pears, Messrs GUSTAVE RIVIÈRE and GABRIEL BAILLACHE have compared 24 fruits, of which

this out because a known change of the kind would greatly delight the evolutionist who believes in the direct influence of the environment upon the individual. He would, I am sure, be wrong in finding support for his views in this plant. There is indeed no reason to find the origin of the spurious *A. Thompsonii* in this way, any more than it is necessary to include the other golden variegated *Abutilons* under *A. striatum*. There is, for instance, the very distinct *A. vexillarium* (*A. megapotamicum*) also with fine golden variegation. Quite distinct species of *Abutilon* for some reason are liable to be variegated in the same way. That we know nothing about the origin of this spurious *A. Thompsonii* is hardly remarkable, since we know just as little about the origin of several others. We have forgotten who was responsible for the brilliant series of hybrids of *A. Darwinii* and others, although representatives are to be found in gardens at the present time. And the confusion of quite distinct plants is not unknown as, for instance, in the case of what I shall call the true *Lasiandra macrantha* and *Tibouchina semi-decandra*. The true *Lasiandra macrantha* is now exceedingly rare—and should be looked after like the picture of a great master—and both these were distributed, as one thing, about the same time by the same nurseryman. I do not suggest that these two *Abutilons* were sent out together in the same way. I do not think it was done. I am interested in *A. Thompsonii*, var. *flor. pleno*. It is a variegated plant, and not the one that Mr. Brown has found at Kew under the name and which must now be known as *A. pleniflora*, *N.E.Br.* Without variegation it could not have been called *A. Thompsonii*, as that name indicates exclusively the golden form. I have not seen this double form for a very long time, and cannot say precisely what it is beyond the fact of its being quite similar to *A. Thompsonii* but with double flowers—hence the name. I should be very much obliged to anyone who could kindly send me cuttings of the true plant. I shall then have five or perhaps six of these golden forms, each one distinct from the other. I cannot agree with Mr. Brown in referring to *A. striatum* the third "*Thompsonii*" he has found at Kew, and to which he gives the varietal name *Kewense*. I have had apparently the same plant from Cornwall under the name *A. Thompsonii*, and that name was given to it when sent to Kew. That it should have been named *A. Thompsonii* is inexplicable, unless at Kew there happened to be the same plant with the name *Thompsonii* mistakenly applied. From what Mr. Brown says this appears to have been the case, and that he has found it there. Mr. Brown says he has not seen the flowers. The plant from Cornwall named at Kew *Thompsonii* (which I think must be the same) came to me with flowers. They are entirely unlike those of *A. striatum*; they are small and very peculiar, practically without veins, and of a reddish-brown colour. Next year I propose to have all these *Abutilons* growing together, and therefore I would now say nothing further about nomenclature, except that instead of applying the names *Thompsonii*, *Vitch*, and *Thompsonii*, *Hort.*, as Mr. Brown apparently permits, I would call the spurious *Thompsonii* by the further name *spurium*. If then it came to be *Abutilon spurium* it would not matter, but *Hort.* and *Vitch* as essential adjuncts to a name would not long be retained by gardeners. *R. Irwin Lynch.*

—By the courtesy of the Editors, I have had the opportunity of reading the above note from Mr. Lynch before publication, and would remark thereon that my old friend (and perhaps others) appears to have misunderstood the meaning of my application to the plant now widely grown as *A. Thompsonii*, of the name "*A. striatum* var. (*A. Thompsonii*, *Hort.*). Botanicallly, this means that I consider the plant to be a variety (whether of hybrid origin or otherwise) of *A. striatum*, but do not give it a varietal name, that in parentheses being a synonym intended to indicate the plant meant, in contradistinction to "*A. Thompsonii* var. *Thompsonii*." I refrained from giving it a name, because I thought it likely that someone would be able to give information as to the origin of the plant, when something more definite might be said of it. According to Mr. Maine, we have knowledge of the false *A. Thompsonii* for about 30 years, whilst the true plant was introduced 12 years earlier. Surely someone must have knowledge of one or both

plants for as long or longer a time, and could throw some light upon the question of the origin of the false *A. Thompsonii*. Mr. Lynch may be quite right in believing it to be of hybrid origin, but as the wild plant, in its native country, varies in pubescence, &c., very considerably, a fact Mr. Lynch appears to have overlooked, it is not absolutely certain that the plant may not have done so here under open-air cultivation for a number of years. I do not gather from my friend's note that the Cambridge plant has been annually subjected to that treatment, and I do not insist that it would bring about such a result. The point to be explained is, how comes it that the false *A. Thompsonii* is now so widely cultivated to the exclusion of the true plant, and how has one replaced the other. The plant must either be a hybrid, a variation induced by open-air cultivation for a number of years, or a distinct plant introduced and distributed under the erroneous name of *A. Thompsonii* many years ago. Can no one give information concerning it in its early days? *N. G. Brown.*

ABUTILON SCHWARTZII.—I have now in bloom this white-variegated *Abutilon*, and I should much like to know its origin. In flower, it is similar to *A. striatum* or *A. Thompsonii*, but the flowers are longer and narrower in actual measurement, while in colour it seems to me almost identical with *A. Thompsonii spurium*—as I venture to name it. The leaves, in outline, are much like *A. striatum*, but the serrations are more acute. The relation of this plant to *A. striatum* might explain the relation of *A. Thompsonii spurium* to that central species—as we may term it. *R. Irwin Lynch.*

HARDY BAMBOOS AND MUTISIA CLEMATIS.—The interesting notes on hardy Bamboos (see pp. 396, 415) lead me to endorse the remarks as to the beauty of *Arundinaria nitida*, which makes a graceful and not too rampant clump. It certainly loses its leaves more than most of the other varieties, and this is not due to cold in all cases, for here in sheltered spots it loses them as freely as in the more exposed positions. *A. anceps* is much better in this respect, and it retains a fresh, green appearance all through the year; moreover, the plant has a very graceful appearance. For forming bold groups in moist dells *A. palmata* is most effective, for, although it may lack the gracefulness of the more slender growing species, it is very conspicuous in its deep green colour and bold foliage. *A. aurea* develops stout, feathery plumose growths that are very effective. *A. nigra* is most effective for contrasting with lighter green backgrounds, and, planted in a good position with plenty of room, it forms a fine clump. A viridiglan-escens presents a fresh green colour, sending up long culms that ramble freely. These are a few Bamboos that do especially well here. A correspondent recently stated in the *Gardeners' Chronicle* that a plant of *Mutisia Clematis* grew rampantly with him, but had not developed flowers. Our specimen here has since that was written stopped growing rampantly, and is showing flower-buds. It will be interesting to watch whether they will develop so late in the year, although *Cassia corymbosa*, *Habrothamnus elegans*, and *Clianthus puniceus* are still flowering freely in these gardens. *R. W. Norman, The Gardens, Heligon, St. Anstell, Cornwall, December 20.*

FRUIT-TREE STOCKS.—Mr. H. Somers Rivers' excellent paper upon fruit-tree stocks (see pp. 325, 444) touches a subject of interest to all fruit-growers. The question of selecting the most suitable stocks upon which to bud or graft the various kinds of fruit trees to produce the best results is of great importance in the successful cultivation of fruit trees. I am of Mr. Rivers' opinion that much confusion prevails about the Paradise stock; indeed, there appears to be a lack of knowledge generally with regard to the merits of the various kinds of fruit-tree stocks, and many are unable to distinguish one kind from another. It is evident from the very interesting extracts given by Mr. Rivers from old authors on fruit culture as far back as the 16th century, that careful attention was paid in those days in selecting suitable stocks upon which to work fruit trees. The surface-rooting, dwarfing Paradise stock was adopted for Apples, and the Quince was used as a stock for Pears; even the variety of Quince was given (see extract from

"Evelyn," in which he says the Quince stock is very sound and produce large leaves and fine shoots, and have smooth, shining, black bark). Mention is also made of certain Pears not doing on the Quince that may be regrafted, or double-worked, as we call it now. The French were undoubtedly in advance of growers in this country in the cultivation of fruit trees and Roses and in raising many fine fruits, notably varieties of Pears. They evidently knew the advantage of surface-rooting stocks for the production of early fruitfulness. But from a long experience, I have found many Continental varieties of stocks quite unsuited to this climate, notably the varieties of French Paradise and Doucin. They are too slow of growth, and have too much dwarfing influence. Many sorts of Apples worked upon them become stunted, and produce small fruits. A good variety of English Paradise is far preferable for most varieties of Apples, as the trees make good growth and produce fine fruit; moreover, the swelling at the junction of the graft is more even and less obstructive to the flow of sap. It is difficult to trace the origin of many fruit stocks. The Paradise was undoubtedly selected from seedling Apple trees that had surface roots. The late Mr. Thomas Rivers appears to have raised seedling Apples from which he selected two varieties for stocks, the Broadleaf and Nonesuch Paradise, both of which have proved excellent for the purpose. Messrs. Osborn & Sons had some old trees of an excellent variety of the so-called English Paradise at their Fulham nursery. I spent many days, 50 years ago, layering these for stock, and they must have been there 50 years before my time. They also had the best variety of "muscle" stocks called "Whitley's Muscle." I have found this variety identical with a very old Plum called "Muscle Plum," which was listed in former catalogues. It makes vigorous growth, fibrous roots, clean, smooth skin, and large, shiny leaves. Nearly all varieties of Peach, Nectarine, and Apricot do well grafted on it. It makes splendid, clean stems for trained trees. There are several varieties of "Muscle" stocks in existence, some being poor and almost worthless. The stock on which I should swell equally as much as possible, and I find "Whitley's Muscle" meets this condition better than any other. The sorts of Peaches and Nectarines that will not do on this stock I work on the "Brompton" stock, and Apricots on the Brussels. *Geo. Cannon, Eding.*

THE MILD SEASON.—The mildness of the weather this Christmas is evidenced by the appearance near Bridgwater of a Hazel tree covered with catkins 2 inches long and fully expanded. *Petasites fragrans* and *Anthriscus sylvestris* are in bloom on a bank near by, while the glossy leaves of the wild Arum are already extended 6 inches. *H. S. Thompson, December 25.*

ABOUT SOME DIFFICULT ROSES.—There is a slip in my notes in last week's issue under this head. *Mme. Lacharme* is a white Rose; the "old Dijon Tea" of a brilliant lemon-yellow, erroneously referred to under this name, was the last Rose sent out by Lacharme. Many cultivators considered this Rose his masterpiece, but the name has, for the moment, escaped me. *R. P. S.*

SAXIFRAGA LANTOSCANA.—Respecting *Saxifraga lantoscana*, Mr. Farrer (see p. 474) agrees with our version of the form that was (*vide* Mons. Correvon in a previous issue) given to the world by Boissier under this name. Mons. Correvon is a personal friend of ours, and we were very anxious that nothing we had said should seem to cast aspersions upon his well-known botanical knowledge, so we sent him a rosette of his (Boissier's) plants a week ago, in order that he might pass his judgment upon it, and he replies that, so far as he can say after careful examination, it is identical with his own plants, and that, if it bears an upright stem with pedicels uniformly distributed all round, it must have been modified in habit by cultivation. We can only say that it flowered in this way this year we received it, whereas the *S. lingulata* which we had from him at the same time still retains the semi-pendant habit of inflorescence that it always exhibited and is exactly the same as the Kew plant of this name. It seems to us that, if this be the *Lantoscana* as named by Boissier (and we accept Mons. Correvon's decision), then it follows, since

the man who first gives any new plant a name must be the authority for its nomenclature, that the plant Mr. Farrer and ourselves have in our minds as the true *S. lantoscana* (as grown at Kew ought to be given some other name. We cannot call it *lantoscana superba*, because there is already a well-known form under that name. We can only concur most emphatically with Mr. Farrer that the "Boissier" version is a "terrible contrast" compared with the exquisitely lovely "Vésubie" form. *Heath & Son, Berkhamsted, Cheltenham.*

SCOTLAND.

PLANTING OF TREES IN GLASGOW STREETS.

WITH the object of improving the appearance of some of the broader Glasgow thoroughfares, such as the Great Western Road, by the planting of trees, a remit was made to the Superintendent

structing such greens in the Plantation Park, and the work of construction will be proceeded with immediately. In Dumfries, a public bowling green on the Dock Park was opened last summer, and this has been so successful that the Town Council has agreed to proceed with the formation of another green, which will be ready for use in the coming season.

DATURA SUAVEOLENS IN THE PLEASURE GARDEN.

DATURA SUAVEOLENS is a capital subject for cultivation in the border of a greenhouse or conservatory, but it may also be used for decorating the flower garden during the summer months, provided it is given a position which is sheltered from the prevailing winds. This species is frequently to be seen bearing the old name *Brugmansia suaveolens*. Its large, white flowers are very fragrant. In fig. 220 is shown a specimen in

Prince Albert, Mère de Ménage, Bramley's Seedling, and Bismarck were grandly staged. All the prizes were awarded to Bramley's Seedling. Each dish was of exceptional merit, the fruits being large and finely coloured. The prize-winners, in their order, were Messrs. J. LINTON, Stirtloe; T. KING, Colne; and M. N. DAY, Findarton. For a dish of Cox's Orange Pippin there were 11 entries. The 1st prize was awarded to G. HUNNYBUN, Esq., Godmansburton. R. M. COPLEY, Esq., Burghley Hall, St. Ives, was a good 2nd. There was not an inferior exhibit staged in this class. The 1st prize in the class for a dish of any other dessert Apple was won by Mr. C. COUSINS, who showed an exceptionally fine dish of Allington Pippin, Mr. R. M. COPLEY followed closely with Ribston Pippin. For three dishes of dessert Apples there were eight entries. Mr. J. F. HOOLEY showed remarkably fine specimens of Cox's Orange Pippin, Ribston Pippin, and Blenheim Pippin, and was awarded the 1st prize; 2nd, Mr. G. HUNNYBUN. In the class for a dish of 12 Apples, containing 6 varieties each of cooking and dessert varieties, Mr. C. COUSINS was placed 1st and Mr. R. M. COPLEY a close 2nd. The best exhibit of three dishes of dessert Pears as shown by Mr. T. LONGMAN; 2nd, Mr. F. F. HOOLEY. For a dish of five dessert Pears, Mr. T. LONGLAND, Warboys, was awarded the 1st prize for a magnificent dish of Doyenné du Comice. Kidney and Round Potatoes were well shown by numerous exhibitors, prizes being won by Messrs. C. H. COOTE, Houghton Grange; C. E. GIRLING, Hemingford; G. D. DAY, St. Ives; C. COUSINS, Croxton Park; and E. E. CHAMBERS, St. Ives. Onions were remarkable for their size and high finish. Messrs. C. COUSINS, J. F. HOOLEY, and F. GOLDING won the 1st, 2nd and 3rd prizes in the order of their names.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending December 21.

Another persistently warm, wet, and gloomy week.—Each of the last 17 days has been warm for the time of year, and during the same period there occurred only one unseasonably cold night. If we except one day when the highest reading in the thermometer screen was 45°, the temperature from day to day throughout those 17 days was remarkably steady, the maxima reading ranging only between 48° and 53°—or a difference of only five degrees. The ground is still three degrees warmer at two feet deep, and as much as five degrees warmer at one foot deep, than is seasonable. Since the beginning of the month rain has fallen on all but three days, and to the total depth of five inches, which is about twice the average rainfall for the whole of December. During the same three weeks 26 gallons of rainwater have come through the bare-soil percolation gauge, and 25 gallons through the gauge on which short grass is growing—or practically the whole of the rainfall. Since the beginning of the month there have been altogether only seven-and-a-quarter hours of sunshine, and on 10 days none at all was recorded. The brightest day of the month as yet was the 18th, when the sun shone for two hours, fifty minutes. The winds were, as a rule, rather high, and in the windiest hour the mean velocity amounted to 21 miles—direction S.W. The average amount of moisture in the air at three o'clock in the afternoon exceeded a seasonable quantity for that hour by one per cent. *E. M., Berkhamsted, December 21, 1910.*

Week ending December 28.

Another warm week, and the fourth in succession.—During the last 24 days there has been only one unseasonably cold day, and but four cold nights. On the coldest night, however, which occurred during the past week, the exposed thermometer registered 11° of frost. The ground temperatures have fallen rather rapidly the last few days, and are now only 1° warmer at 2 feet deep, and of about seasonable warmth at 1 foot deep. Rain has fallen on all but five days during the present month, and to the total depth of nearly 5½ inches, or more than 3 inches in excess of the average quantity for the whole of December. In the same four weeks 29 gallons of rainwater have passed through the bare-soil percolation gauge, and 28 gallons through that on which short grass is growing. The sun shone on an average during the week for 1 hour 48 minutes a day, which is about 20 minutes a day in excess of the usual duration at this period in December—making this the first unseasonably bright week recorded here for five weeks. The winds were again as a rule rather high, but in no hour did the mean velocity exceed 19 miles—direction W.S.W. The average amount of moisture in the air at 3 p.m. fell short of a seasonable quantity for that hour by 5 per cent. *E. M., Berkhamsted, December 28, 1910.*

FIG. 220.—*DATURA SUAVEOLENS* IN AN IRISH GARDEN IN SUMMER-TIME.

of Parks, Mr. James Whitton, and the Master of Works to report on the subject. It is a matter of regret that it has been found inexpedient to proceed with the work. The two gentlemen named have reported that the cost of the number of trees required, about 867 in all, together with that of the guards, gratings, &c., would amount to about £1 500. A still greater obstacle appears to be that the gas or electricity mains are generally laid in the lines in which the trees would be planted, and that their removal would involve great cost. In view of the report the Statute Labour Committee has come to the conclusion that it is inexpedient to proceed with the suggested improvements.

PUBLIC BOWLING GREENS.

THE provision of bowling greens in Scottish public parks is extending very rapidly, and quite a number are in process of formation or are contemplated. In Govan, the Burgh Parks Committee has approved of arrangements for con-

the pleasure grounds at Edenmore, Whiteabbey, near Belfast, the residence of Mr. Torrens. The plant was put out-of-doors at the beginning of June, the pot being plunged beneath the grass. The illustration, for which we are indebted to Mr. Isaac Smith, Macedon Gardens, Belfast, was taken on November 1, at which time 36 flowers were expanded.

SOCIETIES.

ST. IVES (HUNTS.) SHOW.

DECEMBER 19.—The annual farm, dairy produce, root, and fruit show was held in a large marquee in the Broadway, St. Ives, on this date. The occasion was market day, and the tent was crowded with visitors during the afternoon. The president is Mr. C. B. Coote, J.P., and Mr. G. H. Cannon, is the energetic secretary. There were 12 exhibits in the class for a single dish of cooking Apples, and such well-known varieties as Lane's

GARDENING APPOINTMENTS.

MR. WILLIAM DAVIDSON, for the past 3½ years General Foreman in the gardens at Moulton Paddocks, Newmarket, as Gardener to Sir WILLIAM EDEN, Bart., Windlestone Hall, Ferry Hill, Durham.

MR. W. FRANKLIN, for the past 3 years Carnation Grower at Porter's Park, Shenley, as Carnation Grower at Grandley Hall, Ripon, Yorkshire.

MR. HENRY H. JONES, for several years Gardener at Ditton Park, Slough, as Gardener to CAPTAIN M. HILL, Westwood House, West Bergholt, Essex.

MARKETS.

COVENT GARDEN, December 28.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices for any particular day, but only the general averages for any week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers such as Anemones, Azaleas, Carnations, Chrysanthemums, Gardenias, Hyacinth, Lilies, Mimosa, etc., with their respective prices per dozen or bunch.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage plants such as Adiantum, Asparagus, Berberis, Croton, Ferns, etc., with their respective prices per dozen.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants such as Aralia, Euonymus, Ficus, Geraniums, etc., with their respective prices per pot or specimen.

Fruit: Average Wholesale Prices.

Table listing various fruits such as Apples, Grapes, etc., with their respective prices per barrel or dozen.

Fruit: Average Wholesale Prices (continued).

Table listing various fruits such as Apples, Grapes, Lemons, Melons, Nuts, etc., with their respective prices per barrel, bushel, or dozen.

Christmas Fruits and Preserves.

Table listing various Christmas fruits and preserves such as Figs, Nuts, Dates, etc., with their respective prices per pound or dozen.

Vegetables: Average Wholesale Prices.

Table listing various vegetables such as Artichokes, Mushrooms, Cabbages, etc., with their respective prices per dozen or bushel.

REMARKS.—Apples of all kinds are meeting with a steady demand, and prices are firm. Pears are a limited supply. Many growers are finishing their crops of Grapes this week, and prices show a slight increase. The Nut trade shows an improvement in all sections, there being a good demand for selected samples. Californian Seedless Oranges have met

with a ready sale at remunerative prices. Pineapples have sold well this season. The Vegetable trade generally is quiet: the market is overstocked with Brussels Sprouts and Cauliflowers. E. H. R., Covent Garden, December 29, 1910.

Potatoes.

Table listing various potato varieties such as Kents, British Queen, Bedfords, etc., with their respective prices per cwt.

REMARKS.—As anticipated, trade is very quiet this week. Prices remain about the same, and stocks in London are still heavy. Edward J. Newborn, Covent Garden and St. Pancras, December 28, 1910.

COVENT GARDEN FLOWER MARKET.

The supplies at Christmas were fully equal to all demands, and prices were not exceptional. Many salesmen have stores in the neighbourhood of Covent Garden where flowers can be purchased after the close of the market, and buyers do not trouble very much about attending early. Such large quantities as usual, almost any flower obtainable at this season could be procured after the close of the market. Supplies of Chrysanthemums hold out well, although some growers have finished with them for the season, and prices may advance. This year the prices of Chrysanthemums have been disappointing to growers, especially during the early part of the season; and they have not been much better for the late varieties. Roses, with the exception of good white blooms, continue to be well supplied. "Liberty" and "Richmond" are both good; the latter seems to be taking the place of the former variety, and the old favourite, General Jacqueminot, suffers neglect, though this sort has a rich perfume, which is absent in many others. Catherine Mermet remains the best Rose of its colour for mid-winter blooming. Good yellow Roses are scarce. Forced bulbs are prominent. Tulips are good in white, yellow, and red varieties; many are sent to market in boxes. Liliums, as usual, were dearer during Christmas week, but high prices are not likely to be sustained. Richardias also advanced in value to a slight extent, yet they were procurable after the close of the ordinary flower market. Lily of the Valley varies but little, the supplies being equal to all demands, and the quality remains good. Gardenias are rather scarce.

Cut foliage, including Ruscus aculeatus (Butcher's Broom) and large quantities of Mahonia aquifolium (Berberis), is well supplied. The dyed Berberis is not suitable for use with flowers, as it stains them.

POT PLANTS.

Good Chrysanthemums are becoming scarce, and those on sale require to be purchased with care, as some are far advanced in blooming. Begonia Gloire de Lorraine is procurable in well-flowered plants of various sizes. Cyclamens are seen but they are not so well flowered as usual. Well-budded plants of Erica hymenalis have been plentiful and supplies promise to hold out for some time, but Erica hyemalis autumnalis is nearly over for the season. Roman Hyacinths, in pots and in boxes, are procurable at prices a little above those quoted for the cut blooms. In foliage plants there is but little variation to record. The forced variegated Funkias show more white in the foliage than when grown under natural conditions. Ferns and Palms of all sizes are well supplied. Aspidistras sell for good prices, especially those with freely variegated leaves. Ficus elastica is not so popular as it was some years ago for dwelling rooms, yet good plants command fairly high prices. Euonymus, in various sizes, and other hardy foliage plants are seen on many stands. Conifers grown in pots last well, but those taken up from the ground and potted, drop their foliage soon in a dry atmosphere; consequently experienced decorators avoid using them as much as possible. A. H., Covent Garden, December 28, 1910.

TRADE NOTICE.

MESSRS. STANLEY & CO. Mr. H. Stanley, formerly of Messrs. Stanley & Co., Orchard Specialists, Southgate, has no interest in this business, having severed his connection with the firm on December 20.

DEBATING SOCIETIES.

READING GARDENERS'.—The final meeting of the autumn session took place in the Abbey Hall, on Monday, December 12; the vice-president, Mr. Leonard Sutton, J.P., occupied the chair. After the minutes of the last meeting had been read, the nomination of officers for the forthcoming year was proceeded with, in view of their election at the annual general meeting, to be held early in January. Mr. W. J. Townsend, the Gardens, Sandhurst Lodge, was to have delivered the lecture on this occasion, but he was unable to be present, and the paper he had prepared was read by his son, Mr. F. Townsend, the subject being "Flowering Trees and Shrubs." The members of the association have, on several occasions, enjoyed the hospitality of Sir W. Larrin, at Sandhurst Lodge, where the beautiful collection of flowering shrubs, in combination with bulbs and other charming spring flowers, always prove a delightful feature in the early months of the year. The lecture was illustrated by a selection of lantern slides prepared by Mr. Townsend. The exhibition held by the association on November 23 yielded a profit of £144s., which sum has been equally divided between the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund.

GUILDFORD AND DISTRICT GARDENERS'.—Mr. H. Tamm presided at the meeting held on December 15. A paper on "Violets" was read by Mr. F. W. Wise, of Loveley Park Gardens. Mr. Wise has on several occasions staged excellent exhibits of these fragrant flowers at the association's meetings. A discussion followed the reading of the paper.

CHELMSFORD & DISTRICT GARDENERS'.—The last meeting of the 1910 session was held at the County Laboratories, Chelmsford, on December 16. Mr. G. Stewart, principal of the Laboratory, presided. Mr. J. C. Gumwood, of the Colchester Gardeners' Association, read a paper on "Plant Diseases and Pests." In his opening remarks the lecturer dealt with the habit of growth of a fungus, and the manner in which it affected the growth of a plant. Lantern slides were used to illustrate the paper. The life-histories of some insects which attack garden plants, were described and illustrated by means of lantern slides.

WARGRAVE & DISTRICT GARDENERS'.—The last meeting of the autumn session took place on Wednesday, December 21. The nominations of the officers and committee for 1911 were first taken, and then the chairman introduced Mr. F. Townsend, of Hill-side Gardens, Reading, who gave a paper on the "Chinese Primula," the remarks being illustrated by means of lantern slides. The points dealt with in the paper included the history of the Primula; and its cultivation.

••• The Editors will be glad to receive, for consideration, large photographs of horticultural subjects, suitable for reproduction as Supplementary Illustrations in this Journal.

CORRECTION: FORGOTTEN FORAGE PLANTS. In the article by Dr. Perez (see p. 389), on "Forgotten Forage Plants," *Cajanus indicus* should read *Cajanus indicus*.

TENNIS COURT AND CROQUET LAWN: A. W. D. The following particulars for laying out tennis and croquet grounds are taken from the new edition of *The Calendar of Garden Operations:—Tennis court:* The

PLAN FOR TENNIS COURT.

lines AB and BA indicate a double court for three or four players; SS, SS, a single court for two players; AA and BB are the base lines; CC and CC, service lines; HH, half-court line; NN, net. A court for the single game is 27 feet wide and 78 feet long; and for the double game 78 feet long and 36 feet wide. The posts for supporting the net should

be placed 3 feet beyond the sides. The service lines run parallel to the net, and are 21 feet distant from the same. The net should be 3 feet high in the centre and 3 feet 6 inches at the posts, which are put 2 or 3 feet outside the line, to allow of the net dropping.—*Croquet lawn:* The following particulars show the present regulations of the Croquet Association: The ground shall be rectangular, 35 yards in length by 28 yards in width, with a defined boundary. A flag shall be placed at each corner, and corner spots, 5 feet from both boundaries, shall be accurately defined. Points on the boundary 3 feet from each corner flag, shall be marked by white pegs, not exceeding 3/4 inch in diameter and 3 inches above the ground. The bank (see diagrams) shall also be defined, the hoops shall stand 12 inches out of the ground, outside measurement, and be firmly fixed. The crown shall be straight and at right angles to the uprights, which shall be not less than 3 3/4 inches or more than 4 inches apart (inside measurement) from the ground

MANURES FOR CHRYSANTHEMUMS: Lancashire. The mixing of manures for soil composts will be understood most easily if we direct that so much manure shall be used to each barrow-load or three bushels of soil rather than to any particular thickness of turf. As a rule, when writers recommend certain quantities to be used to the square yard they refer to top dressings or applications for digging into the ground rather than for loose composts intended for potting purposes. (1) At the time of chopping up the turf for Chrysanthemum growing, add to each barrow-load or three bushels of soil 1 quart of bone meal; this is preferable to dissolved bones, because it is free from sulphuric acid, which, in certain soils, is injurious to the plant roots. Also add 6 ounces of sulphate of potash, 1 lb. of basic slag, or 1 lb. of double superphosphate and 1 peck of soot. If the soil is light and sandy, add 1/2 a bushel of decayed horse and cow manure. (2) The soil used for the final potting should be prepared some time before using in order that the ingredients may

(From Laws of Croquet.)

PLANS FOR LAYING OUT CROQUET LAWNS.

upwards. The turning and the winning pegs shall be of wood, and of a uniform diameter above the ground of 1 1/2 inches. They shall stand 18 inches out of the ground, and be firmly fixed. The setting of the hoops and pegs must be in accordance with one of the diagrams, and the order in which the points are to be made shall be in accordance with the arrows which appear thereon. Measurements:—Setting No. 1: Pegs in centre line of ground 7 yards from nearest boundary; hoops in centre line of ground 7 yards from peg, and 7 yards from the nearest boundaries. Setting No. 2: The winning peg equidistant from the corner; hoops in centre line of ground 7 yards from peg; corner hoops 7 yards from the nearest boundaries. In laying out a croquet ground it is essential to have sufficient room outside the lawn (35 yards by 28 yards) to allow of the roller or mower being turned. This is necessary to avoid unduly wearing the most important part of the turn, viz., that where the "yard line" is situated.

become well incorporated, and the compost should be turned over two or three times during that period. Press the soil firmly into the pots around the roots. It does not matter if a few small stones happen to be in the soil, as they will assist in the drainage, a very important point in Chrysanthemum culture. (3) Chrysanthemums require very generous treatment throughout their growth up to the flowering time, but if good, strong stems and large blooms are to be obtained let the manures be of a phosphatic and potash nature, rather than nitrogenous. For after-feeding use a manurial mixture composed of three parts double superphosphate, two parts fish meal or phosphatic guano, and one part nitrate of potash; 1 ounce of the mixture in 2 gallons of water may be given once a week.
